In this section I describe the main findings from the analysis of data. I divided it into three main categories: the differences between how gminas deliver the care service (outsourcing or hiring caregivers in SWCs), political and managerial pressures to implement the system, and the last part asks the question about the costs of introducing the innovations. All of the sections describe the implications of these contextual problems for the design and use of technology.

3.1 Diverse modes of care service provision

In the researched gminas there **are different modes of care service provision**. Urban gminas tend to outsource the provision to private companies due to greater number of inhabitants requiring care. In rural gminas social workers reported app. 30 beneficiaries of care services. In urban gminas those numbers were at least ten times bigger. In some cases there are even more than one company operating in an urban gmina. Rural gminas tend to hire the caregivers on employment contracts or more flexible commissioned job contracts.

Nevertheless, irrespective of the type of gmina, social workers and managers in the social assistance institutions highlighted problems in hiring caregivers. They point out to low earnings for physically demanding work and outflow of young people to better paid occupations due to proximity of urban gminas, which give such perspective. Very often the caregivers are female close to retirement age or already older than 60 years old who wants to earn more money. Also, as the researched gminas are attractive for migrants, work in companies is often done by Ukrainian migrants. Age and nationality background is often perceived as something that impedes the successful implementation of the system among caregivers. Additionally, social workers point out to challenges in their own work at SWCs, namely low wages (below the average salary in Poland), high demands to enter the job (especially educational – studies in social policy or social work) and great workload, especially bureaucratic. The described problems are of the systemic nature.

In case of outsourced care service, there are additional actors involved in the provision of the service. Except caregivers employed by the private company, there are coordinators of the service who are responsible to ensure unproblematic cooperation between caregivers and beneficiaries. This takes some of the work of social workers who become mediators only in cases of conflicts between beneficiaries and the company. Social workers are also

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

expected to visit the beneficiary of care service at least every half a year. During this visit they conduct follow-up community interviews and reassessment of the diagnosed needs, in case one is needed.

Despite the introduction of Digital Interviews, social workers are not obliged to conduct it using the computer. Some of the interviewees report that they still go to their beneficiaries with pen and paper forms because they either prefer it this way or conducting the interview on the laptop is not possible. One interviewee mentioned that her beneficiary is a hoarder and it is impossible for her to "find even a place to sit, not mentioning to put a laptop". However, if the social worker wants to use the ECS, they have to provide the data from the community interview into the system, which doubles the work.

Gminas include various activities in their caregiving services, depending on the living conditions of their residents. In one of the smaller municipalities, the scope of services sometimes includes lighting a heating stove in beneficiaries' homes. SWCs' managers point out that in smaller gminas, where caregivers are employed directly by the centre, negotiating the scope of duties is easier. In one municipality, there was a change in service providers - responsibilities previously handled by a local company were taken over by a nationwide firm. The manager of this centre noted that the company's employees began rejecting previous practices and adhering to standards set by urban gminas, despite such stipulations were not included in the contract with smaller gminas. One such example was beneficiaries' hygiene - caregivers refused to lift individuals into bathtubs, as it posed a risk of accidents. In this case, the family of beneficiary decided to individually hire previous contractor – the local company.

> "*They said that if a person is bedridden and there is a bathtub, then changing a diaper is considered a specialised service. And I said, 'But girls, hold on, we signed a contract, and there was nothing like that in it. You didn't mention anything, did you?' Because, you know, we really deal with the most difficult cases.*" (Director of local SWC in a rural gmina)

This shows that dynamic of the relations between gminas and companies is defined mostly by standards set out by bigger and wealthier players. As urban municipalities played a dominant role in designing the system, it did not include experiences of social workers from smaller gminas. This leads to standardising the service from the perspective of institutions, but for inhabitants and beneficiaries it might be a reason to opt out from the public service and decide to get the service in the private company. In this case financial situation of the family plays important role. As put by one of our interviewees:

> "*And when you have a choice, it's very different. And such rich people say: 'oh, thank you, we'll go straight to commercial', yes? And people who save every penny will say: 'we want you'. And it's clear*" (Director of local SWC in a rural gmina)

Nevertheless, the ECS is designed strongly with idea of outsourcing the server, which mirrors the dominant position of urban gminas, which initiated the process of digitalization and are wealthier than rural gminas. It influences the potential use of technology by social workers. During some of the interviews social workers expressed that they will opt out from the system as soon as it will be possible, because the system does not serve their purposes and often doubles the work.

3.2 Political and managerial pressures

One of the goals explicitly expressed by policymakers is to improve the quality of caregiving services. They point out issues related to the current service delivery model, particularly the lack of control over caregivers' punctuality and fulfilment of assigned tasks. One proposed solution was the creation of caregiving service standards by some of the larger municipalities - documents defining the scope of duties and the manner in which caregivers should perform them.

However, this did not solve the issue of monitoring working hours. According to policymakers and SWCs' managers, the solution to this problem would be NFC-based logging, requiring caregivers to clock in upon arrival at the beneficiary's home and clock out before leaving using designated sticker. The system allows logging without scanning the designated stickers, thus depriving decision-makers of real control over the caregivers' location at the time of logging.

From the policymakers' perspective, caregivers manipulate the system by performing certain tasks incompletely or not in accordance with the regulations. One example, highlighted by an interviewee, is the issue of shopping:

> *"So, for example, one caregiver has two recipients and she has to go shopping here and here, she gets paid for this and that, so she goes shopping and shops for these two people at once. And she's paid separately, so that's why they resist. (…) The municipality wants to have control over its money, we want to know what we pay for."* (Urban gmina policymaker)

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

In the eyes of the interviewee, shopping simultaneously for both beneficiaries is cheating the system, because the caregiver has assigned hours to shop for both of them in separate periods. The issue of shopping was also present in the interviews in rural gminas' SWCs:

> *"On Saturday morning, she goes shopping. We also have caregivers who look for the best prices so that the client doesn't spend too much money - they shop here for a discount etc. If they're shopping for themselves, they'll pick up groceries for their client at the same time. And sometimes, they don't even count those hours at all. They say, 'If I was already shopping for myself, what does it matter to grab a loaf of bread for my Marysia?' So they don't include that time in their working hours."* (Rural gmina SWC director)

In this case, interviewee highlighted the importance of mutual trust in the community. Director and social workers allow caregivers to have more personal relations with beneficiaries and state clearly that they do not feel the need to control the time of the service. The same director said they considered outsourcing the provision of care services, but their calculations have shown it would be more costly than employing caregivers directly in the SWC. These interviewees strongly criticised the idea and implementation of ECS in their SWC. In their opinion, the system works good in case of bigger number of care services, when the control over caregivers is complex due to the number of beneficiaries. In small communities, control over caregivers' work is done either directly or through contacts with neighbours.

> "*We didn't need it at all. The only thing left from it are these laptops, which, honestly, employees don't take with them into the field… And for office work, they're not really suitable because they're so tiny [laughs]. So, they were really expensive—almost 8,000 PLN* (app. 1900 EUR, 1970 USD) *[laughs]—and now they're just lying around somewhere…*" (Rural gmina SWC director)

The other goal expressed in the interviews was attaining data to manage the care services. One of urban gmina policymaker complained that statistical software used by the ministry does not produce easily quantifiable data. This is needed to "*be able to correlate them with other phenomena*". Digital Interview introduced changes into the way community interview is conducted. Namely, IT designers and policymakers decided to include check-boxes instead of text inputs to describe the social, economic and health conditions of the beneficiaries. This entailed categorisation of possible life situations.

Policymakers perceive this change as favourable for social workers:

> "*So, our goal was to make life easier for social workers by automating whatever could be automated - but not at the expense of human interaction. People need more time to work with clients, not to fill out unnecessary, not to use unpolite words, tables that no one needs. That should be done by a computer, a system, an app. A person should be able to ask questions, smile, and complete the form. We also proposed modifying the community interview as much as possible, but it turned out to be impossible. So, we came up with the idea of using checkboxes. If the ministry insists on plain text, then fine - the plain text will be generated from the checkboxes. They'll get what they want, but they won't be able to extract any real insights from it because plain text isn't manageable. Meanwhile, with checkboxes, I can manage the data, segment and group people with similar issues, and create targeted, cost-effective solutions for specific clients.*" (Urban gmina policymaker)

From their perspective, the goal of the ECS is to collect quantifiable data to "*segment and group people with similar issues*". This fragment also shows NPM approach to policy making – the interviewee is using the language of targets, tailor-made services and cost-effectiveness. Nevertheless, the profiling mechanism implemented into the system is an object of critique of social workers (more about it in the next section).

The implementation of ECS also entailed changes in other ICT systems used in SWCs. Before ECS, SWCs used at least 3 different systems. In order to cut the budget of ECS, one of SWCs was forced to change the main ICT system into one of other two used in the majority of centres. These main systems were further changed to be compatible with the software of ECS and to be able to exchange data on beneficiaries. Policymakers emphasised that the decision to switch the system in one of the SWCs was purely budgetary, as in the budget of ECS project there were money only for changes in two systems. As this decision seem rational, it creates organisational problems (social workers need to get accustomed and learned the new ICT system) and creates unclear decisions on how ICT systems are chosen. There is a possible conflict of interest, as one IT company behind ICT systems for SWCs was also commissioned to design and implement the ECS software.

3.3 Who carries the costs of innovation?

This question is asked not only in the financial aspect, but also in the aspect of effort to adjust to the change and learning new system. Noteworthy, the project was supported financially by the EU funds, meaning that system needs to be used at least for the time specified in the agreements. However, some directors of SWCs and social

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

workers already expressed frustration and guaranteed they will opt out as soon as it will be possible.

In the financial sense, the costs of the remote control is split between gminas and beneficiaries, however gmina's council may decide to exempt beneficiaries from the payment and cover 100% of the costs. Social workers pointed out that at first beneficiaries and their families were keen to using remote technologies. The obligation to pay for the service had not been explained clearly, as some of the beneficiaries later were surprised to be asked for payments for the service. Remote wearable technologies could be either bought by the SWCs or rented from the company with a monthly subscription pay.

> "*However, for them, it was already a burden. They pointed that out. Even though their income was, for example, two thousand or just slightly over two thousand, it still made a difference. At the beginning, the ECS and remote control were introduced gradually - there was a project, and it was implemented step by step. First, people received the devices, and later, the payment system was established, which is where the issue stemmed from.*" (Social worker from a rural SWC)

The elderly often fear the technology, as one of the main reasons to opt out from the remote control was concern they might unintentionally destroy the device. As the device resembles a watch, some of the beneficiaries take care of it as if it was a watch – they only wear it occasionally and most of the time they take it off. In such case, families often decide to return the device as it is not used properly. The other reason were mistakes made by technology. In one of the SWCs, social worker told us that one beneficiary opted out from the service because the device mistook leaning over with falling down, which triggered the mechanisms calling the monitoring centre.

> "*Because we assumed that all individuals receiving caregiving services would have wristbands. But what turned out? That wasn't the case—only one-third of them did. You see, the service provider is a private company with a set budget. We wanted to make everyone happy, and on the project level, it all seemed to add up. But when it came to implementation and we went to the people, it turned out that only a third would actually use them.*" (SWC director)

Another issues are with profiling algorithm suggesting the scope of care services assigned to the beneficiary based on collected data. Social workers emphasised missing one of the key elements important to their beneficiaries, namely the financial situation in the household. The algorithm suggest much more hours of care work than beneficiaries are able to afford. The documentation of the ECS also shows that such aspects were not taken into account when designing the algorithm. Because of that, social workers disregards the suggestions from the algorithm and review it as useless element.

Also, the questionnaire used for profiling is described by social worker as complicated and too long. According to the program's assumptions expressed in documentation, social workers should ask specific questions to the beneficiaries. Nevertheless, in the interviews they confessed to either filling this part based on their own assessment of autonomy level or asking different and, in their opinion, easier questions to the beneficiaries and based on the answers filling in the corresponding check boxes.

> "*Yes. Sometimes not directly, because there are many questions with many possible answers. Older people also sometimes perceive things differently and may have difficulty communicating, so I explain everything in very simple language.*" (Rural SWC social worker)

The other aspects of costs in innovation is with cognitive work to learn the new system. It seems that all groups of stakeholders involved in the system have to involve in learning new technology. However, during the observations of caregivers' work with the mobile ECS app, it seemed that it is often too much of technical information they have to learn.

One of the issues is clearly technical language used to explain instructions to caregivers regarding the ECS and app. Upon entering the beneficiary's home, the caregiver is supposed to select the appropriate function on their phone to activate NFC and scan the sticker. During one observation, a caregiver confused the term "NFC" with "NFZ", which is the abbreviation of the National Health Fund (pl. *Narodowy Fundusz Zdrowia*).

Another problem is with the additional work that is asked from caregivers to learn the new app. The observations conducted by us are focused on the logging into the app and scanning the NFC sticker to begin the work hours of a caregiver. However, the app has much more functionalities that are not learned during this meetings. Instead, caregivers are asked by coordinators and social workers to learn the app by "swiping through it" in their free time. Caregivers, despite being potentially digitally excluded due to demographic characteristics or have problems with language due to migratory status, do not have additional training in how to use the app.

4. Summary

The neoliberal political reforms also entailed changes in welfare institutions. NPM preferred outsourcing and cost-effectiveness, especially when implemented in post-communist countries during the transition period. NPM focused also on the performance measurement and led to disjointed and inconsistent service provision. Karen Yeung introduced the term New Public Analytics to describe implementation of new technologies into the NPM thinking or as she called it "neoliberalism with techno-solutionist makeover" (Yeung, 2023). However, the cause of the problem with implementation of new technologies in public administration are rather systemic and stems from the issues caused by NPM approach – disaggregation, competition and incentivisation (Kempeneer, 2023).

This can be seen in the case of ECS in selected Polish municipalities. The underpinning of the program is clearly bureaucratic, as policymakers want to refine data about care service provision and based on them manage the service over the municipalities. However, the implementation of ECS is hampered by disaggregated services. Diverse modes of care provision were not taken into account and the system is focused on the interests of bigger and wealthier gminas. This leads to domination of "big players" – e.g. care companies that can afford to implement the service because of the scale, or IT companies which has adjusted their software to be compatible with ECS. The question what will be the stake for smaller players to entre this domain is still open. However, this domination presents risk to one of very core principles of NPM – competition of market entities.

One of the driving factors behind the implementation of ECS is the pressure from social welfare system managers and political decision-makers at the gminas level. Their assumption is that ECS will give them a sense of control over the tasks performed by caregivers, even though the system is designed solely to measure punctuality. However, the narrative presents it as a significant improvement in service quality. This reflects the typical NPM focus on measurable achievements, even though obtaining quantifiable results in social policy remains ambiguous.

The last issue presented in the paper is the question of costs of technology implementation. As I have shown, the incomparable cognitive costs are put on the caregivers. Their work is underpaid, often done by women close to retirement age or with migratory background. This may make it more difficult for them to learn and understand the new system, and as a result – they will have limited abilities to argue with its outcomes. Additionally, there is not enough work done with beneficiaries regarding clear communication about the financial costs of the system and the aims of wearable technologies.

From the perspective of social workers, caregivers and beneficiaries, it seemed that their experiences were not taken into account when designing the system. Social workers point out that often they are unable to conduct Digital Interviews using computers due to the conditions in the households. Caregivers are not accustomed with technical language used in the mobile app. Beneficiaries are more accustomed to taking good care of the objects they posses and treat the wristbands as precious watches.

In this paper, I shown the importance of including diverse perspectives and experiences in successful implementation of ICT systems in public administration. Policymakers need to think forward about social and political-economic results of their decisions in the field of digitalisation. New ICT systems should not make it difficult new players to enter the market and learn how to use it. It is exceptionally important in the field of public services which are often provided to less favoured populations that may have difficulties with understanding their rights and possibilities in digital welfare states.

Abstract. The U.S. government has made various efforts to increase broadband access, even before the pandemic. However, there is still a significant gap in broadband coverage across U.S. states, indicating the persistence of digital divides. Previous research has focused on geographic and socio-demographic factors, often overlooking the role of state governments, including state administrative efforts. In this paper, we explore how the administrative capacity of states influences the coverage of four broadband technologies across states in the U.S. Using secondary data, beta regression is employed to explore the impact of state administrative capacities, i.e., broadband plans, grantmaking, broadband offices, broadband maps, and state regulations, on the coverage of cable, fiber optics, fixed wireless, and fiber/cable at urban, rural, and state levels. The findings confirm the dominance of cable, followed by fixed wireless, while fiber shows limited coverage. Infrastructure-focused broadband plans negatively affect fiber optics' coverage, highlighting implementation challenges. Conversely, grantmaking positively affects fixed wireless but not fiber, highlighting a tendency toward cost-effective, faster-deployment technologies.

Keywords. Broadband availability, adoption, state broadband, state administrative capacity.

1. Introduction

Besides highlighting the important role of broadband internet, the Covid-19 pandemic also exposed the persistent issue of digital divides in the United States. The disparity still exists, especially in terms of geographic, economic, educational, and socio-demographic aspects (Li et al., 2023). In addition to the affordability issue (Bauer, 2023), the low coverage or absence of internet access in some regions in the U.S. is caused by the lack of infrastructure (Busby et al., 2023). Efforts have been made to address the lack of broadband infrastructure, not only from the government but also scholars. At the federal level, scholars analyzed federal policies, market influences (Ali, 2020; Bauer, 2023), and subsidies (Dinterman & Renkow, 2017), while state and local studies have focused on sub-federal governance (Ali et al., 2022), state grants (Bravo & Warner, 2023), and regulation (Galperin et al., 2021).

Unfortunately, there is state-by-state variation in internet coverage across the nation, with some areas having higher coverage and other areas having limited or even no Internet access (Rachfal, 2023), as seen in the 2021 Broadband Development Report (FCC, 2021). Some states such as California, Connecticut, New Jersey, and New

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

York, outperformed their counterparts, with more than 98% of their population having access to fixed broadband. On the other hand, Alaska, Arkansas, Mississippi, and West Virginia fell below the average, with less than 85.5% of their residents having the service. These gaps indicate variation in broadband availability across states.

Regrettably, there is a lack of scholarly literature addressing the diffusion of broadband across states and the factors contributing to the disparities. If there were any, the earlier work focused on broadband speed and different forms of market competition instead of the variability of broadband users among states (Denni & Gruber, 2007). Nonetheless, it can be learned from previous literature that the variations can be attributed to geographic and socio-demographic factors that vary among states (Rachfal, 2023). Some states have more challenging geographic locations, such as rural or high-cost areas with low population density, discouraging telecommunication providers from investing due to the high deployment costs and the uncertain return on investment (Ali, 2021).

Furthermore, other scholars highlighted the critical but frequently overlooked role of state governments' efforts in advancing broadband deployment (Whitacre & Gallardo, 2020). They acknowledged that the diffusion of broadband among states is influenced by the state broadband policies, including the presence of state broadband office and its key functions, such as policies, stakeholder outreach, planning and capacity building, operations and funding, etcetera (Stauffer et al., 2020). These key functions demonstrate the role of administrative aspect of state capacity, or state administrative capacity (Haque et al., 2021). Stratton and Astuti (2024) also demonstrated variations in addition to uniformity among state governments' efforts in the administrative dimension.

Given the lack of discussion about the role of state administrative capacity and the broadband variation among states, this paper aims to answer the following research question: *"How do state administrative capacities correlate with the adoption of broadband technology (fiber, cable, fixed wireless, and fiber/cable) across states in the U.S.?"* As the definition of broadband could cover various technologies, this study analyzes the impact of administrative capacities on the adoption of three broadband technologies—fiber, cable, and fixed wireless as well as a fourth that combines fiber and cable or fiber/cable to capture overlapping deployment in broadband technologies. Beta regression is employed to quantify the impact of different administrative capacities on broadband coverage in the fifty states in the U.S. It is expected that the analysis can help identify which aspects of states' administrative capacities have the most significant effect on broadband availability, in urban, rural, and the state-level areas.

This paper is structured as follows. Section 2 presents the literature study, section 3 describes the methodology, subsequently, section 4 outlines the findings based on twelve beta regression models across the four technologies and geographical areas. Then, section 5 presents the discussion and section 6 concludes this paper.

2. Literature Study

2.1 From Digital Divides to Broadband-Enabled Digital Equity

Digital divide has emerged from its original focus on the "access divide", which highlighted disparities in internet connectivity based on factors such as location, age, and socioeconomic status (Campos-Castillo, 2015; Hindman, 2000), then extended to include the "usage gap" and "capability divide", which consider the skills and motivations needed to effectively use the internet (DiMaggio & Hargittai, 2001; van Deursen & van Dijk, 2014), and an "outcome divide", which focuses on the tangible benefits derived from internet access (Wei et al., 2011). Even though the concepts have evolved, digital equity has been considered as the ultimate goal (Puigjaner, 2016). Central to achieving digital equity is broadband access, which the FCC currently defines as a minimum of 25 Mbps download and 3 Mbps upload, though recent calls suggest raising this to 100 Mbps download and 20 Mbps upload (Congressional Research Service, 2021). Unfortunately, existing studies on digital divides mostly take individual perspectives, leaving the study on institutional efforts and policy initiatives to remain overlooked.

2.2 The Federal Efforts for Digital Equity

The policy initiatives in broadband development expansion across the U.S. have demonstrated a long journey. Starting from the Communications Act of 1934, an act focused on equitable access to communication services across the nation, then the Telecommunications Act of 1996 that fostered the competition in the telecommunications industries. The government also released the Broadband Data Improvement Act to improve the accuracy of federal data on broadband and create the National Broadband Map to encourage better reporting from Internet Service Providers. The American Recovery and Reinvestment Act (ARRA) of 2009 was launched to stimulate the economy during the pandemic through funding like BTOP and BIP that focused on broadband deployment in underserved areas (Kruger, 2011). The federal government then launched CARES Act of 2020 and the American Rescue Plan (ARPA) of 2021 to provide relief and support to Americans due to the Covid pandemic, including broadband support for low-income households through the Emergency Broadband Benefit. The latest, the Infrastructure Investment and Jobs Act of 2021 marked a major focus, emphasizing not only broadband expansion, but also digital equity programs.

2.3 State Government Efforts and Conceptual Framework on State Administrative Capacity

2.3.1 Variations among States Government's Efforts on Broadband Expansion

Due to a policy shift toward devolution, the federal government has allocated a considerable amount of funds and grants to states and local governments (Gainsborough, 2003; Pandey & Collier-Tenison, 2001). States have more flexibility to address problems tailored to the uniqueness of their geographic, demographic, and economic conditions (Adkisson & Peach, 2000; Dilger & Cecire, 2019). Especially due to the Covid, the federal government has allocated grants-in-aid and other categorical grants for states to implement programs to expand broadband infrastructure and increase its adoption. Despite the huge amount of grants, state broadband programs vary across the U.S. due to political, geographical, resource factors, and organizational structures (Stauffer et al., 2020). Stratton and Astuti (2024) demonstrated variations with regards to states' administrative capacity prior to the establishment of the IIJA, such as broadband offices that plan and manage broadband initiatives, state government's collaboration with other entities, the making of state broadband plans, broadband availability maps, and broadband grants.

2.3.2 Conceptual Framework on State Administrative Capacity

To systematically explain why such variations occur across the U.S. states, this study refers to the policy capacity model (Wu et al., 2015) which defines three dimensions of governance capacity necessary to shape policy outcomes: analytical, operational, and political capacities. Analytical capacities refer to the knowledge and skills required to generate, analyze, interpret, and use evidence to evaluate policies, including research skills, data analytics, and policy evaluation. Operational capacity reflects any capabilities required to implement and manage policies, including staffing, budgeting, resource allocation, collaboration, and so forth. Political capacity includes any capabilities required to successfully navigate a complex political situation, such as stakeholder engagement, public communication, political mandates and leadership.

In the context of broadband expansion, state efforts varies and their efforts (Stratton & Astuti, 2024) reflect the combination of these capacities. The variations show that some states have demonstrated the use of detailed broadband availability maps to guide their investment decision on infrastructure expansion which shows an analytical capacity. In terms of operational or managerial capacity, some states have established broadband offices to manage their broadband initiatives, developed broadband plans focusing on infrastructure, and created grantmaking programs for resource management. These activities are part of staffing, planning, and resource allocation which encompass the state's operational capacity. Regarding the political capacity, some states have also demonstrated regulatory efforts as a tool for political authority and negotiation. Furthermore, each of state's efforts is explained as follows.

Broadband office
States vary in managing broadband initiatives. While many states have dedicated broadband offices, others manage broadband tasks within existing departments. States without specific broadband offices incorporate these efforts into broader departmental agendas, like Montana's ConnectMT program (Read & Gong, 2021). Additionally, states frequently collaborate with state and local entities, including broadband task forces and committees. Their efforts in managing broadband tasks varied, suggesting that the type of state broadband office could be linked to the availability of broadband access in a state. Understanding that states that operate independently or located within a strategic departments like commerce could be more specific to focus on their broadband efforts, we propose the following hypothesis:

> *Hypothesis 1: A more independent/specialized type of broadband office has a positive and significant influence on the availability of broadband access.*

Broadband plan
In terms of broadband planning, thirty-five states had issued a broadband plan prior to the IIJA funding requirements (Stratton & Astuti, 2024). These plans varied in detail and also revealed that broadband expansion emerged as a common priority. However, only about half addressed affordability, and fewer still included digital literacy or inclusion initiatives. The variation in the details and the priority of each state in broadband expansion as state in their broadband plans could impact the variation in the broadband availability among states. Thus, we propose a second hypothesis as follows.

> *Hypothesis 2: A state with a broadband plan focusing on infrastructure expansion prior to the IIJA has a positive and significant link to the availability of broadband access.*

Broadband availability map
One of the most noticeable programs mentioned by states in their broadband plans is to develop a state broadband availability map, as a response to the inaccuracy of the FCC's national broadband map. States depend on federal grants to expand their broadband to underserved and unserved areas. However, the allocation of some federal

grants has been hindered by the national broadband map which was not detailed enough to capture unserved and underserved areas in each state in the U.S. (Peikes, 2023). To counteract this, some U.S. states have developed their broadband maps (Read & Gong, 2021) even before the IIJA, where the data sources they utilized were various, such as data obtained from the FCC sources, ISP reports, citizen input, Census Bureau, or a mix of these to obtain a clearer picture of coverage needs (Stratton & Astuti, 2024). States that developed their state broadband map could identify and address the unserved populations more accurately than states without such maps. Therefore, the third hypothesis proposes a link between the presence of the state broadband map and the availability of broadband access.

> *Hypothesis 3: There is a positive and significant association between state's broadband map and the availability of broadband access.*

Grantmaking efforts

States have shown variation in grantmaking efforts, with many of them focusing on infrastructure expansion (Stratton & Astuti, 2024). During the Covid-19 pandemic, many states funded projects to connect underserved and unserved areas (Read & Gong, 2022). Although states developed their broadband funding programs, the mechanisms were similar, often involving grants and loans sourced from the Universal Service Fund, special funds, and other revenues such as service provider fees (An, 2019). Besides, states also use other mechanisms, such as tax incentives and bonds. Mainly, federal grants, particularly ARPA, were the primary source of state's broadband funding. However, aside from that, some states also allocated funding from non-ARPA grants, such as Idaho and Arizona. States with grantmaking efforts before the IIJA could have connected more underserved areas than states without grantmaking efforts. Thus, we argue that there is a link between grantmaking efforts prior to the IIJA and broadband availability.

> *Hypothesis 4: A state with grantmaking efforts prior to the IIJA has a positive and significant impact on the availability of broadband access.*

Broadband internet regulations

Variation is also seen in the states' regulatory approaches to broadband. The State Broadband Policy Explorer (Pew, 2021) presents diverse laws in governing broadband Internet access across states. For instance, California implemented regulations on authorized services and facilities in 2018, and Maine enhanced competition among public providers through joint exercise of powers in 2015. Supportive regulation is essential for promoting broadband deployment, especially in high-cost areas. States with broadband regulations could have more coverage on Internet access. Therefore, we propose the following hypothesis.

> *Hypothesis 5: There is a positive and significant association between a state's regulations governing broadband internet access prior to the IIJA and the availability of broadband access.*

Drawing from the literature, this paper suggests that administrative capacity (in terms of task force/agency, regulation, grantmaking programs, broadband plans, state broadband availability map) influences a state's broadband-technology adoption.

3. Methodology

2.1 Data Collection

This paper is quantitative and secondary research, which aims to investigate the influence of a state's administrative capacities on broadband technology adoption. The majority of the data used in this study is the output of the work of Stratton and Astuti (2024), where the data were sourced from a variety of secondary sources, including federal and state government websites and other authoritative bodies, government reports, state broadband plans, articles, policy documents, and broadband access statistics at a state-level unit of analysis. Additional data were then added in this study, including municipal regulations and the broadband technology adoption. Together, we came up with a state-level database in an Excel file which includes all the variables needed.

To test the hypotheses, five independent variables that represent a state's administrative capacities are used, i.e., type of office, regulation, broadband plans, grantmaking, and state broadband availability map. All independent variables except the type of office are operationalized as binary (0 and 1) due to the nature of the available data and our goal to capture the "presence" as 1 and "absence" as 0 of these administrative aspects. For example, the presence of an infrastructure-focused broadband plan in a state is coded as 1, and 0 if a state did not have any broadband plan focusing on infrastructure. The state's broadband adoption is the dependent variable with three different technologies (fixed wireless, cable, fiber) and one combined technology (fiber and cable). We use the data from the FCC's broadband national map (FCC, n.d.) in 2022 for the dependent variables, considering the availability of the data, and the effect of policies on administrative capacities that were imposed before the IIJA. Finally, the required data is presented in Tab. 1, including the characteristics and the sources of the data.

Tab. 1 - The variables used in the study

Category	Dependent/ Independent	Variable	Type	Description	Data Source
Broadband Adoption	Dependent	Urban covered by fiber	Continuous (%)	Percent of urban areas covered by fiber at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Rural covered by fiber	Continuous (%)	Percent of rural areas covered by fiber at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	State (Units) covered by fiber	Continuous (%)	Percent of units covered by fiber at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Urban covered by cable	Continuous (%)	Percent of urban areas covered by cable at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Rural covered by cable	Continuous (%)	Percent of rural areas covered by cable at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	State (Units) covered by cable	Continuous (%)	Percent of units covered by cable at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Urban covered by fiber and cable	Continuous (%)	Percent of urban areas covered by fiber and cable at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Rural covered by fiber and cable	Continuous (%)	Percent of rural areas covered by fiber and cable at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	State (Units) covered by fiber and cable	Continuous (%)	Percent of units covered by fiber and cable at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Urban covered by fixed wireless	Continuous (%)	Percent of urban areas covered by fixed wireless at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	Rural covered by fixed wireless	Continuous (%)	Percent of rural areas covered by fixed wireless at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
	Dependent	State (Units) covered by fixed wireless	Continuous (%)	Percent of units covered by fixed wireless at 25/3 Mbps in 2022	The FCC's national broadband map as of June 2022 Data
Administrative Capacity	Independent	Type of office	Categorical (1-3)	1=Broadband office under CED/Communication department 2=Broadband office under IT department 3=Broadband office under other departments	State Government Websites State Broadband Plans/ Reports
	Independent	Regulation	Categorical (Binary)	0=State does not regulate competition/regulation before the IIJA; 1=State regulates	State Government Websites State Broadband Plans/ Reports State Broadband Policy Explorer

Category	Dependent/ Independent	Variable	Type	Description	Data Source
				competition/regulation before the IIJA

	Independent	Grantmaking programs	Categorical (Binary)	0=State does not create any grant programs for broadband before the IIJA; 1=State has grant programs before the IIJA	State Government Websites State Broadband Plans/ Reports State Broadband Policy Explorer Pew
	Independent	State broadband availability map	Categorical (Binary)	0=State with no broadband availability map before the IIJA 1=State has broadband availability map before the IIJA	State Government Websites State Broadband Plans/ Reports State Broadband Policy Explorer

2.2 Assumption Check and Data Analysis

The analysis uses beta regression because our outcomes—the percent of areas covered by broadband technologies—are continuous and have values between 0 and 1. Beta regression is ideal to be used for modeling such proportions of values (Ferrari & Cribari-Neto, 2004). Other models—such as logistics regression that requires binary dependent variables, or Ordinary Least Squares that require outside 0-1 range—are not suitable for the analysis. The general formula of beta regression is seen below, where μ_i is the mean of the dependent variable Y_i within the interval of 0 and 1 (such as the percent of broadband coverage), $g(\mu_i)$ is the logit function log, X_i is the independent variables (five aspects of state administrative capacity), and β is the regression coefficients.

$$g(\mu_i) = X_i\beta \qquad (1)$$

A beta regression model is applied to analyze broadband coverage across four technologies and geography. For each technology, we measured at urban, rural, and state. Thus, this results in 12 unique dependent variables, meaning 12 beta regression models. Each model uses five independent variables to test the hypotheses. Because each dependent variable is a proportion with the value between 0 and 1, we apply a logit transformation to handle the 0-1 range so that a linear model can be performed with 0-1 range values (Ferrari & Cribari-Neto, 2004).

Several assumptions were checked before analyzing the regression models, including the linearity check, multicollinearity, and homoscedascity as seen in Tab. 2. The linearity check was performed to assess the linearity between the dependent variable in the logit scale and trange.he independent variables. We employed residual versus fitted plots to conduct this check. Next, the second multicollinearity check is done to investigate the correlation between independent variables through their Variance Inflation Factor (VIF) value (above 5 indicates high multicollinearity). Last, the homoscedascity check is to identify heteroscedasticity through the spread of the residuals/errors. We used residual plots to perform this check.

Tab. 2 - The assumption checks and criteria

Assumption Check	Method	Expected Results
Linearity	Residual vs. Fitted Plot	No clear patterns
Multicollinearity	VIF	VIF < 5 for all predictors
Homoscedasticity	Residual Plots	Even spread of residuals

Running the assumption checks

Initially, we had seven variables, adding *taskforce* and *broadbandplans*. However, a multicollinearity issue was found between *taskforce* and *typeoffice* when we run *cablefiber* models for a state level. Since *typeoffice* is categorical type of data, centering variables to address multicollinearity could not be performed (Aiken et al., 1991), so we removed *taskforce*. Another problem was also found between *infrastructure* and *broadbandplans*. We retained the *infrastructure*, and redefined it as states with a broadband plan focusing on infrastructure expansion (Stratton & Astuti, 2024). We then run another round to ensure that all assumptions were met. Finally, five independents were used in our regression analysis: *typeoffice*, *infrastructure, regulation, broadbandmaps,* and *grantmaking*. Figure 1, Table 3, and Figure 2 represent the sample results of final assumption check we performed.

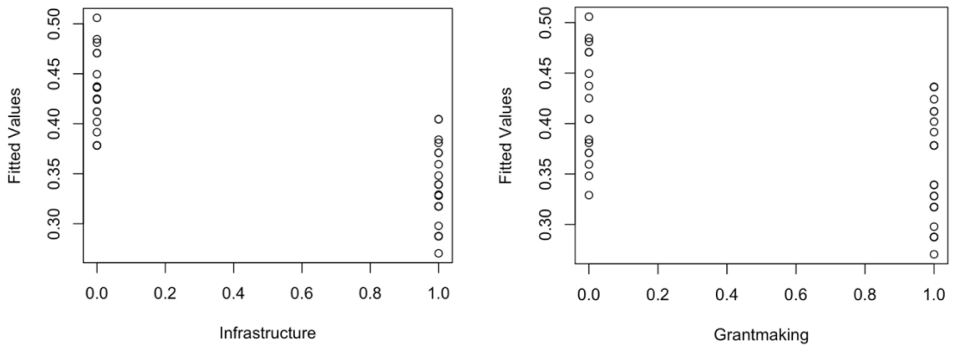

Fig. 1 - Linearity check for two variables on fiber in urban

Tab. 3 - The multicollinearity check using VIF (>5)

		Type of Office	Infrastructure-focus BB Plans	Municipal Regulation	BB Maps	Grantmaking
State	Cable/Fiber	1.34	1.06	1.16	1.17	1.43

		Type of Office	Infrastructure-focus BB Plans	Municipal Regulation	BB Maps	Grantmaking
Urban	Fiber Only	1.31	1.06	1.15	1.21	1.46
	Cable Only	1.33	1.06	1.16	1.19	1.44
	Fixed Wireless	1.32	1.06	1.15	1.20	1.46

4. Findings

This section explores the link between the different broadband technologies and the states' administrative capacities in rural, urban, and overall state settings.

4.1 Broadband coverage across states based on four different technologies

At the state-wide level, the majority of the U.S. is covered by the fixed broadband, cable and fiber broadband, as seen in Table 4. However, among the four technologies, the cable technology has the highest coverage (79%) than fixed wireless (62.9%) and fiber technology (with only 35%). Regarding the spread, it is indicated that there is a widespread availability of fixed broadband, as indicated by an SD of .081 for cable and fiber technology. With moderate coverage, the wireless has an SD of .18, suggesting significant variation across states. As the technology with the lowest coverage, fiber technology also shows a significant variation (SD = .138) in fiber broadband availability across the states.

In urban areas, the coverage is dominated by cable broadband services, with 94.4% of urban areas having access to Internet access using cable technology. Fixed wireless covers 70% of the urban areas, while and fiber technology has the lowest coverage, with only 37.7%. Comparing cable and fixed wireless, interestingly, the coverage the two technologies indicates that the cable technology serves most of the Internet connection in urban regions. Surprisingly, the SD of fixed wireless (SD = .163) indicates a significant variation in urban areas across states, whereas cable coverage is widespread in urban areas (SD = .030). The fiber technology also shows a significant variation (SD = .153) that underlines the disparities in access using this technology in rural areas. Internet coverage in rural areas is considered low. Most coverage is dominated by cable (46.8%) and fixed wireless (46.7%), while fiber only covers 25.4% of the rural areas. Together, fiber and cable technology only cover 60% of the whole rural areas in the U.S. Speaking about the spread of the technology, the standard deviation of all four technologies indicates significant variation, especially the fiber technology that has the highest variability relative to its average (SD = .147), suggesting widely dispersed technology. Cable technology (SD = .217) and fixed wireless (SD = .467) also show variability, meaning the technology is spread out in rural areas, even though the spread is not as wide as the fiber.

Tab. 4 - The descriptive statistics of the four technologies

Level	Technology	Average	SD	Minimum	Median	Maximum
State	Fiber/Cable	0.854	0.081	0.643	0.862	0.993
	Fiber Only	0.351	0.138	0.061	0.352	0.792
	Cable Only	0.790	0.114	0.523	0.801	0.986
	Fixed Wireless	0.629	0.177	0.286	0.589	0.963
Urban	Fiber/Cable	0.966	0.024	0.905	0.975	0.999
	Fiber Only	0.377	0.153	0.043	0.371	0.799
	Cable Only	0.944	0.030	0.877	0.951	0.995
	Fixed Wireless	0.705	0.163	0.425	0.688	0.978
Rural	Fiber/Cable	0.609	0.173	0.294	0.591	0.954
	Fiber Only	0.254	0.147	0.084	0.231	0.738
	Cable Only	0.468	0.217	0.192	0.416	0.951
	Fixed Wireless	0.467	0.205	0.155	0.424	0.874

To sum up, statewide analysis highlights the disparities in broadband availability, depending on geographic settings and technology type. Broadband coverage is generally high and consistent across different technologies in urban areas, showing widespread access. Rural areas, however, experience more variability in coverage, with significant disparities in access to different broadband technologies. Among all technologies, fiber only is the lowest in coverage in rural and urban areas.

4.2 State-wide broadband coverage and administrative capacity

This analysis aims to see the link between broadband coverage and administrative capacity at the state level. The estimated coefficients and the p-values of the beta regression analysis are presented in Table 5. The findings show that infrastructure has a significant negative effect (-0.446, p-value <0.01) on fixed broadband (fiber/cable) coverage, meaning that broadband plans focused on infrastructure have nothing to do with increasing the Internet coverage. Other variables, show no significant impact. For fiber only technology, it shows a strong negative association to broadband plans that prioritized infrastructure development (-0.593, p-value <0.000). Surprisingly, grantmaking also shows a low significant and negative association with fiber technology (-0.360, p-value = 0.050). Other variables show no significant impact on fiber only coverage. As for cable only, no significant effects are observed from any of the variables, indicating a more stable technology. The last one, grantmaking has a positive significant impact on fixed wireless (0.518, p-value = 0.37), which could indicate that fixed wireless benefits more from state grant programs than other technologies. To sum up, our findings suggest that broadband plans focused on infrastructure deployment significantly influence broadband coverage of fixed broadband and especially fiber technology. However, they appear to have a negative impact on fiber/cable and fiber only networks. Another conclusion is that for fiber only and fixed wireless technologies, grantmaking is significant but varies in direction and magnitude. Other administrative capacity's variables do not show any significant impact.

4.3 Administrative capacity and Urban Broadband Coverage

As seen in Table 5, for fixed broadband (fiber/cable technology), it indicates that infrastructure has a significant negative effect (-0.478, p-value =0.009) on the coverage of this technology in urban areas. Other variables, such as the type of office, grantmaking, broadband maps, and municipal regulations, do not have a significant impact. For fiber technology, infrastructure shows a significant negative impact (-0.410, p-value = 0.021), while other variables do not show a significant effect. Cable technology is not affected by any variables in urban areas, as the analysis indicates that infrastructure and other factors do not significantly influence cable coverage. However, the table shows a positive link between fixed wireless coverage and state's grantmaking programs (0.501, p-value = 0.054) and no link between fixed wireless and other variables. To conclude, state broadband plans focusing on infrastructure tend to have a negative impact on the coverage of fiber and fiber/cable. However, these plans show no significant impact on the coverage of cable and fixed wireless. On the other hand, grantmaking programs demonstrate a significant and positive influence on fixed wireless coverage.

Tab. 6 – The summary of the hypotheses

Hypothesis	Statement	Result	Hypothesis Outcome
H1	A more independent/ specialized broadband office has a positive and significant influence on broadband availability.	No significant effect in any model	Hypothesis not supported
H2	A broadband plan focused on infrastructure has a positive and significant impact.	The relationship is reversed, significantly negative in various models (fiber, fiber/cable) in rural and urban.	Not supported (significant but reversed)
H3	A broadband map has a positive and significant impact.	No significant effect in any model	Not supported
H4	Grantmaking has a positive and significant impact.	Significant only is fixed wireless models for state and rural, but not significant for fiber/cable	Supported (especially for fixed wireless)
H5	Broadband regulations have a positive and significant impact.	No significant effect in any model	Not supported

4.4 Administrative capacity and Rural Broadband Coverage

According to the Table 5, fixed broadband (fiber/cable) is negatively influenced by infrastructure-focused broadband plans (-0.726, p-value < 0.001), and not impacted by other variables. Similarly, the coverage of fiber technology is also negatively impacted by broadband plans emphasizing infrastructure deployment (-0.781, p-value < 0.001). In addition, grantmaking tends to have a negative impact on fiber coverage too (-0.394, p-value = 0.049), while other variables do not show any significant effects. Cable coverage in rural areas is not influenced by any variables. In contrast to fiber, the coverage of fixed wireless shows to be influenced positively by a state's grantmaking program (0.668, p-value < 0.001), while other variables tend to have no significant influence on this technology. The findings show a similar pattern as seen in urban areas where infrastructure-focused broadband plans tend to have a negative effect on both fiber/cable and fiber technology coverage. Grantmaking effort by states shows a negative impact on fiber technology. However, a state's effort in grantmaking is likely to increase the coverage of fixed wireless technology. Finally, we present the summary of our findings in the Table 6.

5. Discussion

Based on the findings, this section presents the discussion, especially to seek the possible explanations of the negative significance of broadband plans focusing infrastructure on fiber technology, the positive significance of grantmaking on fixed wireless adoption, and the negative significance of grantmaking on fiber.

The domination of cable technology, but disparities are still pronounced
The descriptive analysis demonstrates that cable technology dominates the Internet coverage in the U.S. at the rural, urban, and the state level, followed by the fixed wireless with moderate coverage, and fiber optic with the lowest one. The result validates the disparities in technology deployment and Internet access coverage, highlighting the challenges faced by the U.S. government in bringing digital equity. The cable technology's domination extends beyond urban areas, as it does in rural areas. According to some scholars, this domination is a result of a combination of various aspects, including regulatory (Berresford, 1999; Cooper, 2016; Garcia & Wilkins, 2001), technological (Garcia & Wilkins, 2001), and economic aspects (Garcia & Wilkins, 2001; Hazlett & Weisman, 2011).

In urban areas, cable technology shows a very high percentage, demonstrating widespread Internet availability across the U.S. urban landscape. However, despite the significant level of cable penetration in urban areas (94.4%) 5.6% of these areas are not covered by the cable broadband services, indicating that over 15 million people may not have access to the Internet. Those who live in these underserved areas are characterized by socio-economic factors, such as low-income households, Black, and Hispanic neighborhoods with the affordability issue to provide the cost of Internet services (Li et al., 2023; Mossberger et al., 2012; Zahnd et al., 2022). From the side of internet service providers, deploying network infrastructure in areas where there is not enough demand for Internet services seems to be non-profitable, because of low return on investment (Joyce, 2019; Rachfal, 2023).

Moreover, even though cable technology dominates the broadband landscape, the disparity in access coverage between urban and rural is highly distinct, with a 47.6% gap. Scholars attribute the disparity to various challenges, such as geographic (Pereira, 2015), economic viability, (Pereira, 2015; Wu, 2021), and regulatory challenges (Ali, 2020). Geographically, rural areas have less significant population densities compared to urban regions, which results in higher costs for deploying network infrastructure and less economic viable. On the other hand, the existing policies do not really address rural needs (Ali, 2020), which exacerbate the rural-urban divides.

The execution challenges of infrastructure-focused broadband plans and its influence on fiber coverage
This study demonstrates that infrastructure-focused broadband plans have a negative impact on fiber coverage at urban, rural, and state-wide level. The result implies an implementation or execution issue of the plans, which are possibly caused by several aspects, including data availability and accuracy, budget issues, intergovernmental organizations and stakeholders dynamics, and regulatory challenges.

Helderop et al. (2019) mention that the absence of precise and detailed data about broadband could impede the correctness of broadband needs and assessment, including fiber broadband. Besides, fiber broadband deployment requires a large amount of investment. However, while relying the funding on state or federal governments is insufficient, some low densely populated areas are less attractive for private service providers to invest (Valentín-Sívico et al., 2022). Nuechterlein and Shelanski (2020) also mention a real challenge, i.e., the mismatch between the capital-intensive deployment projects and the market itself that is not fully prepared which may discourage private network providers to invest. Providers usually seek immediate returns, while the deployment of fiber technology usually has a longer return due to high capital investment, mainly in rural areas and cities with low-density populations (Beardsley et al., 2010; Monath et al., 2003; Rachfal, 2023). If there is an imbalance between the push for deploying the infrastructure and the market demand for fiber technology, the growth of fiber technology could be very low compared to other less expensive technologies (such as cable or fixed wireless). Ultimately, the lack of competition will only benefit the incumbent and suppress prospective new entrants.

Moreover some challenges come from the internal organizations, such as the lack of coordination, and organization's participation among agency officials (Valentín-Sívico et al., 2022). Valentín-Sívico et al. (2022) mention the lack of the regional planning commission's involvement in the broadband initiatives, possibly due to the lack of expertise, insufficient capacity to execute the deployment projects, or limited resources. Besides, governments' priorities could change over time, and different stakeholders could even have conflicting priorities. These hurdles could obstruct fiber deployment.

Furthermore, there are other regulatory and administrative challenges such as complex permitting requirements, compliance with local regulations, and the rights-of-way access processes to place fiber optics which have made the implementation of fiber optics more challenging (Beardsley et al., 2010; Monath et al., 2003; Nuechterlein & Shelanski, 2020). The literature mentioned the physical barrier as another issue, as it needs either to lay out new cables underground or to lay out the cables along the existing utility poles. Both approaches require efforts, for example, bargaining about the rights-of-way access, complying with environmental regulations, and navigating local zoning laws. Besides, from the standpoint of policy outcomes, policymakers tend to seek technologies that show immediate visible results rather than long-term investment with almost no immediate return. As a result, their attention could shift to prioritize cheaper, faster, and less complicated technologies such as cable and fixed wireless so that network coverage can be reached quickly.

State's grantmaking and its role in the coverage of fixed wireless and fiber

The findings of this study confirms that state's funding for broadband has an impact on broadband coverage, especially on fiber coverage and fixed wireless, even though the impact varies in direction. The results show that grantmaking is positively linked to fixed wireless coverage in both rural and urban areas, meaning that grantmaking efforts could increase the fixed wireless coverage in both areas. The findings indicate that grantmaking programs are most likely to prefer wireless technologies.

Scholars mention some qualities of fixed wireless that could be used to justify why grantmaking efforts have a positive link to the availability of fixed wireless. First, fixed wireless is known for its faster deployment time, lower costs, and adequate coverage, which makes it a more economically viable option for states to connect underserved areas (Bravo & Warner, 2023; Rachfal, 2023). Second, this technology can be tailored in various geographic settings, even in a difficult terrain, making it easier to connect rural areas (Zhang et al., 2021). It can also be scaled up to accommodate various user densities (Prasad & Velez, 2010). Third, from the network provider's standpoint, deploying fixed wireless is less complicated than fiber technology due to less extensive regulatory permit, resulting in a faster deployment time.

However, different from fixed wireless, our study reveals that grantmaking has a significant and negative impact on fiber optics in rural areas. It seems that state grant programs before IIJA did not prioritize fiber optic deployments in rural areas because of high-cost investments and longer return, due to the low-density populations and geographic challenges. In addition, the complexity to deal with fiber deployment, such as permitting and securing right-of-way access, could hinder new providers—who have not as well established as incumbents or big players—in competing for state grants. Reflecting from the link between fixed wireless and grantmaking efforts, it is clear that state's grantmaking programs prefer a faster deployment technology like fixed wireless.

No significant role of other administrative capacities in broadband availability

The findings suggest that having broadband office, broadband maps, or municipal regulations is not proven enough to directly increase Internet coverage. Even though having broadband office, broadband maps, and municipal regulations sound helpful, this study shows that those factors have not had an impact as expected. For example, the existence of broadband offices has no impact on broadband coverage of states, which could be attributed to the lack of staff, expertise, shortage of funding, political supports, coordination issues, and the lack of resources to manage the broadband programs and initiatives. It designates a necessity to increase the effectiveness of this office so that this office can be more impactful.

Broadband maps also have no impact, which might be attributed to the inaccuracy issue of the data. As this map served as the guideline, inaccurate maps could lead to a wrong target for the deployment of infrastructure and grant allocation. Assuming that the maps are accurate, it indicates that they are not effectively used by state governments to support the efforts in increasing broadband coverage, such as grant allocation. For service providers, even though they identified the underserved areas on the map, if they have not enough funding to deploy broadband infrastructure, the maps will have no impact on the coverage. Additionally, whether or not a state regulates competition or has broadband-related regulation before the IIJA, it has no impact on the coverage of the state broadband at the rural, urban, and the state level. State-level regulations do not seem to serve as the key role in determining the state's broadband coverage, but there are other factors that are more influential than state's regulatory frameworks. The results imply the importance of funding availability than competition. While regulation about competition is put in place, however, many other factors such as low market demand, not enough funding availability, low return on investment—could discourage network providers, especially non big players, to invest.

6. Conclusion

This paper seeks to answer the question of *"How do the administrative capacities of states correlate with broadband technology (fiber, cable, fixed wireless) adoption across states in the U.S.?".* Our scope was to explore state administrative capacity before the IIJA and its link with broadband coverage across states in 2022. Overall, the findings regarding state administrative capacity highlight the impact of infrastructure-focused broadband plans and grantmaking programs on the availability of broadband across states, even though the direction of the impact varies. The findings show that broadband plans emphasizing infrastructure deployment have a negative impact on fiber coverage. This means that having the broadband expansion plans might tend to slow down the deployment of fiber optics, revealing the tendency that policymakers prioritize lower costs technology with faster results than fiber optics. We also discussed the challenges of executing broadband plans that impede the deployment of broadband infrastructure, including data availability and accuracy, budget issues, intergovernmental organizations and stakeholders' dynamics, and regulatory challenges. Conversely, the findings emphasize a positive influence of administrative effort in terms of states' grantmaking programs on fixed wireless coverage in rural and urban areas, meaning that the more incentives, grants, and awards given by states to network providers, the greater the availability of the wireless broadband. The findings indicate that: 1) funding availability is the main determinant of broadband deployment, and 2) broadband deployment environment in the states in the U.S. favors fixed wireless technology, as it is known for its low cost, quick deployment time, moderate coverage, flexibility, and scalability. Other administrative capacities—including broadband offices, broadband maps, and regulations—do not have any significant impacts, emphasizing issues with the effectiveness of these capacities that call for further investigation.

We suggest some future recommendations which target the demand and supply sides of broadband. First, given that funding availability is the main determinant for broadband deployment particularly for fixed wireless, state governments should prioritize finding sustainable broadband financing models to secure funding for their broadband infrastructure projects. While this study did not find evidence that broadband office has an impact of broadband availability, there is a chance that these offices have experienced a lack of fiscal authority, technical resources, and mechanism of coordination to implement such models. As such, these offices should be given authority, responsibilities, and more resources to plan, coordinate, execute, and monitor the financing models. These internal capacities of broadband offices should be explored to understand the potential of the offices. Second, a plan is just a plan if it is not well monitored and executed. As the execution of broadband plans was indicated to be problematic, the broadband offices should also be given metrics to monitor the implementation of broadband plans. Third, despite its focus on increasing broadband coverage in all areas, the state government should also focus on gradually increasing the coverage of high-speed broadband using fiber optics to prepare for next-generation digital demands. Currently, the broadband deployment environment favors fixed wireless, as it is cost-efficient with shorter deployment time. The state governments should work together with network providers to increase the coverage of fiber optics and its market, including giving more incentives for them to enter the market, encouraging them to be innovative in promoting and providing fiber services. Regulations should be more effective in supporting network providers—especially new entrants—to encourage a more competitive environment. Thus, there is a need to streamline administrative processes to reduce administrative burden in getting the right-of-way access and make the deployment faster.

There are plenty of rooms for future research, such as to investigate the roles and effectiveness of broadband offices. As our findings confirm the absence of influence of broadband offices on broadband coverage, further investigation could focus on the capability of this office in practice, which can be seen from various aspects, such as the amount of annual budget for state broadband office, the expertise of its staff, whether its leader has political support to push important policies, and so on. In addition, fiber optics is the least prioritized when it comes to broadband deployment. Exploring states' approaches to increase fiber optics through a case study could be worth investigating.

Track 15: Re-imagining flexible work in the public service: the shift to remote and hybrid offices

Track Description

Telework and other flexible work arrangements were available to government and private-sector workers long before the COVID-19 pandemic. However, the pandemic accelerated the shift to new work modalities, such as remote and hybrid work, to continue delivering services during the public health emergency. The shift to partially or entirely remote work was strongly supported by digital technologies, which enabled many of the changes. Especially in the public sector, the availability of remote and hybrid offices enabled new ways to complete, register, monitor, and manage civil servants' work. Following the pandemic, governments are rethinking their workforce management with the support of flexible work strategies. In many cases, returning to the office may be unnecessary, decreasing productivity and leading to a poor work-life balance. Furthermore, it remains unclear how flexible work strategies affect the government's ability to recruit and retain diverse talent in the digital era. This track aimed to discuss the use of new technologies, opportunities, experiences, and challenges in adopting remote and hybrid offices for digital government workforce management.

Abstract: The COVID-19 pandemic has significantly transformed work arrangements and reshaped employees' expectations of their employers. In Canada's public sector, hybrid work, where employees alternate between office and home, has become the new norm. However, the fairness and equity of existing hybrid work arrangements remain understudied. For instance, in 2022, the Ontario Public Service (OPS) mandated three office days per week for all employees, but the latest OPS People Plan (2023-2026) lacks concrete commitments to hybrid work. This paper explores public servants' perspectives on the fairness and equity of hybrid work arrangements within the OPS. Specifically, it examines public servants' views on access to hybrid work arrangements, consistency in their implementation, and the impact of hybrid work on recruitment and retention. By analyzing Reddit posts from 627 OPS subreddit users collected in 2022 and 2023, the study addresses two research questions: 1) How do Ontario public servants interpret fairness and equity in the current hybrid work model? and 2) How can these interpretations inform potential changes in the Ontario Government's approach to hybrid work? The findings reveal vivid discussions on hybrid work arrangements, highlighting concerns with the existing approach as well as the operationalization and implementation of the hybrid work. From a fairness and equity perspective, several key aspects emerged: the uneven burden of hybrid work, lack of consistency in its implementation and enforcement, and the impacts on employee recruitment and retention. The study concludes that significant changes are needed in the OPS approach to hybrid work, starting with a thorough analysis and subsequent incorporation of public servants' perspectives on fairness and equity. This could determine if the Ontario government remains competitive in the digital age.

Keywords: hybrid work, public service, fairness, equity, Ontario

1. Introduction

The COVID-19 pandemic has significantly altered where people work and they are looking for from a prospective employer. In Canada's public sector, the hybrid work model, where public servants alternate between working from the office and home, has become a permanent fixture (Charbonneau & Doberstein, 2024). Remote work, at least part of the week, is now seen as a right rather than a privilege (Gintova, 2024a; Deschênes, 2024; Williamson et al., 2022). With the exception of the United States, where President's recent executive order prescribed federal public servants to "return to work in-person at their respective duty stations on a full-time basis" (White House, 2025), governments in developed and developing countries are signalling that hybrid work is here to stay (Australian Government, 2023; Kleiman et al., 2023; UK Government, n.d.).

Nevertheless, despite claims that government employers are embracing hybrid work, it remains unclear if these arrangements are fair and equitable. For instance, in 2022, the Ontario Public Service (OPS) mandated that all employees, regardless of their position, work from the office three days a week (AMAPCEO, 2022). However, the latest *OPS People Plan* (2023-2026) does not include any commitments or guarantees regarding hybrid work. Additionally, since 2023, Ontario public servants have been required to attest to their presence in the office, which

public sector unions have criticized as micromanagement (AMAPCEO, 2023). Furthermore, union challenge of restricting remote work for unionized employees to two days per week because of the three days in the office mandate resulted in the arbitration in favour of the union's position (AMAPCEO, 2024).

It is apparent that fairness and equity in the way hybrid work model is designed can mean different things. Nevertheless, emerging research highlights the need to consider the diversity and needs of public servants while determining work arrangements in the public service post COVID-19 pandemic (Roy, 2022). However, the existing hybrid work model adopted by government employers lacks any anti-racism or diversity considerations, making public servants question the discrepancy between government rhetoric on anti-racism, equity, and diversity, and governments' actions contradicting this rhetoric (Leedham, 2023).

This article aims to explore public servants' perspectives on the fairness and equity of hybrid work arrangements within one of Canada's largest provincial public services -- the OPS. Building on a literature review of hybrid and flexible work arrangements in the public sector, it analyzes public servants' posts on Reddit—a platform where users can anonymously discuss topics in specialized communities (subreddits). Specifically, the study examines insights from 627 OPS subreddit users and addresses two research questions: 1) How do Ontario public servants interpret fairness and equity in the current hybrid work model? and 2) How can these interpretations inform potential changes in the Ontario Government's approach to hybrid work?

The article is structured as follows. First, it provides a literature review and identifies research gaps. Next, it describes the methodology, data collection procedures, and approach to data analysis. This is followed by a discussion of the findings and a conclusion that focuses on future research directions.

2. Literature review

2.1 Flexible work arrangements post COVID-19 pandemic

Scholarship on post-COVID-19 work arrangements in the public sector has recently flourished, with a particular focus on hybrid work arrangements (Champagne, Choinière, & Granja, 2023; Charbonneau & Doberstein, 2024; Deschênes, 2024; Gintova, 2024a, 2024b; Roy, 2022; Williamson et al., 2022). Although flexible work arrangements like telework, flexible hours, and compressed work week were available to public servants before the pandemic, many workers, especially managers and executives, realized the benefits of remote work while working from home during the pandemic (Yuan et al., 2023). Moreover, although the impacts of hybrid work on job satisfaction among public servants are still yet to be fully understood, emerging literature highlights increased performance and work-life balance while working remotely (Barbieri et al., 2024; Williamson et al., 2022). Finally, managing teams remotely and using technology for routine tasks such as meetings and virtual client visits have quickly replaced fully in-person interactions (Gintova, 2024a).

It is important to distinguish between pre-pandemic telework and the evolving hybrid work arrangements. While some scholars use these terms interchangeably or define telework simply as remote work, the public services in Canada have a distinct approach to hybrid work (Charbonneau & Doberstein, 2024). Specifically, hybrid work arrangements apply to all public servants, regardless of position, and are set by the government employer rather than negotiated through collective agreements between the government employer and public sector unions or between the government and an individual employee (Gintova, 2024a).

In Canada, the right to hybrid work has become a significant labor relations issue, with unions representing federal and provincial public servants demanding hybrid work guarantees for their members (Shingler, 2023). However, governments are still struggling to find the right mix of working from home and office (Roy, 2022), as evidenced by the constantly changing approaches to mandatory office presence at the federal level. Since the return to office began, the Government of Canada has changed its hybrid work policy three times: initially allowing individual government departments to determine their own arrangements, then mandating two to three days in the office, and now requiring three days in the office for non-executives and four days in the office for those in leadership positions (Government of Canada, 2024a). Therefore, the debate over the 'right' approach to hybrid work arrangements—balancing existing political constraints while allowing government agencies discretion in operationalization of the hybrid work arrangements—remains ongoing in Canada.

The Ontario Government's approach has remained consistent, requiring employees, regardless of their positions, to be in the office for at least three days unless another arrangement is agreed upon with their reporting manager. However, there are no formalized commitments guaranteeing Ontario public servants the right to remote work (AMAPCEO, 2023). This essentially means that only unionized workers have access to flexible work arrangements (negotiated with the employer pre-pandemic), while non-unionized employees can be required to return to office at any time. Despite this, access to flexible work arrangements, including remote work, is considered an important tool for attracting and retaining workers in the public service (Charbonneau & Doberstein, 2024). This is particularly crucial given the growing concern that governments in Canada are struggling to attract and retain

talent (IPAC, 2016).

2.2 Hybrid work: benefits and challenges

Although hybrid work in Canada is a relatively new phenomenon, studies like the one by Deloitte (2022), show that hybrid workers experience higher job satisfaction compared to other workers, but they also face the challenge of combining remote and in-person work models. The Government of Canada (2024b) claims that the current hybrid work model aims to "foster innovation, collaboration, and productivity" and can be tailored to meet the needs of federal organizations nationwide. However, hybrid work presents several challenges, particularly in implementation. These challenges include issues related to employee control and accountability (Charbonneau & Doberstein, 2024), managing employee expectations regarding onsite requirements (Deschênes, 2024), and a lack of strategic considerations (Lauring & Jonasson, 2025).

The most significant issue in navigating hybrid work arrangements is the current lack of operationalization. Existing research often defines "hybrid" as any work arrangement where employees alternate between working from the office and a non-office location (Lauring & Jonasson, 2025). Consequently, the optimal mix of in-office and remote workdays remains unclear. Despite this, public services in Canada have specified a concrete number of in-office days, but this operationalization lacks concrete evidence. As Charbonneau & Doberstein (2024) note, current hybrid work decisions in various Canadian public services, including the OPS, were made without productivity and efficiency analysis. Furthermore, despite a clear employee preference for remote work, the federal public service did not provide a justification for not considering these preferences before announcing the hybrid work policy (Gintova, 2024a). Similarly, the 2022 OPS Employee Experience survey revealed that 44% of respondents preferred remote work, while 41% favored hybrid work arrangements (Ontario Government, 2023a).

The absence of a strategic approach to hybrid work and the lack of concrete evidence supporting the current model pose significant challenges for the OPS. This also brings the discussion about its fairness and equity to the forefront.

2.3 Conceptualizing fairness and equity of hybrid work

The literature on fairness and equity in hybrid work arrangements within the public sector is notably scarce. Despite scholars' calls to consider the diverse needs of public servants when formulating hybrid work policies (Charbonneau & Doberstein, 2024; Gintova, 2024a; Roy, 2022), there remains a gap in understanding how these policies might disproportionately impact the careers of public servants from equity-seeking groups. Studies on the impacts of alternative work arrangements on public servants in Canada who identify as racialized, disabled, women, and Indigenous are limited, with the notable exception of Mullins et al. (2021), which examines the influence of alternative work arrangements on the work satisfaction and retention of public servants who are caregivers.

Emerging scholarship on fairness and equity in the post-COVID-19 work environment underscores its multi-faceted nature (Aplin-Houtz et al., 2025; Lane & Aplin-Houtz, 2023). For example, Lane & Aplin-Houtz (2023) identify four types of justice perceived by workers: organizational justice, based on perceptions of decision-making; distributive justice, based on perceptions of resource allocation; procedural justice, based on perceptions of implied or inferred bias; and informational justice, based on the perceived adequacy, timeliness, and truthfulness of communicated information. Defining fairness and equity in hybrid work from an employer's perspective is challenging due to the lack of clear definitions in publicly available government documents outlining hybrid work arrangements. For instance, the Government of Canada (2024) claims that its *Common Hybrid Work Model* brings "greater fairness and consistency" to the operationalization of hybrid work across the federal government but does not specify what this entails. Although it does not directly address hybrid work, the *OPS People Plan* (2023-2026) describes an equitable organization as "inclusive, anti-racist, accessible, diverse, respectful, and free from workplace harassment and discrimination, and that supports well-being" (Ontario Government, 2023b).

In this paper, we aim to explore public servants' perspectives on fairness and equity of the existing hybrid work arrangements within the OPS. Specifically, we seek to understand perspectives on three key aspects of fairness and equity: access to hybrid work arrangements, consistency in implementation, and the impacts of hybrid work on OPS employee recruitment and retention.

3. Research design

This paper examines the perspectives shared by current and former public servants in Ontario Government. The OPS with over 60,000 employees is among largest and diverse employers in the province of Ontario and in Canada. The study employs computer-assisted and manual content analysis of Reddit data from the OPS subreddit – a community representing current and former Ontario public servants. It is important to note that although Reddit posts are typically anonymous (unless a user decides to identify themselves), Reddit quotes referenced below are further anonymized for ethical considerations (i.e. no usernames or data collection files are provided).

Analysing Reddit data to gain insights into professional communities is becoming increasingly popular among scholars (e.g. Aplin-Houtz et al., 2025; Gilbert, 2020; Gruzd et al., 2020; Lane & Aplin-Houtz, 2023). These studies demonstrated that these communities provide members with a space for in-depth discussions and advice. Additionally, members of professional communities on Reddit often possess significant expertise (Gruzd et al., 2020). However, Reddit's user base is predominantly white men, which limits the diversity of perspectives on the platform (Gilbert, 2020). Although it is impossible to comment on demographical composition of the OPS subreddit users, our research indicates that the voices of women and people of colour are somewhat represented on it. Nonetheless, we observe a lack of perspectives from racialized public servants.

For this study, we collected a total of 8,274 Reddit posts (4,251 from 2022 and 4,023 from 2023) from 627 unique users. Posts were gathered twice between March and May of each year to capture the periods when discussions about returning to the office and hybrid work were most intense, allowing for a comparative analysis one year into the implementation of hybrid work arrangements in the OPS. The data was collected using Communalytic, a research tool for collecting and analyzing social media data (Gruzd & Mai, 2021). The analysis combined computer-assisted sentiment analysis (using TextBlob and VADER via Communalytic) with toxicity analysis (using Detoxify via Communalytic). Additionally, a manual content analysis was conducted on 827 posts—representing 10% of the collected data—selected through systematic sampling, a widely used approach among scholars for manual coding of social media data (see, e.g., Gintova 2019). Toxicity analysis helped identify rude, disrespectful, or derogatory comments by subreddit members, which were assigned a Detoxify toxicity score over 0.3 (on a scale from 0 to 1) (Pascual-Ferrá et al., 2021). Sentiment analysis using both TextBlob and VADER was applied to interpret the emotions (positive, neutral, or negative) underlying opinions or statements on Reddit (Savela et al., 2021). This approach allowed us to compare the results and overcome the limitations of using a single sentiment analysis library. When referring to neutral or positive Reddit posts in the analysis below, we reference posts that both TextBlob and VADER identify as such (with scores ranging from −0.05 to 1, on a scale from −1 to +1).

Manual content analysis was conducted by three coders with professional experience in the public sector. Each year's posts were coded by two coders, with one coder participating in both years to ensure coding integrity and contituity. The coding book, developed during the initial coding period, was consistently applied in the second round of coding. Codes were assigned through a consensus approach, where coders collectively agreed on the best coding option for posts they initially coded differently. This method maintained coding integrity, as coders discussed emerging codes and themes and consistently applied the coding book (Appendix A).

4. Findings

The analysis shows that return to office and hybrid work arrangement discussions were major discussion topics for both years (49% of coded posts (N=209) for 2022 and 18% of coded posts (N=71) for 2023). Other notable topics included HR, careers, benefits, leadership, and (mental) health. The perspectives included these from public servants in unionized and non-unionized positions (e.g. management viewpoints were represented well). Most of the conversations focused on the concerns of working onsite, operationalization and implementation as well as enforcement of hybrid work arrangements, and resisting working from the office. Discussions on benefits of hybrid work were mostly non-existent. Overall, posts were generally non-toxic and neutral were generally non-toxic and neutral in nature. **Fig. 1** compares hybrid work discussion topic/themes for 2022 and 2023. Below, we focus specifically on concerns, operationalization and implementation as well as enforcement conversations which were focused on the most notable aspects of fairness and equity in the context of hybrid work.

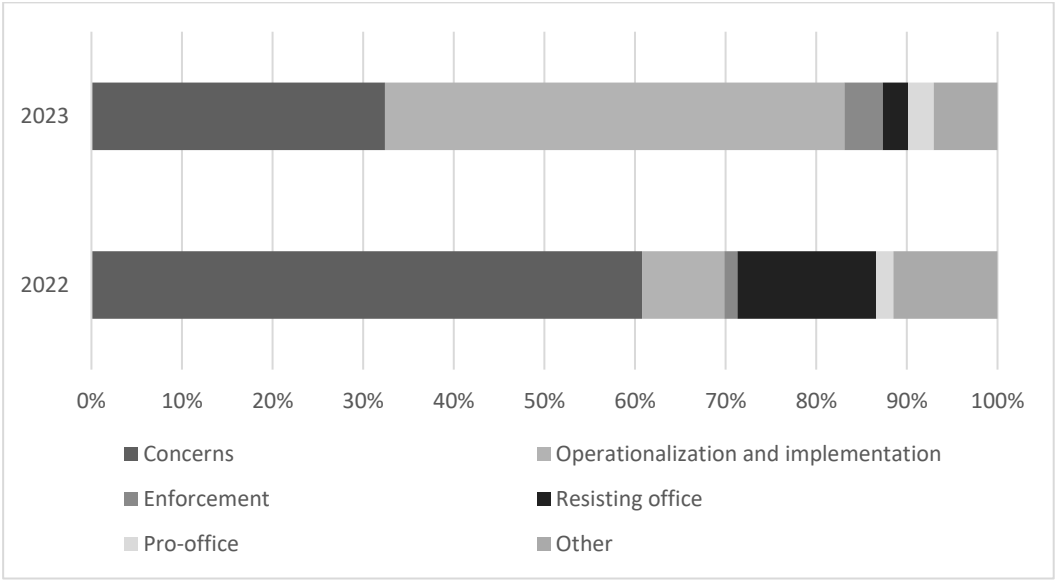

Fig. 1 - Topics/themes for OPS subreddit posts on hybrid work for 2022 and 2023

4.1. Concerns with unfair burdens of hybrid work

Concerns with unfair burdens of hybrid work echoed those noted by Williamson et al. (2022) to a certain extent. Public servants noted that working from office is less desirable for women who are caregivers. However, they also noted that white men in the positions of power benefit the most from the exiting OPS hybrid work model. The first two quotes speak to uneven impacts of hybrid work on women and men and the last one highlights the interplay between hybrid work, power, and systemic racism.

> *Exactly! [Men] are rarely the ones impacted [by work arrangements] especially when the children are sick. Men always find any excuse to get out of the house. My SO always finds excuses to go to the store so he can disappear for a couple hours LOL (OPS member, 2023).*

> *I'm terrified to go into the office, especially as a pregnant person who will be taking public transit. With the 6th wave [of COVID-19] it feels like there is zero way to keep myself safe, even if I wear my mask as much as possible. How on earth do I keep hydrated and eat in a crowded office without being scared of taking my mask off?! (OPS member, 2022).*

> *It's called systemic racism, look it up. [E]very powerful position in my organization is a white, middle-aged male. That isn't by accident. They benefit from a great deal of privilege which is furthered by [working from the office]. They all can afford to have multiple family cars, private parking spots, can afford extra childcare and all of the other costs assumed by going into office (OPS member, 2023).*

The lack of equity and diversity considerations in the Ontario Government's "one-size-fits-all" three-day office mandate is particularly significant. This issue is compounded by the absence of evidence supporting the government's hybrid work policy, as noted by Charbonneau & Doberstein (2024). OPS members feel they are merely pawns in the government's effort to revitalize the downtown core. The following quote encapsulates this perspective:

> *Those [executives] get their orders from [Premier] Ford and that dumb [Secretary of Cabinet] to push us back into buildings run by giant corporations. There's too much at stake for those companies if we're allowed to work from home or if [return to office] is optional. We're just pawns here. (OPS member, 2023)*

As implemented, the existing hybrid work arrangements could further contribute to disproportionately negative impacts on the careers of racialized Ontario public servants, particularly those who identify as women. These perspectives are crucial for understanding the impacts of current hybrid work arrangements. However, this important viewpoint was represented by only two posts on the OPS subreddit. This can be partially explained by the under-representation of racialized public servants in roles where working from home was possible during the pandemic and/or their reluctance to voice their opinions and concerns on the subreddit. It can also be attributed to the limited representation of this group on the OPS subreddit and Reddit more broadly.

4.2. Lack of consistency in implementation

Although discussions about the operationalization and implementation of the three-day office mandate dominated conversations in 2023, it is crucial to note that inconsistencies in its application began in 2022. OPS members noted varying space capacities across different office buildings, leading to initial inconsistencies in the mandate's implementation. This brought up the argument that public servants can “vote with their feet” and consider joining the ministry with more relaxed office presence requirements. The quotes below highlights lack of space for some ministries.

> [*Three days in the office] is literally impossible in many workplaces due to not having enough space/desks to accommodate people (OPS member, 2022).*

> *I have heard rumours of teams that continue to work fully remotely or managers that don’t really care or pay attention to how often folks are in or areas that go twice per week due to space limitations. But I wouldn’t count on finding somewhere that deviates from the direction (OPS member, 2023).*

In 2023, discussions about inconsistent implementation were further enriched by comparing the number of days managers and unionized staff spent in the office. Although no specific requirements were noted in official Ontario government communication, OPS members expressed concerns that this expectation could deter one from pursuing leadership opportunities. The quotes below highlight the issue:

Yes, [my manager] goes in at least 3 days per week, if not more. I also know other Managers that also go in 4-5 days per week. This is not the case for all though (OPS member, 2023).

Lastly, it is important to remember that some OPS roles positions (especially, front line and administrative roles) do not allow for hybrid work arrangements. The quote below emphases this:

Ministries have been directed to have folks in-office three days per week. [Of course] there are also roles that require being on site 100% of the time (OPS member, 2023).

Overall, one year into the implementation of the mandatory three-day office mandate, inconsistencies in its operationalization among the ministries persisted. While limited office space can be seen as an external factor constraining management's options, the most frequently discussed issue was the varying leadership approaches between ministries and even within the same ministry. These discrepancies are also evident in the inconsistencies in enforcement, which we discuss next.

4.3. Lack of consistency in enforcement

As noted above, in 2023, Ontario government has required its employees to attest their onsite presence. Despite the goal being to yield consistency in office presence across the OPS, the OPS members highlighted individual discression of leadership in interpreting what consistutes onsite presence and enforcing the requirement. Two quotes below talk about employee experiences in two different ministries.

You're right. I have a former coworker who is now a manager in a [ministry]. They have told me about this attestation form. The way they handle it is they tell their staff the policy is 3 days a week, but then don't check into it any further than that. Essentially turning a blind eye to it while still maintaining the company line. Also, they have staff who simply ask to [work from home] for medical reasons every single week. My manager friend simply says yes and maintains they still are following policy because medical accommodations and flexibility are encouraged (and who is my manager friend to argue about medical need? They aren't a doctor!) (OPS member 2023)

It's ludicrous how inconsistent it is across ministries, and even within ministries. We sign attestations in my ministry too - but there is no stipulation that [alternative work arrangements) must be pre covid (at least not in my area) and lots of staff have formally requested (and been granted) them for less than 3 days.

This underscores a significant issue within the OPS: the potential for inconsistent treatment of employees based on individual managers' enforcement approaches. Furthermore, the existing hybrid work model's lack of consideration for systemic racism, diversity, and inclusion can exacerbate discriminatory practices by managers, who have the authority to determine their employees' work locations.

4.4. Hybrid work's impact on recruitment and retention

Finally, the current OPS hybrid work model inadvertently excludes individuals living in remote locations without OPS offices from applying for or advancing in their OPS careers. While some OPS members noted inconsistencies in granting employees the opportunity to work fully remotely as part of initial employment contract negotiations, many highlighted career limitations due to the office attendance requirement. The first quote illustrates the possibility of securing a fully remote position despite the mandate, while the second quote discourages a member from seeking promotional opportunities in a specific ministry.

When I got hired (externally) I told the hiring manager I had to be 100% remote or I would decline the offer. It was in my cover letter too. No [alternative work arrangements]. I just work too far (OPS member, 2023).

Must not be [Ministry X]. In [Ministry X] the managers have to sign monthly attestations that they have forced all their staff back 3 days per week.

Members also highlighted that they were looking for completely remote work options as these provide better work-life balance and improve their well-being. The quote below summarizes this viewpoint:

So now I'm looking for fully remote positions. And that's taking a lot of my time so I can have more music time. Apparent in this comment, no kids. This doesn't also factor in other obligations so I'm constantly doing mental scheduling acrobatics when things come up so I can do what I need to (OPS member, 2023).

Finally, for some, the mandatory three-day office requirement has led them to reconsider their career choices and question their future within the OPS. As one member noted:

> *I no longer care for or about a career in the OPS & actively tell people thinking about joining (the very few that could actually be good at the job & qualified) that they would have a WAY better time/career anywhere else. As a recent post-graduate, there are a lot of better options out there where you can look forward to more than stagnant wages & a useless pin after 25 years of service, and avoid the nonsensical, soul-sucking, expensive commutes in the meantime. More importantly, you won't be embarrassed being used as a puppet for our corrupt leaders!! Great job "putting people first" OPS (sarcasm), you have us lining up to be the first out the door!! (OPS member, 2022).*

Discussions on the OPS subreddit reveal that flexibility in choosing work locations is a crucial factor for current and prospective OPS employees when considering employment opportunities. While it is unclear how many of these employees, who prefer remote work, are managers or are actively seeking career advancement, work-life balance and mental well-being are consistently highlighted as key characteristics of remote work.

4.5. Sentiment and toxicity of discussions on hybrid work

The general sentiment of Reddit posts on hybrid work in the OPS community was neutral or positive (54%), with toxic posts accounting for 8%. Most toxic posts (N = 11) appeared in March 2022, the month following the announcement of the mandated return to the office for at least three days a week. Ontario public servants learned about this announcement from the news rather than through direct communication from the OPS employer (Gintova, 2024a), therefore, it is not suprising that they were very unhappy and frustrated.

Since toxic posts discourage participation or cause people to leave an online conversation, the OPS subreddit is a well-maintained community. This can be attributed in part to the active moderation of the subreddit, where moderators remove posts that violate established rules. Additionally, OPS members are not only willing and able to express their viewpoints but are also open to considering others' perspectives.

It is also important to note that OPS members primarily expressed displeasure with the OPS leadership team, particularly the Secretary of Cabinet, and how she handled the issue. They were also discontented with the lack of opposition to political demands and the inability of directors and assistant deputy ministers to defend the interests of their teams. Finally, in 2023, toxic posts criticized the lack of leadership long-term commitment to hybrid work and expressed frustration that employees' needs were continuously being disregarded by the employer.

5. Discussion

The results of the study demonstrate that hybrid work was a prominent discussion topic in the OPS public servant community in 2022 and 2023. The conversations on the OPS subreddit provide important insights for answering the study's two research questions: 1) How do Ontario public servants interpret fairness and equity in the current hybrid work model? and 2) How can these interpretations inform potential changes in the Ontario Government's approach to hybrid work?

Public servants discuss fairness and equity from both employee and employer perspectives. From the employee perspective, fairness and equity are primarily viewed through the lenses of procedural and distributive justice (Lane & Aplin-Houtz, 2023). Specifically, OPS members noted that men, particularly white middle-aged men, tend to benefit the most from being in the office, highlighting the need for procedural justice considerations. Additionally, OPS members residing in remote communities in Ontario emphasized that fully remote work is the only option due to the lack of physical offices in their locations, thus focusing on the resource allocation aspect of distributive justice. From the employer perspective, as the Ontario Government's view of fairness resembles that of the federal government – i.e. similar working arrangements implemented across the government - OPS members focused on the lack of consistency in implementation and enforcement, not just across Ontario ministries but sometimes within the same ministry. Discussions on the subreddit highlighted the varying capacities of ministries to accommodate their workforce in the office, the significant discretion in allowing remote work beyond two days a week and the enforcement of mandatory attendance, and the possibility of "voting with their feet" by seeking opportunities within ministries that are more flexible with alternative work arrangement agreements.

Despite calls by scholars to consider the expectations (Deschênes, 2024), needs and the diversity within the public service (Roy 2022), and the potential disproportionate impacts current arrangements might have on racialized employees (Gintova 2024a) while implementing hybrid work arrangements, it is apparent that Ontario Government have not done any of these. Moreover, the most recent human resources strategy – *OPS People Plan (2023-2026)* – excludes any references to hybrid work completely, while underscoring the OPS employer aspiration to "create an equitable organization" (Ontario Government 2023b). Nevertheless, as the results of the study show, OPS subreddit members consider hybrid work to be an integral component of the human resources strategy. As noted above, some OPS members viewed the opportunity for less presence in the office as an important factor in determining whether they will pursue OPS employment or career advancement opportunities.

Therefore, we emphasize that in order to be a competitive employer and continue on its quest to creating an equitable organization, Ontario Government should rethink its approach to hybrid work. It is quite clear from the results of the study that maintaining status quo could potentially lead to the loss of talent and further decrease in job satisfaction (Gintova 2024b). It is also unclear whether the status quo will continue to disproportionately impact careers and work conditions of the racialized public servants, especially those who identify as women and those who are employed in the positions requiring constant onsite presence. As noted in Gintova (2024a), a comprehensive and transparent gender-based analysis plus can be a good starting point to comprehensively understand equity and fairness of hybrid work though an intersectionality lens.

Furthermore, hybrid work approach needs be grounded in evidence (Charbonneau & Doberstein, 2024). However, this evidence should not include solely operational requirements but an analysis of employees' perspectives and needs. Employee viewpoints on fairness and equity of hybrid work arrangements, as highlighted by this study, are crucial for employing multiple lens to determine what consistutes a fair and equitable hybrid work model. In addition, it is also important to consider for the hybrid work approach to allow for individual ministries' flexibility to customize it (Gintova, 2024a, Roy, 2022) given that this already happening but organically as opposed to strategically. This will also create incentive for leadership within individual ministries to take stoke over their approach to employee engagement and development.

Finally, the *OPS People Plan (2023-2026)* must include concrete commitments to hybrid work. Strategically positioning hybrid work within existing human resource strategies and policies will signal its permanence, regardless of political preferences. Currently, alternative work arrangements, including partial or full-time remote work, are formally available only to unionized employees. A commitment to hybrid work for all OPS employees would demonstrate the employer's broader dedication to fairness and equity in the workplace.

6. Conclusion and future research

This study offers a number of important scholarly and practitioner contributions. From the scholarly perspective, it begins to unpack the concepts of fairness and equity in the context of the hybrid work arrangements in the public sector. It is important to note that, as the results of the study show, these are multi-dimensional and need to be understood both from the public servants' and government employer perspectives. However, further research is required to delve into the perspectives of racialized public servants on fairness and equity of hybrid work in the public sector as Reddit data might not contain those due to platform representativeness limitations.

Second, the study builds on the emerging body of literature on hybrid work in the public service post-pandemic and examines perspectives and sentiments of public servants on hybrid work arrangements between two years. Although we do not note significant change in sentiment surrounding hybrid work between 2022 and 2023, it is important to highlight that the discussions surrounding the issue have shifted from primarily concerns with the approach adopted by government to how the hybrid work arrangements are operationalized, implemented, and enforced. With the specific emphasis on the lack of consistency in implementation and enforcement.

Third, the methodology applied in this study can be adapted for future research in public policy and administration. Specifically, professional communities on Reddit can offer valuable insights into various policy and public administration issues, supporting government decision-making. However, it is crucial to recognize the limitations of Reddit data as previously discussed and to corroborate these findings with other data sources. This is particularly important for research on hybrid work in government. It is essential to include the perspectives of public servants from equity-seeking groups, as the challenges they face may differ from those encountered by non-marginalized public servants.

For practitioners, this study offers a number of considerations and recommendations for hybrid work implementation. First and foremost, existing literature (Charbonneau & Doberstein, 2024) and the results of this study highlight the need for a strategic approach to hybrid work. Without this, governments as employers risk underutilizing benefits of this post-pandemic work arrangement as well as pushback from public servants who might feel that hybrid work arrangements are not a permanent fixture.

Second, hybrid work arrangements should become an integral part of the human resource strategies and policies. As employees no longer view hybrid work as a privilege (Gintova, 2024a; Deschênes, 2024; Williamson et al., 2022), it is crucial to manage the employer's expectation that they can unilaterally determine how hybrid work arrangements are designed and implemented, especially considering the concern that governments in Canada are struggling to attract and retain talent (IPAC, 2016).

Finally, hybrid work arrangements must be based on evidence rather than political agendas. Continued failing to correct this could lead to increased employee dissatisfaction with public service leadership and a loss of talent to other opportunities. Moreover, this could impede the implementation of transformation initiatives, including digital government transformation, thereby obstructing the achievement of these initiatives' intended objectives.

In conclusion, the hybrid work model post-COVID-19 presents both unique challenges and opportunities for governments. However, the examination of this issue by practitioners and scholars should not only focus on the pros and cons of the new workplace model but also address the existing barriers to its fair and equitable implementation.

Topic/theme	Additional topics/themes	Sample post
Hybrid work	Concerns/ fairness	We're constantly guilted about our carbon footprint, emissions and climate change yet we need to head back to the office…to support downtown businesses? Employers and the government have exposed their hypocrisy and ineffectual tactics.
	Operationalization/ implementation	It is more expensive because you would need to park in the visitor parking. I believe it's like $23 a day. During COVID when we were going 1-2 times a week, Unit park had allowed sharing as long as both staff were not parked in the lot at the same time but now with the 3 days it doesn't work out because there will always be one day overlap.
	Resisting office	Return to the office: a slap in the face. We often talk our frustrations, but we do nothing. How can we organize and protest this? Ideally, if people have the guts, we should all stay home on the days we are supposed to go back to the office. They can't fire us all. Together we could effect change.
	Enforcement	In Health all managers must sign an attestation every month that their staff are attending 3x week (except where there are accommdations, pre-covid-awa, or insufficient space to permit it). Managers who knowing lie when they sign the attestation are putting their jobs on the line.
	Supporting return to office	I think a lot of people on the sub have to remember, for the last two years those whom have dreaded going back have not been bothering their managers with "When will we not have to go back to the office" whereas people like me have been vocal about their design TO return to the office... Squeaky wheel and all. There might also be an implicit bias to the reddit community- or even your friend circle that would lead you to believe no one wants to return... but you might just not be surrounded by those people.
	Other	"Interesting that Millhouse says people need to go the office then points out he's working from home. And the other dude is off base saying PSAC needs to be begging for their jobs and become HR directors."

Challenges for monitoring flexible work: trade-offs of formal and informal information systems use.

Abstract. Flexible work has become a trend since the pandemic emergency. All around the world, governments have increased the number of civil servants working in hybrid or full-remote work settings. This new landscape of work practices has raised several new challenges to public administrations, including monitoring work activities. Some governments support the idea that flexible work requires new monitoring methods. Instead of controlling timesheets, a new trend towards results management has emerged. Accordingly, new management information systems have been developed to support the management methods. This paper discusses challenges from data use through the new information systems for flexible work monitoring. Based on a Brazilian Federal government case, we raise new questions regarding the levels of formality of the data and its use. We conclude that flexible work information systems can produce more data regarding work practices. However, the level of formality in the use of the information produced may reduce the data availability to improve decision-making.

1. Introduction

A new wave of discussions regarding flexible work has emerged. It is known that during the pandemic emergency, businesses and governments were pushed to increase the number of employees working from home as much as possible (Bloom et al., 2024; Kisil, 2024). The need to reduce human contact to decrease the spread of the virus caused society to reorganize activities in many ways. After the emergency was gone, a debate started over the possibilities, benefits, and risks of keeping workers at home, working remotely, or in hybrid settings (Kothawala et al.; Marković, 2024). Though initially, such discussion focused on silver linings from the lessons learned during the hard times, it didn't take long for leaders in the public and private sectors to intervene, independently of evidence (Bloom et al., 2024; Marković, 2024). It has been more than 3 years since the end of the emergency, and there are still a lot of doubts and tensions regarding the topic of flexible work (Schuster, 2024).

On the one hand, the flexible work critiques list arguments that companies should face: remote work generates a lack of engagement, challenges corporate culture and values, creates onboarding issues, etc (Bloom et al., 2024; Marković, 2024). On the other hand, the flexible work supporters present reasons why the practice should be maintained, such as office and transportation costs, environmental impact, time management, etc (Kisil, 2024; Schuster, 2024). The topic has become another polarized discussion in public opinion about pros and cons, with little room for conversation.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

However, work flexibility is not new, and research has focused on understanding challenges and opportunities regarding work flexibility (Klonek & Parker, 2021; Madureira & Rando, 2022; Madureira et al., 2020). Many remote and hybrid work aspects must be considered depending on the approach. For instance, organizational psychology has analyzed factors that enable or hinder the opportunities for flexible work practices. Discussions regarding work design have already suggested that it is key to focus less on individuals and more on teams when improving remote work experiences (Bell et al., 2023; Klonek & Parker, 2021). Research has indicated that work flexibility is a continuum ranging from full onsite work to plain remote, with diverse combinations for hybrid settings (Kisil, 2024; Kleiman et al., 2023).

The development of new work practices has involved adopting new management approaches. For instance, previous results-based management or delivery monitoring activities gained new space to support flexible work (Madureira et al., 2020; Weerakkody et al., 2021). Though it is possible to use regular timesheets to monitor work activities, several new approaches can unleash better performance management, such as results-based-management. The shift from formal control to dynamic performance measurements is challenging but rewarding (Madureira & Rando, 2022; Madureira et al., 2020; Rubin, 1979).

The Brazilian Federal Government has implemented a new way of work monitoring called the Management and Performance Program (Kleiman & Barbosa, 2024; Kleiman et al., 2023). Through this program, teams and individuals overcome strict time controls for outcome planning and delivery. And by doing so, a great load of new data is being produced regarding work in the government (Kleiman et al., 2023; Pojo et al., 2024; Rego, 2022).

Kleiman et al. (2023) has indicated that the new program appears to support better flexible work practices in the government. The possibilities of agreeing on deliveries and keeping track of performance in place of time or activities are promising to achieve improved results. The author suggested that three conditions for the program were (1) the legal framework, enabling civil servants' practices to be supported by law; (2) the cultural shift from individual timesheet control routines to team delivery plan management; and (3) the support of new information systems that facilitate registers and monitoring of the delivery process. Adopting these new registry systems generates great amounts of data that can be used for different purposes.

In this paper, our main research question is: How does the level of formality in using work management information systems influence the data availability to improve decision-making? As an exploratory study, we aim to discuss the consequences of increasing formality using the existing data. Our main hypothesis is that the more formal the use of the information systems, the more bureaucratic the registers are, reducing the systems' data availability that can be used to improve decision-making processes. With an exploratory approach based on the literature and a case study, this paper aims to explore the consequences of increasing levels of formality in information system use.

In the first section, we explain the background, and following, we present this study's methodology. Next, we discuss existing research on the formality of registers in information systems. In the fourth section, we explain the Brazilian Federal government case, giving some context about the changes in the management information systems specifically designed to manage flexible work arrangements. In the fifth section, we apply the concepts to the case, indicating trade-offs for increased formality levels using the existing registers. Lastly, based on the discussions, we present new hypotheses to be tested in future research about information systems to manage flexible work.

2. Background

Historically, the use of data in workforce management has varied through the years, with a direct relationship with technological developments. When only paper-based timesheets (or stamping cards) were available, the time needed for summarization and information production was much longer than the digital control systems that can produce real-time information (Eom et al., 2016; Galanti et al., 2021; Klonek & Parker, 2021). Though the founders of Industrial and Organizational Psychology had already advanced in studies about human behavior and human-machine interactions, so far, the digitalization of the workplace has brought an incredible amount of new data possibilities, together with improved data quality (By, 2007; Madureira & Rando, 2022; Pryor et al., 2008).

A short review of the topic of workplace data management indicates grounded references. Røed and Raaum (2003) defines administrative registers as the ones designed to serve the needs of public institutions (p. 261). In that regard, their research indicates that there tends to be a higher quality of essential information than secondary information, which has fewer checks and updates. The variables less important to the administration may contain errors or inaccuracies, especially concerning the timing of events. Additionally, Karimian et al. (2022) found that information is the basis of decision-making and information flow and that informal information sources are used more than formal information sources in decision-making by managers (p. 99).

On the one hand, management activities refer to tasks and actions for decision-making and usually have an urgency to enable fast choices; on the other hand, control activities check compliance with rules and norms, having data precision as their main priority, as they can implicate consequences. Notwithstanding that, decision-making data

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

also requires precision, as control data demands up-to-date registers. However, the role played by time and precision differs in each case. For the sake of this research, we consider monitoring activities as an action between management and control.

Shifting from a timesheet management mindset to managing work based on results adds another layer of complexity to information management systems. Still, some data characteristics should be discussed before moving forward. Back in 1986, Johnson (1986) stated that informal information compensates for the inadequacies of formal information, complementing it. Formal information systems are approved by senior management, contributing to organizational awareness. Formal performance evaluation information systems focus on accounting and represent performance numerically, while informal information systems are unofficial but may affect decisions.

On the one hand, informal information can be easier to use and understand, increasing confidentiality, timeliness, and qualitative details. Depending on the business nature, it can result in situational variability in decision-making. On the other hand, formal information may result in practical limits on the information systems' conditions to remain up-to-date and flexible for specific management needs (opus cit.., p. 121). The authors conclude that the dependence on formal information systems for decision-making will likely result in short-term and long-term dysfunctionalities, such as negatively affecting attitudes toward that information, especially when setting inadequate mandatory details.

From this perspective, the levels of formality in information systems will vary depending on the information system's objectives. And these levels of formality can also differ in different aspects of the information system. For instance, one dimension of information systems formality can be how people register data. This layer focuses on access levels, accountability for the provided information, and the alternatives for backchecking the register.

Another layer that can be analyzed is the different levels of access within the system. Whether to monitor registers, to adjust and correct them, or to exercise privileges of extraction, there are also levels of formality involved in the access to systems. One last layer is the formality of use applied to the data obtained in the system. Access levels may be connected to people's use of the available data. Once more, different levels of formality in using the registers implicate various objectives upon which the information system is built. The official system incorporates informal information indirectly as adjustments or modifications to formal information. Previous conclusions on informal information studies suggest challenges in variability and semantic definitions.

According to Altaee (2018) an informal information system constitutes a twin system of the formal information system. It supports formal communication and helps the administration with management activities. Additionally, they improve decision-making as decisions depend on the information that the existing systems can provide. In that sense, reducing informal sources of information to only formal channels can also limit the information available for decision-making and harnessing its quality. The content of the information system can also influence the formality possibilities on the register, access, and use of that system. For instance, stock management systems should have different requirements depending on the type of products they are related to. In this paper, we focus on work management systems in government.

Moreover, Pan Fagerlin and Lövstål (2020) define management control as techniques and procedures that foster employees' actions consistent with organizational goals (p.4). Formal and informal controls differ in how explicitly designed or planned they are. They suggest three uses of control systems: interactively, when managers participate directly in their teams' communication and decision-making activities; diagnostically, when used only for traditional feedback based on preset performance targets; and constraining, when used to increase predictability. These three different uses also relate to management styles: participative, facilitative, empowering, and authoritative, more related to command and control.

Lastly, Saundry et al. (2015) indicates a difference in how line managers perform work management, especially in preferring informal approaches to workplace issues. However, as their management responsibility increases, they tend to seek more rigid guidelines, given a lack of confidence and a fear of mishandling issues' repercussions (both legal and organizational). They suggest that "informality can result in inconsistencies in how employees are treated, which can damage employee morale, satisfaction, and trust" (p.430). Thus, formalization is wanted as guidance and a protective shield against criticism and litigation: "Managers can hide behind the formal procedure to justify a decision to discipline an employee and may move to formal sanctions very quickly" (p.431).

In short, the more advanced the methods to register work are, the greater the possibilities for its use. Workforce monitoring has been studied from different perspectives throughout the years. From an information systems approach, management, monitoring, and control are three different data-related activities that implicate requirements for workforce data production. Though this discussion can be extended to any economic sector, this paper focuses on the approach toward governmental activities.

Work management information systems have several peculiarities in their data structure: they deal with large amounts of personal data, they tend to register data according to law-regulated careers, they may refer to several different positions, and they tend to have bureaucratic language. Work registers may strongly impact their users' lives, given that they derive rights, benefits, or losses, given that they will result in a paycheck.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Besides the challenges of setting up the information systems is the register the system is specified for—different ways to monitor work requests that the system is prepared to collect multiple types of information. For instance, from a historical development perspective, work registers have evolved alongside technology. In a simplified view of such development are the different ways work monitoring was conceived: time, activities, and deliveries.

A system that registers only time can be very simple, adding only a few layers to control unplanned events such as leaves, nonattendance, or emergencies. A more sophisticated system can start to include some quality to such registers, i.e., connecting hours to financial sources (projects, budgets, etc.) or describing the time spent. This complexity increases as the registered data advances towards having structured silos to connect the data. Predefined budgets and projects can be defined to simplify the system's use. A common use of time can consist of categories of labelled time spent. Over time, the growing complexity of the details increases the requirements for the information system to work.

Adopting a results-based management approach depends on having an information system capable of collecting appropriate registers to the needed level of detail to make this methodology work and generate useful information for those using the system. A few characteristics can be mentioned in the system specification. A stable result-based management system must define its syntax and semantics so multiple users can understand. Simplifying language and how it can interact with different interpretations is one of the challenges in information system design. Another assumption, especially for governmental data systems, is finding ways to make the data interoperable so that various systems can use it. Work registers, moreover, when connected to deliveries, should be flexible enough that multiple enough to fit multiple purposes, including work effort distribution and performance assessment.

Especially in public service, each country, region, and local government can specify how these characteristics apply to work registers. In this paper, we will discuss the Brazilian Federal case. We will do so by understanding the underlying discussions resulting from a major change in the work management system caused by a new program called the Management and Performance Program, the PGD. Though the case is specific for the country, we expect the discussions and reflections to support new insights for other governments and organizations facing the same challenges regarding the implementation of new information systems to manage flexible work.

3. Methodology

This paper is based on two sources of information. As an exploratory study (Visser, 2015), it starts with a short review of the literature (Ghobadi, 2015; Kuipers et al., 2013; Offermann et al., 2010), aiming to define the main concepts to be discussed throughout the text. Following our main research question, we aim at understanding "how does the level of formality in using work management information systems influence the data availability to improve decision-making?".

This exploratory study discusses the consequences of formality levels, hypothesizing that increased formal use of information systems leads to more bureaucratic registering practices. We aim at understanding if, by having more bureaucratic use, the systems' data availability is reduced, hindering their usefulness for decision-making processes. Based on our research question, we look for discussions on the effects of levels of formality in work management information systems' data registries and the use of their availability for decision-making improvement.

Based on internal documents and previous publications, we present a case study about Brazil's Management and Performance Program (Kassen, 2013; Yin, 1989). We describe the case for analyzing the impact of decisions in its process and develop a Stakeholder Power-Interest grid to understand different perspectives for defining system requirements (Bryson, 2004). Though the case is still in its infancy, facing technical and governance challenges coming from the implementation process, we use it as a reference to reflect on the set of options available to the coming developments. The goal is to shed light on actual choices for designing information systems in practice from a data usage standpoint.

We use the concepts from the review and the insights from the case to discuss trade-offs present in information systems design. The idea is to explore benefits and risks within the available choices and indicate future research streams over the consequences of formal and informal registers and the use of work information systems.

4. Information systems in the Management and Performance program

The traditional way to monitor work in the Brazilian government has always been through timesheets. The goal was to register the amount of time each civil servant dedicated to working for the government, assuming that while they were in the office, they were working (Camões et al., 2023; Ferlie et al., 1996; Madureira et al., 2020). One of the innovations introduced by the New Public Management (NPM) approach in the 1980s was to challenge public administrations to move forward and focus on service delivery (Lane, 2002; Schedler & Proeller, 2000). Within its guidelines were the ideas of making work in governments more flexible. Besides flexibility, NPM focused on improving the efficiency and efficacy of public service, adopting private sector management practices. Those

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

referred to cost reduction and accountability principles that would be transposed to the public service. Though most of the discussions focused on flexible contracts, some authors still mentioned the concept of more efficient ways to manage work in public institutions.

One of the main barriers to changing timesheet management and implementing new workforce policies was the risk of switching from process control to results (Weerakkody et al., 2021). Processes can be easy to measure and monitor, while results can vary and require more complex management. The timesheet control over civil servants' work is a clear example. It is easier to check whether someone came to the office on a certain day and attest to their presence than to set clear outcomes that individuals and teams are supposed to deliver by the end of a defined period, and verify those results (Kleiman et al., 2023).

This was the context in which the Brazilian Federal Government started implementing its management by results policies. In the 1990s, Brazilian politics were shaken by the neoliberal wave. Besides cost reduction, the modernizing efforts were also targeted at improving service delivery by introducing new management methods (Abrucio, 2007; Bresser Pereira, 1998; Silva, 2001). A whole set of rules was designed to update the federal-level government, and one of these measures proposed ways to make work more flexible. Though the focus was on creating mechanisms to reduce the existing public workforce, one program was designed to enable exceptions to timesheet control. Named as the Management Program, it sought to allow workers (mostly researchers) to work based on predefined goals (Kleiman et al., 2023; Pojo et al., 2024; Rego, 2022). Those joining this program would not report the time spent in the office, but the results achieved by the end of the month. The legislation was approved, supplying the needed legal framework for such experiences; however, only a few cases have been reported in the coming years.

It is known that such approach has been adopted in several pilot experiences that happened in more technical or technological governmental fields, such as teams in the national controlling office, the income tax department, or agencies that had a more flexible structure since their start – the idea of having public bodies to regulate specific fields was also an innovation coming from the same legal framework. In parallel to these non-timesheet work registers, cases of remote work were reported in similar fields. Since the 2000s, Information and Technology teams have had experience in enabling their workers to work from home. The overlapping between results management schemes and remote work was not noted until the 2019 pandemic (Brazil, 2024a).

With the sanitary emergency and the push to send as many workers as possible to work from home, the National Human Resources Secretariat within the Ministry of Economy was required to issue legal guidelines for the whole government on how to proceed with work management in the new situation. With the scaled request to control the work of dozens of thousands of workers out of the office, keeping them under the timesheet control was not feasible. A team found the legislation from the 1990s and based their new regulations on the mechanisms previously created – they designed the Management and Performance Program (Programa de Gestão e Desempenho – PGD) (Kleiman et al., 2023).

There was little time for larger developments, and guidelines were issued as available. The first regulation issued, the Normative Instruction 65/2020 (Brazil, 2020) established new government workforce management rules. It defined concepts such as participants, objectives, and steps to be followed to implement the PGD in each unit. At this stage, the PGD was legally defined as a "management instrument that regulates the development and measurement of its participants' activities, focusing on results delivery, through office or teleworking, aiming to improve the public service delivery quality within the federal government". Next, Decree 11.072/22 (Brazil, 2022) was signed by the President, narrowing the PGD to focus on the services provided to society, ruling over how the Program could be adopted and maintained by units, and setting specific procedures for teleworking, such as workload limits. In December 2023, the Normative Instruction SGP-SRT-SEGES/MGI 52/23 (Brazil, 2023, December 21) set new guidelines and procedures over workforce management, adding to the existing legal framework, details on the accountability for workers' activities diverging from their workplans, such as penalties, fees, and other financial consequences of failing to comply with the agreed deliveries.

By that time, the idea of registering time had to be substituted by the register of activities, which the management teams could attest. Such a register had to be delivered in an electronic system, adapted from a previously existing system not specifically designed. Kleiman et al. (2023) has reported that many challenges arose from this transition phase, though registering activities was already more efficient than trying to control timesheets from home. The waiting time for a new software version resulted in challenges for units and teams to reference their registers differently. Spreadsheets and task management tools were temporarily used in a transition towards new unified systems, affecting the quality of the resulting registers.

In a nutshell, in the transition period, an existing management information system was adopted, focusing on individual task registers. The Federal Private Insurance Agency (Superintendência de Seguros Privados- SUSEP) implemented the Workforce Management System (Sistema de Gestão de Pessoas – SisGP), previously developed to monitor requests within the agency. The system's flexibility favoured the PGD program to enable the creation of an extensive list of activities that could be individually assigned to each civil servant. The system was login entry-based, which supported an initial level of confidentiality for the provided information.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

However, as the system was designed to monitor individual tasks, it could only monitor activities at the individual level, making it difficult to analyse aggregated team deliveries or results. The pre-defined list of activities was also challenging. Each government department or unit had to be customized, increasing the complexity of analysing aggregated outcomes or connecting them to broader strategic goals or priorities. Lastly, as a transition system, the individual-level monitoring fostered micromanagement practices, reducing the program's potential to increase engagement. Moreover, the semantic limitation resulting from the predefined task list reduced the usefulness of the available information for decision-making.

A second phase was initiated after this transition stage with innovative procedures to plan, approve, perform, register, and monitor deliveries. In 2024, another legal instrument was issued (Brazil, 2023) to define the PGD as a program to improve the public service institutional performance, connecting individual work plans to the unit's delivery plan and the government's strategic priorities and planning, clarifying the unit's autonomy in starting its programs. These last definitions were aligned with the PGD new version, combining team delivery and individual assessment, creating transparency mechanisms. It also defined the Program's governance structure, creating an Executive Committee responsible for supporting units to implement their programs and issuing additional regulations needed for the Program's improvement. One specific unit was responsible for coordinating the Committee and maintaining the Program's webpage, which included information dashboards, enabling full transparency in the implementation progress by each governmental unit (Brazil, 2024a). An implementation index was defined to enhance such monitoring activity, allowing each unit to check its conformity with the requirements for a full Program implementation. Through such an index, each unit was requested to define their program webpage, containing full information on the program, such as the one from the National Aviation Agency, with full information on individual and team delivery plans (Brazil, 2024b).

Named PGD 2.0, this new phase would foster the units to focus more on team deliveries than individual performance, and to plan results with concrete characteristics (instead of individual activities). It would have a newly designed digital system following the program's logic, result-based-management. The previous information system limitations were converted into requirements to create a new PGD information system.

Though the regulations were flexible towards having various information systems to manage the program, the Ministry of Management and Innovation in the Public Service (MGI) engaged in developing an option for the units that lacked the conditions to produce their own. The main system feature was to enable the perspective of delivery management over the individual task monitoring perspective. Still, the new information system was required to allow individual work registers, which could support individual-level performance evaluations. The new system would focus on team delivery, as the sum of the efforts distributed among team members. Additionally, it would support inter-unit collaboration by allowing common deliveries to be tagged on different teams and team members. The pre-defined task list was replaced by customized deliveries, specified by each team. This new system architecture made interactions visible and enabled a broader analysis of workforce management.

As the government allowed each unit to use its information system, more than 30 information systems started operating. These systems were developed based on the same requirements, aiming to transfer the same mandatory data. Accordingly, the specific system offered by MGI was available to those units opting not to build their own. From an informational availability standpoint, what was observed is a combined process of cultural change and new practices. The inexistence of common ways to monitor work besides monitoring workload through timesheets fostered the development of several new systems. The initial strategy was to base the register on existing information systems, adapted to register work data regarding the new program. A diverse set of stakeholders was engaged to influence the definition of the new work information systems based on their requirements and needs. Using a Bryson (2004) Power-interest grid, we can visualize some of the tensions – Figure 1.

For instance, on the one hand, top management personnel found the opportunity to increase their strategic view of governmental management. In short, that was an opportunity to connect the mid-management layer to top government priorities with the new information produced. This meant improving decision-making in the government by using real-life information from the team´s work. With a high influence on decision-making, they were also interested in defining the system's data requirements, especially focusing on increasing the available data for decision-making.

HR managers, on the other hand, perceived the risk in changing the stabilized timesheet control routines to more dynamic delivery monitoring. Their main fear is explaining new contradictions and imprecisions from new data to the public or control and accountability units. However, with less influence, they were subject to top decision-makers (Brazil, 2024a). Conversely, control and accountability units were also interested in having more detailed information about the functioning of the public service, but from a formal perspective. They raised their eyes toward more sources for punishment, command, and control to increase their controlling capacity.

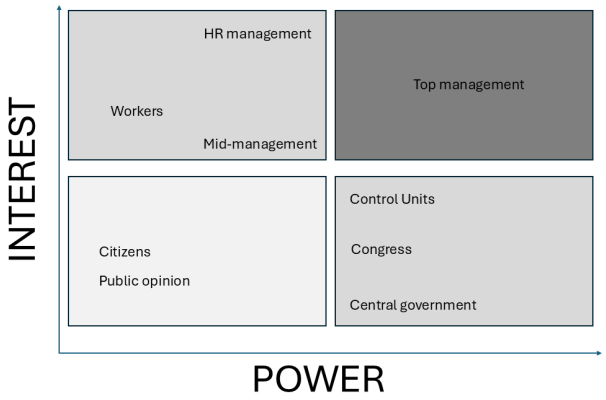

Fig.1 – PGD Power-interest grid, based on Bryson (2004)

Less influential mid-managers could feel the increased duties to fill in the systems. Besides working with their teams, registers would play an important part in their tasks and time. The less detailed or mandatory the register request is, the better. Workers found themselves in a contradictory situation of benefiting from more flexible systems to connect their actual work to public service deliveries. At the same time, they resisted the increase in control over their work and the risk of micromanagement from the top. Though with interests at stake, their influence on the system definition was low.

Since the beginning of data requirements and specifications, requests coming from command-and-control units have generated tensions with the decision-making requirements. While decision-makers' needs tend towards increasing data availability independently of their quality, the risk of the information leading to consequences in terms of conformity and formal analysis goes in the opposite direction. Evaluation and performance metrics can be developed in formal consequential ways, leading to risks in data quality, and informal trend analysis for decision-making can be more prone to imprecise information. The tension between formal and informal registers expands to the consequences of formal and informal use of the available data.

The resulting information systems were diverse, depending on the units they were related. However, the PGD set rules to enhance the benefits of monitoring deliveries. The first idea was to define the team as the unit´s reference for the deliveries. The unachievable idea of individually monitoring what each worker does could be addressed by understanding how teams work and connecting their activities to higher-level goals (Brazil, 2024a). The main outcome was strengthening the connection between governmental planning, strategic objectives, and the results expected from units and teams within the public service. Both managers, at different levels, and workers could benefit from gaining a better understanding of work and the contribution their actions have to the general government´s achievements. Lastly, increased engagement resulting from better comprehension of priorities and deliveries was expected.

The diverse set of information systems and information availability of the program resulted in many data registrations and uses. In the next session, we present some of the trade-offs of such complexity, indicating paths to follow next.

5. Trade-offs in the levels of formality in the use of PGD registers

The latest reported situation of the program is exemplary of the different trade-offs and contradictions regarding the next steps of the system development. Two different information systems are at work to receive information from each PGD unit. One is the central system of information related to the legal formalities, which is manually supplied with the actual situation of each unit. A team of civil servants needs to manually check whether the unit complies with all the six requirements to meet the formal conformity (published acts of institution and rules for having a functional program, system integration via API to transfer program information and a formal representative named to take part in the PGD network formal meetings).

In December 2024, out of 215 units allowed to join the PGD program, 191 actively participated. However, only 148 (77,94%) comply with all the formal requirements. The average compliance index is 94,33% among the 191 participating units. From the system integration perspective, 186 declares to have an operating system to manage its delivery and work plans. 97 institutions are adopting different versions of the PGD standard system, 53 have another publicly available system, and 36 units have declared to have developed their systems. The five units without a system do not comply with the program's requirements and should be disconnected if they cannot fulfill them in time (Brazil, 2024a). Only at the level of formality and conformity with the program regulations, even the objective of requirement compliance is questioned by some of the units.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The second information system is the one built upon API data transfer. The collection of the distributed data from all the program's compounding units into summarized information is the goal of the PGD team. Though system integration is ongoing, the data indicates several challenges. Besides the formality of the data, the PGD experience already indicates increasing complexities coming from the levels of aggregation to be used with this workforce management data source for decision-making.

The idea of offering decision-making dashboards with the program's indicators is still in its infancy. Aiming at going beyond the number of PGD participants, the systems should present data on the work plans, evaluations, and deliveries of the teams from each institution. However, as previously indicated, the perspective of developing management dashboards depends directly on the quality of this data. For instance, all PGD participants, regardless of the system chosen by their units, are expected to fill in their agreed work plans under their team's delivery plans. Mandatory data submission via API officially began in January 2025, and the governance structure of the PGD program has focused its efforts on analyzing the consistency of the data received via API. On the one hand, data transfer failures due to system issues result from bad system integration. On the other hand, due to a lack of data, team training and engagement are noticed due to poor liaison between the senior leadership of the institutions and the heads of the participating units.

Since August 2024, 159 units have sent more than 25,000 delivery plans, related to more than 240,000 work plans. It already sums up hundreds of thousands of individual contributions of the 70,000 PGD participants registered with the API (Brazil, 2024a). Given that evaluation deadlines and scores, defined in the legislation, should be followed, the focus comes back to information quality. As with the existing system, the differences in individual and collective performance, i.e., may result in different perspectives on the information systems. It is expected that the more the command-and-control individual perspective is adopted, the less prone civil servants will be to updating systems with real-life information. The risks of consequences increase their resistance to updating the system dynamically and their willingness to have a better stable picture to be assessed.

As discussed in the literature, what was observed in developing the PGD information system resembles the tensions within other requirements-setting processes for information systems. Consequently, this explorative analysis arrives at a final reflection regarding the new program implementation, the formality of the information use. Based on the insights coming from the literature, after the program reaches its maturity in terms of technology convergence, the API should be able to capture the amount of information needed for the dashboard consolidation. However, as in the literature, the more focused on results and evaluation the use of the information systems is, the less likely it tends to receive actual information from civil servants. The discussion indicates a risk that the PGD program information systems' official and formal use results in more bureaucratic, hence, outdated information. As a consequence, it is hypothesized that the information coming from the PGD information systems might become less realistic and useful for decision-making, by attending strictly to legal requirements or frameworks.

6. Conclusion and future research

Based on the main research question of "How does the level of formality in using work management information systems influence the data availability to improve decision-making?" we performed an exploratory study to discuss the consequences of increasing formality using the existing data. The Management and Performance Program (PGD) resulted from a policy transformation in the Brazilian public administration, which replaced the timesheet workforce management with a delivery-based system.

Driven by the guidelines of New Public Management (NPM) and accelerated by the 2019 pandemic, this shift brought higher levels of autonomy to public servants, empowering teams and managers in their management procedures. The focus on delivery indicates the potential to increase service delivery efficiency despite challenges such as the risk of micromanagement. Converging with the literature findings, the PGD case also indicates that a way to tackle the formal bureaucracy of inaccurate records could be to prioritize team performance based on concrete goals. The new management system shows a path to foster a new management culture in the public sector, more appropriate to support flexible ways to organize work than timesheets.

Though potential remedies to these challenges posed by formalization are not directly discussed, some examples can indicate an agenda for further research. For example, analysing whether increasing the use of informal data sources could improve data flexibility and lead to better decision-making. Or if enhancing system user design could nudge participants to improve their register practices, leading to increased trust in the system's information.

The discussions indicate that the immediate effect of strengthening the system through formality could be to reduce the system's availability of useful management data. Consequently, the data availability reduction would also decrease the new management program's potential to analyze trends, obtain accurate information, and improve decision-making processes. Further research should incorporate more empirical evidence and explore better ways to balance formal management and data availability to increase its importance to policymakers. More evidence is also needed to test the actual consequences of increasing levels of formality in the PGD information system use.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 26 May 2025

Abstract. Using the PRISMA framework for scoping reviews, we identified 27 studies on remote and hybrid work in the victim services sector that met our inclusion criteria. Studies were examined regarding (1) the data and methods used to examine remote and hybrid work in victim service agencies; and (2) provider-level and client-level outcomes. Findings show most studies are exploratory in nature, rely on qualitative data from professionals only (i.e., not service users), and suffer from methodological limitations (e.g., reliance on small, convenience samples). Further, most studies focus on the transition to remote service delivery during the COVID-19 pandemic and on domestic violence/sexual assault agencies. Findings show that common provider-level challenges include technological barriers, concerns about the security of online services, and the development of rapport with clients virtually; while strengths include personal-professional flexibility, the development of new collaborations, and work productivity/efficiency. Client-level challenges include technology access, digital literacy, and confidentiality and safety concerns, while strengths include increased access to services, reduced cost, and increased anonymity of virtual services. Results suggest that we need additional, rigorous evaluation research to understand how processes and outcomes differ between remote and in-person services. Expanding research to a wider range of types of crime victim service providers and crime victims are also important next steps.

Keywords. Crime victims, virtual victim services, telehealth, victim advocacy.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1040

1. Introduction

Crime victims have a wide range of needs that can vary across victimization types and individuals. Victims may have legal needs such as requests for victim compensation (e.g., monies for funeral expenses for a homicide victim), notification of criminal case progression, court accompaniment, and no contact orders, as well as non-legal needs including medical, housing, and/or psychological support. Victim service providers (VSPs) help facilitate meeting these needs directly or through a "warm hand off" (e.g., a specific referral to another provider) (Richards, 2016). Historically, most VSPs worked with victims face-to-face in a physical setting (Pfitzner & McGowan, 2023). Over the past few decades, however, technological advances in communication such as videoconferencing, mobile chat, and electronic forms and applications (aka apps) have resulted in a wide range of options for remote and hybrid work (Flores, 2019), including for VSPs. Further, the use of "telehealth" or "telemedicine" (where electronic technology is used to provide health services to a patient) has also grown, resulting in an increased level of comfort in discussing sensitive/confidential topics remotely (Villalobos et al., 2023). Electronic services and service provision was further spurred by the COVID-19 pandemic which forced wide expansion of remote and hybrid work (RHW) modalities within the private and government sectors (Aksoy et al., 2022), including within the criminal

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

justice system (Ivković & Maskaly, 2022). As such, many criminal justice and victim service agencies pivoted to fully remote service offerings and continue to offer remote services to clients (and remote or hybrid work options for employees). While virtual services may increase accessibility for clients and improve efficiency and work-life balance for professionals, they come with challenges regarding technology access and safety (Arunprasad et al., 2022). Prior scoping reviews have examined studies of technology-based solutions (eHealth) for psychosocial support among sexual assault (SA) (Bach et al., 2024), intimate partner violence (IPV)(Anderson et al., 2021; El Morr & Layal, 2020; Linde et al., 2020), and violence against women (Eisenhut et al., 2020) survivors. However, it is unclear what is known about the challenges and opportunities for crime victims, regardless of victimization type, seeking services remotely *or* the impact of RHW on victim service professionals. As such the current scoping review aims to answer the following questions: (1) What data and methods are used to examine RHW in victim service agencies? (2) What is known about RHW in victim service agencies regarding provider-level outcomes and client-level outcomes.

2. Methods

A scoping review is a "systematic approach to map evidence on a topic and identify main concepts, theories, sources, and knowledge gaps" (Tricco et al., 2018, p. 467). Scoping reviews are useful in an emerging field to determine the "scope" of a body of literature on a topical area and report on the types of evidence available and the ways such evidence has been collected (Munn et al., 2018). In the current scoping review, we examine the existing research on RHW within victim service agencies and the ways in which this knowledge has been gathered.

2.1 Stages of Scoping Review

Below we describe details on each of the four stages included in the current scoping review: (a) establishing eligibility criteria; (b) identifying relevant studies; (c) screening relevant studies; and (d) charting and organizing data. The PRISMA framework for conducting and reporting scoping reviews (Tricco et al., 2018) was utilized. Our protocol was preregistered with Open Science Framework.

2.2 Eligibility Criteria

Studies were considered eligible for inclusion if they (a) reported findings from an empirical study (i.e., not literature reviews, theoretical articles, commentaries or conceptual papers); (b) were written in English; and (c) examined remote and/or hybrid work in community- and/or systems-based victim service agencies. No studies were excluded based on the year of study. Unpublished theses, dissertations, and reports were included.

2.3 Information Sources and Search Process

MeSH and other terms combined with Boolean Operators (OR and AND) were used to create the following search equation: ("remote" OR "hybrid" OR "online" OR "web-based" OR "virtual") AND ("victim*" "survivor*" OR "victim services"). The search equation was run for title, abstract, and keywords in 4 electronic databases: PubMed, PsycINFO, SCOPUS, and Web of Science and in abstract and summary text in ProQuest Dissertations and Theses and ProQuest Social Science Premium Collection (which includes NCJRS Abstracts). We also searched Google Scholar using a combination of "remote work and victim service agencies" and "hybrid work and victim service agencies"; the first 10 pages of records sorted by relevance were reviewed. We also reviewed the reference lists of included studies.

2.4 Study Selection

All records were reviewed, and after removing duplicates, two Co-Investigators independently screened articles based on the title and abstract (Stage one review). Disagreements in screening were resolved using a third screener, a trained, doctoral-level research assistant. Studies screened in at this stage were read in full by one of the Co-Investigators and the doctoral-level researcher (Stage two review). Again, disagreements were resolved using the third screener. Inclusion/exclusion was tracked at each stage using the PRISMA flow chart (See Figure 1). Rayyan software was used to manage and organize the review process.

At Stage one, 1,998 records were identified. After removing 712 duplicates manually and using the duplicate detection function in Rayyan, 1,286 records were included in the Stage one review. During the Stage one review, 1,245 records were excluded because they did not meet the inclusion criteria leaving 41 records for the Stage two review. At Stage two, the 41 remaining records were read in full; 14 records were removed because they did not meet the topical inclusion criteria. The remaining 27 records were included in this scoping review. In addition, the reference pages for these 27 records were reviewed for additional records that met the inclusion criteria; none were identified.

2.5 Data Charting

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Key information about included records (i.e., included after Stage two review) were extracted and charted including author(s), year, study location, sample, data, research questions, and main findings regarding provider-level challenges and benefits and client-level challenges and benefits.

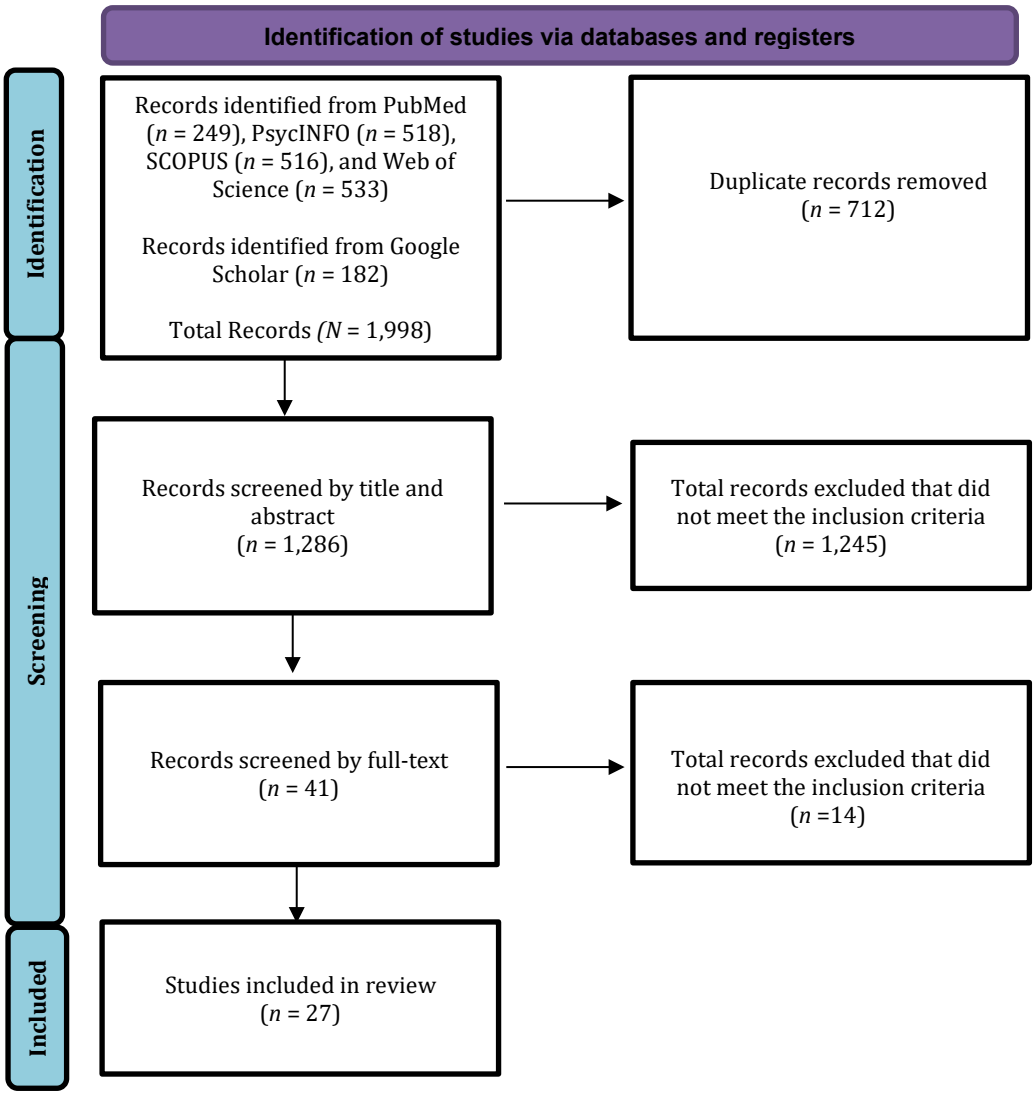

Figure 1. Identification of studies via databases and registers using the PRISMA framework.

3. Results

The 27 articles included in this scoping review span publication dates from 2011 to 2025, with only three studies taking place prior to the onset of the COVID-19 pandemic (i.e., Chen 2019; Gloor & Meier, 2020; Hassija and Gray, 2011). The studies were conducted in the following countries: the United States (*n* = 15), Australia (*n* = 3), United Kingdom (n = 2), Portugal (*n* = 2), Canada (*n* = 1), England (*n* = 1), Spain (n =1), and Scotland (*n* = 1). Virtual service delivery ranged from video- and teleconferencing, to application-based services, chat-and voice-based hotlines, texting/emailing, and synchronous and asynchronous remote counselling among other services (See Table 1).

Most studies (*n* = 15, 55.6%) reported on qualitative research only, either using open-ended survey responses or interview methods. Two studies (7.4%) used only quantitative methods, while a mixed methods approach was adopted in the remaining 10 studies (37.0%). Sample sizes for qualitative studies varied widely, with as few as seven participants engaging in interviews to as many as 564 participants completing surveys with open-ended responses; samples sizes for quantitative analyses were relatively small ranging from 15 to 352 participants. Given these small sample sizes, it is unsurprising that the quantitative studies relied on descriptive and bivariate statistics rather than multivariate analyses. Most studies (*n* = 23, 85.2%) focused on the transition to remote victim services and remote and hybrid victim service work environments during COVID-19. All these studies used convenience samples and acknowledged their exploratory nature; only two reported response rates (18.7% and 26.5%, respectively). These studies mostly focused on the perspectives of professionals working for domestic violence (DV) and/or SA response organizations, although one study interviewed child protective service workers (Renov

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

et al., 2021), one surveyed professionals who supported victims of torture (Santamarina et al., 2023), and two interviewed a range of professionals, including providers who supported child abuse and trafficking victims (Voth Schrag et al., 2021a, 2022). Further, only four studies included the perspectives of crime victims.

As noted above, three studies took place or used data collected before COVID-19. The first assessed change in PTSD and depressive symptoms as well as client satisfaction associated with a synchronous videoconferencing therapy for DV and SA victims in a rural area who did not have access to in-person therapy (Hassija and Gray, 2011). The second examined the feasibility and acceptability of an asynchronous counselling service for DV victims (Gloor & Meier, 2020), while the third described support providers' use of technology to contact and serve trafficking victims as well as trafficking victims' concerns regarding technology use (Chen et al., 2019).

3.1 Virtual Victim Services During COVID-19 Challenges and Benefits to Service Providers

As noted above, 23 studies focus on virtual victim services after the onset of COVID-19 and predominantly examined service providers' perspectives. As seen in Table 2, there was significant overlap across studies regarding the challenges and benefits for VSPs. Nineteen studies discussed provider challenges with providing virtual services. In three studies, VSPs identified difficulties in "accessing technology" or with internet connectivity specifically while three indicated that they had problems obtaining the necessary hardware (e.g., computers, tablets, phones) or that they had to use their personal computers/phones to provide virtual services. In addition, service providers in seven studies reported having limited technical or digital literacy or limited knowledge regarding digital videoconferencing or videotelephone platforms (e.g., Zoom, Skype) and one study mentioned problems obtaining information technology support from their organization. Popular videoconferencing sites did not have the necessary encryption and safety features required to meet some providers' policies, so providers had to search to find platforms that were compliant. Likewise, two studies discussed providers having to learn about technology safety and teach their clients; finding that "technology safety is part of the job now" (Voth Schrag, 2022, p. 230).

Providers also discussed the challenges in assessing victim's physical safety and home environment virtually with several providers specifically mentioning the difficulties in reading body language with videoconferencing technology and the lack of any cues (e.g., body language, tone of voice) with chat, email, and application-based services. Four studies found that providers were concerned about their ability to build trust and rapport virtually, and in turn, about the quality and effectiveness of the services they were providing (see for examples, Evans et al., 2023, Speed et al., 2020) and two studies noted that clients were less likely to show up for virtual appointments. Remote work was also isolating for many providers, with six studies discussing the difficulties in connecting with co-workers to seek advice about clients and/or debrief after an especially difficult client interaction. Providers across several studies also indicated that remote work decreased their work/life balance because it blurred the lines between their work, which focused on traumatic events, and their home, which was their safe space. Two studies mentioned new difficulties in setting boundaries between work and home when they transitioned to providing remote services.

In addition to challenges, 12 studies identified benefits to providers. Providers noted that videoconferencing had expanded their access to trainings (three studies), had notetaking and recording features that assisted them in their client and co-worker interactions (one study), and increased their ability to engage with new partners despite physical distance (three studies). Providers also noted the cost effectiveness of remote services to their clients and/or virtual staff trainings (two studies) and their newfound ability to provide services to clients even when clients travel or relocate (i.e., continuity of services; one study). In three studies, providers noted that virtual visits had increased their productivity through efficiency (i.e., no travel time between appointments) and that their clients had better attendance at remote appointments (two studies). In two studies, providers noted that remote work gave them *better* work life balance, with providers citing more personal flexibility in working from home and more control over their physical workspace (i.e., to create a positive workspace) as specific benefits.

Table 1. Summary of Studies Included in Scoping Review*.						
	Author/Year	**Study Location**	**Sample**	**Purpose**	**Qualitative/ quantitative**	**Remote modalities/services**
1	Evans et al. (2023)	Ohio, USA	Agency workers (n = 170; 26.5% response rate).	Surveys asked about how the COVID-19 pandemic changed victim service work.	Qualitative	Videoconferencing
2	Roebuck et al. (2022)	Canada	VSPs and adult volunteers (N = 564).	Surveys asked about spending more time working from home during the COVID-19 pandemic as a service provider.	Qualitative and quantitative	Videoconferencing
3	Voth Schrag et al. (2021a)	USA	VSPs for IPV, SA, child abuse, or human trafficking (n = 33).	Semi-structured interviews focused on approaches used by the interpersonal violence workforce to address social distancing needs during COVID-19.	Qualitative	Teleconferencing
4	Waid et al. (2022)	Midwestern state, USA (rural)	Administrators and/or supervisors of direct service staff from federal, state, and local entities or non-profit, community-based settings serving victims of crime (n = 9).	Interviews focused on how service providers adapted to work with victims, the types of victimization experienced, the training received, and any technical or financial assistance received during the COVID-19 pandemic.	Qualitative	Videoconferencing; Participants were working remotely or in a hybrid format.
5	Bibi (2021)	North Dakota, USA (rural)	VSPs in rural agencies (n = 8).	Interviews focused on the strategies agencies developed during COVID-19 and how they can better serve victims/survivors in rural communities.	Qualitative	Videoconferencing; Participants were working remotely or in a hybrid format.
6	Cambell et al. (2023)	Detroit, Michigan, USA	Advocate/counseling staff (n = 12) at largest SA service agency in Detroit.	Interviews focused on how the agency responded to pandemic restrictions, how their clients engaged with these changes in service, and what they saw as key lessons learned from the pandemic regarding services and organizational planning.	Qualitative	Videoconferencing and online crisis chat hotline.
7	Caridade et al. (2021)	Portugal	Support professionals from the Portuguese National Support Network for victims of DV (n = 196).	Surveys focused on the type of support provided to victims during the COVID-19 pandemic compared to before the pandemic; their level of training to provide support remotely; the advantages and barriers of remote support, and their institutional policies regarding remote support.	Quantitative	Phone, email, social applications, and videoconferencing; Participants were working remotely or in a hybrid format.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

8	Carrington et al. (2021)	Australia	Domestic and family violence service providers in Australia (n = 362).	Surveys asked about the impact of the COVID pandemic and associated lockdown restrictions experienced by the DV workforce and their clients.	Qualitative	Phone, email, social applications, and videoconferencing; Participants were working remotely or in a hybrid format.
9	Chen et al. (2019)	USA and Southeast Asia	Staff members at VSPs and survivors of trafficking (n = 17).	Semi-structured interviews focused on how VSPs use technology in their interactions with clients and what, if any, concerns exist around this technology usage.	Qualitative	Phone, hotline, SMS, social media (e.g., Facebook), and email.
10	Gloor & Meier (2020)	Zurich, Switzerland	Counselling service users during first 10 months (n = 200) and during a six-week period (n = 33); Experts in information technology (IT) (n = 3) and counselling (n = 3).	Review of user data and user survey data; interviews with experts in IT and counselling to examine the development, performance, and acceptance of the remote counselling service.	Qualitative and quantitative	Asynchronous web based individual counselling service via a protected area on the provider website.
11	Downes & Barbosa (2024)	United Kingdom	All Advocate Educators and Clinicians in the Identification and Referral to Improve Safety (IRIS)-Network (n = 187), and convenience sample of clinicians in IRIS-trained practices (n = 8) and patients/service users (n = 4).	Survey and interview data examined whether confidentiality can be guaranteed in remote consultations; IRIS training effectiveness and acceptability to clinicians when delivered virtually; and virtual IRIS advocacy support effectiveness and acceptability to patients.	Qualitative and quantitative	Virtual training and service delivery for IRIS program (i.e., DA screening and referrals to victim services).
12	Santamarina et al. (2023)	Madrid and Barcelona, Spain	Professionals (n=21) and torture survivors (n=21) from a sample of Istanbul Protocols (IP) interviews between 2019 and 2021.	Surveys asked about the evaluation process, satisfaction, difficulties encountered, and compliance with therapeutic aspects and compared across remote and in person formats.	Qualitative and quantitative	Videoconferencing.
13	Pedersen et al. (2023)	North East Scotland and Orkney Islands, UK (rural)	Managers of domestic abuse services (n = 12).	Semi-structured interviews focused on the move to digital and telephone provision of support due to COVID-19.	Qualitative	Telephone and online.
14	Speed et al. (2020)	United Kingdom	Service providers at gender-based violence organizations (n = 52; 18.7% response rate).	Surveys on the impact of COVID-19 gender-based violence services operations and support to victims.	Qualitative and quantitative	Telephone helpline/webchat or online.
15	Wood et al. (2022)	USA	IPV and SA service workers (n = 352) from 24 states.	Online surveys about service adaptation and technology use at work before and during the COVID-19 pandemic.	Qualitative and quantitative	Videoconferencing, texting, computer chats, email, phone call, and video calls (e.g., Facetime).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

16	Perez (2022)	California, USA	DV service providers, including case managers, therapists, and program coordinators (n = 9).	Interviews focused on the barriers, benefits, and strategies in providing services during COVID-19.	Qualitative	Telephone and videoconferencing.
17	Sleath et al. (2025)	England	Sexual violence service professionals (n = 22) and service users (n = 221) from 15 Sexual Assault Referral Centers.	Surveys asked about pandemic impact on survivors of sexual violence and abuse and their help-seeking and recovery journeys; pandemic impact on service delivery and staff; and challenges and opportunities.	Qualitative and quantitative	Telephone and videoconferencing.
18	Wood et al. (2020)	USA	Individuals with active safety concerns from violence, threats, stalking, or abuse (n = 53).	Surveys about the use of virtual and phone services during COVID-19.	Qualitative and quantitative	Virtual counseling and/or advocacy services.
19	Domingo-Cabarrubias et al. (2023)	Victoria, Australia	Legal practitioners (n = 7) who support victims of domestic/family violence.	Interviews explored benefits, limitations, risks, and future innovation opportunities in remote legal support during the COVID-19 pandemic.	Qualitative	Telephone, videoconferencing, Skype or Zoom, email, online chat, text messaging, websites, self-help centers, and online tools.
20	Renov et al. (2021)	USA	Child Protective Service (CPS) caseworkers and administrators (n = 37).	Interviews assessed how the COVID-19 pandemic changed the way CPS staff conducted investigations and provided services to families in the CPS system.	Qualitative	Virtual home visits, care portal.
21	Klein et al. (2022)	Midwestern University USA	Hotline staff and volunteers (n = 9).	Interviews assessed perspectives regarding the benefits and challenges of offering a chat service, as well as the strategies used to adapt services to the chat modality.	Qualitative and quantitative	Telephone and web-based hotline.
22	Pfitzner and McGowan (2023)	Australia	Victim-survivors who sought domestic/family violence advice or support (n = 61).	Surveys asked about experiences and challenges in accessing support during lockdowns; the method by which remote support was provided during lockdowns and whether that method was helpful; what service providers could have done better during lockdowns.	Qualitative and quantitative	Telephone support, hotline.
23	Voth Schrag et al. (2022)	USA	VSPs for IPV, SA, child abuse, or human trafficking (n = 33).	Semi-structured interviews asked about strategies used to help clients address violence, threats, stalking, or abuse since the coronavirus pandemic began and changes as the pandemic unfolded.	Qualitative	Teleconferencing, telephone/web hotline, texting/chat, Google voice numbers, email; Uber account for transportation.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

24	Ferreira et al. (2024)	Portugal	Professionals from DV support service (n =24).	Semi-structured interviews focused on the primary challenges faced by DV professionals during interventions.	Qualitative	Video and phone calls.
25	Nahar et al. (2023)	Dallas-Fort Worth, Texas, USA	VSPs (n = 15).	Interviews examined experiences providing telehealth services during COVID-19.	Qualitative	"Telehealth services".
26	Voth Schrag et al. (2021b)	Southwestern State, USA	For interviews: campus and community-based advocates (n =23) For surveys: survivors (n = 63). Participants were drawn from 3 universities.	Interviews and surveys asked how advocates were using technology with emerging adults who are survivors of IPV and sexual violence in the year immediately preceding the COVID-19 pandemic; and what survivor recommendations for advocacy and service engagement via technology were.	Qualitative	Text messaging, apps, My Plan, email, phone; Website for making appointments.
27	Hassija and Gray (2011)	Wyoming, USA (rural)	Clients referred to the Wyoming Trauma Telehealth Treatment Clinic (WITIC) for psychological services after DV/SA (n = 15).	Pre-and post-treatment PTSD and depression symptoms were assessed as was client satisfaction.	Quantitative	Videoconferencing-based psychological services delivered using secure technology.

*Full citations are available upon request.
Common Acronyms: IPV=intimate partner violence; DV=domestic violence; SA=sexual assualt

3.2 Virtual Victim Services During COVID-19 Challenges and Benefits to Service Victims

Nineteen studies discussed victim challenges with virtual services; however, only four studies included the perspectives of service users (i.e., victims). In eight studies, difficulties with victims accessing technology or accessing hardware such as computers, tablets, and phones was noted, while eight discussed victims' challenges navigating technology, limited digital literacy, or discomfort using technology. Further, two studies described challenges working applications or videoconferencing platforms as particularly difficult for older clients and clients with complex health needs. Four studies noted that virtual services felt impersonal; for example, one victim said that they wanted to talk with someone face-to-face for a "a proper chat" (Sleath et al., 2025 p. 146). Another study reporting victims' perspectives discussed how the quality of virtual services was dependent on the provider and their knowledge and skills to provide remote services (Pfitzner & McGowan, 2023).

The most noted concern was about victim safety and confidentiality when accessing virtual services. Twelve studies mentioned concerns about victims having a private space to connect with service providers (i.e., to access confidential services), as well as the risk for victims seeking services while in physical proximity to their perpetrators. Likewise, three studies specifically mentioned victim's fear about using virtual services because their abuser monitored their digital devices (e.g., checked their call or browser history, read their email, etc.).

Fifteen studies also addressed victim benefits regarding virtual services. Increased flexibility and access to services was highly valued (12 studies) with multiple studies specifically noting that virtual serives did not require transportation or childcare and expanded access to rural victims. The immediacy of services in virtual formats such as text/chat-based services was also noted in one study. Other identified benefits included virtual translation systems that allowed for broader language access and the ability of videoconferencing to hold virtual visits or assessments without victims needing to be in the same physical space, and sometimes without even seeing their perpetrators (i.e., using breakout rooms). Studies also discussed the benefits of increased anonymity in virtual services for disclosing victimization and/or accessing services (five studies). For example, some noted that it was easier for victims to discuss their victimization remotely (i.e., less fear, stigma, shame) while others noted that remote services reduced victims' fear of physically accessing a victim service provider and being recongized by someone they know (see Pedersen et al., 2023; Pfitzner & McGowan, 2025).

3.3 Challenges and Benefits of Virtual Victim Services Outside of COVID-19

Four studies were focused on virtual victim services outside of the COVID-19 pandemic context. In the oldest study from 2011, clients obtained trauma-focused psychotherapy services from a university-based therapy clinic via videoconferencing at domestic violence/rape crisis centers in their home areas (Hassija and Gray, 2011). Survivors experienced large reductions in PTSD and depressive symptoms overall and by trauma type, and reported high satisfaction with services. Similarly, Gloor & Meier (2020) piloted an asynchronous counselling service for victims of DV accessible via a specially protected area on the support provider's website. Review of user data and user survey data showed that users increased over time by 50%, that 57.5% of users engaged in multiple sessions, and that 52.5% of users accessed the service outside of traditional work hours when in-person counselling services are not readily available; more than 93% of users rated the responses from counsellors as 'very comprehensible', 'very helpful', and 'very sensitive'. Further, Klein et al.'s (2022) formative evaluation described the feasibility and acceptability of a chat-based hotline for college students. Their work showed that students were willing to use the chat hotline at similar rates as a voice hotline. Hotline staff perceived that "chatters" felt greater safety to disclose and more control over their disclosure in chat over voice hotlines (1) given the greater anonymity and (2) ability to write out and edit their chat messages. At the same time, chat hotline staff reported more pressure to type the "right thing" than they did in responses via the voice hotline and concerns that they could not always perceive the chatter's emotional state or emotional needs through text alone. Finally, Chen and colleagues (2019) explored support providers' use of technology to contact and serve victims of trafficking as well as trafficking survivors' concerns regarding technology use through in-depth interviews. Providers noted that their primary way to make/recieve contact with survivors was through remote means such as voice hotlines, SMS, email, or via social media and that continued support was often delivered remotely until a survivor could escape their trafficker. A wide range of difficulties for survivors were identified including their often limited access to technology and/or the control of their digital devices by the perpetrator. Results are presented in Table 2.

Table 2. Summary of Provider and Client Level Findings Related to Remote Victim Services.				
	Provider level challenges/negative outcomes	**Provider level benefits/positive outcomes**	**Client level challenges/ negative outcomes**	**Client level benefits/positive outcomes**
1	(1) Mixed feelings about the utility and effectiveness of virtual services (e.g., reduced effectiveness in therapeutic work with children, clients being less likely to show up for virtual appointments, or difficulties related to internet access technology).	(1) More personal flexibility in working from home.	(1) Difficulties with accessing technology, (2) difficulties navigating the technology, (3) challenges exacerbated for victims with disabilities (e.g., Deaf).	(1) Increased access to services (e.g., more flexibility, no need for transportation, childcare).
2	(1) Working from home decreased work-life balance which in turn a decrease in mental health, (2) difficulties negotiating and setting boundaries, (3) virtual format makes it difficult to draw on co-worker support.	(1) More personal flexibility in working from home, (2) remote work improved work life balance, (3) remote work at home allows for more control over their physical workspace (i.e., a "positive space" to work).	none discussed.	(1) Increased access to services (e.g., more flexibility, no need for transportation, childcare).
3	Regarding virtual services (1) empathic connection is harder, (2) assessing environment (e.g., for home visits on children) is challenging, (3) technological challenges, (4) boundary maintenance, (5) technology safety is part of the job.	none discussed.	(1) Difficulties with accessing technology, (2) difficulties navigating the technology.	(1) Increased access to services (e.g., no need for transportation, childcare), (2) immediacy of services, (3) language access, (4) anonymity & comfort disclosing.
4	(1) Security on videoconferencing sites (e.g., Zoom), (2) reduced networking opportunities when using a virtual format.	(1) Note taking and recording features in videoconferencing platforms, (2) reduced costs of training staff virtually, (3) increased access to collaboration through virtual meetings	none discussed.	(1) Increased ease of serving victims and perpetrators in the same meetings (e.g., using breakout rooms, coming and going as needed without seeing each other).
5	(1) Concerns about patient acceptance, especially regarding the privacy and intimacy of virtual exams, (2) space limitations for machinery in small EDs, (3) lack of staff training, (4) concerns regarding the quality of exams.	(1) Telemedicine can improve patient care and evidence collection in SA cases, (2) 24/7 IT support is key to addressing technical challenges.	none discussed.	none discussed.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

6	(1) Security on videoconferencing sites, (2) Identifying a videoconferencing site that would meet strict agency requirements (e.g., could not use Zoom).	none discussed.	Telehealth options were not widely utilized by the client population of this agency (e.g., low income, urban population) due to (1) difficulties accessing technology, (2) inadequate privacy to utilize telehealth, (3) limited comfort in discussing traumatic events remotely.	none discussed.
7	(1) Limited knowledge/training on technology/in providing support remotely.	none discussed.	(1) Difficulties accessing technology, (2) difficulties navigating the technology, (3) risk of control of digital devices by the perpetrator, (4) proximity to the offender (i.e., inadequate privacy to utilize telehealth).	(1) Reduced financial costs, (2) reduced inhibition, fear, shame.
8	(1) Difficulties conducting services remotely (e.g., difficulty building rapport/trust, interpreting body language), (2) difficulties assessing client's environmental risk/home conditions/physical safety, (3) clients were less likely to show up for virtual appointments, (4) lacked equipment, (5) limited knowledge/training on technology/in providing support remotely.	none discussed.	(1) Difficulties accessing technology, (2) difficulties navigating the technology, (3) risk of control of digital devices by the perpetrator, (4) proximity to the offender (i.e., inadequate privacy to utilize telehealth), (5) exacerbated challenges for victims with disabilities or complex health needs.	none discussed.
9	(1) Limited knowledge/training on digital platforms, (2) boundary maintenance, (3) technology safety is part of the job.	none discussed.	(1) Difficulties accessing technology, (2) difficulties navigating the technology, (3) risk of control of digital devices by the perpetrator, (4) proximity to the offender (i.e., inadequate privacy to utilize remote services), (5) victims may not believe the VSP can be trusted (due to relationship only being virtual).	(1) Increased comfort level communicating digitally (i.e., "less raw" p. 92).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

10	(1) Trained counselors who are dedicated to the online service (only) are needed (2) professional technical support is essential, (3) technical realization of the service was challenging (i.e., balancing safety/security requirements, user ease, and user interface).	none discussed.	none discussed.	(1) Increased flexibility (i.e., 52.5% of users accessed outside of traditional work hours), (2) users noted increased comfort level communicating digitally.
11	(1) Most clinicians felt more confident identifying and asking about DA in person versus virtually, (2) more confident responding to disclosures of DA in person versus virtually (3) nearly 49% had received a disclosure of DA virtually, but only about a third reported making a referral to an Advocate Educator during a remote consolation, (4) most Advocate Educators were concerned about difficulties in concentration or IT issues with online training, (5) difficulties in assessing service users safety or risk virtually, (6) difficulties in asking sensitive questions virtually.	(1) Most clinicians felt confident identifying and asking about DA virtually, (2) most clinicians had asked about DA virtually, (3) most clinicians preferred online training to face-to-face.	(1) Nearly half of Advocate Educators reported a delay/difficulty in getting their service users to survivors' groups or other relevant services.	(1) Most Advocate Educators reported their users were just as positive about the remote support as the face-to-face support, (2) users reported increased access, (3) users reported decreased fear/stigma in disclosing virtually.
12	More professionals in the remote format compared to the face-to-face format (1) needed an interpreter, (2) reported privacy issues/inadequate interview location, (3) problems in connection/ material resources, (4) timing problems, (5) difficulties in understanding the survivor's emotional response.	none discussed.	Fewer survivors in the remote format reported (1) feeling well emotionally immediately after the process, (2) feeling well emotionally after the process was findings, and (3) post-process resilience (4) more felt they needed subsequent psychological support.	(1) All survivors in the remote format reported being satisfied overall (2) being satisfied with the interview process and report writing.

13	For videoconferencing/ online services (1) difficulties obtaining needed hardware (e.g., computers, phones, tablets), (2) limited knowledge/training on digital platforms, (3) difficulties with internet connectivity. For telephone services, (4) inability to build rapport/read body language, (5) need to concentrate harder led to exhaustion, (6) remote format made it difficult to draw on co-worker support.	(1) Potential to train staff virtually, (2) increased access to collaboration through virtual meetings.	For videoconferencing/ online services (1) difficulties with internet connectivity, (2) limited knowledge about digital platforms, (3) concerns about privacy/abuser proximity, (4) lack of easy access to a computer, (5) fear of control of digital devices/tracking online contacts by the perpetrator.	Providers reported (1) a more flexible approach of remote services being welcomed by some users, (2) preference of phone contact versus videoconferencing, (3) increased access to services (e.g., in rural areas).
14	(1) Difficulties obtaining needed hardware (e.g., computers, phones, tablets), (2) difficulties accessing IT support, (3) concerns about quality of virtual services for victims.	none discussed.	(1) Concerns about privacy/abuser proximity, (2) limited knowledge about digital platforms.	none discussed.
15	Professionals reported (1) limited knowledge/training on digital platforms and in providing support remotely, (2) difficulties conducting services remotely (e.g., difficulty building rapport/trust, interpreting body language), (3) difficulties assessing client's safety/how they are doing, (4) difficulties accessing/connecting to internet, (5) remote format makes it difficult to draw on co-worker support.	none discussed.	(1) Discomfort using phone/technology to receive services, (2) lack of privacy/ concerns about proximity to the perpetrator.	none discussed.
16	(1) Clients were not answering calls/ following up with services.	(1) Law enforcement was more willing to engage victim service partners because it was over the phone (i.e., they did not have to wait for victim services to show up), (2) easier access to the home environment to observe family dynamics, (3) can provide services to clients located anywhere in the US.	(1) Discomfort using phone/technology to receive services, (2) lack of hardware, (3) concerns about victim safety, (4) concerns about client privacy and confidentiality.	(1) Increased accessibility (e.g., more convenient, no need to drive to their office, for childcare).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

17	(1) Difficulties conducting services remotely (e.g., difficulty building rapport/trust, interpreting body language), (2) boundary maintenance in working from home, (3) remote format makes it difficult to draw on co-worker support.	(1) Remote services are cost effective.	Most service users surveyed reported that online/telephone service delivery reduced their engagement in help-seeking and support due to difficulties building relationships, interpreting body language (i.e., "having a proper chat").	A minority of service users reported that remote services (1) increased accessibility (e.g., more convenient, no need to drive to their office, for childcare) and that it was (2) easier to disclose over the phone.
18	none discussed.	none discussed.	Concerns about (1) confidentiality, (2) tech safety, (3) technical issues (e.g., delays, technology interruptions), (4) wanted to talk face to face/in person.	Almost half (42%) of respondents had used virtual counseling or advocacy services at a violence prevention or intervention agency since the pandemic. (1) increased accessibility (e.g., more convenient, no need to drive to their office).
19	(1) Difficulties conducting services remotely (e.g., difficulty building rapport/trust, interpreting body language).	none discussed.	(1) Lack of access to technology/hardware, (2) virtual forms in English only/need for translation, (3) concerns about tracking/monitoring online activity by the perpetrator, (4) concerns about privacy/proximity to the perpetrator, (5) digital literacy.	none discussed.
20	(1) Difficulties assessing client's environmental risk/home conditions/physical safety, (2) difficulties with virtual interviews with young children (i.e., easily distractable, hard for them to manage digital device).	(1) Better work-life balance through remote/hybrid work, (2) increased productivity/ability to see their clients more often through virtual visits.	(1) Concerns about privacy/proximity to the perpetrator, (2) need for hardware like phones.	(1) Online care portal increased access to needed goods, (2) improved engagement with families through virtual alternatives.
21	(1) Absence of vocal cues/can be difficult to know a "chatter's" emotional state/needs, (2) difficulty building rapport/expressing empathy, (3) some chats are very dense with multiple topics making responses cumbersome, (4) more pressure to type the "right" thing, (5) pre-generated shortcuts could seem impersonal.	(1) Staff can respond from anywhere in a private/confidential way.	none discussed.	(1) Chat allows for increased privacy/anonymity, (2) written form allows for more control over how users present the information (i.e., they can write out/edit their story via chat).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

22	none discussed.	none discussed.	(1) Concerns about privacy/proximity to the perpetrator, (2) virtual services felt impersonal, (3) not all service providers had the same level of virtual service delivery skills (i.e., quality was dependent on the practitioner)	(1) Increased accessibility (i.e., more flexible hours), (2) increased anonymity by not having to access services in person
23	(1) Tech safety is now part of the job for everyone.	(1) Seeing clients more frequently (for shorter interactions) through virtual interactions like emails, (2) increased engagement with partners through virtual meetings, (3) expanding engagement with new communities (e.g., having iPad at the multicultural center with service center's zoom information ready to go), (4) rideshare apps increased access to easy/efficient transportation (i.e., no need for vouchers).	(1) Digital literacy and tech safety needs, (2) concerns about proximity to the perpetrator, (3) concerns about privacy/confidentiality.	none discussed.
24	(1) Isolation of remote work/not seeing co-workers, (2) challenges building and maintaining rapport/personal connections with clients, (3) need to develop technical skills.	none discussed.	(1) Digital literacy needs, (2) concerns about proximity to the perpetrator.	none discussed.
25	(1) Limited digital literacy, (2) challenges building and maintaining rapport/personal connections with clients, (3) isolation of remote work/ not seeing co-workers.	(1) Better attendance by clients for virtual appointments, (2) increased efficiency/productivity.	(1) Concerns about proximity to the perpetrator, (2) concerns about privacy/confidentiality, (3) limited access to hardware, (4) limited access to internet, (5) perpetrator monitored digital devices, (6) limited digital literacy.	(1) Increased accessibility/flexibility

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

26	(1) Need to set boundaries, (2) tech safety is part of the job now.	(1) Technology allows for more options for the "best way" to communicate with a survivor.	(1) Concerns about privacy/ confidentiality, (2) technical glitches can retraumatize survivors (e.g., sad/romantic hold music, preform emails sent months after disclosures).	From survivors: (1) 43% of survivors reported using technology (phone, text message, e-mail, or secure message system) to connect with their advocate more than once. From advocates: (2) increased accessibility/flexibility/speed of response.
27	none discussed.	none discussed.	none discussed.	Survivors experienced large reductions in PTSD (d = 1.17) and depressive symptoms (d = 1.24) overall and by trauma type (DV: (d = 1.00, d = 1.33; SA: d = 2.18, d = 1.05, respectively), and reported high satisfaction with services (M = 52.93 out of 55).

4. Discussion

The present review aimed to describe what is known about hybrid and remote work (RHW) in crime victim services and how such knowledge has been developed. Using the PRISMA framework for scoping reviews, 27 studies were identified that met our inclusion criteria. Given the development of remote services across government sectors and the necessary expansion of RHW since the onset of the COVID-19 pandemic, conducting a review of research in this area is prudent to inform future practice and research in the victim services field.

Although technology has led to increased options for remote service delivery for several decades, studies identified through this review are relatively recent, published since 2011. Only three studies report on data collected prior to 2020, as most studies focused on the transition to remote services in response to the COVID-19 pandemic. There is limited global diversity in this body of research with all studies stemming from the Western world and more than half stemming from the United States. Regarding data and methods (RQ 1), most studies (93%) utilized qualitative data or took a mixed-methods approach. Existing studies are largely exploratory and descriptive in nature, most using small, convenience samples limiting generalizability.

Provider-level outcomes (RQ 2) were organized in terms of challenges and strengths. Common challenges included technological barriers (e.g., access to computers, phones, internet), security of online service provision (e.g., digital security of videoconferencing platforms), the development of rapport with clients virtually, and negative impacts on providers' work-life balance. Strengths/benefits included personal flexibility in work location, the development of new collaborations, efficiency (e.g., reduced travel time), training access, and increased frequency of communication with clients due to remote options (e.g., phone, chat, text, video, etc.).

Client-level outcomes (RQ 2) were also organized in terms of challenges and strengths. Most research on client-level outcomes was from the perspective of service providers. Challenges identified across studies include technology access and digital literacy, hardware access (e.g., phone, computer, etc.), less utility for some populations (persons with disabilities, persons in urban low-income areas, older persons), provider's skill in delivering remote services, and confidentiality and safety concerns with remote services given perpetrators' potential proximity and digital abuse. Strengths/benefits included increased access to services, efficiency in services, reduced cost, and digital communication feeling more comfortable and/or anonymous. Further, there is some indication that clients may equally satisfied and/or more satisfied with technology-facilitated services, although providers may be less satisfied with these service options (e.g., Pedersen et al., 2023; Santamarina et al., 2023).

Existing studies provide valuable insights on experiences with remote and hybrid victim service delivery. However, the vast majority of what we know about virtual victim services - especially during COVID-19 - stems from the perspectives of DV and SA service *providers*, not other VSPs, and not service *users* (i.e., crime victims). Additionally, there have been few evaluation studies that examine outcomes for victims who use or professionals who deliver remote/technology-based victim services and/or the effectiveness of various forms of technology-enhanced or remote service delivery. Expanding research to other types of crime VSPs, crime victims/clients, and enhancing evaluation efforts are important next steps. Finally, while other facets of criminal justice and social services have developed research in the context of human resource management, this has not yet been a focus of hybrid and remote victim service provision research. Research in this vein may be beneficial in terms of enhancing staff retention, reducing burnout, and addressing safety.

In addition to the limitations of existing research, limitations to the current review include that the search – while robust – may not have identified all relevant articles, including those not published in English and/or not captured by our search terms. Although we feel it is important to examine victim services distinct from related, and at times overlapping, services (e.g., healthcare services) there may be relevant findings in a broader literature that contextualize benefits and challenges of remote crime victim services.

5. Conclusions

In conclusion, there is a need for continued and robust research on RHW in victim services. There are common themes across the 27 studies identified in this review. Having flexible service options provides choice, accessibility, and accommodation to crime victims. Some populations may benefit more from remote/virtual services than others, and there may also be differences between providers and clients in terms of their comfort with remote service options. Just as victim safety is a critical concern in offering in-person services, it is also a concern in the offering of virtual services. For providers, there is a need for training in effective online service delivery. Critical to the success of remote services is the infrastructure to make it possible: hardware, digital literacy, broadband internet access, and technological security and support. Remote and hybrid service options have the potential to expand the reach of victim service work, and as technology continues to evolve so too will avenues for meeting the needs of crime victims and supporting those who work with them.

Track 16: Smart Cities for Social Cohesion

Track Description

In the era of cities and under the UN 2030 Agenda for sustainable growth, cities aim to secure social sustainability and coherence (e.g., deal with affordable energy, poverty, hunger, equal opportunities in education, jobs, and health, etc.) and enhance their performance to become friendlier and able to host their increasing populations. Additionally, new types of businesses emerge, while the coexistence of autonomous things and people poses another challenge that cities are beginning to phase out. Smart Cities are enablers of smart growth, social cohesion, and industrial transformation by adopting cutting-edge technologies (e.g., IoT, AI, Blockchain). The goals of smart cities are to generate opportunities that engage, upskill, and enhance equity in their communities. This track aimed to gather research and practices on smart cities' development strategies, policy models, citizen engagement, and technological innovations, and on the Smart and Inclusive Cities, emphasizing participation, access to technology, and the ability of citizens and the community to keep on functioning and prospering despite the challenges that they can face (i.e., inequity, poverty, violence, environmental threats, etc.).

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 21 May 2025

Abstract. It is estimated that the metaverse has the potential to affect peoples' and communities' lives. As an integrative virtual space that offers immersive experiences to its users, the metaverse can foster virtual interactions that not only mimic but also enhance real-world social activities and relations. With its ability to narrow or eliminate physical boundaries, the metaverse presents potential opportunities for enhancing social cohesion in diverse communities. Social cohesion - characterized by a sense of belonging, mutual trust, and collaboration - plays a vital role in connecting community members. This article provides a systematic review of existing literature on the metaverse's implications, to explore its potential to promote social connections and inclusivity in communities, both essential elements of social cohesion. The study reviews articles sourced from the scientific repositories ScienceDirect, Web of Science, Google Scholar, and Scopus. The results show that the metaverse has the potential to bridge economic, social, and cultural gaps by facilitating social interactions, broadening access to education, fostering engagement as well as by creating new economic opportunities. These advancements can encourage a sense of unity and belonging, especially in the context of smart cities, where innovation and community building come together.

Research paper, DOI: https://doi.org/10.59490/dgo.2025.983

1. Introduction

The metaverse is rapidly emerging as a transformative digital space with the potential to impact various aspects of individuals' lives. The metaverse has been recently defined as "an integrative ecosystem of virtual worlds offering immersive experiences to users, that modify pre-existing and create new value from economic, environmental, social and cultural perspectives" (ITU, 2023). This definition outlines the metaverse's potential to reshape the relationships between people as well as societies within physical and virtual spaces. Given its potential to shape daily life significantly, a thorough examination of its implications is essential. However, it is important to especially focus on the impact of the metaverse on communities and more specifically, to examine whether the metaverse can contribute towards social integration. Social cohesion, defined as *"the capacity of a society to ensure the well-being of all its members, minimizing disparities and avoiding marginalization, while fostering a sense of belonging, trust, and shared values among its members"* (Council of Europe, 2005), is vital for thriving communities. This article explores the relation between the metaverse and social cohesion within cities and communities. Addressing this issue is challenging, since the metaverse seems to have begun to transform from a science fiction concept into a tangible reality enabled by advances in technologies (Lee et al., 2021), reshaping human interactions and redefining the way communities are formed.

This transformative potential extends to urban context in the form of the "CitiVerse", an urban application of the

metaverse. Metaverse in cities -the so-called CitiVerse- (ITU, 2024) can be catalysed by the existence of installed Information and Communications Technologies (ICT), and more importantly by emerging ones like Digital Twining and Artificial Intelligence (AI), which are both targeted by smart cities. According to Anthopoulos (2017) and Díaz-Díaz et al. (2017), a smart city can be seen as an ICT-based urban innovation that aims to address challenges that cities face, such as efficiency, quality of life, and sustainability. Being such an urban innovation, smart cities generate public value and drive social cohesion, integrating technological progress with community needs. Furthermore, Camboim et al. (2019) refer to the smart city as an ecosystem of urban innovation, while Appio et al. (2019) identify it as a collaborative ecosystem that fosters innovation and establishes relationships between its stakeholders (citizens, government, businesses).

The existing literature on smart cities and digital transformation mainly explores the role of emerging technologies such as Internet of Things (IoT), AI and Blockchain in enhancing urban efficiency and governance (Anthopoulos, 2017). However, there is a notable gap in research concerning how the metaverse can contribute to social cohesion within smart cities. This research contributes to bridging this gap by examining the role of the metaverse in promoting social cohesion through its integration in urban ecosystems. The remainder of this article includes the following: Section 2 discusses the theoretical background of this article, and in particular the concepts of smart city, metaverse, CitiVerse, and social cohesion. Section 3 contains the systematic literature review methodology that was followed, while Section 4 outlines the systematic review results. Finally, Section 5 focuses on the implications of the metaverse related to social cohesion, and Section 6 contains the conclusions of the article.

2. Background

This section outlines the theoretical background relevant to the subject of this article. Firstly, it explores the smart city concept, emphasizing the use of ICT to enhance efficiency, sustainability, and quality of life. Following, the evolving concept of the metaverse as well as its integration into real-world cities, the so-called CitiVerse are presented. To conclude, this section discusses the key factors of social cohesion.

2.1 Smart City

Trying to find a single, comprehensive definition of "smart city" is not entirely feasible as there are several different approaches to this concept. They range from ICT-based cities to smart resource management, to mobilizing partnerships between different stakeholders using ICT, to cities that apply new technologies to innovate, or even cities that innovate politically and managerially (Anthopoulos, 2017).

According to Díaz-Díaz et al. (2017), the term "smart city" refers to urban innovation where, mainly through the use of ICT and innovation, challenges of modern cities, such as efficiency, quality of life, climate change, and sustainability are addressed. In a smart city ecosystem, technology, infrastructure, data, services, stakeholders, the physical environment, and governance are interconnected (Anthopoulos, 2017), which consequently conveys that a smart city is characterized by connectivity, sustainability, security, and technology (Grossi & Trunova, 2021). Moreover, Barrutia et al. (2022) describe a smart city as one that aspires to become smarter by prioritizing efficiency, equity, and sustainability. They also argue that a pivotal attribute of smart city's intelligence lies in the comprehension of citizens' expectations and the subsequent satisfaction. Various stakeholders interact, transferring knowledge and creating shared value, in a participatory and flexible governance that invests in digital infrastructure (Camboim et al., 2019; Cosgrave et al., 2014).

Furthermore, according to Bibri et al. (2022), the most prominent digital processes supporting data-driven smart cities are digital instrumentation, digital hyper-connectivity, datafication, algorithmization, and platformization. Digital infrastructure of the smart city produces enormous volumes of data from devices like IoT sensors, enabling real-time analysis and city governance. Hyper-connectivity based on technological advancements like IoT and 5G connects systems, devices, and individuals, organizing smart cities. Additionally, datafication in smart cities, driven by digital hyper-connectivity, has enabled algorithmization and platformization. Datafication turns social activities into quantifiable data that can be tracked in real-time and analysed through AI algorithms. Algorithmization converts urban activities into structured instructions for AI and big data systems, enabling smart cities to make data-driven decisions based on predictive analysis. Digital platforms, which combine technology with organizational structures, are expanding in governance, economy, and services, and are inducing a shift in social, political, and economic practices. These platforms enable citizen participation, and permit public-private partnerships. The metaverse, driven by data and platformization, is impacting urban life by integrating digital technologies into smart city infrastructure. As such, the metaverse is perceived as a central force in shaping the future of urban life, presenting new forms of digital governance and infrastructure.

2.2 Metaverse

The concept of the metaverse has its roots in science fiction, first coined in 1992 by the author Neal Stephenson in his novel "Snow Crash" (Stephenson, 1992). In this book, Neal Stephenson described a virtual world where users,

represented by avatars - digital representations of people's physical identities - could interact with each other in an immersive virtual environment. The last decades, the metaverse has evolved from a science fiction concept into a reality, due to the advancements in digital technologies like the IoT, Digital Twins, Augmented Reality (AR), Virtual Reality (VR), AI, and Blockchain (Lee et al., 2021). Various virtual spaces have already been developed, such as Second Life (https://secondlife.com/) and later Decentraland (https://decentraland.org/), both of which allow users to create, socialize, and trade within shared digital spaces.

With the ongoing technological developments, the metaverse possesses the ability to significantly change the way people work, socialize, learn and entertain themselves. Kontogianni and Anthopoulos (2024) are considering whether the metaverse can affect people's lives by generating value. They conclude that it offers several opportunities for economic, public, and social value generation. The metaverse holds economic value for both industry and consumers. Moreover, public benefits focus on citizen empowerment and improved government efficiency, while socially, the metaverse promotes employment growth and provides immersive experiences in areas like entertainment and education.

The metaverse can further benefit smart cities as it holds the potential for the overall transformation and maintenance of the smart city environment by seamlessly integrating the digital and physical worlds while keeping people at the centre of its operational framework. The smart city concept can be augmented through the implementation of an interconnected city's representation approach, endowing users and residents with the capacity to be actively involved in the strategic planning processes, generating new value for cities through the concept of increased public participation (ITU, 2023b), thus bonding the community. Yaqoob et al. (2023) emphasize the metaverse's transformative role in smart cities, detailing its key advantages for various smart city applications. One major benefit is enhanced teamwork and collaboration, as the metaverse enables real-time communication, skill development, and AI-led innovation across diverse disciplines. Additionally, training and testing processes, particularly in fields like medicine, can be improved through the use of extended reality (XR) technologies by providing realistic simulations. They also argue that the metaverse creates new business opportunities through virtual retail, and trading, expanding the digital economy within smart cities. Moreover, the use of digital twins further enables urban planning and infrastructure management by replicating real-world objects with real-time data. Social connections enabled in the metaverse strengthens human connections by overcoming geographical and accessibility challenges, offering immersive experiences for community building. Furthermore, the metaverse redefines entertainment experiences, through virtual events and metaverse tourism, making cultural and entertaining activities more accessible. Lastly, they highlight metaverse's contribution to environmental sustainability in smart cities by replacing physical transportation with virtual experiences, which can significantly lower energy use and carbon emissions.

2.3 CitiVerse

The term "CitiVerse" is a compound word derived from the combination of the terms "cities" and "metaverse". CitiVerse can be understood as the integration of the metaverse into real-world cities, facilitating the interaction between tangible and intangible entities of the physical world within a city's envisioned digital framework. Although the term CitiVerse has not yet been scientifically defined, the International Telecommunications Union (ITU) proposes that CitiVerse can be perceived as an *"interconnected and distributed hybrid and virtual worlds representing, and synchronized with, their physical city and community counterparts to offer new and improved capabilities to cities and communities"* (ITU, 2024). The concept of CitiVerse delineates a particular physical expanse, constrained by the geographical and/or administrative parameters of a physical city. According to Zhao et al. (2022), by applying metaverse in cities, it is feasible to provide functional services through simulation, prediction, and optimization while maintaining an accurate depiction of the physical components of the urban environment. Users can have a highly realistic experience of the city by immersing themselves in this virtual world, exploring the city, and interacting with its infrastructure and its simulated population.

The CitiVerse, as proposed by NCP Flanders (2023), has the potential to influence various urban sectors including energy, transportation, water supply, waste management, and education by leveraging technologies such as IoT, AI, Digital Twin, and Blockchain. It can enhance the interactivity and responsiveness of cities, and address the challenges presented by aging infrastructure and population growth, optimizing the utilization of existing resources. The integration of the CitiVerse concept will contribute towards the creation of urban spaces that promote interactivity and inclusivity which helps in social bonding.

Furthermore, Vanderhorst, Heesom, and Yenneti (2024) introduce the concept of a "Meta Smart Twin City" which integrates digital twins methodology, smart urban environments, and blockchain technology in order to create more sustainable, efficient, and intelligent urban environments. Digital twins -virtual replicas of physical entities- enable real-time monitoring and simulation. When applied to urban environments, they enable improved planning, management, and operational efficiency. The use of blockchain technology ensures secure and transparent data transactions, further enhancing the reliability of digital infrastructures. The authors also present a comprehensive framework for integrating these technologies into the physical world, emphasizing the use of IoT devices, reality capture tools, immersive technologies like VR and AR, and AI to optimize urban management. While these

innovations offer significant potential, the authors highlight the ethical, social, and technical challenges that must be addressed to ensure their long-term effectiveness.

Some cities have already announced their intention to develop their own CitiVerses, which will meet the needs of their citizens. One of them is the city of Seoul which has initiated the process of developing a CitiVerse, referred to as "Metaverse Seoul" (Seoul Metropolitan Government, 2023). Metaverse Seoul aims to provide urban services and improve current ones by acting as a virtual duplicate of the city. Within the Metaverse Seoul framework, there will be virtual administrative offices specializing in services regarding education, culture, and tourism, and simultaneously, users will be able to digitally simulate visits to diverse tourist landmarks such as Seoul City Hall, Seoul Plaza, Blue House, Gwanghwamun Square, and the Bukchon Hanok Village, among others. Apart from the city of Seoul, the "Dubai International Financial Centre Metaverse Platform" constitutes a part of the Dubai Metaverse Strategy, which was launched in July 2022, pursuant to the objective of furnishing an enriched customer experience to its inhabitants, notably within the spheres of tourism, education, public services, retail, and real estate (UAE Government, 2023).

2.4 Social Cohesion

The study of social cohesion began in the late 1800s and has been examined by many academic fields, including sociology, mental health, and public health (Fonseca et al., 2019). As Bruhn (2009) pointed out, social cohesion is a complicated social construct, given the diverse geographical locations, the political representatives, and the economic systems of human societies around the world. That is why we meet many definitions of this concept. Starting from 1897, Durkheim defines social cohesion as *"the characteristic of society that shows the interdependence in between individuals of that society"* (Durkheim, 1897) reaching to 2013 that Parsons (2013) views social cohesion as a degree of stability and order that is derived from common norms and values. As noted by Fonseca et al. (2019), social cohesion can be comprehensively understood by examining it across three different levels, each contributing to the complexity of the concept. These levels include the level of the Community, the level of the Individual, and the level of the Institutions, influencing each other. Cohesion emerges at the intersection of the three identified levels. The relationship between the three levels and the components of each level are addressed by the framework they created to describe social cohesion, based on the literature. The developed framework presents possible factors that are relevant to social cohesion per level, in an indicative manner. According to this framework, at the level of the Community, the main factors include the social environment, the relationships and the ties, and the performance and the common objectives of the community. At the level of the Individual, self-motivation, perceptions, norms and values, and participation and performance are indicated as primary factors, while at the level of the Institutions the mentioned factors are the conflict management and the decision making, the human rights, and the environment.

Furthermore, the purpose of Schiefer and van der Noll (2017) was to examine the literature on social cohesion to identify its core elements. They identified six key dimensions of social cohesion: social relations, identification, orientation towards the common good, shared values, equality/inequality, and subjective/objective quality of life. Proposing that (in)equality, quality of life, and shared values are better understood as outcomes of social cohesion rather than core components, they define social cohesion as *"a descriptive, multifaceted and gradual phenomenon attributed to a collective, indicating the quality of collective togetherness"*.

3. Methodology

The systematic literature review, as a research methodology, gives rise to the identification, evaluation, and interpretation of all relevant studies concerning a specific research question or concept. All studies considered in a systematic literature review are referred to as primary studies, whereas a systematic review is considered as secondary. Its importance lies in the fact that it synthesizes the existing study equitably (Kitchenham, 2004). This method was applied to identify the implications of the metaverse. Preliminary research in scientific repositories Google Scholar, Scopus, Science Direct, and Web of Science concerning the metaverse's implications was conducted to gather data on the metaverse's implications, with the numerical findings presented in Table 1.

Tab. 1 - Literature findings (August 2024).

Sources	Results
Scopus	7
ScienceDirect	9
Web of Science	3
Google Scholar	104

As the number of the studies reach 123, it was considered necessary to apply a systematic methodology to delimit the results. The methodology used, follows the guidelines mentioned by Kitchenham in her paper "Procedures for performing systematic reviews" (Kitchenham, 2004) which help to opt for quality studies. This approach was selected as it follows a standard protocol that develops in three phases, with the following particular stages (Figure 1):

Phase 1 – Planning the review: Includes the identification of the need for a review and the development of a review protocol.

Phase 2 – Conducting the review: Includes the implementation of the review protocol.

Phase 3 – Reporting the review: Includes the presentation of the results.

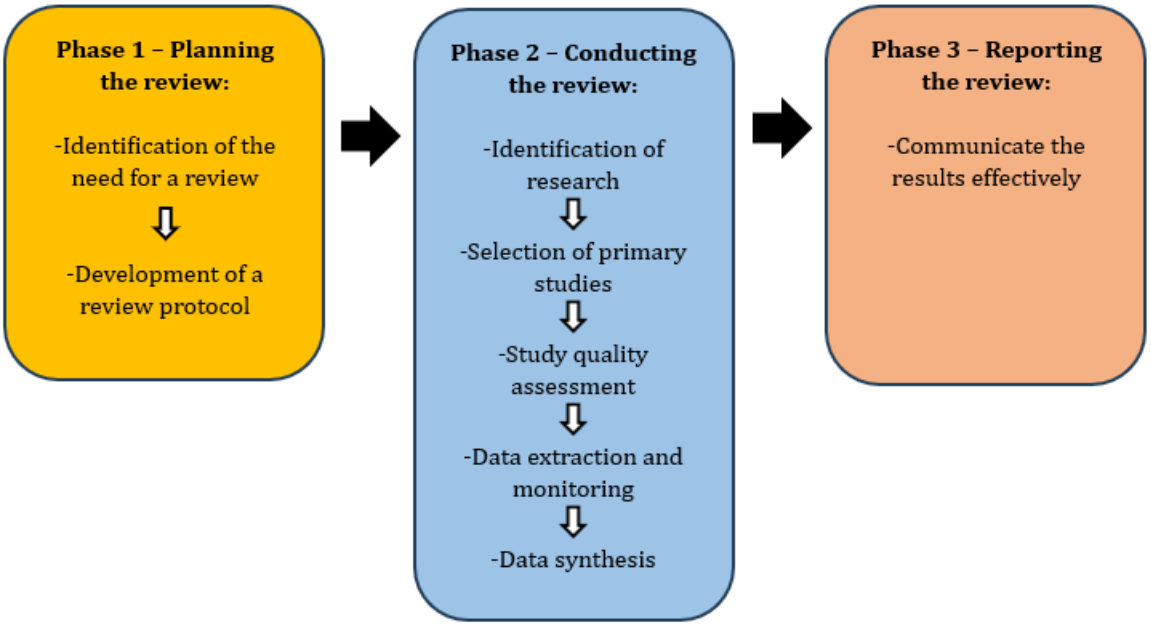

Fig. 1 - A systematic review into three main phases.

Phase 1. In the existing literature, numerous articles examine the implications of the metaverse. However, most of them focus on specific sectors, and there is a lack of studies that unify the overall findings on the metaverse. Hence, the need for a systematic review is deemed imperative. Furthermore, examining the implications of the metaverse will provide insights into its impact on cities and communities. In order to carry out the systematic literature review, a review protocol, which is described in Phase 2, was defined. The protocol includes elements such as the research questions, the search strategy for primary studies, the criteria for inclusion and exclusion of studies, the quality control criteria, and the data extraction strategy.

Phase 2. The research question that the review is intended to answer was defined. As the implications of the metaverse need to be studied, it is important to identify which sectors seem to be affected by the metaverse according to the findings so far. As such, the research question that emerges is "Which sectors are affected by the metaverse based on current findings?"

The search strategy included an automated search in digital libraries, which was conducted in August 2024. The selected digital resources included Google Scholar, Scopus, Science Direct, and Web of Science. The search term used was “metaverse implications” applied to the title, abstract, and keywords of the articles. Following, inclusion and exclusion criteria for primary studies were defined and applied, in order to evaluate the gathered articles and to determine which of them will be included. The inclusion and exclusion criteria used were as follows:

Inclusion criteria:

- Articles published in journals and conference proceedings.
- Articles discussing the metaverse’s implications.

Exclusion criteria:

- Articles referring to the metaverse in general, without reflecting any implications.
- Articles written in languages other than English.

Apart from the primary article selection criteria mentioned above, it is equally important to assess the quality of the final sample of studies in order to produce more detailed article selection criteria and to weigh the importance of the results of each study, which will be requisite subsequently in the synthesis of the results. The criteria for quality assessment in the review process included:

- the clarity and documentation of the terms, methods, and results cited in the article,
- the accessibility of the data used (i.e. providing organizations, DOI),
- the detailed description of the methodology followed, and
- the comprehensive presentation of the results.

The search conducted using the term "metaverse implications" initially returned 7 articles from Scopus, 9 from ScienceDirect, 3 from Web of Science, and 104 from Google Scholar (Table 1). The Inclusion criterion 1 resulted in a subset of 89 articles, 78 of which were journal articles and 11 were conference articles. After studying the remaining articles, 69 more were excluded based on the inclusion/exclusion and the quality assessment criteria. Consequently, the number of articles was limited to 20, comprising 6 articles from Scopus, 7 articles from Science Direct, 3 articles from Web of Science, and 4 articles from Google Scholar. Finally, after the removal of duplicate articles, the final sample consisted of 16 unique articles (Figure 2).

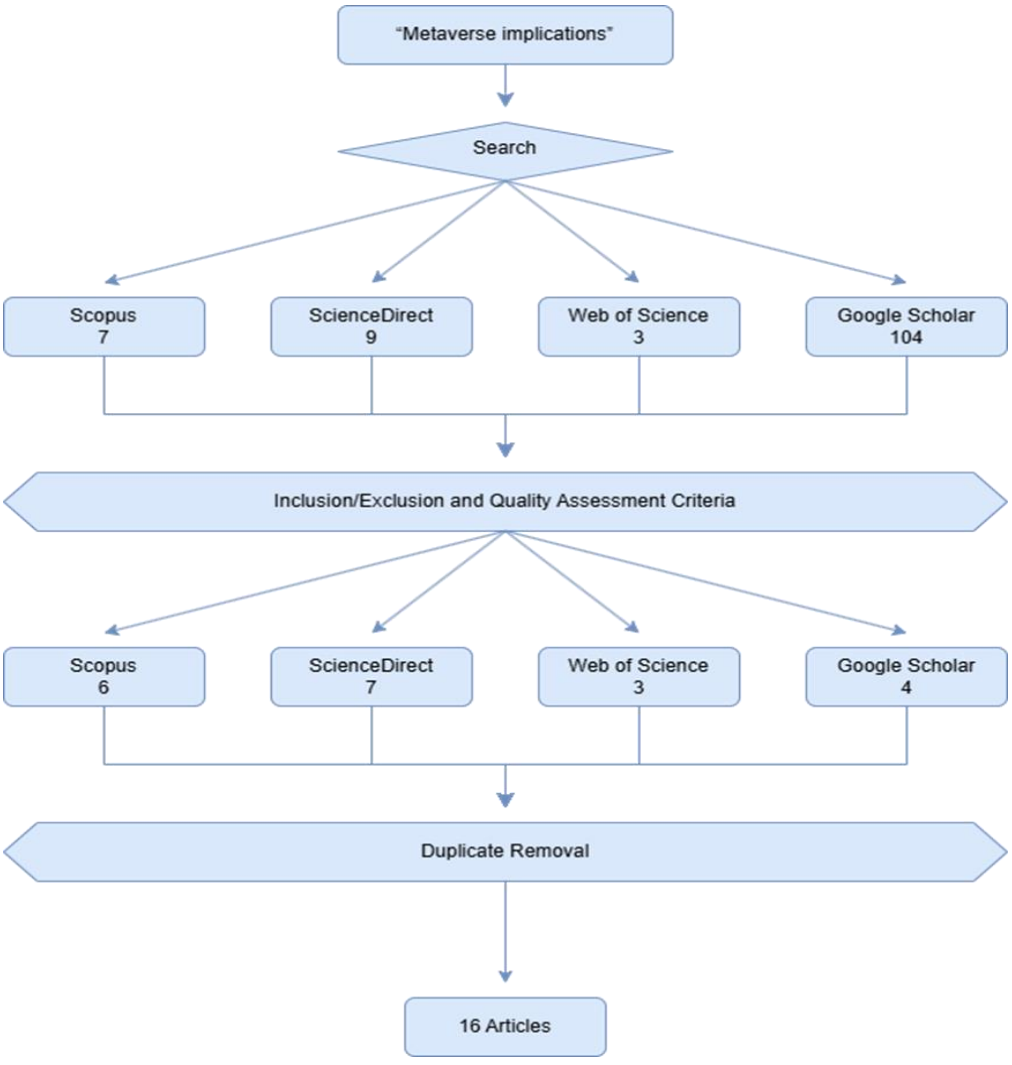

Fig. 2 - Selection process of the final sample of the review articles.

To complete the second phase, the final sample of 16 articles was studied in detail and analysed. Key insights regarding the implications of the metaverse were meticulously extracted from each article and subsequently organized according to the sector they addressed. Upon completing this initial categorization for every article, broader thematic categories were synthesized to enhance the clarity and coherence of the results' presentation. This structured approach ensured a comprehensive understanding of the metaverse's implications in different areas.

Phase 3. This phase involves the comprehensive presentation and critical evaluation of the findings from the systematic review. A coherent presentation, which facilitates an in-depth understanding of the main implications of the metaverse is presented in Section 4.

4. Systematic Review Results

This section describes the findings of the research and is organized in two subsections. Section 4.1 outlines the initial sample of articles, while section 4.2 provides a summary of the results from the analysed articles.

4.1 Quantitative Analysis

The number of studies examining the implications of the metaverse up to August 2024 are presented in Table 1. The search returned in total 123 articles, 7 from Scopus, 9 from ScienceDirect, 3 from Web of Science, and 104 from Google Scholar.

Furthermore, Figure 3 illustrates the distribution of different types of these publications. Journal articles constitute the majority, representing 63% of the total. Book chapters constitute 13% of the publications, while conference papers represent the smallest proportion at 9%. The remaining 15% (other) includes final theses, dissertations, call for papers, etc. Additionally, Figure 4 illustrates the number of publications for the search term "metaverse implications" per digital library. The majority of studies come from Google Scholar (85%), followed by ScienceDirect (7%), Scopus (6%), and Web of Science (2%).

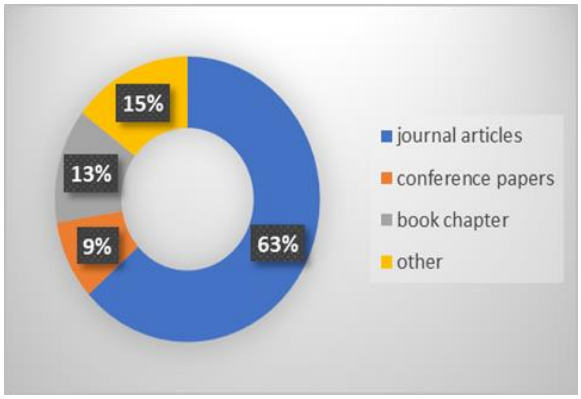

Fig. 3 - Types of publications.

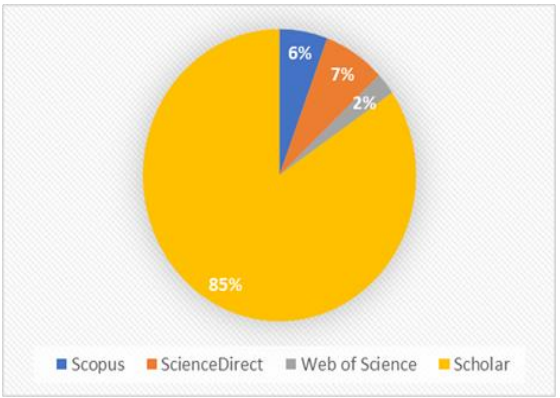

Fig. 4 - Number of publications for "Metaverse Implications" search term per digital library.

The initial study was published in 2020, the sole publication for this year. For 2021, the number of publications increased only to two. From 2022 onwards, there is an increase in the number of publications, with 14 publications recorded for that year, followed by a significant increase to 62 publications for 2023. By August 2024, 44 publications had been documented for that year (Figure 5).

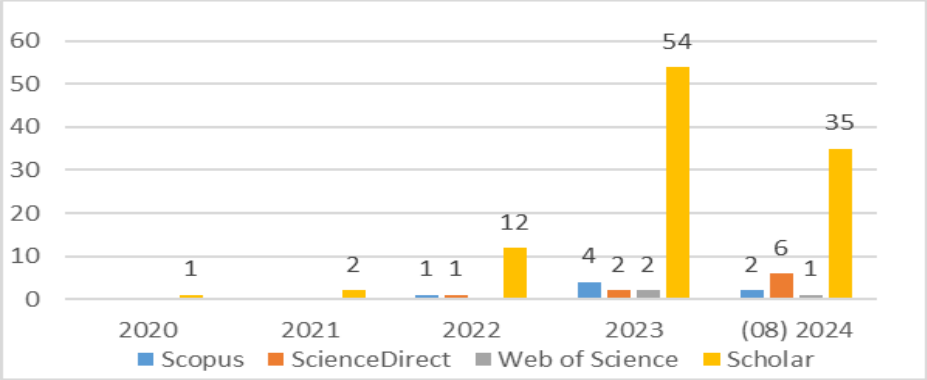

Fig. 5 - Number of publications per year and per digital library.

Figures 3, 4, and 5 present key statistical insights on the implications of the metaverse. Especially Figure 5 highlights the growing academic interest in the impact of metaverse, showing a notable rise in publications over time. This trend reflects an increasing focus on understanding the metaverse's role in digital transformation, indicating its emerging importance in shaping the digital future.

4.2 Qualitative Analysis

Using Kitchenham's methodology, the authors analysed a total of 16 articles from the original sample. Each article was systematically studied to identify all the implications of the metaverse discussed within. In response to the research question, the identified implications were categorized based on the sectors they pertain to. Subsequently, all identified implications were grouped by relevance into broader categories, encompassing all sectors referenced in the 16 articles examined.

Trying to provide a systematic analysis of the articles reviewed, the Table 2 was structured. The first column of this table introduces the broader categories that were defined, which serve as general themes that encompass the subcategories identified in the second column. In the third column, the associated references are listed.

The broader categories that were created are: Economic and Business Implications, Educational and Skill Development, Environmental and Sustainability Impacts, Healthcare and Well-being, Industry Implications, Security and Privacy Concerns, Social and Ethical Implications, and Technological and Innovation Impacts. The "Economic and Business Implications" category includes economic impacts (Metz & Gurău, 2023; Dwivedi et al., 2023; Dwivedi et al., 2022), business-oriented impacts (Schmitt, 2023; Jung et al., 2024; Lim et al., 2024; Dwivedi et al., 2022), marketing strategies (Bilgihan et al., 2024; Lim et al., 2024), and brand development (Bilgihan et al., 2024). The category of "Educational and Skill Development" covers the metaverse's potential in enhancing education and training (Salvetti, 2023; Jung et al., 2024; Pellegrino et al., 2023; Dwivedi et al., 2022; Pentangelo et al., 2024; Al-kfairy et al., 2024; Han et al., 2023), and opportunities for content creators (Bilgihan et al., 2024), while the "Environmental and Sustainability Impacts" category covers the environmental consequences (Pellegrino et al., 2023), urban ecosystem implications (Pellegrino et al., 2023), and sustainability issues (Pellegrino et al., 2023; Dwivedi et al., 2022). The "Healthcare and Well-being" category embraces the metaverse's role in healthcare (Jung et al., 2024; Al-kfairy et al., 2024), in mental health support (Din & Almogren, 2023), and overall well-being (Dwivedi et al., 2022; Din & Almogren, 2023). Furthermore, the "Industry Implications" category includes impacts on various sectors, such as the military (Metz & Gurău, 2023), hospitality (Jung et al., 2024; Dwivedi et al., 2022), retail (Dwivedi et al., 2022), tourism (Jung et al., 2024; Dwivedi et al., 2022; Din & Almogren, 2023; Suanpang et al., 2022; Baker et al., 2023), and the fashion industry (Donvito et al., 2024). The "Security and Privacy Concerns" category consists of issues like data protection (Jung et al., 2024), privacy (Bilgihan et al., 2024; Dwivedi et al., 2022; Al-kfairy et al., 2024), security ((Metz & Gurău, 2023; Dwivedi et al., 2023; Schmitt, 2023; Jung et al., 2024; Dwivedi et al., 2022), misinformation (Dwivedi et al., 2023), and legal challenges (Metz & Gurău, 2023; Dwivedi et al., 2023). The "Social and Ethical Implications" category involves social and political attitudes (Dwivedi et al., 2023; Schmitt, 2023; Pellegrino et al., 2023; Lim et al., 2024; Dwivedi et al., 2022; Al-kfairy et al., 2024; Din & Almogren, 2023), ethical considerations (Dwivedi et al., 2023; Schmitt, 2023; Bilgihan et al., 2024; Pellegrino et al., 2023; Lim et al., 2024; Al-kfairy et al., 2024), and the impact on users (Al-kfairy et al., 2024), on consumers (Bilgihan et al., 2024; Lim et al., 2024; Dwivedi et al., 2022), and on vulnerable populations (Dwivedi et al., 2023; Din & Almogren, 2023). Lastly, the "Technological and Innovation Impacts" category incorporates technological advancements (Bilgihan et al., 2024; Dwivedi et al., 2022), and innovation (Lim et al., 2024; Dwivedi et al., 2022). These categories provide a structured framework for a comprehensive exploration of the areas affected by the application of the metaverse, as discussed in the articles studied.

The analysis highlights the impact of the metaverse on key sectors such as business, security, education, society, technology, environment, healthcare, and various industries. Moreover, it underlines the metaverse's transformative potential to reshape economies, redefine social interactions, drive technological innovation, and create new opportunities while also presenting challenges that should be addressed.

5. Discussion: Metaverse and Social Cohesion

The systematic literature review first highlighted the quantity and types of studies examining the implications of the metaverse. Subsequently, this article pointed out the areas affected by the metaverse as indicated in the analysed articles. Further delving into these areas and examining them more closely reveals that the metaverse can significantly promote social cohesion within the smart city context.

Primarily, the metaverse can transform education by creating virtual environments that foster inclusivity, accessibility, and collaboration. By bridging physical and cultural gaps, the metaverse allows students from different socio-economic and geographical backgrounds to interact and collaborate, reducing barriers to education and communication (Pentangelo et al., 2024). Students from developed or developing regions, with many or few resources for education, can participate equally in these learning environments, bridging therefore educational inequalities. Moreover, the immersive nature of metaverse technologies enables students to engage in social interactions that resemble real-world experiences, fostering a sense of community and belonging (Lim et al., 2024). Immersive technologies (like VR and AR) offer new ways to engage students and improve learning outcomes (Al-kfairy et al., 2024). The metaverse facilitates personalized learning experiences, enhances communication and collaboration, and introduces new ways of teaching and learning, by enabling students to not only hear about concepts but to immerse themselves in the learning experiences (Pellegrino et al., 2023). Additionally, the integration of AI, Blockchain, and immersive tools within educational environments ensures security, and transparency for all users, further enhancing social integration (Han et al., 2023). This inclusiveness promotes social cohesion by creating equal opportunities for education and by promoting interaction and collaboration among students. Such educational and collaborative environments can help bridge divides and build cohesive, well-integrated communities that value diversity and mutual support.

Furthermore, healthcare can become a medium for promoting social connections and mental health. In a metaverse environment, healthcare can extend beyond traditional medical treatment. Virtual healthcare environments offer personalized healthcare services for vulnerable groups such as the elderly and people with disabilities, reducing social isolation and promoting a sense of community engagement (Din & Almogren, 2023). The integration of technologies like XR can enhance patient care, revolutionize surgical practices, and elevate the education and training of medical professionals. By combining XR with traditional treatments, such as those for post-traumatic stress disorder, anxiety and fear conditions, and pain management, the metaverse can offer an individualized, cost-effective alternative to conventional treatments (Jung et al., 2024). Additionally, by creating supportive spaces where patients can communicate with healthcare professionals, the metaverse can reduce waiting times, relieve pressure on healthcare systems, and create safe, anonymous environments where patients can comfortably share their concerns (Jung et al., 2024). Thus, the metaverse can contribute to mental wellbeing, a key component for building connected urban communities. However, challenges such as data privacy and potential addiction to such virtual environments may arise from the use of metaverse (Jung et al., 2024).

In addition, virtual marketplaces, created by the metaverse, can provide equal access to economic opportunities by connecting people across several economic layers (Dwivedi et al., 2022). By facilitating global transactions and offering new models of remote work, the metaverse can integrate emerging and frontier economies into the broader digital economy, fostering economic inclusion (Schmitt, 2023). Moreover, the metaverse's capabilities for global collaboration and virtual workspaces enhance productivity and connect people globally. By creating a global network, geographical barriers are broken down and a sense of common purpose and inclusivity among the various participants is promoted (Schmitt, 2023). This inclusivity not only promotes economic growth but also promotes social cohesion by ensuring that no community is left behind. Similarly, the integration of metaverse technologies in smart cities can enhance these benefits by enabling digital infrastructure, promoting economic growth and improving urban quality of life. As smart cities utilize advanced technologies such as IoT and AI to optimise urban services, the metaverse can also help by offering immersive platforms for collaboration, virtual commerce and innovative urban planning.

Along with these, the metaverse's immersive nature can redefine social interactions and enhance a sense of belonging. Virtual spaces provide opportunities for individuals to engage with others, which can reduce loneliness and promote cultural exchanges (Din & Almogren, 2023). Additionally, the metaverse supports the hosting of events and social activities that reinforce common values and mutual trust. Especially in the context of smart cities, which prioritize the integration of technology and sustainability, the metaverse can promote the development of interactive spaces where citizens can participate in a variety of activities. As a result, the integration of metaverse in smart cities can strengthen social bonds and community networks, promoting citizens' interactions and engagement. However, challenges such as the potential for unethical behaviour must be addressed through robust governance and ethical guidelines (Dwivedi et al., 2022; Al-kfairy et al., 2024).

Additionally, as sustainability aligns seamlessly with the principles of smart cities, the metaverse can contribute in several ways to this effort. By promoting virtual tourism, the metaverse holds the potential to reduce the environmental impact of physical travel, and thereby fostering a sense of shared responsibility among citizens (Suanpang et al., 2022). Other than virtual tourism, the metaverse can also reduce the need for physical mobility by facilitating activities such as work, education, and entertainment in virtual spaces. By creating shared virtual environments within smart cities, citizens can collaborate, learn, and engage in several activities, fostering a sense of community and inclusivity with less environmental impact. Moreover, the metaverse can positively impact urban ecosystems involving citizens in city planning and decision-making. Citizen participation ensures that urban development serves all groups of citizens equally. Such initiatives in smart cities can support social cohesion by promoting transparency, participation and inclusiveness while utilizing advanced digital technologies.

While the potential benefits are promising, the role of the metaverse in promoting social cohesion requires addressing significant challenges. These include ensuring digital equality to prevent the exclusion of less privileged groups, implementing effective governance to address issues such as cyberbullying, hate speech and unethical behaviour, and protecting privacy (Dwivedi et al., 2023; Dwivedi et al., 2022).

In conclusion, in the smart city context, the metaverse can be a catalyst for strengthening social cohesion, by bringing people together regardless of physical, cultural, and economic differences. It offers innovation in education, new ways of communication, new models for healthcare, and opportunities for economic growth, promoting inclusivity and social well-being. However, to fully realize these benefits, it is necessary to implement safeguards that promote ethical use, protect privacy and ensure equal access for all. Careful integration of the metaverse in the context of smart cities can, thus, pave the way for more cohesive, inclusive and connected communities.

6. Conclusions

This article attempted to highlight the role of the metaverse in promoting social cohesion, especially in the smart

city context. As the metaverse is increasingly becoming a part of people's lives, it is of high interest to explore its impact on both individuals and communities.

In this paper a systematic literature review was conducted to explore the existing literature on the metaverse's implications on people. The outcomes were utilized to identify how social cohesion, especially within cities and communities is associated with them.

The review has extracted some useful findings: the metaverse can offer significant opportunities to promote social cohesion, in particular in the context of smart cities. By improving education, expanding access to healthcare, promoting economic participation and facilitating social interaction, the metaverse can create more connected and inclusive communities. As a result, people from all social backgrounds can participate, collaborate and thrive together. In an era when cities are digitally transformed, the metaverse has the potential to bring community members closer together by enhancing social interactions and connections, encouraging civic engagement and participation, and developing a sense of social belonging – all essential components of social cohesion. However, challenges such as the digital divide, security and privacy concerns and ethical behaviour in virtual spaces need to be addressed. Effective governance, strong regulatory frameworks and collaborative efforts need to be put in place to ensure accessibility and inclusiveness of the metaverse.

From a broader perspective, the metaverse presents both promising opportunities and considerable challenges. On the one hand, it has the potential to transform the urban experience by creating immersive, accessible, and innovative spaces for education, economic growth, social interactions, and civic participation. It can serve as a tool for reducing physical barriers, enabling global connectivity, and enriching smart city experiences. On the other hand, digital exclusion, data privacy, and governance remain key issues. The rapid expansion of virtual spaces raises questions concerning equitable access, the potential for aggravating socioeconomic disparities, and the ethical considerations of digital interaction replacing real-world social relationships. Despite these challenges, the metaverse has enormous potential to promote social cohesion in smart cities. By balancing technological innovation with ethical governance and inclusive policies, smart cities can leverage the metaverse to create more inclusive, equitable and resilient urban environments.

These findings contribute to the growing discussion on digital urbanism, and the evolution of smart cities, highlighting the metaverse as a critical contributor. In addition, these insights offer guidance to policy makers, urban planners and technology developers to design metaverse-driven solutions that promote social cohesion in communities. Priority needs to be given to strategies to mitigate digital exclusion, ensure ethical use of metaverse technologies, and promote equal participation.

While this study provides valuable insights, it is subject to certain limitations. A limitation of this research is the relatively small number of articles analysed, as only a small subset met the applied inclusion criteria. Furthermore, the evolving nature of metaverse technologies, driven by continuous advancements in AI, VR, and blockchain, makes long-term predictions challenging.

Some future thoughts concern the analysis of the implications of the metaverse by sector in order to develop a more detailed framework of its impact on both people and society. Moreover, future research should explore long-term social effects of metaverse-based urban planning, incorporating qualitative approaches to understand users' experiences and perceptions. As we move forward, continued research and collaborative efforts will be essential to navigate this evolving digital landscape, ensuring that the metaverse becomes a key for strengthening the society as a whole. By addressing these research directions, future studies can contribute to a more comprehensive understanding of the role of the metaverse in promoting social cohesion within smart cities.

Abstract. Various organizations and researchers have developed Smart Cities Measurements (SCM) to monitor the advance of Smart Cities (SC) initiatives worldwide, yet there is no consensus about their impact on local governments. Local managers implement SC and SCM projects differently depending on their contexts, but few studies have analysed these measurement initiatives from local governments' perspective. To address this gap, this paper aims to identify how municipalities use SCM and adopt indicators according to local context. Data were collected by in-depth semi-structured interviews with representatives from seventeen Brazilian cities, including different regions and population sizes. The results describe how local governments adopt measurement frameworks, expanding the literature on SCM.

Keywords. Smart cities, Measurement, Context-sensitive indicators.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.984

1. Introduction

Smart Cities (SC) initiatives aim to improve people's quality of life by adopting multidimensional strategies and using digital technologies to mitigate various complex urban challenges. In this context, Smart City Measurements (SCM) have been developed to monitor and assess the implementation of such projects. The literature shows the importance of measurement in verifying the advance and progress of SC initiatives (Caird et al., 2016; Fachinelli et al., 2023; Hajek et al., 2022). Besides the ultimate goal of improving the quality of life in cities (Sharifi, 2019), being smarter can attract resources, such as investments and talent (Hajek et al., 2022). Other benefits were listed by Huovila et al. (2019), which include easy language to show the development of SC, transparency for citizens about the benefits provided by SC, and support for government decisions.

However, most SCM frameworks are designed to cover many cities, leading to the lack of context-specific indicators that allow to capture the complexity of SC initiatives (Backhouse, 2020). While SCM aim to measure progress, facilitate comparisons, and guide decision-making for local and national governments, they often fail to account for the diverse contexts, priorities, and challenges of individual cities, imposing universal models instead (Backhouse & Dhaou, 2020; Skargren, 2020). Universal measurements can also pose difficulties in understanding the local context, particularly in countries where the diversity of cities' conditions can lead to different needs and issues. In addition, local governments can also adopt different SC perspectives and dimensions. This variety of frameworks is also true for adopting SCM (Albino et al., 2015).

Besides the lack of context-sensitive indicators in measurement frameworks, an additional gap is the need to understand the use of SCM by local governments, particularly in different contexts (Albino et al., 2015; Hajek et al., 2022). Despite the increasing number of papers focusing on defining SCM (Hajek et al., 2022; Huovila et al., 2019; Sharifi, 2019, 2020), just a few studies analyze smart city indicators from the perspective of local governments and local managers (Caird et al., 2016), showing the need for more studies regarding the usefulness of SCM for cities (Sharifi, 2020).

This paper takes a unique approach by focusing on how local governments adopt and use SCM in their smart city initiatives, which leads to developing an understanding of context-sensitive measurement frameworks. To achieve this objective, data were collected by in-depth semi-structured interviews with representatives from seventeen cities in Brazil, including different regions and population sizes. The respondents were top-level managers involved or in charge of measuring indicators related to SC projects. Brazil was chosen because of the complexity and diversity of conditions among more than 5,500 municipalities, providing a fruitful environment to analyse the inclusion of SCM in monitoring SC initiatives.

The theoretical contribution relies on context-sensitive frameworks for local governments and enhances discussions on SCM and SC (Albino et al., 2015; Hajek et al., 2022; Huovila et al., 2019; Sharifi, 2019, 2020). External indicators can help local governments monitor SC projects, especially with limited resources. However, literature suggests that local managers should critically adopt SCM based on their specific contexts, choosing relevant indicators (Sharifi, 2019). Additionally, this paper can provide insights for local governments and policymakers on effectively utilizing SCM frameworks and selecting appropriate indicators for their SC initiatives.

2. Context-sensitive measurement of Smart Cities

The concept of SC focuses on improving urban quality of life through multidimensional strategies and technologies addressing challenges in areas like the environment, mobility, and housing (Albino et al., 2015; Cunha et al., 2016; Nam & Pardo, 2011). However, the lack of consensus on SC dimensions affects the creation of monitoring frameworks and indicators (Hajek et al., 2022; Sharifi, 2019, 2020).The diversity of concepts has led to multiple interpretations and numerous methods and frameworks to measure and monitor SC (Metwally et al., 2023). In this context, SCM has gained interest among SC scholars and practitioners, with different measurement approaches emerging globally (Sharifi, 2020).

SCM frameworks commonly focus on developing indicators, metrics, or standards for SC, including assessment tools, indexes and rankings (Hajek et al., 2022). Literature has been analysing the existing SCM or defining the best indicators and measurements (Sharifi, 2019), such as Bosch et al. (2017) and Huovila et al. (2019) studies. In addition, there is an increasing recognition of the need for context-specific approaches to SC initiatives, given the diverse cultural, social, political, and technological environments of cities (Albino et al., 2015; Alcaide Muñoz & Rodríguez Bolívar, 2021; Esposito et al., 2021). In this sense, Lopes (2017) and Tomor et al. (2019) emphasize how these contextual factors significantly affect SC governance.

De Oliveira et al. (2024) found that the variety of measurement frameworks reflect these contextual influences and highlight the inadequacy of a single definition for SC. Previous studies also advocate for tailored measurement approaches rather than a universal framework (Angelidou, 2014; Albino et al., 2015; Hajek et al., 2022). However, most SCM initiatives did not consider the local contextual conditions (Backhouse, 2020; Ependi et al., 2022; Patrão et al., 2020; Sharifi, 2019). Backhouse and Dhaou (2020) also highlighted that SCM frameworks reflect the priorities and concerns of their creators (whether individual researchers or organizations) and not necessarily the city's needs, and rarely reflect the nuances of the local context, making complex for cities to adopt them considering their needs and challenges (Backhouse & Dhaou, 2020; Backhouse, 2020; Giffinger et al., 2007; Patrão et al., 2020). In this sense, it is fundamental that cities understand possible applications of measurement frameworks in their realities, including adopted dimensions, purposes of measurement, and how the indicators' results impact their goals (Backhouse, 2020).

One way to guarantee the local context is to include context-sensitive indicators aligned with local goals, enabling governments to tailor their actions based on specific needs (Backhouse, 2020; Sharifi, 2019, 2020). However, there is no consensus on defining these indicators. Although many studies have highlighted the importance of context and specific conditions, they do not specify the meaning of context sensitivity or factors that contribute to contextualizing SC indicators (Fernandez-Anez et al., 2020; Hajek et al., 2022; Huovila et al., 2019; Patrão et al., 2020). An exception is Lai and Cole (2023), who argue SCM should measure and compare cities in equal conditions based on a given parameter, such as population size. They also highlighted the importance of weighting for a fair assessment, evaluating cities in a common basis characteristic. For instance, a context-sensitive measure might assign a higher weight to environmental sustainability in a city with a high pollution level. In contrast, measurements might prioritize public safety initiatives in a city with a high crime rate (Lai & Cole, 2023).

To identify the characteristics of context-sensitive frameworks, we conducted a literature review about SC and context-sensitive indicators. Our findings, summarized in Table 1, identify three macro dimensions and their characteristics associated with context-sensitive SCM. First, most authors emphasizes the importance of indicators related to local conditions, including economic, geographic, territorial, and social characteristics. The second dimension focuses on local needs, highlighting areas for local government actions to enhance quality of life, participation and collaboration with local stakeholders. The last dimension incorporates flexible methodologies, proposing different strategies to ensure proper comparability and customization for the cities.

Source: Elaborated by the authors.

Among local conditions characteristics, population size is a contextual data of cities appearing frequently to analyze SC (Desemoustier et al., 2019; Esposito et al., 2021; Wang et al., 2022). Regarding geographical characteristics, context can be related to a country (Fachinelli et al., 2023; Masik et al., 2021; Shen et al., 2018; Yadav et al., 2019), a world region (Fernandez-Anez et al., 2020; Peter et al., 2023; Marchetti et al., 2019) or smaller territories (Arief et al., 2020), such as villages, or neighborhoods (Maja et al., 2020; Visvizi & Lytras, 2018). For instance, Anand (2021), Marchetti et al. (2019), and Sharifi (2019) pointed out the lack of SCM adapted to the Global South or specific regions in the world, such as Latin America, highlighting the need for adapting or developing measurements that include their specific contexts and issues. Economic and social characteristics, such as developed or developing countries, as well as political and cultural aspects, can also be included as a contextual variable (Alcaide Muñoz & Rodríguez Bolívar, 2021). These contextual characteristics play a crucial role in shaping the governance and measurement of SC, highlighting the relevance of researching SCM according to the cities' specificities.

Another way to adhere to a context-sensitive approach is to include indicators considering local needs (Fachinelli et al., 2023; Malek et al., 2021; Miller et al., 2013; Sharifi, 2019). According to Huovila et al. (2019), a "standard indicator set should be considered as a starting point. Individual cities should thus always select and adapt indicators corresponding to their needs" (p. 150). Thus, SCM should compare cities with similar characteristics, avoiding evaluating cities together that have different needs (Sharifi, 2020). This approach can include measurements related to citizens' needs and participation as well as sectors of investments and priority areas necessary to improve people's lives, such as mobility, public safety, and housing. In this sense, Hajek et al. (2022) and Sharifi (2020) observed that most SCM did not include stakeholders participation among their indicators or in the process of measurement definition.

Some authors suggest that SCM should include a flexible methodology, for example, suggesting a combination of quantitative and qualitative approachess (Khatibi et al., 2022; Lee & Lee, 2014; Sharifi, 2020, 2019) and the inclusion of core and additional indicators (Sharifi, 2020). Methodological flexibility can also include weighting indicators to reflect their importance within an assessment scheme (Sharifi, 2020). This allows cities to differentiate indicators according to the context's importance or have an alternative to customize the SCM (Sharifi, 2020). Sharifi (2019) suggested the adoption of adjusted weights to fit different city contexts with assessment frameworks and bespoke indicators. In this sense, an example is the International Telecommunication Union's maturity model for Smart Sustainable Cities (SSC) adaptation by Przeybilovicz et al. (2020), which showed the need for customization to reflect Brazil's diverse contexts and include more context-related indicators.

While existing studies, like Caird et al. (2016), highlight the alignment of indicators with city strategy, local governments' practical use of SCM also remains underexplored. This paper specifically examines Brazilian municipalities and their implementation of SCM. Considering the need to incorporate more context-sensitive frameworks based on local conditions, needs, and methodological flexibility, this paper focuses on understanding

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

SCM adoption from the local government's perspective, leading to developing an understanding of context-sensitive frameworks. Therefore, considering this gap, this paper analyzes how Brazilian municipalities adopt such measurements in their SC initiatives.

3. Methodology

This paper is anchored in a qualitative approach through in-depth online interviews with representatives from Brazilian cities via a semi-structured protocol. This method allows for detailed exploration of context-sensitive SCM frameworks, providing insights from the data that can inform and enrich theoretical understanding (Gregor, 2006; Walsham, 1995). Based on the literature review, the interview script addressed five key topics: 1) respondent's background and involvement in SC initiatives; 2) city SC initiatives; 3) city measurement strategies; 4) SCM frameworks and local adaptations; and 5) external SCM frameworks influencing SC public policies.

In the last two decades, many SC initiatives have been implemented in Brazil (Cunha et al., 2016). The country is also characterized by 5,570 municipalities with different conditions, such as economic activities, geographic features, and population size (Ribeiro et al., 2020). It is also one of the most unequal countries in the world (Brazilian Institute of Geography and Statistics [IBGE], 2020), with significant regional and local disparities among socioeconomic indicators, such as access to education and healthcare, and people's income (Przeybilovicz et al., 2020). These inequalities pose challenges that can affect the development of SC in specific contexts. In this sense, Brazilian cities offer a rich source for understanding contextual factors that can make difficult or facilitate SC initiatives, including indicators about city characteristics in SCM frameworks.

Between December 2023 and February 2024, twenty-seven local government managers involved in SC initiatives were interviewed across 17 Brazilian cities, representing diverse socioeconomic and demographic conditions. This included cities from four of the five geographical regions and four state capitals. Population size was a key selection criterion, as this city characteristic is frequently presented in the literature as a fundamental contextual variable (Wang et al., 2022; Esposito et al., 2021; Desemoustier et al., 2019), categorizing analyzed cities into three groups: five with populations up to 100,000, eight between 100,000 and 500,000, and four with over 500,000 inhabitants. All cities had implemented SC initiatives and adopted SCM frameworks. Most respondents were top-level local managers responsible for SCM definition, implementation, or monitoring in their cities, including seven who were municipal secretaries mainly related to innovation, science and technology development, and urban planning or had positions in the mayor's office, and a deputy mayor. Interviews with information technology directors or those in similar positions were conducted in four cities. In other cases, the interviews included coordination positions in municipal autonomous agencies related to technology, innovation, and data offices or observatories.

The interviews were transcribed utilizing the Happy Scribe application. Data from interviews were analyzed through a deductive-inductive content analysis technique that categorized how cities adopt and use SCM in their activities according to context-sensitive dimensions found in the literature, along with additional codes that emerged during the process. One author coded the interviews, with results discussed in meetings with the other authors. Microsoft Excel was used to organize data related to the observed dimensions and to create matrices for analyzing how local governments implement SCM in their SC initiatives. Table 2 summarizes the interviews and the main characteristics of the cities.

Table 2. Characteristics of cities and respondents

Region	Interview code	Population size	Location	Number of interviewees	Interviewees positions
North	North_1	Up to 100,000 inhabitants	Non-capital city	1	Project Coordinator

4. Findings

This section presents the results of the content analysis of the interviews. First, we present the adoption of SCM in Brazilian cities, followed by the challenges and benefits, and finally, context-sensitive approaches adopted by the cities.

4.1 Adoption of SCM

Firstly, all representatives confirmed their knowledge of at least one SCM, collectively mentioning over 30 measurements. Local managers typically monitor results from multiple frameworks, primarily citing national SCM, with some international standards as exceptions. International standards followed by Brazilian cities included the Sustainable Development Goals (SDG) indicators, the ITU maturity model for Smart Sustainable Cities (SSC), and SC indicators from the International Organization for Standardization (ISO). Among national measurements, the Connected Smart Cities index and the Bright Cities platform were most frequently mentioned. The first ranks cities with over 50,000 inhabitants based on 70 indicators (Fachinelli et al., 2023; Fariniuk, 2020), while the Bright Cities platform assesses cities using 160 indicators across governance, education, health, urbanism, and environment dimensions (Bright Cities, n.d.). Both are supported by Brazilian consulting enterprises that providing indicators and offering services to develop SC initiatives.

The initial categorization of Brazilian cities identifies two SCM user types: observers and participants. While observers merely follow some SCM for Brazilian cities to check the results, participants play a more active role. They provide, collect, and analyze the data and results for the city and actively seek to be part of SCM proposed by external organizations. This includes sending information or registration for rankings, awards, or other ways of monitoring the SC projects and adopting recognized national and international frameworks like the SC indicators proposed by the ISO. Some of these cities have already received certification from the Brazilian Association of Technical Standards (ABNT), which ISO accredits to translate SC standards in the country, and others are in the process of certification.

Some cities frequently update data for national SCM indicators, guaranteeing that the data used is the most current and accurate one. One example was detailed by the interviewee from Southeast_3: "*One that we follow very closely is the Connected Smart Cities index. (...) we monitor how these indicators are being measured within the city government*". These indicators can also influence the actions of local governments, as pointed out by the South_6 interviewee: "*We use (…) Connected Smart Cities ranking as a means of monitoring [the city], which is divided into thematic axes. Within these axes, we can see which indicators are monitored, which criteria they use, and which data source they use. (...) based on these indicators, (...) we have meetings with the municipal departments once a year, when the indicators are released, and we plan next steps*".

Generally, they combine different external and internal indicators, showing that Brazilian local managers looked for using different sources of data according to the city context. For example, South_1 not only uses external measurement frameworks but also developed its own public relevance index, focusing on contextualized SC indicators as a small city: "*When you start looking at these manuals, you realize that you are always following the big cities. It is as if small cities are a shadow because everything is first tested in the bigger cities and, if it works there, replicated to the small cities. But, in innovation, it does not work, because you create a parameter of: You are a smart city, if you have X startups, if you have X incubators, X accelerators, and we start to question ourselves: But I will never get there. I will never have this ecosystem (...) What, in fact, considers us as a smart city*?".

Another local manager highlighted that cities should adapt the indicators to their context, not incorporating methodologies that do not include local issues: "*The ranking is not the only thing that will tell us whether we are doing well or not. Many times, it will show other cities advancing, not necessarily yours. That is why I think it is essential to have data and to have a purpose and indicators established by the policy (...) because I will look at my context. So, there are indicators and data which are often not mapped in rankings, but they are essential*" (Southeast_3). Therefore, regarding the adoption of external SCM, Brazilian municipalities not only demonstrate awareness of these models but also actively engage in monitoring and incorporating them according to their context: "*Indicators serve as a map, a guiding tool, but it is essential to consider the context of each city. This approach makes it easier to develop and implement strategies effectively*." (South_2)

4.2 SCM challenges and benefits

According to local managers, incorporating external SCM to monitor the cities' SC projects has numerous benefits. The benefits include comparisons with other Brazilian cities, enhancing the visibility and transparency of municipal actions, and attracting investment. SCM indicators also drive the engagement of public managers in SC, as it prompts government officials to respond to the reported results or take action to improve their results.

Furthermore, these frameworks enable the municipality to starting points for measurement initiatives, offer guidance on various indicators, and foster accountability by informing citizens about local government actions. In their opinion, adopting SCM also save resources and enhance city marketing and competitiveness. The following quotations highlight some advantages considered by Brazilian local managers:

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

"*The ranking actually publicizes how cities are doing, and this generates engagement from public managers because they want to be well-placed, showcase their city's progress, and so on.*" (South_5)

"*The key aspect (...) is having at least a minimally comparable basis to assess whether the path being followed [by the city] is indeed one that leads to improvements in public policy (...). There is also another important advantage (...) which is mobilization. Every time a ranking is released, it mobilizes the city.*" (Southeast_3)

"*We strive to keep these numbers updated and available because this is also (...) a marketing strategy for the city, enhancing its competitiveness to attract investments*." (South_7)

On the other hand, challenges mentioned by SC managers in Brazil regarding SCM adoption include a focus on larger cities, lack of standardization among different SCM, and difficulties in adapting measurement models to the unique characteristics of certain regions or contexts, such as the North and Amazon regions. The interviewer from North_1 pointed out these difficulties: "(...) *The models we have read about, (...) have looked for in the literature, do not fit our reality. The closest city here is 100 kilometers away. Everything is different when compared with the Center-West region, the Southeast region*". Because of these disparities, they opted to develop their own regional indicators to measure SC initiatives: "A*bout 40% of the indicators are global at the Brazilian level, about 70% are regionalized indicators for the North region (...) I have other difficulties (...) like access to the cities. There are cities in Amazonas State, cities in Acre State, you cannot access by roads. So, these are indicators that we must take into consideration*".

Another example is related to specific dimensions, such as transportation and mobility: "*If we look at cities that have a subway and those that do not, it is completely different. So, there's no point in suddenly adopting a methodology that incorporates the subway, and we do not have one. These things are sometimes the disadvantages of taking something closed and trying to put it that way without really adapting it to the local context*" (South_3). The requirements to have an airport close to the city were also mentioned: "*The number of airports that are taken into consideration for you to say that I am a smart city. (...) So we question the indicators for some things, that's why we look at the indicator, the source, to really know if it applies to us. If it doesn't, we need to adapt it*" (South_6).

Another challenge includes the laborious nature of data analysis. Some interviews highlighted difficulties to collect or access some indicators: "*There are indicators that require data that are not within the municipality's jurisdiction, but rather the jurisdiction of the private entity or another public organization. So, this makes it very complex. And it is not because the city does not want to show itself, it is because (...) data curation process is complex*" (Northeast_1). There are also concerns about the lack of transparency, uniformity in data availability, and the weights given to indicators among different SCM. The promotion of excessive competition among cities, particularly through rankings or indexes, was also mentioned as a challenge: "*We talk a lot about (...) not looking at rankings, because each city has its own peculiarities. (...) It is nice to be first, but there's a whole trajectory of why we are not in the first position*." (South_5). Table 3 summarizes the main benefits and challenges pointed out by Brazilian local managers.

Table 3. Benefits and challenges for adopting SCM according to the Brazilian local managers

Benefits of SCM	**Challenges of SCM**
Internal to the government • Recognition and legitimacy of the municipality's actions • Data for decision-making and management improvement • Comparison with other cities • Establishment of a baseline for indicators • Mobilization of public managers • Saving local government resources related to the creation and collection of indicators	**Lack of context-sensitive approaches** • Focus on the context of larger municipalities • Lack of in-depth analysis for specific contexts • Measurement models are not very useful for the context of some Brazilian regions, such as the North and Amazon regions • Comparison with municipalities that have different contexts • General results without segmentation according to the city's main characteristics, such as size
External to the government • Recognition and legitimacy of the municipality's actions • Attracting investments to the city • Transparency of SC initiatives • Mobilization of citizens	**SCM methodology** • Lack of transparency of SCM • Lack of standardization among indicators and weights of different SCM • Lack of in-depth indicators

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

• Reliability of information for society as it is provided by an external organization	**Other** • It is laborious to collect and analyze the data • Promoting excessive competitiveness to maintain position in rankings or indexes

4.3 Context-sensitive approaches adopted by the cities

This section presents findings from the content analysis of interviews, using the three dimensions of context-sensitive frameworks identified in the literature section. The analysis revealed new characteristics for measurement studies that could be expanded for the debates related to SCM and the local context. Among the novelties, interviews demonstrated the importance of including digital infrastructure and historical conditions in SCM frameworks, as well as the need for SCM transparency and data source flexibility.

Following the literature (Caird et al., 2016; de Oliveira et al., 2024; Esposito et al., 2021; Sharifi, 2019; Visvizi & Lytras, 2018; Wang et al., 2022), **local conditions** were emphasized by local managers, particularly the lack of context-sensitive indicators or approaches. Local managers noted the absence of indicators for small municipalities, specific regions of the country, and cultural and historical characteristics. For instance, the Connected Smart Cities Index, evaluating only cities with over 50,000 inhabitants, i.e., only 12% of Brazilian cities in 2023. Despite this limitation, the city of South_1, a small municipality, follows this index to gain insights into their SC projects and learn about other initiatives. Another example is the difficulty of finding SCM considering regional specificities, such as the municipalities in the North and Amazon regions. This region in Brazil has many natural and geographic challenges, including difficulties with Internet access. The IT manager from North_3 mentioned that there are only two fiber internet providers along the BR-364 road, and they face interruptions due to weather conditions like rain or fire. This affects critical services, making the Amazon region highly sensitive to ensuring the continuity of technology services, such as technologies highly dependent on fiber optic connection. The main adaptations to local conditions challenges pointed out by the local managers were choosing only appropriate indicators for their contexts or even creating locally relevant indicators for their specific contexts and needs, mixing external and internal measurements.

Regarding **local needs** initiatives to include citizens and local stakeholders in SC projects and measurement, some cities adopted participative approaches, particularly in developing medium or long-term goals. Some cities have official plans that received contributions from society to establish achievements for 2030 or 2040. Shorter-term goals were also mentioned, such as government plans for four-year terms. However, most cities did not involve society in the measurement process, a situation reinforced by literature highlighting the lack of SC indicators focused on citizen participation or the inclusion of the local stakeholders in SCM decisions (Malek et al., 2021; Miller et al., 2013; Sharifi, 2020). The main initiatives were related to the transparency of SC indicators: Half of the cities adopted data observatories and portals to share data related to their SC projects (Northeast_1; South_2; South_3; South_4; South_5; South_7; Southeast_2; Southeast_3; Southeast_5). According to the local manager from Southeast_2, citizens can monitor the same indicators that local managers can access internally, including ISO 37120 indicators for sustainable and resilient cities: "*We created an observatory here in the city to monitor this data and for citizens to be able to follow it with us. The same data that I monitor here as an internal manager, citizens can also follow (...). All these approximately 400 indicators are available on a web portal (...) and it is possible to monitor each one of them to keep track of the progress*". These findings echo the observations of Huovila et al. (2019) that cities are developing strategies to increase indicators transparency, including adopting dashboards. Sharifi (2019) has underscored the crucial role of SCM in enhancing governance transparency. Managers also cited priority areas for developing indicators on SC. Ten cities had initiatives to monitor the SDG in their contexts, including, in some cases, the integration and adaptation with the local government goals and policies. This link of SC-related indicators was also presented by the literature through studies that linked SCM with themes, such as sustainability and resilience (Ependi et al., 2022; Samarakkody et al., 2022; Wang et al., 2022). In some cases, the cities also prioritized SC indicators related to the most prominent social issues in the local context. For instance, a city won many prizes and awards for public safety monitoring, including technology initiatives to decrease violence against women (Northeast_2).

About **methodological flexibility**, generally, cities avoid changing SCM-defined indicators to maintain comparability and certifications, such as ISO framework or rankings: "*Adaptation is not an option. At times, we simply do not provide the data. An indicator is an indicator—it has a specific calculation and a defined data composition. (...). For the indicators we follow, either we have the necessary data, ensuring its reliability, or we do not present it*" (Northeast_1). In some cases, local managers propose different data sources according to the information available for the city, as exemplified by Southeast_4, which commissioned a survey to measure English-speaking women due to a lack of structured data. Sharifi (2019) mentioned this type of customization and considered allowing proxy data to be the main flexibility criterion proposed by SCM. Still, cities depend on the approval of the SCM organizers to include a different source for one or more indicators. Another approach is to consider missing data for indicators that are difficult to measure or not applicable to the city's context. When they do not follow officially an SCM, some cities adapt indicators to their specific characteristics, such as segmentation

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

by population size.

The findings suggest a lack of SCM frameworks that consider smaller cities as well as those that address the unique geographical, cultural, historical, and digital characteristics of different regions. Regarding local needs, the results emphasize the importance of measuring relevant indicators and ensuring their transparency through observatories and online dashboards. Finally, the analysis reveals that city managers hesitate to change methods to maintain comparability, though adaptations to data sources may be necessary.

5. Discussion

SCM frameworks are designed to cover many cities. This leads to the lack of context-specific indicators that capture the complexity of SC initiatives focused on cities' needs and issues (Ependi et al., 2022; Patrão et al., 2020; Sharifi, 2019; Backhouse, 2020), particularly in countries where the diversity of cities' conditions can lead to different challenges and needs. Previous studies indicated that different characteristics and levels of inequalities among Brazilian cities could affect the development of SC and the adoption of technologies by local governments (Brazilian Internet Steering Committee [CGI.br], 2022; Przeybilovicz et al., 2018; Ribeiro et al., 2020).

In this sense, the results evidenced that a single SMC framework cannot capture a Brazilian city's diversity. Among interviews with representatives from 17 cities, more than 30 SCM frameworks were mentioned, demonstrating that the city managers combine different frameworks to cover their needs to understand their SC initiatives' progress in different contexts. In contrast to the observations of Backhouse and Dhao (2020) related to the lack of SCM criticism by the cities, these municipalities did not adopt such frameworks uncritically; rather, in general, they contextualized and evaluated them from a critical perspective by combining indicators from different sources and even incorporating internal municipal indicators to monitor their SC policies.

According to local managers, the advantages of incorporating external SCM are various, verifying the advance and progress of smart city initiatives (Caird et al., 2016; Fachinelli et al., 2023; Hajek et al., 2022), attracting resources, such as investments and talent (Hajek et al., 2022), transparency for citizens about the benefits provided by SC (Huovila et al., 2019) corroborating the literature perspective on the importance of measurements covering many cities. Another crucial aspect is the possibility of comparing cities' results, an advantage mentioned by most cities. However, some challenges mentioned in balancing external comparison and context-sensitive approaches are related to focusing on the local conditions of larger cities that do not fit the context of smaller cities. Historical and cultural differences should also be considered when adapting the SCM frameworks, as well as geographic and territorial differences.

In terms of context-sensitive indicators, besides adopting external SCM, all local managers emphasized that they also have internal indicators for smart city projects, complementing external standards for monitoring their SC initiatives. For example, this includes local relevant indicators for municipal public policies in education and health sectors and according to local conditions like population size and geographic characteristics. Regarding local needs, there are more initiatives related to the transparency of SC-related indicators than those that involve the participation of society or other local stakeholders in these initiatives. Thus, there is room for improving citizens and local stakeholders' participation in both SC and SCM initiatives, as outlined by Miller et al. (2013) and Malek et al. (2021).

There is less room for adaptation in terms of methodological flexibility. From the perspective of local managers, the comparison between cities must be maintained using the same methodology. However, one recurring adaptation is the data source, which is based on the information available in the city (Sharif, 2019, 2020).

6. Conclusion

This article explores how local governments adopt and utilize SCM frameworks in their smart city initiatives. It was conducted 27 interviews with local government managers from 17 Brazilian cities and analyzed literature to identify characteristics of context-sensitive SCM frameworks. Results indicate that local conditions—such as socioeconomic, geographic, cultural, and digital infrastructure—are key for adapting SCM frameworks. Additionally, local needs including citizen and stakeholder participation, priority areas (e.g., mobility, health, education), and SCM transparency must be considered. Methodological flexibility, involving qualitative and quantitative approaches, indicator weights, and the distinction between core and supplementary data, can also enhance adaptability.

Another conclusion is that a single SCM framework is inadequate for capturing a city's complexity and measuring its SC development. Measurement models often simplify reality, making it difficult to assess the specific context. Interviews revealed that managers often use multiple models to evaluate their SC initiatives. Additionally, a dichotomy exists between addressing local context and maintaining comparability. While managers prioritize their city's specific conditions and needs, they tend to avoid flexible methodologies to prevent losing comparability.

The interview analysis shows that cities often use multiple frameworks, incorporating local indicators for internal monitoring and external ones for benchmarking. The interviews indicate that the context-sensitivity of SCM is not inherently tied to the model itself but rather to how it is appropriated, adapted, and implemented by each city. For

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

academia, future studies may investigate how local governments in other contexts, countries, and regions adopt and use SCM in their SC initiatives and whether this tendency to use multiple frameworks, add local indicators, and maintain comparability is also how managers appropriate and "contextualize" the models. For SC managers, the recommendation is to employ multiple frameworks, integrate local indicators, and maintain comparability.

The paper's limitations include its focus on local government officials in Brazil, potentially restricting the generalizability of findings to other countries. Additionally, the sample size may not fully represent Brazil's diversity in SC initiatives. Future studies could include comparative analysis across different countries to understand the variations in implementation, contextual factors, and other stakeholders' perspectives, such as citizens and the organizations that develop the SCM frameworks.

Abstract. In the era of smart cities and digital transformation, ensuring digital inclusion has become a critical factor in fostering social cohesion and equitable urban development. While digital technology brings unprecedented opportunities for development, education, and civic engagement, barriers such as limited infrastructure, financial constraints, digital literacy gaps, and social exclusion continue to hinder full digital inclusion. This article explores the complex challenges of the digital divide and its impact on marginalized groups, including older adults, low-income households, migrants, and rural communities. Through a critical review of literature and policy analysis, this study examines key obstacles to digital inclusion in smart cities and evaluates the European Union's response to these challenges through policy interventions, broadband expansion, digital skills programs, accessibility standards, and affordability measures. Additionally, the paper highlights strategies to enhance digital participation, such as citizen engagement, inclusive urban planning, and public-private partnerships. Through the analysis of EU initiatives and emerging policy approaches, this research contributes to the discourse on digital equity and provides insights into building smart, sustainable, and inclusive urban environments. The findings emphasize the need for integrated, cross-sectoral strategies to bridge the digital divide, ensuring that all citizens can access and benefit from the digital economy and society.

1. Introduction

Digital inclusion is a crucial factor for social and economic development in the modern era, as access to and use of

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

digital technologies have become an integral part of everyday life, education, work and social participation. In a world that is changing rapidly due to the digital revolution, inequality in access to technological capabilities can intensify already existing social and economic discrimination (Helsper, 2008). The European Union (EU) and international organizations, such as the United Nations (UN), have adopted policies and programs that aim to reduce these inequalities, through the expansion of digital infrastructure, education and the promotion of digital access (European Commission, 2021).

Digital inclusion includes both access to the internet and or/any devices along with the capability of people to use technologies in order to equally participate in the information society. Losing this ability drives in digital exclusion which in turn affects mostly elderly people, people with low income, migrants and rural communities (Correa & Pavez, 2016, Gorelova et al, 2023). Usually, the reasons for digital exclusion concern economic, social, cultural and academic inequalities that discourage equal participation in a society. In addition, social exclusion and digital divide are two important factors that need to be understood so we can clarify the importance of digital inclusion. Social exclusion refers to the inability of people to participate in social, economic and cultural activities, a situation that can be caused by many factors such as lack of access to basic services and inadequate social networking (Sanders, 2020, Karelis et al., 2024). At the same time, the digital divide describes inequalities in access to and use of digital technologies among different social groups or geographical areas. Factors that contribute to the digital divide include lack of digital skills, the technologies' cost and geographical isolation (Damodaran et al., 2015). Since technological developments evolve over time, the digital divide constitutes a dynamic phenomenon. Even today, regardless of improvements in the deployment of high-speed networks, there are many people who do not have access to reliable internet connections (or cannot afford them), particularly those from rural and remote areas (Mervyn, Simon, & Allen, 2014). Moreover, age and educational levels can create such gaps, with elderly people and those with low educational levels facing such challenges (Tomczyk et al., 2023).

Addressing the challenges of digital divide and social exclusion requires a multifaceted strategy that involves technological infrastructure, fostering digital literacy, and implementing policies that ensure inclusivity and equitable access to technology. In the context of this research, the main obstacles to achieving digital inclusion will be examined, as well as strategies that can contribute to mitigating inequalities and promoting a more inclusive digital environment. This research contributes towards this purpose, to systematically identify the key barriers to digital inclusion and examine the extent to which the European Union's policies and initiatives address each of these challenges. In this context, both barriers and the EU-specific strategies are examined, while assessing the effectiveness of these initiatives in promoting a more inclusive digital environment.

The rest of this study is structured as follows: In section 2 background information is provided, necessary for landscaping the field we examine. Section 3 reveals our methodology which underlies our research. Section 4 presents barriers to digital inclusion while section 5 highlights EU efforts in addressing these barriers. In section 6 an analysis of means of mitigation is presented, followed by conclusions and directions for future research steps in Section 7.

2. Research Methods

The study adopted a qualitative approach with secondary data (scientific literature and policy documents) analysis and further data triangulation.

Data Collection: The research began by making queries for publications relevant to the topic on Google Scholar using the keywords "Digital inclusion in smart cities", "Barriers to digital inclusion", and "Smart city equity challenges" conducted in September 2024. The criteria to include the publications in the study were that they had to be published in 2008 and later, they were focusing on smart cities and urban digital inclusion, and addressing citizen-centric approaches. We deliberately omitted the exclusion criteria in order to explore the broader range of topical academic literature.

Data Selection and Analysis: The selected literature was analysed using a thematic analysis approach. During the "Data Selection and Analysis" step we identified the most common barriers to digital inclusion in the scientific literature. Specifically, the analysis resulted in six primary barriers which are *infrastructure, economic, educational, social and cultural, policy and regulatory, and psychological and perceptual challenges.* Following the identification of barriers, during the next step of our research we retrieved key strategies for countering digital disadvantage presented in the literature, with a focus placed on policy initiatives, infrastructure development, digital literacy, accessibility, and affordability. In addition, real-life examples of effective practices were included to enrich the research with authentic field experiences.

Focus on the European Union: We explored EU initiatives (policies and frameworks) to provide evidence on the ways to tackle digital inclusion barriers in Europe. This included an in-depth review of policies, frameworks, and strategic documents from the European Union, such as the 2030 Digital Compass and NextGenerationEU. The aim was to assess how these initiatives address the identified barriers and to evaluate their effectiveness in promoting digital inclusion across diverse member states. The findings were then thoroughly analysed to gain an extensive

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

.

comprehension of the dynamics of the studied field both on scientific and political levels.

Mapping: Finally, we conducted a systematic mapping of the identified barriers against the identified EU initiatives, policies and frameworks. In a few words, we aligned each barrier with specific EU initiatives, policies, and frameworks to evaluate the degree of alignment between the barriers and the EU responses and highlight gaps, overlaps, and areas of strong intervention. This approach provided deeper insights into the effectiveness and comprehensiveness of the EU's strategies in promoting digital inclusion.

During this phase, a qualitative stance was conducted with secondary analysis of scientific literature and policy documents. To seek out relevant EU initiatives, policies, and frameworks for dealing with digital inclusion in a systemic manner, a focused research methodology was adopted, with a thorough and stringent selection process in place.

The research began with a critical review of policy and literature, with a specific focus placed on formal documents of the EU, strategic documents, and regulating policies. European Commission and European Parliament reports and documents, together with other European Union agencies such as the Digital Economy and Society Index (DESI) and 2030 Digital Compass, were key sources involved. All these sources provided key information about the ongoing digital transformation agenda in the EU and its commitment towards lessening digital inequalities.

To further restrict selection, a specific keyword search was performed via Google and academic databases, including Google Scholar, and Scopus, and via official databases of the European Union, including EUR-Lex, European Commission Publications, and the EU Open Data Portal. Search keywords included "Digital inclusion policies EU," "Smart cities && EU digital equity," "EU frameworks && digital transformation," "EU barriers && digital inclusion && strategies," and "European actions && digital divide." Criteria for selection involved relevant and updated policies and programs for access, literacy, infrastructure, and inclusion.

Following the selection of resulted policies, a comparative mapping and classification exercise was performed in an attempt to map each initiative in a systematic manner in relation to the six most important digital inclusion barriers: infrastructure, economic, educational, social and cultural, policy and regulatory, and psychological and perceptual barriers. Mapping revealed in detail how such policies contribute towards lessening digital inequalities, even when not explicitly under social cohesion and digital inclusion programs. Most of the shortlisted initiatives address key structural barriers through augmented digital infrastructure, enhancing digital competencies and workforce capabilities, augmented access for disadvantaged groups, and cybersecurity and trust in cyberspace. Cross-referral with academic studies and case studies, in addition to critical analysis, examined the effectiveness and impact of such EU actions.

While some of the identified EU policies and initiatives are not explicitly framed under digital inclusion or social cohesion, they were selected based on their direct and indirect contributions to bridging digital inequalities and fostering a more inclusive digital society. These initiatives collectively address key structural challenges by ensuring equal access to digital infrastructure, enhancing digital literacy and skills, and promoting inclusive and secure digital participation.

3. Barriers to Digital Inclusion

Digital inclusion is of major importance to ensure that people and communities have access to and can effectively use digital technologies to improve their quality of life. However, there are many barriers that hinder this goal creating a digital divide that leads to disadvantaged groups.

Despite the rapid evolvement of technology, especially if we consider the expansion of broadband networks, many rural regions lack reliable internet access, which in turn limits opportunities for economic development, education and social engagement. The urban-rural divide remains a persistent issue, as cities enjoy high-speed connections and advanced digital services, while rural communities struggle with slow, unreliable, and costly internet options (Sanders, R., 2020; Helsper, E., 2008; Correa, T., & Pavez, I., 2016). A typical example can be considered the deployment of 5G which, despite its promise to tackle such challenges, is progressing unevenly in smaller and remote areas with delays in its adoption.

Economic barriers is another critical barrier, part of digital inclusion, especially for low-income families and marginalised groups. Regardless of the European Union's efforts to reduce internet services' cost, financial difficulties prevent many individuals from accessing any possible online resources (Sanders, R., 2020; Mervyn, K., Simon, A., & Allen, D. K., 2014; Samodaran, L. et al, 2015). Economically disadvantaged groups, such as unemployed or migrants are unable to afford high monthly subscriptions or the cost of purchasing digital devices (Mervyn, K., et al., 2014; Samodaran, L. et al, 2015). In addition, economic inequalities can be found among the EU member states that worsen the issue (Helsper, E., 2008; Mervyn, K., et al., 2014), e.g., Germany and Sweden achieve high levels of digital inclusion in comparison to Bulgaria and Romania.

A significant part of the population, especially the elderly and those with low levels of formal education, lack the necessary digital literacy skills to effectively engage with digital technologies. The European Commission's Digital

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Economy and Society Index (DESI) reveals that a high level of citizens in the EU have poor basic digital competencies, holding them back from accessing and taking part in online goods and services (Damodaran et al., 2015). Four out of ten adults lack poor basic digital competencies, and one in six professionals in ICT is female, (Virkkunen, H., 2024). Inequalities in access to training programs deepen, with rural and disadvantaged areas not having educational programs for developing competencies in a virtual environment (Sanders, 2020). Poor competencies in a digital environment hinder access to significant information, work and social contacts in an emerging virtual world (Helsper, 2008).

Social and Cultural Barriers also play a pivotal role in digital exclusion, with age inequalities being one of them. Elderly people across the EU countries face difficulties in adopting new technologies, a situation that leads to digital divide (Tomczyk et al., 2023). Many older individuals consider digital tools complex and intimidating, leading to their isolation from the benefits of the digital age we are living in. Furthermore, people with disabilities face accessibility challenges that make it difficult, or sometimes impossible, for them to use any digital devices. Although progress has been made in developing assistive technologies and accessible web design, barriers to the widespread implementation of inclusive digital solutions persist (Damodaran et al., 2015, Sanders, 2020).

Policy and Regulation, particularly those related to cybersecurity and privacy, constitute barriers to digital inclusion. Growing awareness of cyber threats, data breaches, and privacy violations has led some individuals to avoid online platforms altogether. Even though regulations such as the General Data Protection Regulation (GDPR) are important for personal information sharing, their complexity prevents smaller businesses and individuals from fully engaging with digital services (Sanders, 2020, Damodaran, L., 2015). Striking a balance between ensuring user privacy and promoting digital participation remains a challenge for policymakers.

Psychological and perceptual barriers further contribute to digital exclusion, especially among elderly people who often exhibit the known ‘fear of technology’. Distrust or anxiety about digital tools, security, privacy and usability limit their willingness to adopt digital tools (Damodaran, L., 2015, Tomczyk, Ł. et al., 2023). At the same time, many individuals lack confidence in using technologies effectively, a situation that leads to the avoidance of using them and the digital divide.

It is evident that the rapid expansion of internet usage over the past decade has profoundly transformed global communication, commerce, education, and daily life. In 2010, approximately 30% of the global population was online; by 2020, this figure had doubled to 60%, and as of October 2024, it reached 67.5% (A. Petrosyan, 2024). This surge has been driven by advancements in broadband infrastructure, affordability of mobile technology, and increasing reliance on digital services. However, access alone does not guarantee equal participation in the digital world. Long-standing barriers including financial constraints, access barriers, and computer illiteracy persistently exclude significant parts of society. For instance, financial inequality and unaffordability have been long-standing deterrents to computer access (Taylor, D., & Packham, G., 2016). Also, the lack of supporting infrastructure keeps many out of range of accessing the web, electricity, and connectivity, undermining even the best efforts at digital inclusion. That paradox compels full-fledged approaches to digital inclusion that go beyond connectivity in order to make everyone effective in participating in the web economy and society.

To make these trends concrete, the following two charts present a graphical depiction of worldwide expansion in terms of internet use over time in relation to ongoing obstacles to digital access. The first chart (Figure 1) plots overall expansion in terms of internet use and yet reveals that a considerable part of society continues to have difficulty accessing and utilizing digital technology. The second chart (Figure 2) continues to dissect these obstacles, defining them in terms of economic, access, and digital skill-related obstacles, and underlines the necessity for focused interventions.

.

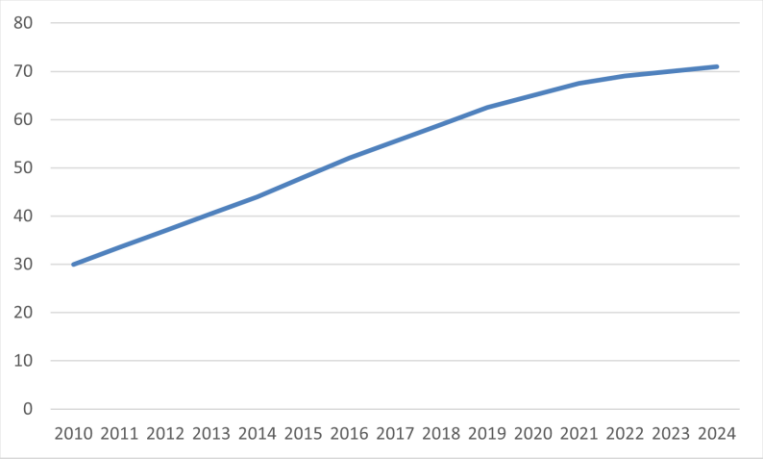

***Fig. 1**: Global Internet Penetration*

Figure 1 reflects the global expansion in internet use between 2010 and 2024. According to statistics compiled by the International Telecommunication Union (ITU, 2023) and Statista, 30% of 2010's population had access to the Internet, rising to 67.5% in 2024 (ITU, 2023; Statista, 2024). This sustained expansion is an indication of significant improvement in technology infrastructure, a fall in price for mobile devices, and an overall rise in the use of digital services in industries such as education, medical care, and business.

However, increased access to the web alone will not necessarily enhance fair digital inclusion. There are a variety of regions, most prominently developing countries and rural communities, with persistent barriers in terms of financial restrictions, infrastructure, and low digital capabilities. All these barriers arise even when connectivity keeps growing. Observations of the OECD and the World Bank point out that access, significant as it is, must accompany investments in digital capabilities and price-affordable alternatives in order to allow everyone to make an effective contribution to the digital economy (World Bank, 2016; OECD, 2021).

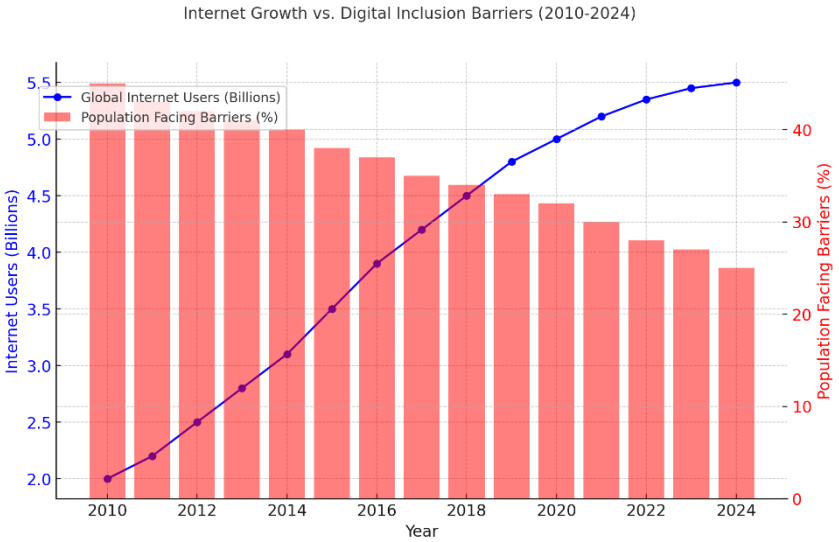

***Fig. 2**: Global Internet Growth vs. Digital Inclusion Barriers*

Figure 2 reveals the steady rise in global internet users from 2 billion in 2010 to approximately 5.5 billion in 2024, demonstrating the increasing digital connectivity worldwide. However, the chart also highlights that despite this growth, a significant portion of the population continues to face digital inclusion barriers, with 45% experiencing challenges in 2010 and 25% still affected in 2024. The trend, even in its demonstration of a decline in barriers over a period, identifies that access to the web alone cannot secure fair access and use of the information society and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

economy. Long-standing barriers, including financial constraints, access barriers, and computer and information skills lack, expose a demand for proactive interventions and policies in closing down the digital divide.

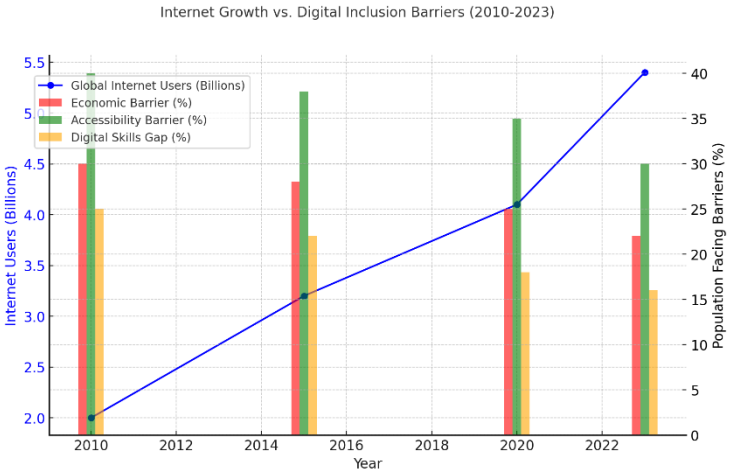

Fig. 3 *Internet Growth vs. Specific Digital Inclusion Barriers*

Figure 3 embarks on a deeper examination of barriers to full digital inclusion and organises them under three general categories: access, economic, and digital skill gaps. As per information, despite a drop in economic barriers over the years, beginning at 30% in 2010 and decreasing to 22% in 2023, lack of affordability continues to hinder access for poor segments of society. Accessibility barriers, which impacted 40% of the population in 2010, remain a significant challenge at 30% in 2023, reflecting the need for more inclusive digital infrastructure and services. Similarly, the digital skills gap has narrowed from 25% in 2010 to 16% in 2023, yet a considerable portion of the population still lacks the necessary competencies to fully participate in the digital world. These findings reinforce the importance of not just expanding internet access but also addressing the socioeconomic and educational factors that influence digital inclusion.

4. EU efforts to address and mitigate these barriers

The EU recognises there is an increasing digital divide and a pressing need, therefore, to promote digital inclusion for all citizens to enable them to participate in a digital economy and society. As digital technologies transform industries, education and everyday life, anyone lacking access to the infrastructure needed to use technology or lacking basic digital skills or affordable internet services, risks falling behind. Recognizing these challenges, the EU has implemented a series of policy initiatives, infrastructure investments, digital literacy programs, accessibility regulations, and affordability measures to create a more inclusive digital ecosystem. These efforts contribute to the goals of the 2030 Digital Compass towards a digitally empowered and technology sovereign European Union with connectivity, skill, cybersecurity, and innovation driving social and economic development.

The European Union has developed policy frameworks to make digital transformation work for everyone in society. Policies have been designed to give direction to member countries, companies, and public sectors for enhancing access, developing capabilities, and closing gaps in terms of digital engagement. The European Union long-term blueprint for digital transformation is the Digital Compass 2030. One of its most important objectives is to enable at least 80% of citizens to have minimum digital skills in 2030 and for all European homes to have access to gigabit connectivity. Having specific objectives, it creates a specific direction for enhancing digital inclusion and for having Europe competitive in a growing changing digital environment. The ESF+ (Social Fund Plus) scheme continues concentrated funding for training and work programmes for developing digital competences in disadvantaged groups, including low-income groups, immigrants, and jobseekers. ESF+ main objective is to reduce skill gaps and increase employability in an emerging digital jobs economy.

The Digital Skills and Jobs Coalition unites governments, employers, educational providers, and civil society in an attempt to bridge technology skills gaps. By developing collaboration, the coalition sees to it that workers and citizens have competencies in a position to join and contribute to the jobs marketplace and digital economy. Coding for All Initiatives supports coding education in schools and communities, preparing

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

students, job seekers, and professionals for future technological careers. It enhances Europe's digital workforce by equipping individuals with essential programming skills. The Upskilling Pathways Initiative empowers adults with low digital skills, offering them individualized training in computer literacy, web use, and problem-solving in a virtual environment. The Digital Europe Program addresses educational and financial barriers through financing for high-level digital competencies and technological capabilities through projects. By focusing on sectors such as supercomputing, artificial intelligence, and cybersecurity, it enables citizens and businesses to thrive in a digital economy, filling gaps in digital competency and spurring innovation in member nations. The European Digital Skills Awards respond to educational barriers through a recognition and motivation of successful programs that have successfully developed citizens' digital competencies in the European Union. By offering such incentives, such awards promote best practice in digital training, challenging educational institutions to apply effective training programs for closing gaps in digital literacy.

To address the urban-rural digital divide, the EU invests in broadband expansion and connectivity projects to ensure that underserved communities can access high-speed internet and digital services. These initiatives are particularly crucial in rural, remote, and economically disadvantaged areas. The Connecting Europe Facility (CEF) programme provides funding for rural and disadvantaged areas in Europe for connectivity improvement. CEF aims at closing geographical gaps in access to connectivity through financing for high-speed infrastructure development, fiber-optic connectivity, and 5G rollout. WiFi4EU scheme brings free public WiFi hotspots to parks, libraries, public spaces, and community spaces in EU nations. In other words, it provides free and secure access for all, no matter geographical location, helping also in breaking down financial barriers to connectivity, especially for those who cannot afford a subscription at home. Both WiFI4EU & CEF support also the infrastructure development. The European Digital Innovation Hubs Network addresses infrastructure and educational barriers through access to technical expertise, training, and financial consultancy for companies and public administration entities. Hubs promote and enable use of digital technology and innovation, specifically in regions with a lack of development in terms of digital technology. The Digital Transformation Compass 2030 addresses infrastructure, educational, and financial barriers through ambitious citizen and business enablement through digital transformation objectives. It seeks to build digital competencies, infrastructure development, and stimulate economic development for assured access to the digital economy.

In parallel, the EU prioritized accessibility regulations to ensure that all individuals, including those with disabilities, can fully participate in the digital world. These regulations encourage accessibility by everyone web development, electronic goods and services, and electronic environments. The Web Accessibility Directive mandates compliance with accessibility for all public sector websites and mobile applications. It enables persons with disabilities to access, use, and enjoy electronic goods and services with no obstacles in between. EU Disability Strategy (2021-2030) deepens commitment towards electronic access through overcoming barriers to access for persons with disabilities in electronic technology. It promotes accessible technology, accessible electronic information, and access policies in private and public sectors.

Some EU countries have introduced subsidies, financial incentives, and tax rebates to make access to the digital economy more affordable. Specifically, in certain EU member states, governments provide financial aid to low-income households, helping them purchase laptops, tablets, and internet subscriptions. For example, Slovenia’s Digital Inclusion Act offers digital vouchers to specific population groups, enabling disadvantaged individuals to buy computer equipment. Additionally, the EU encourages businesses to invest in digital tools and workforce training by offering incentives and tax allowances. These policies support corporate investment in employee digital upskilling while also reducing the cost of personal technology investments.

The European Declaration of Digital Principles and Rights addresses social, cultural, and legislative barriers through an emphasis on protecting fundamental rights, developing digital competences, and granting access to digital technology for all in an equitable manner. It guides the EU’s journey towards an inclusive, citizen-centred digital transformation that considers citizens' diversity in terms of requirements. Mitigation of digital inequity will require a coordinated and overall approach. One of the most effective strategies for creating inclusive digital policies is through actively engaging citizens in developing them. Engaging communities in participatory design sessions enables one to make strategies specific to them. For instance, the European Commission’s 2030 Digital Compass incorporated feedback from a variety of stakeholders, including citizens, in creating its 2030 Digital Compass (Ginters E, 2022). Regional cooperation is yet another key one. Policies such as the European Union’s Digital Decade Policy Programme (Signorelli S, 2024) drive countries to work together, with best practice shared and common objectives harmonized. To ensure accountability, transparent reporting and regular audits have to be conducted. NextGenerationEU programs, for one, exhibit

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

such a practice through reporting twice a year regarding funding operations.

The development of digital infrastructure is most critical in closing the divide, particularly in disadvantaged communities. Public-private partnerships generate additional momentum, such as with WiFi4EU (Kaššaj, M., & Peráček, T., 2024), in funding free public-space installation of WiFi in city councils through private companies for delivery. The integration of technology in current infrastructure also enables digital transformation. Cities such as Barcelona have incorporated smart sensors in public infrastructure in an attempt to make urban services and connectivity better.

The establishment of digital competences and literacy is key in developing an environment of inclusion. Community training programs, designed in collaboration with community groups, address specific individual requirements for individual groups. Interactive and gamificated platforms for training make skill development in a virtual environment accessible and exciting. Mentorship programs extend digital capabilities even further. In MIT's D-Lab (Smith, A., & Adams, N., 2022), experienced learners mentor students to co-create technology, and in Australia's Digital Mentors Program (Dezuanni, M., 2019), volunteers are trained to mentor others in enhancing their digital capabilities, with a view to creating knowledge spillover in communities.

To make tools and services accessible universally, development must be guided through universal approaches to design. Public sector websites have to abide by such standards under the EU Web Accessibility Directive (Ferri, D., & Favalli, S., 2018). Collaborative spaces like community access labs have a critical role in developing accessible tools for all. Implementation of access standards through audits and tracking strengthens compliance.

Affordability is a significant barrier to access, and simplifying access to subsidies can have a significant impact. Sliding scales in pricing frameworks make it even less costly through pricing in relation to incomes.

Effective digital inclusion strategies involve cross-cutting approaches with a high level of community and data-driven decision-making orientation. By having a variety of demographics involved in planning and rollout, programs can best react to community requirements. Participatory design processes in use in MIT's D-Lab and in the case of the platform in Barcelona demonstrate how citizen engagement can produce meaningful and inclusive outcomes. Data analysis is yet another powerful tool for sharpening and acting on strategies. There is an EU Digital Economy and Society Index tracking digital transformation in member nations. Public awareness programs serve a complementary role in creating awareness regarding programs and options that exist out there. Citizens become sensitized about their digital rights through the European Declaration of Digital Rights and Principles.

Table 1. EU mitigation measures to address Digital inclusion barriers

EU Initiatives/Policies/Frameworks	**Barriers Addressed**	**Description**
Digital Compass 2030	Educational, Infrastructure, Economic	Aims for 80% of citizens to have minimum digital skills and universal gigabit connectivity by 2030.
NextGenerationEU	Infrastructure, Educational, Economic	Funding for digital transition, infrastructure, skills training, and connectivity in disadvantaged regions.
ESF+ (Social Fund Plus)	Educational, Economic	Focused funding for digital competences development in disadvantaged groups.
Connecting Europe Facility (CEF)	Infrastructure, Geographical	Funding for broadband expansion and high-speed connectivity in rural and remote areas.
WiFi4EU	Infrastructure, Economic	Free public WiFi hotspots in parks, libraries, and public spaces across EU countries.
Digital Skills and Jobs Coalition	Educational	Collaboration to bridge technology skills gaps across governments, employers, and educators.
Coding for All Initiatives	Educational	Prepares students and professionals for future tech careers through coding education.
Upskilling Pathways Initiative	Educational	Individualized training for adults with low digital skills to improve competencies.
Web Accessibility Directive	Accessibility, Social and Cultural	Mandates accessibility compliance for public sector websites and mobile applications.

.

EU Disability Strategy (2021-2030)	Accessibility, Social and Cultural	Promotes accessible technology and policies for persons with disabilities.
Digital Inclusion Act (Slovenia)	Economic	Provides digital vouchers for low-income groups to purchase computer equipment.
Digital Decade Policy Programme	Infrastructure, Educational, Policy and Regulatory	Sets goals for digital skills, infrastructure, business transformation, and digital public services by 2030.
Digital Services Act (DSA)	Policy and Regulatory, Psychological and Perceptual	Creates safer digital spaces by regulating online platforms and enhancing user protections.
Digital Education Action Plan (2021-2027)	Educational	Promotes high-quality, inclusive, and accessible digital education across Europe.
European Digital Identity (EUDI)	Policy and Regulatory, Accessibility	Provides secure digital wallets for citizens to access services across EU member states.
Cyber Resilience Act	Policy and Regulatory, Psychological and Perceptual	Enforces cybersecurity standards for internet-connected products to enhance digital trust.
Digital Agenda for Europe	Infrastructure, Educational, Economic	Maximizes the benefits of digital technologies for all EU citizens through improved access and digital literacy.
Horizon 2020	Educational, Infrastructure, Policy and Regulatory	Funds research and innovation projects, including those promoting digital inclusion and technological development.
European Regional Development Fund (ERDF)	Infrastructure, Geographical, Economic	Invests in ICT infrastructure in less developed regions to reduce the digital divide.
European Accessibility Act	Accessibility, Social and Cultural, Policy and Regulatory	Requires accessible design for products and services like computers and e-commerce to ensure inclusion of persons with disabilities.
Digital Europe Programme	Infrastructure, Educational, Economic	Funds projects in supercomputing, AI, cybersecurity, and advanced digital skills to accelerate Europe's digital transformation.
All Digital	Educational, Social and Cultural	Brings together organizations to empower citizens with digital skills, focusing on basic competencies, coding, and digital literacy.
European Digital Skills Awards	Educational	Recognizes initiatives that improve digital skills of EU citizens, promoting best practices in digital education.
European Digital Innovation Hubs Network	Infrastructure, Educational, Policy and Regulatory	Supports digital transformation by providing services and resources to governments and businesses through digital platforms.
Digital Transformation Compass 2030	Infrastructure, Educational, Economic	Sets ambitious goals for empowering citizens and businesses via digital transformation by 2030.
European Declaration on Digital Rights and Principles	Social and Cultural, Policy and Regulatory	Promotes principles for a digital transformation that respects European values and citizens' rights.

The EU's policies and initiatives to address digital inclusion barriers reflect a structured, multi-dimensional approach aimed at creating a more equitable digital society. By tackling key issues—such as infrastructure deficits, economic limitations, digital literacy gaps, social and cultural obstacles, and regulatory complexities—the EU reaffirms its strong commitment to closing the digital divide. These efforts align with broader strategies like the Digital Compass 2030, NextGenerationEU, and the Digital Decade Policy Programme, all designed to promote universal connectivity, enhance digital skills, and ensure accessible technology for all citizens.

Despite advancements in technology and policy interventions, significant challenges persist. Rural and underserved areas continue to struggle with infrastructure gaps, affordability remains a barrier for many low-income households, and marginalized groups still face digital exclusion due to limited skills or accessibility constraints. Additionally, the fast-paced evolution of digital technologies necessitates continuous policy adaptation to keep inclusion strategies effective and relevant in an ever-changing digital

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

landscape.

Moving forward, future research should focus on assessing the long-term impact of the EU's digital inclusion initiatives, evaluating their sustainability, scalability, and ability to adapt to emerging technological, economic, and social challenges. Comparative studies across EU member states could also offer valuable insights into best practices, policy effectiveness, and areas that require further intervention. As the digital landscape continues to evolve, ongoing assessment and targeted efforts will be crucial in ensuring that no one is left behind in Europe's journey toward full digital inclusion.

5. Conclusions

The EU is taking a well-rounded approach to breaking down barriers to digital inclusion, ensuring that everyone has the opportunity to benefit from technology. By addressing challenges like limited infrastructure, economic hardship, gaps in digital skills, and regulatory hurdles, the EU is making a strong push to close the digital divide. Initiatives such as the Digital Compass 2030, NextGenerationEU, and the Digital Decade Policy Programme all reflect a shared commitment to expanding internet access, improving digital literacy, and making technology more accessible to all.

However, despite these efforts, significant challenges remain. Many rural and underserved communities still struggle with poor connectivity, while affordability continues to be a major hurdle for low-income households. Marginalized groups often face exclusion due to limited digital skills or accessibility barriers, and the rapid pace of technological change means policies must constantly evolve to stay effective.

Looking ahead, it's crucial to assess the long-term impact of these initiatives—are they truly sustainable, scalable, and adaptable to future challenges? Comparative studies across EU member states could shed light on what's working and what still needs improvement. As the digital world continues to evolve, ongoing evaluation and targeted action will be essential to ensure that no one is left behind in Europe's journey toward full digital inclusion.

Abstract. In the contemporary era, climate change (CC) has become a defining challenge and a wicked problem for society, particularly in urban areas, due to their direct experience of the impacts of climate variability and extreme events. This has led to a heightened focus on the strategic planning processes, which are now under pressure to develop long-term strategies and investments for CC adaptation at the local level. This includes the implementation of effective measures and smart initiatives to address CC. In this context, smart cities (SCs) are progressively adopting emerging technologies (ETs) that hold the promise of enhancing urban resilience. Nonetheless, this implementation should be grounded in the strategic smart initiatives previously delineated in the strategic document of these cities, a domain that has remained largely unexplored. Thus, the present study aims to examine how a sample of European SCs are planning strategic actions to address the CC challenge through the design and execution of smart initiatives. Particularly, we focus on the analysis of governance issues -the leadership of the smart initiatives (RQ1) and the departments involved (RQ2)-, the smart dimensions involved in the strategic actions (RQ3) and, finally, the use of ETs (RQ4) in the different CC adaptation actions planned. The findings indicate fragmented governance, weak interdepartmental coordination, and minimal involvement. While some municipalities have dedicated sustainability departments, many initiatives lack centralized management. Although big data and AI play a key role in decision-making, the adoption of advanced technologies remains limited.

Keywords. Climate Change, Emerging Technologies, Strategic Planning, Smart Cities.

1. Introduction

In the contemporary era, climate change (CC) has become a defining challenge and a wicked problem for society, characterised by its multidimensional and substantial impacts on environmental, social and economic spheres at different spatial scales (international, national, regional and local contexts) -OECD, 2024a-. However, despite intense discussions on CC in the global arena and the urgent measures designed by governments and international bodies to address this challenge, no tangible results have yet been achieved in terms of mitigation and adaptation

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

mechanisms to address CC (OECD, 2024a).

International organisations point out that effective policymaking for CC adaptation requires measurable objectives, whole-of-government coordination, stakeholder engagement, sufficient funding and robust mechanisms to monitor progress and evaluate the effectiveness of policies (OECD, 2024a). Previous research has also highlighted that the ability to implement CC goals and policies in practice is largely determined by the robustness of institutions -e.g. strategic plans, policies- and systems -e.g. infrastructure, ecosystems- (Birchall and Bonnet, 2021). This has put considerable pressure on strategic planning processes to develop long-term strategies and investments for CC adaptation at the local level, including effective measures and smart initiatives to address CC (Bera and Lewicki, 2023).

Although it is acknowledged both that confronting CC necessitates the coordination and alignment of public policies across different administration levels and the important constraints faced by local government in their efforts to enhance climate resilience -including technical, financial and legal capacity issues (OECD, 2023a)-, the impacts of climate stressors manifest at local scales, underscoring the imperative for effective adaptation strategies to be tailored to the specific characteristics of the local context (IPCC, 2018). Indeed, local governments are critical for CC adaptation implementation (OECD, 2024a) and bear primary responsibility for important adaptation policy areas such as the delivery and operation of key infrastructure (OECD, 2024b) or the setting of regulatory functions (such as land-use planning, project permitting and standard setting) that can build climate resilience -OECD, 2024b-).

Local-level governments thus become central actors in fostering resilience through effective CC adaptation (Shi, 2019; Bonnett and Birchall, 2023), given their unique position to lead on CC adaptation actions due to their direct experience with the impacts of climate variability and climate extreme events as well as their understanding of the needs for locally tailored solutions (OECD, 2023a). So, a "place-based" approach to understanding and addressing local differences is essential for developing effective adaptation strategies that can mitigate climate change impacts and enhance resilience in communities (OECD, 2023a; OECD, 2023b).

In this regard, the available evidence suggests that strategies for cities should be developed at the metropolitan (functional urban area) level (OECD, 2024a). However, recent research has revealed that Australian and European cities usually have a low-quality adaptation plan for CC (Reckien et al., 2023) and limited number and low integration of CC adaptation and mitigation actions in urban planning documents (Hurlimann et al., 2021). This evidence could be the result of the limited financial resources that cities own, particularly in the most vulnerable communities and regions, which has compounded disparities in CC adaptation efforts (OECD, 2023a; OECD, 2023b).

As larger local authorities possess greater financial resources and technical infrastructure, they have developed dedicated adaptation plans and strategies to mainstream climate resilience across all locally led functions, often complemented by targeted plans to address specific risks (OECD, 2023a). Furthermore, it can be argued that the 'shock' of CC and its local and regional impacts is creating the conditions for greater innovation at urban and regional scales (Sancino et al., 2022). In this context, the rapid advancement of information and communication technologies (ICTs) has led to the increasing application of technologies in the urban context for the development of forward-looking plans for reducing vulnerability and disaster threats (Kuo and Li, 2022) particularly in the so-called 'smart cities' (SCs) due to their intense use of ICTs in the urban space, advanced governance models and the pursuit of sustainability goals (Su and Fan, 2023). Special attention should be paid to emerging technologies (ETs) in SC which have the potential to assist these cities in achieving resilience (Grovert et al., 2022). The aforementioned reasons provide a robust foundation for the focus on SCs as a fertile ground for research, despite the fact that they have been extensively explored (Butler et al., 2021).

Therefore, the present study aims to examine how a sample of European SCs are planning strategic actions to address the CC challenge through the design and execution of smart initiatives. Particularly, we focus on the analysis of governance issues -the leadership of the smart initiatives (RQ1) and the departments involved (RQ2)-, the smart dimensions involved in the strategic actions (RQ3) and, finally, the use of ETs (RQ4) in the different CC adaptation actions planned.

Recent research has indicated that sufficient resources do not guarantee effective adaptation planning in practice, because governments also face distinct adaptation barriers resulting from governance structure (Birchall et al., 2023). Consequently, within the domain of contemporary urban governance literature, there is an increasing focus on the leadership of smart initiatives and the role of city climate leadership (Rapoport et al., 2019) within the broader urban governance framework (Beer et al., 2021; Sotarauta and Beer, 2021; McPherson and Clarke, 2024). Although leadership in Europe is characterised by its multidimensional and collaborative nature (Hofstad et al., 2022; Sancino et al., 2022), political and administrative leaders play a crucial role in the vision and strategy for CC adaptation, the horizontal and vertical coordination and in leveraging resources from local, regional, and national actors within a multilevel governance system (Meijerink and Stiller, 2013; Hanssen and Tønnesen, 2022). This is

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

also relevant at the implementation stage in order to better coordinate actions and ensure long-term commitment to allocate resources to sustain actions (Vignola et al., 2017). Therefore, administrative leadership plays a pivotal role in steering climate policy initiatives (McPherson and Clarke, 2024).

Nonetheless, while sustainability appears to be evident in the SC fabric, it is influenced by both institutionalised and non-institutionalised factors, with perhaps most noteworthy factor being the unpredictability of the people and departments that eventually assume leadership in the smart initiatives (Haarstad and Wathne, 2019). Nonetheless, whether local governments are being structured for leading CC smart initiatives, as delineated in strategic documents, and the areas which lead these initiatives is an important and under-explored question. Therefore, the following research question is derived: RQ1. Do SCs have a department to lead all the smart city initiatives on sustainability or resilience or are they led by different departments according to the goals pursuit by the smart initiatives?

On another hand, the management of CC impacts constitutes a multifaceted and interdisciplinary domain, necessitating the integration of CC initiatives across various sectors and collaboration between diverse actors and departments within the strategic planning process (Theodora and Stratigea, 2021) to enhance preparedness for climate-related challenges (Bera and Lewicki, 2023). Furthermore, the organisational facet of the SC agenda entails the promotion of an integrated approach towards urban planning, the dissolution of silos, the transcendence of barriers, and the adoption of dynamic and reflexive methodologies to address various urban challenges. The interconnection of services, management and organisation is therefore a vital aspect of the SC agenda (Haarstad and Wathne, 2019).

Nonetheless, empirical evidence has revealed that many smart initiatives were designed to solve a specific problem handled by a specific department and current problems resulting in the development of short-sighted plans and initiatives (Kuo and Li, 2022). This approach hinders the capacity of cities to undergo CC adaptation in an effective manner. Consequently, the second research question of our study is as follows: RQ2. Which departments of the city are involved in the strategic planning processes of the smart initiatives related to CC strategic actions?

In addition, the interaction between technology and nature can be enhanced when a SC approach promotes the integration of climate strategies. Recent research has revealed that smart initiatives promoted by governments have been addressed to multiple smart dimensions (Kuo and Li, 2022), with those addressing the enhancement of smart living being the most prevalent, followed by smart mobility and smart data (Masrur and Sharifi, 2022). However, despite the relevance claimed by prior research concerning the implementation of ET for urban resilience in SCs, the sustainability aspect is not always prioritised in these initiatives. Indeed, the initiatives addressed to the smart environment dimension which takes a wider approach and relates more to climate action in the form of adaptation to CC are not always in the equation (García Fernández and Peek, 2020).

Conversely, when smart initiatives are spearheaded by experts or vendors in the private sector, their primary focus is on economic outcomes, leading to initiatives in domains such as mobility, energy, and heating (Fekete, 2022). While sustainability is often a central tenet of these initiatives, its role in adaptation also remains marginal (Fekete, 2022). In light of these observations, the third research question is thus posed to ascertain the smart dimensions that are present in the smart initiatives related to CC strategic actions in the sample cities of this research. The following question is thus derived: RQ3. In which smart dimensions are European SCs performing strategic actions to face CC?

Finally, local governments must adopt innovative technologies to facilitate the planning and management of activities aimed at CC mitigation and adaptation. This is necessary to enable adaptation solutions and provide a foundation for their implementation (Pancewicz, 2021). In this regard, the advancement of ETs and SCs are bringing new opportunities for innovation in climate mitigation at both the local and global levels, even when projects address only a small number of resilience characteristics (Grovert et al., 2022; McPherson and Clarke, 2024).

Nonetheless, prior research indicates that sustainability measures in SCs are seldom driven by advanced technology, despite the SC agenda being centred on such innovations (Haarstad and Wathne, 2019; Kuo and Li, 2022). Only recent research has detected a change in this trend, thereby identifying intensive efforts aimed at addressing the CC with the integration of innovative solutions based on AI, IoT, and Big Data (Bibri et al., 2023). Consequently, environmentally sustainable SCs have emerged as a rapidly expanding trend, exhibiting a marked escalation from 2016 to 2021, largely attributable to the advent of the pandemic and the rapid advancement of data-driven technologies (Bibri et al., 2023). Within this context, the fourth research question guiding this study is as follows: RQ4. Which ETs are being used for facing the CC challenge into the urban context? And how are the ETs used in the different smart dimensions?

2. Data and Research Methods

Citizens are increasingly concerned about the effects their actions have on the environment, as these impacts directly affect their quality of life. As awareness grows, the need to address climate changes becomes even more pressing (Wang and Zhou, 2023; Masrur and Sharifi, 2022). The implementation of new technologies is no longer sufficient to improve citizens' lives, emerging technologies are increasingly gaining more presence. In fact, they are explicitly playing a crucial role in the fight against climate change, as the integration of these technologies not only optimizes urban resources but also fosters the creation of more sustainable urban environments (Theodora and Stratigea, 2021; Kuo and Li, 2022; Yukhno, 2024; Zhen et al., 2024). So, it is essential to understand how smart cities are incorporating these technological innovations into their strategies and how these initiatives contribute to mitigating the impact of climate change.

With this objective in mind, this study focuses on analysing how the leading European smart cities develop environmental strategies to reduce the effects of climate change, leveraging the potential of emerging technologies. The process of data collection occurred in two phases. The first phase involved identifying the European cities recognized as "smart cities" across a series of prominent international rankings such as: Euro Smart Cities 2024/2025, Cities in Motion 2022, Easy Park IMD and Innovation Cities. These rankings are considered global benchmarks in assessing cities' ability to integrate emerging technologies, manage urban resources efficiently, and promote sustainability (Toh, 2022). To ensure a representative sample, cities that appeared in all these rankings were chosen, reflecting their established leadership in the field of smart cities.

In total, 25 European cities meeting these criteria were selected: Vienna, Brussels, Tallin, Helsinki, Lyon, Paris, Berlin, Hamburg, Munich, Dublin, Milan, Amsterdam, Rotterdam, Bratislava, Madrid, Barcelona, Bilbao, Gothenburg, Stockholm, Geneva, Zurich, Prague, Copenhagen, Rome, and Manchester. These cities were selected for their prominent position in the aforementioned rankings and their focus on strategic projects aimed at mitigating climate change.

Once the European cities were identified, the authors defined criteria for selecting the resilience and climate change strategy documents of these cities, drawing upon the framework proposed by Yigicanlar (2018). In this sense, the selection of these documents was: (1) the document must be officially issued or endorsed by the local government of the selected city; (2) it must explicitly address CC adaptation and/or urban resilience as a key strategic objective; (3) it must refer to the integration of emerging technologies within their strategic actions; (4) the document must be publicly available through the official website of the city; and (5) the strategy document must be a full report rather than an executive summary or highlights; (6) the publication date must fall within the period from 2015-2024 to ensure currently and relevance to the contemporary planning context. This initiated the second phases, which was further divided into two sub-phases. Firstly, between October and November 2024, these documents were accessed through the official websites of the cities, and the data was collected and reviewed for the purpose of identifying the key initiatives, stakeholders, and strategies used to address urban climate challenges. Afterwards, the strategies were thoroughly examined, leading to a total of 1,439 cases of smart initiatives. These initiatives were classified based on the department in charge of the initiative, the smart city domain, the stakeholders involved, and the vision, objectives and strategies for mitigating the impact of climate change.

3. Analysis of results

Climate change represents one of the most pressing challenges of the 21st century, particularly in urban context where cities must develop effective strategies to mitigate its effects and enhance resilience. In this regard, smart cities have emerged as hubs of innovation, leveraging emerging technologies (ETs) to improve sustainability and climate governance (Gil-García et al., 2014; Valle-Cruz, 2019). Such technologies enable local administrations to optimize decision-making, coordinate multiple stakeholders, and enhance the efficiency of environmental policy adoption (Kalampokis et al., 2023). However, the effectiveness of these approaches largely depends on the presence of specified organizational structures and interdepartmental collaborations (Rodríguez Bolívar et al., 2020).

Next, the obtained results will be analysed to answer each of the previous described research questions, aiming to provide a comprehensive perspective on the degree of institutionalization of sustainability in European Smart Cities, the cross-sectional nature of their climate policies, and the role of ETs in the transformation of urban governance.

3.1 RQ1: Do smart cities have dedicated departments for sustainability or resilience management?

To assess if the department of Climate and Sustainability Protection leads the initiatives concerning sustainability issues in each European Smart Cities, we first analyse the entity that leads each initiative. In figure 1, we can observe that just 2 percent of the analysed European initiatives are not directly led by the municipal council.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Although collaboration with private companies and academia is highly promoted in European initiative, it seems that only 1 percent of them are led by a private company and leadership by research institutions is practically non-existent (0.35%).

A significant portion of European initiatives (66.16%) do not specify the leading entity, indicating the lack of transparency in project governance. Among the identified leaders, almost 6 percent of initiatives are led by a dedicated municipal department for sustainability or resilience, while a considerably higher percentage (26.27%) are managed by other municipal departments not specially focused on resilience or sustainability. This suggests that, although European Smart Cities have established specialized governance structure for climate action, a significant portion of the initiative address more specific aspect such as a sustainable mobility, building efficiency, urban infrastructure improvements, support for vulnerable groups and so on, which require the assignment of departments better equipped to handle these challenges. As a result, instead of being centrally managed by sustainability or resilience departments, these initiatives are integrated into broader municipal strategies through the relevant sectoral departments. This aligns with prior research highlighting the uneven institutionalization of sustainability governance across smart cities.

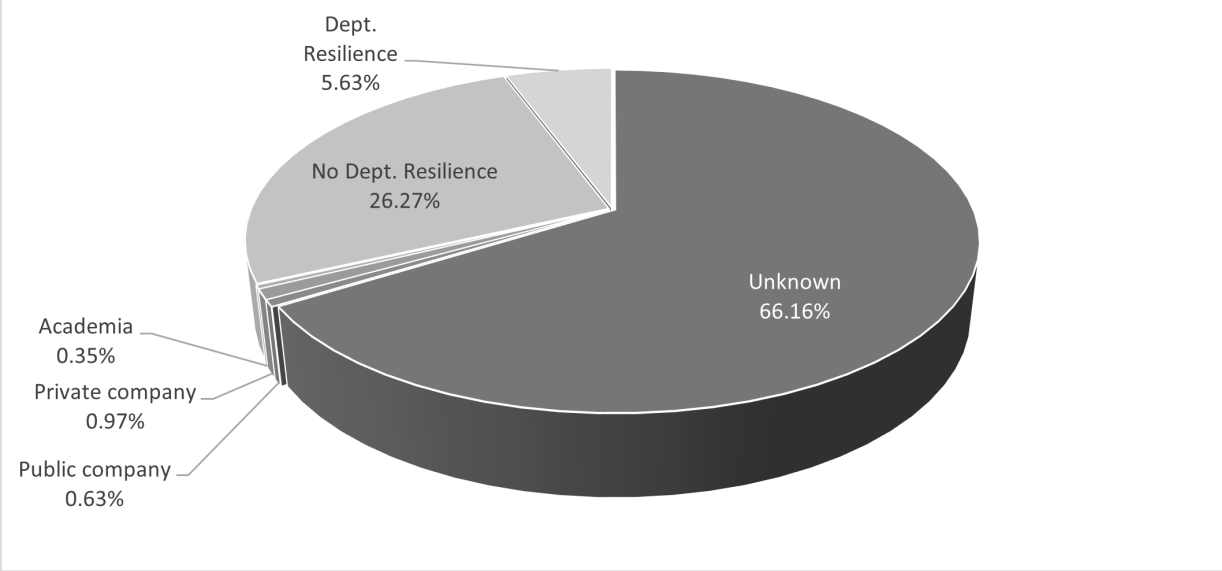

Fig 1 – Departments or Institutions leading European initiatives

Secondly, to further analyse the departments or institutions leading European initiatives, we will evaluate what happens in each of the smart dimensions. For this, the different initiatives have been categorized according to their specific goals based on the smart dimensions of Smart Cities established by Giffinger and Gudrun (2010). The results reveals that a significant portion of initiatives, particularly those related to living -quality life, cultural services, social cohesion and, safety and housing- lack specified leadership (almost 45 percent – see figure 2).

Regarding institutional leadership, public companies play a dominant role in mobility issues (87.5 percent). It may be due to the fact the public transport is generally not an attractive sector for private companies, as it is often not highly profitable. Nevertheless, their presence in other dimensions is minimal. In contrast, private companies emerge as main leaders in environmental initiatives (42.86 percent). It may suggest that these issues require the development and use of advanced technologies that are primarily created and managed by private companies, making their involvement essential in implementing innovative and technical solutions in this field.

Although research institutions play a limited role overall, their involvement in mobility issues (80%), highlighting their contribution to research, technological development, and innovation in transportation and ICT accessibility. However, their absence in other dimensions suggests that they are not primary actors in the direct governance of sustainable initiatives.

As for municipal leadership, sustainability or resilience department is predominant in environmental initiatives (39.51 percent), followed by governance and people initiatives (both 18.52 percent), likely due to their involvement in climate policies, transparency, citizen engagement, and education initiatives on sustainability. We can also observe that environmental initiatives (31.75%) are led by other departments (not sustainability or resilience), as well as living and mobility (both 18.52 percent), reinforcing the idea that each department oversees initiatives aligned with its area of expertise. Therefore, it confirms that European smart cities do not follow a unified governance model for sustainable initiatives.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

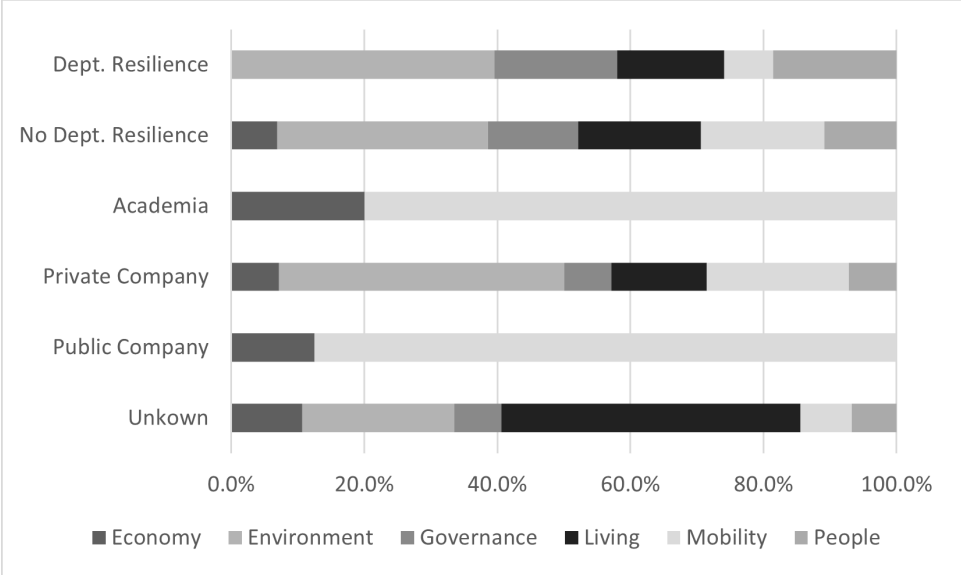

Fig 2 – Departments or Institutions leading European initiatives, depending to smart dimensions

3.2 RQ2. Which department of the city are involved into the strategic planning processes of the measure to protect sustainability and improve city resilience?

In figure 3, we can observe that the majority of European initiatives following a vertical approach, since 70.54 percent of projects being led by a single department. In contrast, just 29.7 percent of European initiative involve multiple departments (transversal approach). Although there is some level of interdepartmental coordination, it remains less common, despite its potential benefits in optimizing resources and creating synergies between different urban policies. The lower percentage of transversal collaboration may reflect structural challenges, such as the complexity of coordinating across departments, bureaucratic barriers, or the need for more integrated governance frameworks. These results align with previous literature, which highlight the difficulties cities face in establishing cross-departmental collaboration for smart initiatives, due to institutional silos, lack of communication channels, and the predominance of sectoral governance models (Liarte et al., 2024; Zhu et al., 2024; Alcaide Muñoz et al., 2023, Rodríguez Bolívar et al., 2023).

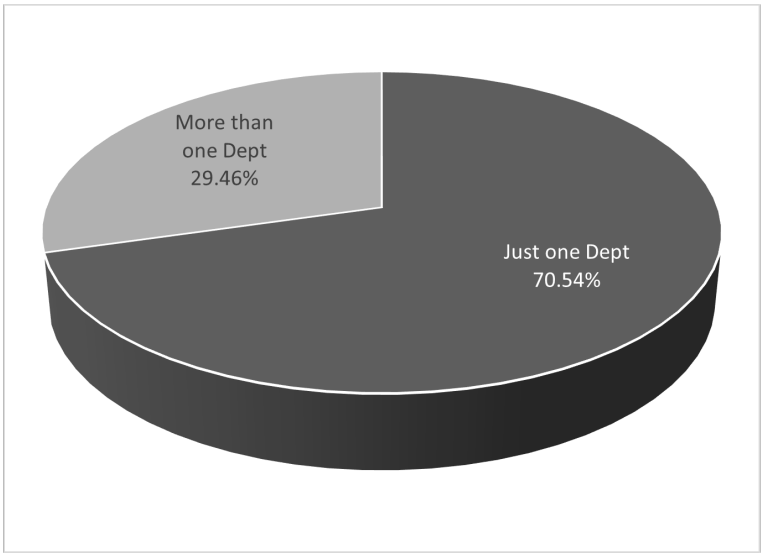

Fig 3 – Interdepartmental collaboration

The analysis provides further insight into how different smart dimensions are managed within vertical and transversal approaches in European smart cities. In this sense, the environment dimension is predominant managed through a vertical approach, that is, 30.35 percent of projects do not involve another department, while only 15.80 percent promote institutional collaboration. It reflects that environmental policies tend to be centralized within specialized municipal units, likely due to the technical expertise required for managing climate-related initiatives, sustainable resources use, and regulatory compliance. As a result, it can limit cross-

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

departmental synergies and interdisciplinary collaboration.

The living dimension exhibits the highest level of transversal governance (47.64 percent). It suggests that initiative related to urban well-being require coordination between housing, social affairs, urban planning and environmental departments to ensure a holistic approach to urban sustainability. Additionally, governance dimension also has a greater degree of interdepartmental collaboration (13.68 percent). This is aligned with previous studies suggesting that governance improvements, particularly in areas like transparency, citizen participation, and decision-making processes, often require multi-stakeholder coordination (Alcaide Muñoz et al., 2023, Rodríguez Bolívar et al., 2023). Finally, mobility, people and economy-related initiatives display a more balanced distribution between vertical and transversal governance models, with no significant disparities between the two approaches.

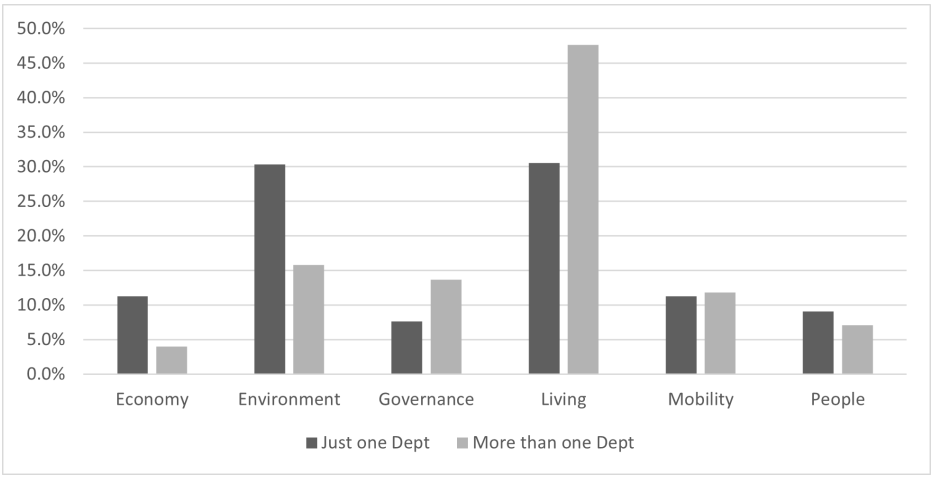

Fig 4 – Interdepartmental collaboration, depending to smart dimensions

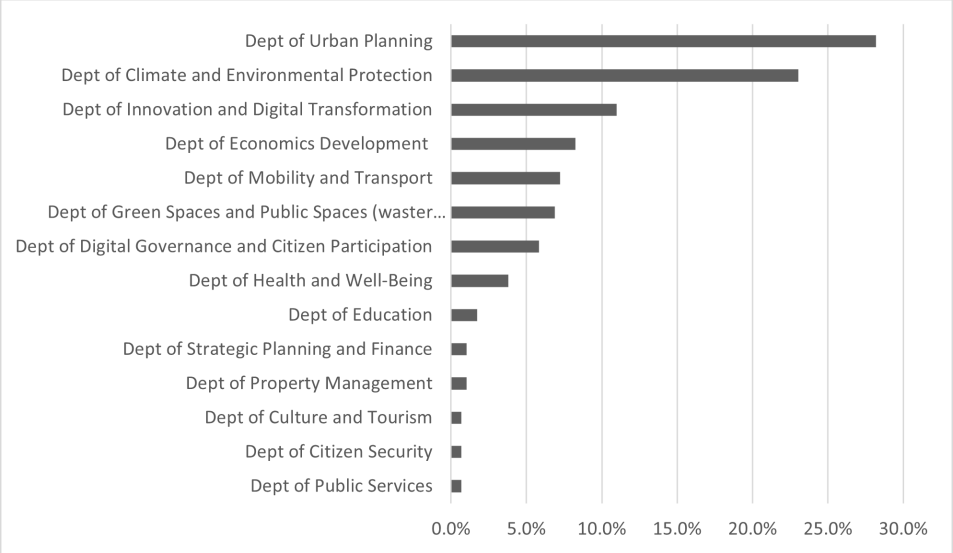
To further explore the governance of sustainability initiatives, we will analyse the departments involved specifically in initiative directly focused on environmental issues (see figure 5). So, we can identify municipal departments that play a central role in environmental governance and how different sectors contribute to the implementation of sustainability policies within European smart cities. In this term, the department of Urban Planning and the department of Climate and Environmental Protection (28.18 percent and 23.02 percent, respectively) play the most significant roles, reflecting the importance of land use planning, infrastructure adaptation, and environmental regulation in addressing sustainability challenges. It suggests that urban planning initiatives are deeply integrated with environmental policies to ensure sustainable urban development.

Alongside these main departments, others contribute to environmental initiatives, revealing the interdisciplinary nature of sustainability efforts. There is a growing emphasis on technological solutions and digital engagement in environmental initiatives due to their involvement of the department of innovation and digital transformation and the department of digital governance and citizen participation (10.99 percent and 5.84 percent, respectively). This in line with previous research on the trend of cities to improve citizens' lives through the adoption of use of technology (Alcaide Muñoz et al., 2023; Wang and Zhou, 2023; Sari, 2023).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license



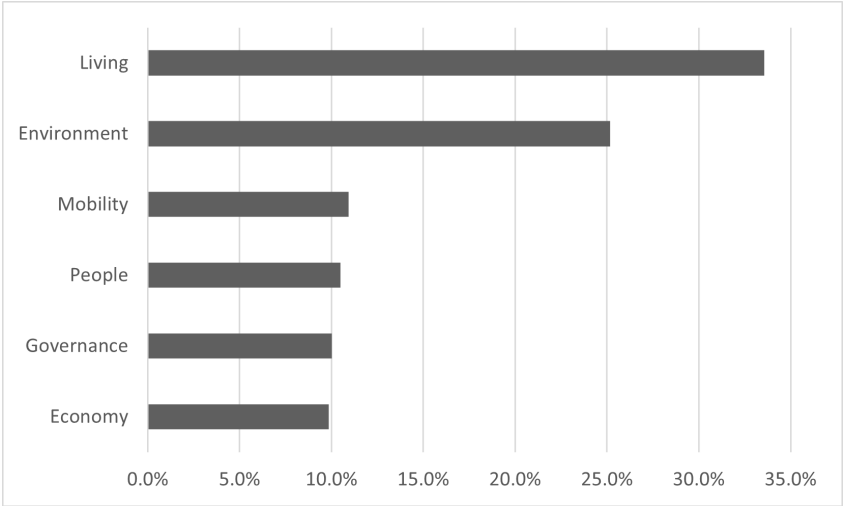


Fig 5 – Department involved in environmental initiatives

Another noteworthy aspect is the involvement of economics and mobility-related departments in environmental initiatives (8.25 percent and 7.21 percent, respectively), which reveals the significant link between environmental sustainability and both economic and mobility issues. Additionally, the existence of a broad scope of environmental initiatives in public health, green infrastructure and education programs issues is also revealed -the department of health and well-being with 3.78 percent, the department of green spaces and public services with 6.87 percent and the department of education with only 1.72 percent-. Nevertheless, the lower involvement of public services, culture and tourism, and citizen security departments (each below 1 percent) suggests their indirect role in climate change affairs.

3.3. RQ3. In which smart dimensions are European Smart Cities performing strategic actions to face climate change?

Figure 6 shows the key actions and thematic areas promoted by European smart cities in their efforts to tackle climate changes. So, we can determine which aspects of sustainability and resilience are being prioritized by such cities under study. It will provide insight into the specific themes and initiatives that are most significant to European smart cities, highlighting their approaches to creating sustainable and resilient urban environments and mitigating their impacts of climate changes.

The main priority of European smart cities is the improvement of quality of life, urban spaces, social cohesion, and safety and housing issues (living dimension-33.56 percent-), as well as the mitigation of climate change via the improvement of energy efficiency and green infrastructure, and the promotion and adoption of sustainable resources (environment dimension-25.16 percent-). Both dimensions involved actions aimed at creation more resilient urban environments and climate adaptation, which reinforces the commitment of cities to adopt eco-friendly initiatives.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Fig 6 – The main scope of European initiatives

The following themes that seem to concern European smart cities are those related to the sustainable mobility and economy (10.94 percent and 9.85 percent, respectively). This shows the great concern from both citizens and their policymakers regarding the high levels of pollution and congestion in European cities, motivating the acceleration of the transition to low-carbon transportation and sustainable mobility solutions in order to reduce their environmental impact. In addition, although at first glance economics factors are not as prominent as environmental or social factors, in the strategic actions against climate change, we can expect that the economy dimension to become more relevant as cities aim to integrate green business models and sustainable growth.

Lastly, the Government dimension, accounting for 10.02 percent, indicates the need for transparent decision-making, participatory governance, and collaboration across stakeholders, which underscores the importance of policy frameworks and institutional cooperation in adopting effective climate change initiatives.

3.4. RQ4. Which Emerging technologies are being used for facing the climate change challenge into the urban context? And how are the ETs used in the different smart dimensions?

Emerging technologies play a pivotal role in shaping the future of urban governance, particularly in the context of addressing the complex challenges posed by climate change and sustainability (Suprayitno et al., 2024). Technologies such as big data, artificial intelligence (AI), smart sensors or blockchain, offer unprecedented opportunities to enhance decision-making, optimize resources management, and foster transparency in public administration (Yukhno, 2024). These innovations enable governments to process vast amounts of data in real-time, allowing for more informed, agile responses to urban challenges (Gil-Garcia et al., 2014). However, despite their potential, the integration of emerging technologies into public sector operations presents several challenges. Public administration must contend with issues such as data privacy and security, bureaucratic resistance, skill gaps, and the need for interdepartmental coordination (Kankanhalli et al., 2023; Alcaide Muñoz et al, 2023; Zhu et al., 2024; Liarte et al., 2024). Furthermore, their successful adoption requires significant investment in infrastructure, capacity building, and the development of regulatory frameworks that ensure ethical and effective use (U.S. Government Accountability Office – GAO-, 2021; Merguel et al., 2024). As cities increasingly rely on these technologies to drive sustainability and resilience, it is essential for policymakers to address these challenges to fully leverage the transformative potential of emerging technologies for public governance (Kalampokis, et al., 2023; Rodríguez Bolívar et al., 2023).

As we can see in figure 7, emerging technologies such as big data and smart sensors are the most widely used, in fact 16.06 percent and 14.03 percent of European initiatives incorporating these solutions, respectively. Big data allows cities to process vast amounts of environmental, transportation and infrastructure data, facilitating informed decision-making that optimizes resources management and supports climate mitigation initiatives. Similarly, smart sensors, deployed throughout urban environments, provide real-time data on key metrics such as air quality, energy consumption, and even traffic flow, enabling cities to monitor and respond to environmental challenges more effectively.

Digital tools, encompassing a wide range of platforms and applications, emerge as a centra technology in 11.57 percent of initiatives. They play a crucial role in urban management by facilitating the integration of various systems, including smart grids and sustainable urban planning frameworks. By leveraging these tools, cities can enhance their operational efficiency and make more informed, data-driven decisions regarding climate resilience. In addition to these, artificial intelligence (AI) (9.48 percent) is a pivotal technology for developing predictive models and optimization algorithms. It plays a critical role in urban sustainability by enabling cities to anticipate environmental challenges, such as extreme weather events, and optimize energy consumption across systems. This technology contributes to enhanced climate adaptation initiatives, ensuring that urban areas can adjust to rapidly changing environmental conditions.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

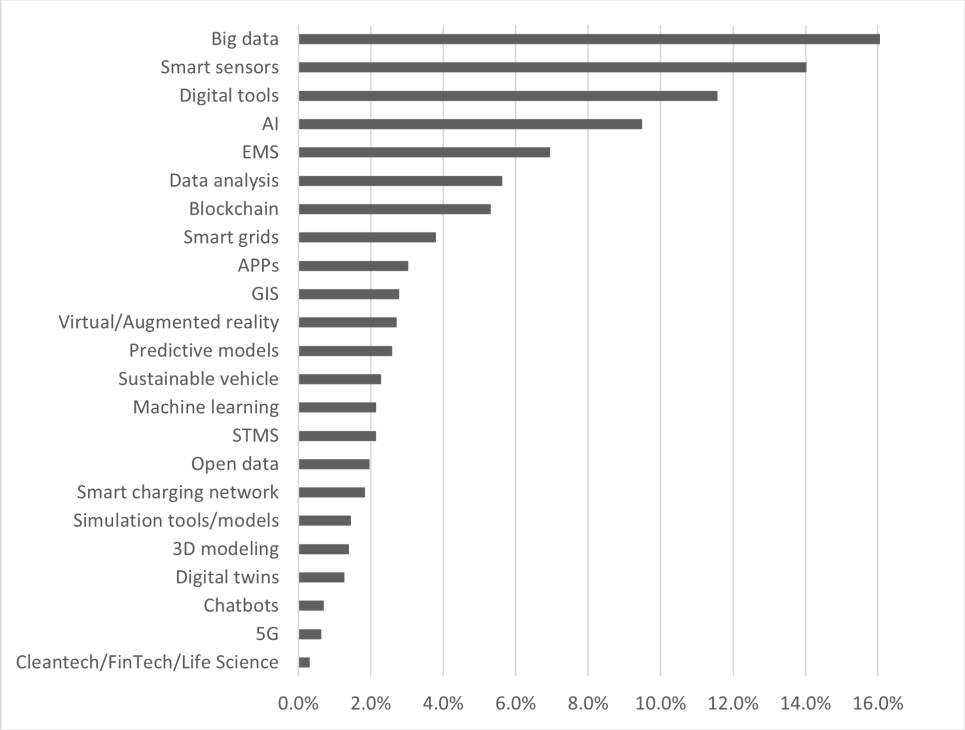

Fig 7 – The main emerging technology used in European initiatives

Energy Management System (EMS) appears in almost 7 percent of initiatives. This technology enables cities to monitor, control and optimize energy distribution and consumption in real-time, ensuring that energy use is both efficient and sustainable. By integrating renewable energy sources and improving the efficiency of urban energy systems. EMS technology significantly reduce cities' carbon footprint. Another important technology in environmental initiatives is blockchain (5.32 percent). Such technology improves transparency, security and efficiency in the management of environmental data. In fact, Blockchain is a great promise in sectors such as carbon credit trading, waste management, and the management of sustainable supply chains, providing secure, immutable records and environmental actions and facilitation accountability in urban sustainability efforts.

Figure 8 shown the representation of each emerging technologies depending on the specific goals of each initiative. In this sense, technologies as EMS and smart sensors and EMS (60.87 percent and 39.39 percent, respectively) play a central role, emphasizing the importance of environmental monitoring and efficiency energy management in European cities' sustainable initiatives. Moreover, big data, with a 21.26 percent of initiatives, and IA, with a 20. Percent of initiatives, are widely used, underscoring the growing reliance on data-driven decision-making to tackle environmental challenges and optimize urban systems.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

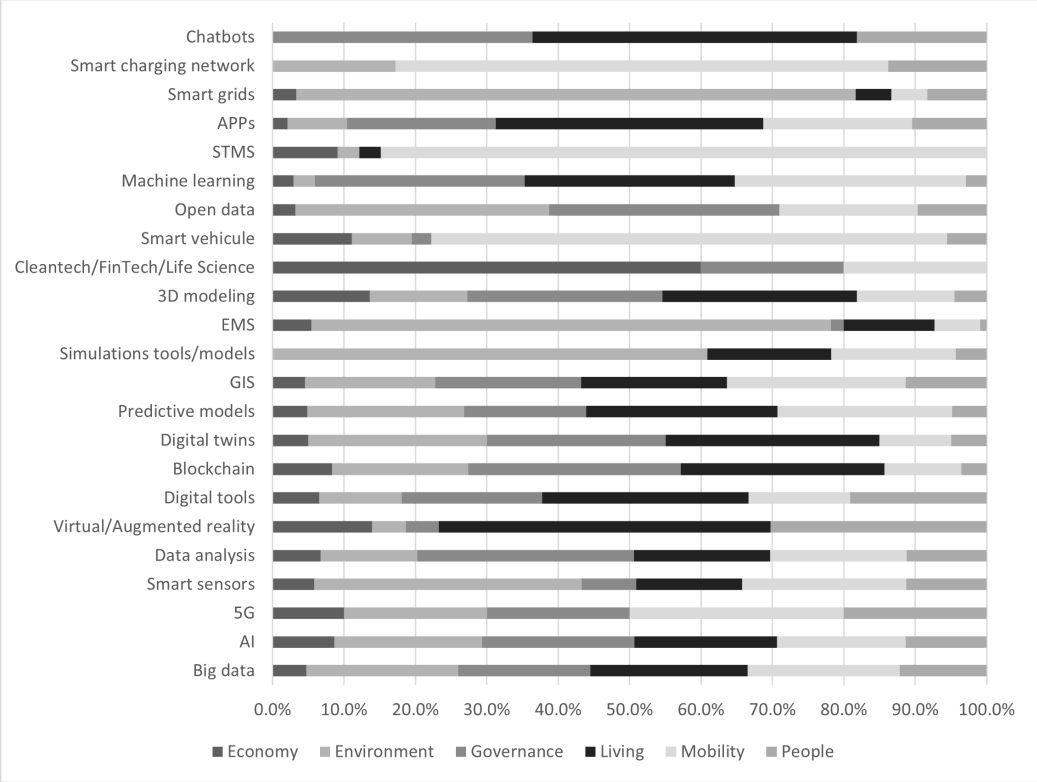

Fig 8 – The main emerging technology used in European initiatives, depending on smart dimensions

Initiatives focused on improving citizens' lives, social cohesion, safety and housing as well as promoting culture and tourism, show a greater presence of virtual/augmented reality and digital tools, with 46.51 percent and 28.96 percent, respectively. It suggests that such technologies are leveraged to enhance urban quality of life, public engagements, and the design of more interactive and sustainable urban spaces. They likely contribute to creating more resilient and adaptative environments that can respond effectively to climate change.

In the case of sustainable mobility issues, the use of smart grids (84.85 percent) and smart vehicles (72.22 percent) stand out. These technologies reflect the growing emphasis on sustainable transportation solutions, such as electric vehicle and intelligent transportation systems, designed to reduce carbon emissions and improve urban mobility. This trend aligns with the push for greener, more efficient cities with less reliance on fossil fuels (Inci et al., 2024; Zheng et al., 2024; Khaleel et al., 2024).

Furthermore, predictive models and digital tools (20.45 percent and 19.67 percent, respectively) are key to enhancing digital governance and transparency in city management (governance smart dimension). The use of these technologies enables municipalities to implement more efficient policymaking, predictive analytics for urban planning, and citizen engagement initiatives making them central to the development of smart government frameworks. Digital tools (19.13 percent), along with chatbots (18.18 percent), are commonly used to improve public services and citizen interaction (people smart dimension), as they not only facilitate better access to services, but also enhance public participation and help cities engage with their populations more effectively.

Lastly, in the economy dimension, CleanTech/FinTech is predominant, used in 60 percent of economic initiatives. This suggests that European cities are focusing on leveraging sustainable technologies and financial technologies to drive economic transformation, aiming to transition towards more eco-friendly and resilient economic structures. These initiatives align with the growing interest in circular economy models, seen as key to promoting long-term economic sustainability in urban environments. Other emerging technologies such as AI (8.57 percent), data analysis (5.86 percent), big data (4.72 percent), and AI are predominant, emphasizing the importance of data-driven decision-making in fostering sustainable economic practices and business models. Additionally, digital tools, with 6.56 percent, and smart sensors, with 5.86 percent, are employed to optimize resources allocation and urban economic planning, enabling smarter and more efficient economic initiatives.

Blockchain (5.31 percent) and predictive models (4.88 percent) also play a role in supporting financial innovation and enhancing the resilience of urban economies, ensuring that cities can adapt to shifting economic landscapes and incorporate green business models.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

To summarise, big data, AI and smart sensors are foundational to environmental and governance initiatives, while virtual/augmented reality, smart grids, and smart vehicles dominate in living and mobility initiatives. In addition, CleanTech/FinTech have a significant presence in economic initiatives. Therefore, European cities are increasingly integrating emerging technologies into their initiatives to address climate change and urban resilience in a comprehensive manner. By targeting specific goals, European cities are adopting a multifaceted approach to achieving sustainability and adapting to the challenges posed by climate change.

4. Conclusions and discussion

This study has analyzed how a set of European smart cities strategically plan actions to address the challenge of climate change through the implementation of smart initiatives. Specifically, four key aspects have been examined: the governance of these initiatives, including institutional leadership and the departments involved; the smart dimensions in which climate adaptation strategies are being developed; the role of emerging technologies in urban planning and climate resilience; and the integration of these technologies into the various smart dimensions of the city.

Unlike previous studies that have analyzed climate governance in smart cities in isolation (Hofstad et al., 2022) or focused solely on the role of emerging technologies in urban planning (Bibri et al., 2023; Su and Fan, 2023), this study offers an integrated perspective that combines both approaches. This allows for a deeper understanding of how governance structures influence the adoption and effectiveness of technological solutions in the context of climate action. While previous research has highlighted institutional fragmentation in smart city planning (Liarte et al., 2024; Zhu et al., 2024), this study advances by identifying the specific departments involved in the strategic planning of climate initiatives, highlighting the absence of efficient interdepartmental coordination structures.

The findings reveal that, although European smart cities have made progress in incorporating climate strategies into their urban plans, the governance of these initiatives does not follow a uniform model. While some municipalities have established dedicated departments for resilience and sustainability, a significant portion of initiatives remains managed by other municipal areas without a clear centralized structure. This aligns with previous studies indicating institutional fragmentation and the lack of coordinated leadership as barriers to the effectiveness of climate adaptation strategies (Birchall et al., 2023; Reckien et al., 2023).

Moreover, the analysis reveals that private sector involvement in the formulation and leadership of these initiatives is minimal. Similarly, the engagement of academic institutions and research centers in strategic planning is practically nonexistent. This finding is particularly relevant as it contrasts with trends observed in other regions, where public-private collaboration and the incorporation of scientific knowledge play a fundamental role in innovation and the formulation of urban sustainability strategies (OECD, 2024a; McPherson and Clarke, 2024). The limited presence of these key actors in the planning of European smart cities suggests a lack of articulation between technological and scientific advancements and their application in climate governance, potentially limiting the impact and effectiveness of implemented initiatives.

Regarding the dimension of urban initiatives, mobility is predominantly led by the public sector and primarily managed by municipal enterprises. This due to the strategic nature of transportation, the substantial investment in infrastructure it requires, and the strong governmental control and regulation in place. Private sector participation in this area is generally limited to complementary services. In contrast, environmental initiatives exhibit a high degree of private collaboration, as they largely rely on innovation and technological specialization. Meanwhile, initiatives aimed at enhancing quality of life face an unclear distribution of responsibilities, which could limit their overall impact. To improve governance in smart cities, it is essential to establish clearer structures and strengthen transparency in the management of urban initiatives, ensuring greater efficiency and sustainability in their implementation.

Moreover, the results highlight a lack of interdepartmental collaboration, as few initiatives involve multiple departments. This low incidence suggests the presence of structural and organizational barriers, such as the complexity of administrative coordination, bureaucratic rigidity, and the absence of more integrated governance frameworks. These findings reinforce prior evidence on the obstacles posed by institutional silos and the lack of interdepartmental communication, factors that continue to hinder the effectiveness of climate strategies in smart cities (Liarte et al., 2024; Zhu et al., 2024; Alcaide Muñoz et al., 2023; Rodríguez Bolívar et al., 2023).

The analysis of the smart dimensions involved in climate planning shows that initiatives related to environmental sustainability and urban quality of life are the most represented, reinforcing the idea that climate action is being integrated into key urban aspects (García Fernández and Peek, 2020; Bibri et al., 2023). However, the limited interconnection between these initiatives and other strategic dimensions, such as mobility and the economy, suggests that opportunities remain for greater cross-cutting integration of climate policies within smart urban planning.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

European smart cities are prioritizing quality of life and environmental sustainability in their strategic approaches, with a strong emphasis on sustainable mobility and the development or greener economies. This focus is largely driven by the existing regulatory framework and sustainability policies within the EU -particularly the European Green Deal 2050 (European Commission, 2024)- as sustainable mobility is considered a strategic priority due to its direct impact on emission reduction and public health improvement.

Furthermore, the study confirms that tools such as big data, AI, and smart sensors are playing a fundamental role in data-driven decision-making and the efficient management of urban resources. However, their implementation still faces significant challenges, including the lack of interdepartmental integration, the need for greater investment in infrastructure, and the regulation of data usage. In particular, the adoption of more advanced technologies, such as blockchain or AI predictive models, remains limited, raising questions about the barriers hindering their integration into urban climate governance (Kalampokis et al., 2023; Rodríguez Bolívar et al., 2023). To overcome these limitations and maximized their impact, a coordinated strategy between governments, businesses, and citizens is essential, ensuring that technological innovations are both accessible and sustainable in the long term.

Based on the results obtained, several lines of research are identified that can contribute to a more detailed understanding of the challenges and opportunities in the strategic planning of smart cities in response to climate change. First, the absence of a unified model and the predominance of sectoral approaches hinder interdepartmental coordination and limit the effectiveness of climate initiatives. Further research is needed to analyze collaborative governance models that promote greater articulation between municipal departments and levels of government, fostering more cross-cutting and adaptive decision-making structures. Future studies could examine successful cases where the integration of governmental actors has facilitated more efficient and coordinated planning.

Similarly, assessing the real impact of emerging technologies on climate adaptation and mitigation represents a priority research area. Although tools such as artificial intelligence, blockchain, and big data have demonstrated high potential for optimizing urban processes and enhancing climate resilience, their effectiveness remains insufficiently documented. Empirical studies are required to analyze the extent to which these technologies have contributed to reducing emissions, improving energy efficiency, or strengthening the capacity to respond to extreme climate events. Additionally, identifying the factors that facilitate or hinder their implementation in different urban contexts would allow for more precise recommendations for their integration into municipal planning.

In conclusion, this study contributes to the understanding of strategic planning in smart cities in response to climate change by providing an integrative perspective on the intersection of governance, technology, and the participation of strategic actors. The identification of shortcomings in interdepartmental collaboration, the limited involvement of the private and academic sectors, and the need to assess the impact of emerging technologies underscore the importance of advancing these research lines. The consolidation of more efficient and adaptive governance models will be crucial to ensuring that smart cities can respond more effectively and in a coordinated manner to future climate challenges.

Abstract. The inteli.gente platform is an adaptation and expansion of the Sustainable Smart City Maturity Model of the International Telecommunication Union – SSCMM-ITU and is the first step towards the formation of a Brazilian BIG DATA with customized information on the levels of maturity in digital transformation and sustainable development. The diagnoses and recommendations for the estimated maturity levels use AI and data science techniques for the analyses, predictions and estimates of the 5,570 municipalities, considering the diverse characteristics and specific needs of each Brazilian territory. The result presented on the Brazilian maturity level for digital transformation and development indicates a country between the planning level (3) and the alignment level (4) of its actions. For the sociocultural dimension, the diagnoses of the municipalities indicate the need for attention in their management and governance policies for digital inclusion and social inclusion in an equitable manner throughout their territory. For the economic dimension, the results indicate that Brazil already has a framework of management tools implemented that enable the development of digital transformation and a sustainable economy. The environmental dimension indicates that strong action is needed to improve basic infrastructure in sanitation, solid waste, among other topics for the resilience of future generations. The result of the Brazilian maturity level for the institutional capabilities dimension demonstrates that municipalities should be concerned with data governance, training leaders for digital transformation, planning and elaboration of goals and plans, among other topics. The availability and use of the inteli.gente platform by managers and public policy makers, using Artificial Intelligence (AI) tools, has made it possible to map and improve institutional public policies based on primary and secondary data from municipalities, promoting cooperation, exchange and the creation of innovative initiatives related to digital transformation and sustainable development in the public sector.

1. Introduction

Planning and actions to become a smart city are increasingly present in sustainable development and digital transformation agendas around the world. The concepts of smart cities emerge from the development of information and communication technologies (ICT) and the need for their incorporation into the governance of public services, both in urban and rural environments.

According to Bibri, S. E., & Krogstie, J. (2017), smart city models were developed through standardization and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

assessments to define their maturity level and for comparisons and incentives to competitiveness. In this sense, the Brazilian Ministry of Science, Technology and Innovation (MCTI) adapted and expanded the inteli.gente platform, a Sustainable Smart Cities Maturity Model (SSCMM- ITU-T Y 4906, 2016), developed by the International Telecommunication Union (ITU), to Brazil. Used mainly in countries of the Global North, also called U4SSC, it is a flexible model that can be applied in different contexts for decision-making regarding the use of technological infrastructure for digital transformation and sustainable development, with the differential of focusing on quality of life for the population.

The National Center for Research in Applied Artificial Intelligence – IARA-USP, supported by MCTI, since November 2021, has remodeled the inteli.gente platform, with AI tools transforming it into a data lake for sustainable development and digital transformation with estimated diagnoses of maturity levels for all Brazilian municipalities.

Using Artificial Intelligence (AI) tools, it is possible to map and improve institutional public policies based on data provided by municipalities, promoting cooperation, exchange and the creation of innovative initiatives related to digital transformation and sustainable development in the public sector.

Inteli.gente is made available free of charge to 5,570 municipalities for the management and governance of data and knowledge in real time, as well as to public policy makers, academia, the general population, students, council bodies, among others. Other initiatives for smart cities are applied in Brazil, as well as some indicators and metrics for international comparability: ITU ICT Development Index (IDI), Cybersecurity: ITU Global Cybersecurity Index (GCI), E-Commerce: UNCTAD B2C E-commerce Index, E-Gov: UN E-Government Development Index (EGDI).

As an ITU Member State, Brazil has approved the inteli.gente platform as a Brazilian use case in the implementation of the SSCMM-ITU (Y-78 ITU-T, 2023).

1.1 inteli.gente platform

The methodology used in the expansion and adaptation of the SSCMM-ITU followed the studies reported in Yigitcanlar (2019), which consider that public participation in decision-making and collaboration between all stakeholders ensure progress towards sustainability.

In selecting the indicators, more than 1,000 indicators from various sources were analyzed, the most significant being (PCSI, 2018; ISO 37120, 2018; ISO 37122, 2019; ISO 37123, 2019; SEADE, 2023; ODS, 2023; CNM, 2023). From this evaluation, 113 indicators were selected. Due to its vast territorial extension, Brazil presents great regional and local differences. Although the laws stipulate that access to information and electronic services must be available on municipal websites, there are still varied realities between cities. In this diverse context, the inteli.gente platform is considered strategic, as it enables the understanding of these differences and realities, guiding the process of planning and building effective and efficient public policies for Brazilian cities.

The diagnoses and recommendations are divided into four dimensions: economic, environmental, sociocultural and institutional capacity, used for the management and governance of public policies. As in the SSCMM-ITU, the measurement of indicators in the inteli.gente platform adopts scoring levels based on the achievement of performance targets, defined based on the average Brazilian performance index, considering several thematic areas relevant to public policies for cities and the population.

The maturity levels provide a diagnosis for cities seeking their own development in the short, medium and long term. Each level has its objectives, indicators and expected practices organized by public policy themes, presenting an evolutionary diagnosis for sustainable smart cities.

The major change to the Brazilian model was the addition of two maturity levels at the bottom of the SSCMM-ITU. The other SSCMM-ITU maturity levels, known as planning, alignment, development, integration and optimization, were kept the same.

The two new Brazilian maturity levels were called "adherence" and "engagement" with the aim of covering Brazilian cities that are less advanced in terms of sustainable development and digital transformation. Thus, the creation of these two additional levels was necessary due to regional and local disparities between Brazilian cities, allowing all Brazilian cities to participate in the new model developed.

At the first level, called Adhesion, the city recognizes some of its main issues and understands the challenges for its digital transformation. This level is characterized by asymmetries in infrastructure, service provision and public facilities. The degree of digitalization related to services and processes is low. Cities at this level present the lowest results in terms of sustainable development and ICT indicators, indicating the need for improvements in economic, environmental and sociocultural aspects. The diagnoses provided by the inteli.gente platform at this level propose

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

the development of public policies that promote the benefits of public management in people's lives and improve sociocultural, economic and environmental indicators.

At the second level, called Engagement, we can see the beginning of transformation actions in the city. Sectoral goals for the incorporation of technology emerge. There are actions to identify the areas most prioritized for investments in basic infrastructure. Among the priorities are the reduction of asymmetries, the standardization of processes and the digitalization of public services, in addition to capturing ideas for the monitoring and evaluation of public policies. The diagnoses provided by the inteli.gente platform at this level propose to offer tools and paths for cities to improve their sustainable urban development strategy and digital transformation.

The structure of the inteli.gente platform is presented in Fig. 1, containing the topics (thematic areas) related to each dimension. These topics are used to guide the indicators according to their purposes.

The knowledge base and information for each topic are obtained through metrics, statistical analyses and adaptations based on (Odum, 1996; IISD, 1997). The data sources come from official regulatory bodies (secondary sources) and/or municipal managers (primary sources).

Thus, the diagnosis of the maturity level of the indicators in the inteli.gente platform offers opportunities and challenges to improve the provision of services to the population in terms of digital transformation, transparency and quality. These diagnoses and recommendations encompass aspects ranging from the infrastructure required for digital transformation and urban development to the training and digital literacy required for solutions and services that improve the quality of life of citizens and city management.

With the experience of the IARA team and based on cities interested in digital transformation and sustainable development, projects and analyses are developed with large volumes of personalized urban data, expanding the range of diagnoses and recommendations for cities, using data science (prescriptive and predictive analyses) in their public policies.

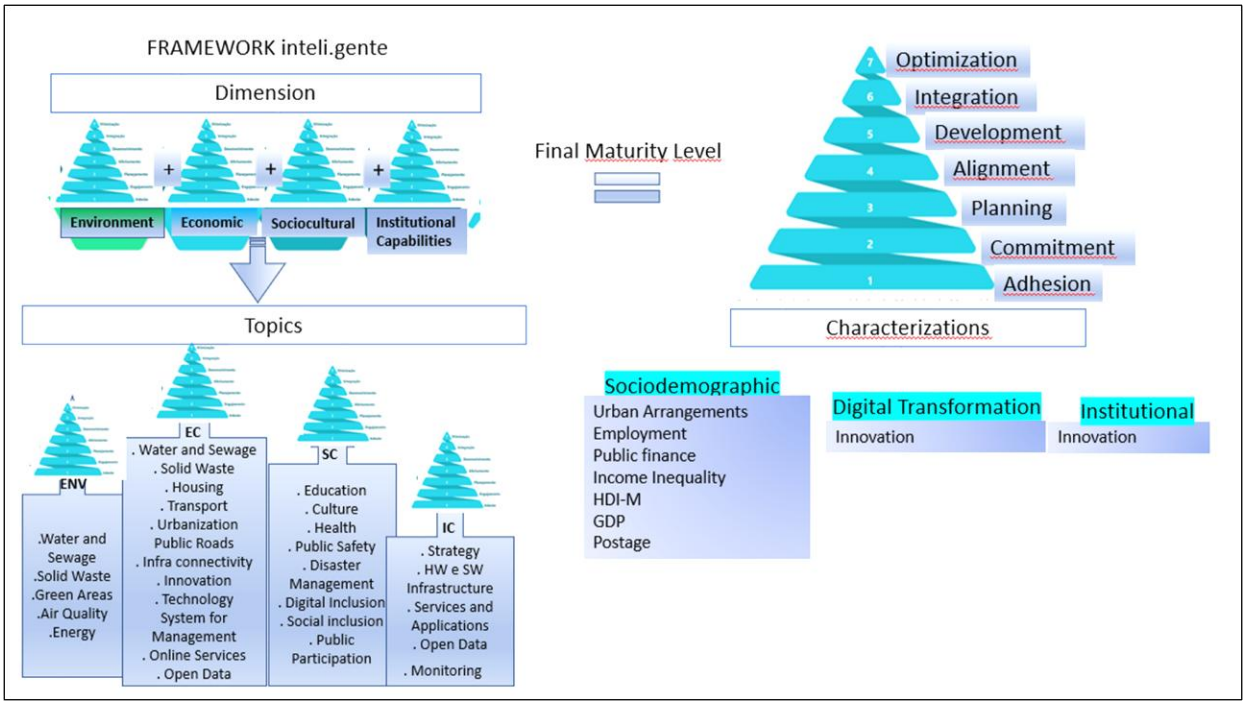

Figure 1 inteli.gente platform framework (Manual Reference, 2023)

2. Brazilian Results inteli.gente platform

The results presented in the inteli.gente analyses reflect the characteristics of a country in the global south, where municipal planning has not yet become a reality in local governance, although in some dimensional analyses the results indicate that the country has been implementing actions and programs for development.

The final maturity level in digital transformation and sustainable development estimated for Brazil, obtained by averaging the levels of Brazilian cities, was level 3 - Planning. This level obtained is equivalent to level 1 - Planning of the SSCMM-ITU.

The application of AI tools in the inteli.gente methodological model allowed cities to have their maturity level

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

estimated regardless of whether they provided their primary information in their own form.

The adaptations implemented in the inteli.gente platform for the Brazilian model were the use of four dimensions: Economic, Sociocultural, Environment and Institutional Capacity, which allowed the assignment of an estimated maturity level value to each dimension, indicator and public policy theme.

In this way, the final maturity level of the municipality is obtained by calculating the arithmetic mean of these four dimensions evaluated. The platform also used indicators to characterize the cities in terms of sociodemographics, digital transformation and institutional aspects.

The analysis of the indicators and themes of the economic dimension (Fig. 2) for Brazilian municipalities indicates that of the 5,570 municipalities, 152 still require greater efforts to reach the level of maturity in digital transformation Planning. These are municipalities that still need to be concerned with basic infrastructure in sanitation, solid waste, housing, innovation and governance strategies, development of master plans, among other topics. The 2,357 cities at maturity level 4 (alignment) and 2,438 at maturity level 3 (planning) indicate that Brazil already has a framework of management tools implemented that enable the development of digital transformation and a sustainable economy.

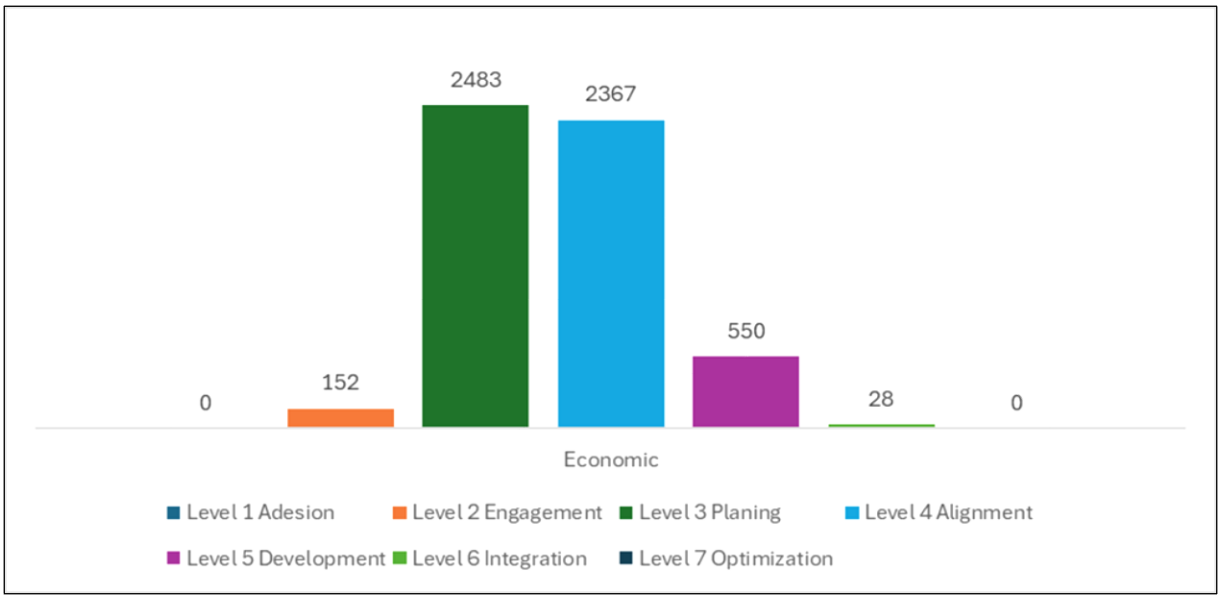

Figure 2 Maturity Level Economic Dimension All Brazilian cities

The analysis of indicators and themes of the environmental dimension (Fig. 3) for Brazilian municipalities indicates that of the 5,570 municipalities, 2,609 still need greater efforts to reach the level of maturity in digital transformation Planning. These are municipalities that still need to be concerned with basic infrastructure in sanitation, solid waste and governance strategies, development of master plans, among other topics. The main demands on solid waste are the lack of selective collection in cities and of selection and recycling, as well as waste of treated water, between the treatment plant/capitation and domestic taps. The 957 cities at maturity level 4 (alignment) and 1,990 at maturity level 3 (planning) indicate that Brazil already has a framework of management tools implemented that enable the development of digital transformation and the preservation and sustainable use of its green areas.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

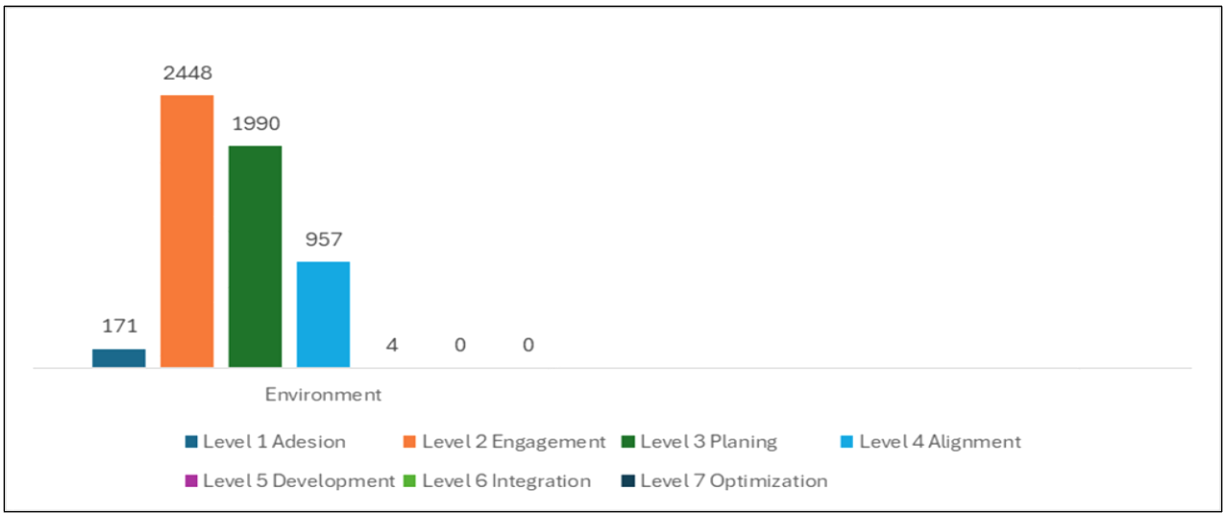

Figure 3 Maturity Level Environment Dimension All Brazilian cities

The analysis of the indicators and themes of the sociocultural dimension (Fig. 4) for Brazilian municipalities indicates that of the 5,570 municipalities, 171 still need greater efforts to be able to reach the level of maturity in digital transformation Planning. These are municipalities that still need to be concerned with basic infrastructure in sanitation, solid waste, health, education, public safety, among other topics. The low number of cities that still require an effort in governance shows that social programs and inclusion efforts are on a positive path. The 29 cities at maturity level 4 (alignment) and 4,356 at maturity level 3 (planning) indicate that Brazil, despite the effort in social inclusion, still needs attention in its management policies to enable the development of digital transformation and social inclusion in an equitable manner throughout its territory.

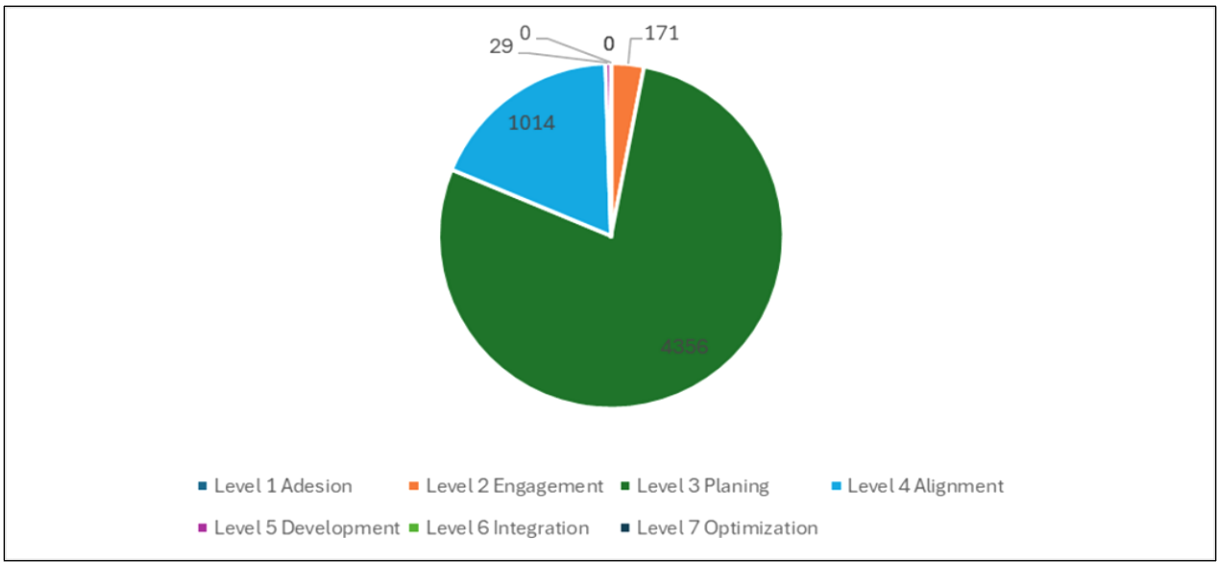

Figure 4 Maturity Level Socialculture Dimension All Brazilian cities

The analysis of the indicators and themes of the institutional capabilities dimension (Fig. 5) for Brazilian municipalities indicates that of the 5,570 municipalities, 5,026 still need greater efforts to be able to reach the level of maturity in digital transformation Planning. These are municipalities that still need to be concerned with data governance, training leaders for digital transformation, planning and developing goals and plans, among other topics. The 21 cities at maturity level 4 (alignment) and 514 at maturity level 3 (planning) indicate that Brazil, despite its efforts, still needs attention in its data management, transparency and public participation policies to enable the development of digital transformation and digital social inclusion in an equitable manner throughout its territory.

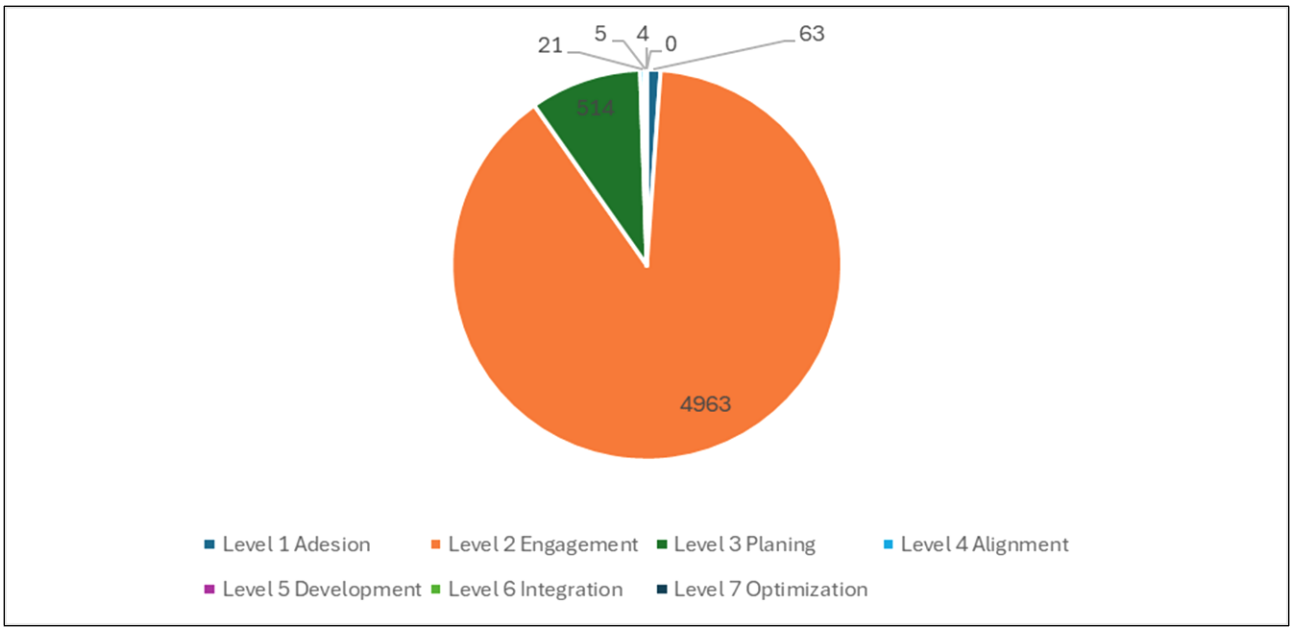

Figure 5 Maturity Level Institutional Capability Dimension All Brazilian cities

3. Conclusions

Diversity in Brazil has led to the need to contextualize recommendations regarding new maturity levels, with the main objective of covering the reality of Brazilian cities and their trajectories, as well as expanding the scope of analysis and diagnostics from the local to the global level of maturity of cities (Paseto, 2021:2020).

The new maturity levels implemented in inteli.gente have demonstrated asymmetries in infrastructure, service provision, public participation and public equipment made available to the population. The degree of digitalization related to services and processes in cities is still low, indicating the need to propose and develop public policies that promote the benefits of public management in people's lives and improve sociocultural, economic and environmental indicators.

The inteli.gente platform allows public policy makers to introduce and develop public policies with knowledge and in synergy with the needs of the population and also demonstrates that the level of maturity of digital transformation and sustainable development of a city does not depend on the size of the population, or even the influence of the municipal network, but rather on data management and governance where knowledge will be a feeding tool for decision-making.

Acknowledgement

We would like to thank MCTI for the research opportunity, CTI for initiating this work (2020-2021), IARA for continuing it (from November/2021:2025), RNP (2020:2023) for developing the digital platform and ANATEL for allowing us to disseminate and present new knowledge with SG 20 of SSCMM – ITU.

Abstract. Smart cities (SC) are becoming increasingly popular around the world. Within the scope of SC studies is governance, which is directly related to the success of planned actions. Refugee migration is currently a challenge all over the world. But at the local level (cities) it can be better examined. The local migration governance network is one way for welcoming and integrating refugees in cities. However, there are barriers that can influence smart governance as well as migration governance. It is important that cities can be more inclusive and effective in welcoming migrants and refugees by promoting social cohesion. This study aimed to identify barriers of local migration governance in two smart cities in order to reflect on the possibility of increasing social cohesion for immigrants and refugees. A multiple case study was carried out on the local migration governance networks of two smart cities in the Global South: Porto Alegre-BRA and Cape Town-ZA. Twenty-five interviews were collected with migration experts and local migration governance actors, nine documents were analyzed, and observations were made in both cities. The data was analyzed through content analysis. The results of the research pointed to sixteen structural, social and political barriers. Social cohesion can be built through public policies that take diversity into account and where, once integrated, refugees can truly feel that they belong to the community. We propose a frame that summarize the actions that can promote social cohesion for immigrants and refugees in smart cities. We based the actions proposed on the barriers and the possibilities of interventions.

Keywords. Local Migration Governance, Smart Cities, Barriers, Refugees. Social Cohesion.

1. Introduction

Smart city (SC) methodologies and initiatives are widespread today, bringing innovative possibilities to the urban challenges we face as a society (Popova & Popovs, 2023). SCs are, by definition, spaces that seek to promote quality of life for the people who live in the city and, to this end, use information and communication technologies (ICT) as tools for urban development (Echebarria, Barrutia, & Aguado-Moralejo, 2020; Ruijer et al., 2023). In order to achieve the objectives of SC, many studies consider that the interactions between governance stakeholders in the urban context are essential to make the necessary improvements and foster development (Mills, Izadgoshasb, & Pudney, 2021).

Within the scope of SC, Pereira, et al., (2018) consider the smart governance dimension to be strongly related to the decisions and strategies necessary for the planned urban actions and policies to be put into practice. It is within the framework of smart governance that policies and actions to build and/or transform an SC are planned and implemented (Bjørner, 2021). Przeybilovicz and Cunha (2024) ponder that in order to be sustainable, smart governance needs to be thought of and implemented as a dynamic process. The sustainability of planned actions is

paramount, as they provide the city with a response to a series of social problems (UN-Habitat, 2022). Smart governance has the potential to help transform the city (Mills et al., 2021) but this also implies including people, especially the most vulnerable, so that the proposed changes can happen and be meaningful for society as a whole. In this sense, Bolívar, Muñoz, & Muñoz (2022) say without practical strategies that really include vulnerable populations, paradoxically SC liable to increase inequalities instead of minimizing them.

UN-Habitat's Envisaging the Future of Cities report considers that, worldwide, growing waves of international migration are transforming urban areas into more culturally diverse spaces and bringing with them a variety of challenges and opportunities (UN-Habitat, 2022). We have seen that in addition to being more populous, the trend is for most cities to become increasingly diverse and for society to have to think progressively about the best ways to address the issues that arise from diversity and people's different needs (IOM, 2022b). Within the scope of migration, one of the groups of migrants who arrive in cities and who require sensitive attention are refugees, as they are a population who face human rights violations and who move to places that will welcome them safely (IOM, 2019). The places that receive this group of immigrants need to think about a series of strategies and reception structures that can be characterized as a governance structure or network (IOM Brazil, 2023). The United Nations Migration Agency (IOM) characterizes migration governance as the set of entities, policies and infrastructures that shape and regulate the processes related to the reception, integration or redistribution of immigrants in a nation-state, as well as the possibilities for cooperation and joint actions with organizations related to migration (IOM, 2022a).

Kvashnin's (2020) study points out that it is usually the national level that designs migration actions, but it is the regional level or even the local level (cities) that implements them, as they have no reference for how to deal with immigrants but end up planning and implementing migration policies. For Stürner (2020), the fact that cities deal directly with the reception and integration of immigrants and refugees on a daily basis, and often without the proper guidelines and resources, has led them to increasingly demand a place in the debates and decision-making spaces of migration governance. The gaps in the dialog between the local and national levels can push immigrants and refugees into spaces where access to information and the provision of public policies is precarious, affecting this population group's enjoyment of health, education and employability services, for example (Skodo & Zanzuchi, 2023).

Thus, there are several factors that can influence local migration governance negatively (barriers) in actions related to the effective reception and integration of immigrants (Caponio, Scholten, & Zapata-barrero, 2019; IOM, 2022). Bolívar, Muñoz, & Muñoz (2022) argue that integrating vulnerable population groups into strategic urban planning is essential to ensure that SC is not just technologically advanced but also socially equitable and inclusive promoting social cohesion. According to Valera, et al. (p.13, 2022) “the term ‘social cohesion’ has its origins in fundamental questions about the elements that connect people to each other and to society as a whole and that motivate them to be part of it”. In this sense, knowing the actors involved in local migratory governance and understanding the barriers of governance can contribute to promoting and/or expanding the quality of life, participation of the immigrant population in the life of the city and social cohesion. In countries classified as developing, the barriers may differ from countries classified as developed, which have more studies on local migration governance. In view of the above, this study aimed to identify the barriers experienced by local migration governance in two SCs located in the Global South and was conducted through a case study carried out in the cities of Porto Alegre-Brazil and Cape Town-South Africa.

This study is justified by the need to better understand the dynamics of migratory governance in the local context, as well as the arrangements and influences suffered in actions to welcome immigrants in SC, especially regarding to refugees. Popova and Popovs (2023) address the importance of looking at the barriers of intelligent governance in a broad way and Moolngearn and Kraiwanit (2024) conclude that there is still a lack of research focused on the scope of the barriers that prevent the effective development of SCs. In this paper, we propose associating SC concepts with the scope of migration, considering the potential that their combination can bring to both the field of action of local migratory governance networks and SC migration studies.

It should also be noted that there are no specific studies on governance and refugees using the concept of SC (Palacios, Luciano, & Pereira, 2024). However, concern about the agenda of political minorities in the SC research agenda is beginning to gain more prominence (Burns & Andrucki, 2021). From a managerial point of view, it is important that actions to welcome immigrants do not lead to their exclusion. In this sense, it is interesting to look at how SCs welcome refugees, also thinking about the possibilities of integrating them into the welcoming and decision-making processes. We argue that the lack of good local migration governance can impact the possibility of effective refugee integration and social cohesion. Cardullo and Kitchin (2019) see SCs as spaces with great potential for encouraging citizen participation in decision-making processes. As citizens, immigrants and refugees (both urban residents) can participate in local migration governance as stakeholders and contribute to initiatives and actions to welcome and integrate this population into the SCs. The UN's 2030 Agenda has included the refugee agenda in several of the Sustainable Development Goals (SDGs). This study is specifically aligned with two of the SDGs: SDG 11 and SDG 16. SDG 11 - Sustainable Cities and Communities - proposes making cities and human

settlements inclusive, safe, resilient and sustainable (UN, 2017). SDG 16 aims to achieve Peace, Justice and Strong Institutions, promoting peaceful and inclusive societies for sustainable development by providing access to justice for all, with an emphasis on building effective, accountable and inclusive institutions at all levels. In addition, target 10.7 in SDG 10 - Sustainable Development is closely linked to the migration agenda: "10.7 - Facilitate orderly, safe, regular and responsible migration and mobility of people, including through the implementation of planned and well-managed migration policies (UN, 2017).

2. Literature review

This session presents essential concepts that ground this study in terms of local migratory governance and barriers of migratory governance, as well as barriers of smart governance.

2.1 Local Migration Governance

The United Nations High Commissioner for Refugees (UNHCR, 2024) considers the protection (and subsequent reception and integration) of refugees as a shared task between public entities, private actors, NGOs, academia and international institutions, as only joint and synergistic approaches are capable of producing comprehensive responses to the needs of immigrants and refugees. With the need to look at the actions of the different levels of government, the scope of migration governance includes multilevel governance, which involves the alignment and joint action of nation-states, states and/or provinces and cities (Caponio & Pettrachin, 2023; Sabchev, 2022). Multilevel migratory governance is interesting when it interacts with and addresses the combined actions of the different levels of government. However, multi-level governance is not the reality in many cities around the world, especially cities in the Global South (Palacios et al., 2024) and the focus of migration governance is still strongly on securitization and protectionist policies at the national level (Elander, Granberg, & Montin, 2022).

Graauw's (2019) study, however, proposes that in Europe in particular, there has been a "Local Turn", in other words, a shift in perspective with more attention being paid to the local level of migration governance. Even though the local level is still a space for applying global (national and international) and multi-level actions, from this perspective, the local level ends up being the driving force behind migration governance. This paradigm shifts from an international and national focus to a local one can be seen in the literature, from the emergence of the terms "City Governance of Migration" or "Local Governance of immigrants or migration" (Zapata-Barrero & Cantle, 2019) and "*modes of city network mobilization"* (Caponio & Pettrachin, 2023), for example.

Tab.1 - Framework for a welcoming governance agenda for refugees/immigrants.

Approach	Definition
A deliberate approach, based on values and rights	city governance, by definition, must be welcoming, inclusive and explicitly announced in formal city policy
Services for all	universal and equal access for migrants and refugees to basic human and social services, without discrimination on any grounds
Promoting integration and social cohesion	equal treatment and opportunities and the prohibition of discrimination as essential components of city legislation, planning, policy and practice
Broad and committed campaign against discrimination, racism and xenophobia	promoting equal opportunities and outcomes for all migrants and refugees. An integral part of this campaign would be the integration of gender equality perspectives into local policies and practices
Ensuring the "right to the city"	deliberate and comprehensive inclusion and integration measures, recognizing migrants and refugees as inhabitants, social actors and political agents engaged in creating opportunities and achieving solutions
Celebrating culture and diversity	recognize cities as genuine places of diversity, taking into account their dynamism and offering the best prospects for future development
Incorporate seven key components for effective city governance	extensive knowledge base, rights-based and gender-specific legislation, deliberate policy, interdepartmental coordination, focal points, urban planning and evaluation
Involving all stakeholders	in consultative, decision-making and implementation bodies of city governance, especially economic actors, social partners, migrants and refugees, civil society organizations and social service actors
Multi-level governance	governance, dialogue and cooperation on various levels, national and local, to obtain the political "space" and support for cities that welcome and integrate migrants and refugees
Financing services for all	social cohesion and maintenance of the workforce should be reflected in allocations for programs, targeted outreach, trained personnel and specialized administrative departments, as well as the necessary infrastructure
Media work and public relations	deliberate strategy on migration and migrants as a key strategy to shore up public attitudes and gain voter support
Accountability on all levels	at all levels, by all actors as an essential aspect of ensuring welcoming cities for refugees and migrants

Source: Taran, Neves & Kadysheva (2016)

When managing initiatives for immigrants and refugees, local migration policies can both diverge from and complement national efforts (Filomeno, 2019; Palacios et al., 2024), where local governance can even take control of integration policies in the absence of overarching national structures (Graauw, 2019). In this sense, there are some relevant elements for formulating strategies aimed at welcoming local migration governance for immigrants and refugees (Table 1). Some cities receive migrants in completely different contexts and find themselves having to redesign urban strategies and actions that were initially designed just for their citizens (Gross, 2019). According to Zapata-Barrero (2024), local governments are dealing with several challenges that diverge each other, and which can overload scarce public resources, demanding innovative responses. For this reason, in certain scenarios it is necessary look at governance models and implies to consider the complex and overlapping identities of migratory flows.

2.2 Barriers in migration governance

There are several barriers that shape migration governance. According Bassi (2019) we can talk about barriers from a macro perspective where, for example, the nation-states view where they need to guarantee their sovereignty have that receiving immigrants can weaken state domination. This interpretation gives rise to the so-called **securitization of migration** (Haddad, 2008), which is overly concerned with security and less with the management and integration of migrants and can be a major barrier to migration governance (Ibreck & Seeka, 2022). Nonetheless Caponio et al., (2019) indicate that migration governance challenges and barriers can be better seen at the local level.

The lack of knowledge (of public actors and civil servants) about procedures, can be an obstacle to accessing services even in cities where migratory governance is more structured. In this sense, the **absence of standardized and integrated procedures** in public institutions that sometimes also prioritize national security (due to **securitization**) over the provision of essential services to migrants and refugees (Caponio et al., 2019). Such an approach can result in challenges to migration governance, intensification of the social and economic marginalization of migrants in vulnerability, perpetuating legal issues, and reinforcing xenophobic or distorted narratives about migrants.

Racism, for example, is another of the social challenge (Johnson, 2022; Zapata-Barrero, 2023), as is **xenofobia** (Hillmann & Pang, 2020; Mourad, 2021). These factors not only hinder the integration of migrants, especially refugees, but also contribute to the reproduction of **structural inequalities** and **social tensions** in host cities and communities (Zapata-Barrero & Cantle, 2019). The **marginalization of immigrants** and refugees can lead to the existence of what Caponio et al., (2019) call "**legal shadow zones**", where these groups are forced to rely on informal networks, parallel economies and precarious sources of income, as well as **lacking adequate representation**. Ambiguity laws and regulations can also serve as barriers both to immigrants and governance (Kloosterman, 2019). This condition of **ambiguity** not only reduces migrants' adaptive capacity but also intensifies their social and economic exclusion (Huq & Miraftab, 2020; Norman, 2021). Although often associated with institutional and legal factors, ambiguity also manifests itself in social and economic dimensions, contributing to precarious living conditions (Zapata-Barrero, 2023). It can reinforce nationalist, xenophobic or racist narratives, further exacerbating marginalization and perpetuating structural inequalities in host cities (Caponio et al., 2019).

Kloosterman (2019) considers that the **Language barriers**, **the lack of reliable information** and **knowledge about rights** can lead to more ethnically homogeneous networks of migrants and refugees, where these groups often fail to integrate into society. In addition, Yüksel (2023) points out the level of **institutional processes complexity**, coupled with language barriers and **limited access to information** in public institutions, that makes the enjoyment of rights by migrants and refugees more inaccessible, which makes governance need to think about the need for greater accessibility and institutional capacity building. Graauw (2019) reflects that municipal bodies dealing with migrant issues coordinate and streamline local efforts to promote integration. In everyday life, migrants have similar needs to the native population, but barriers caused by the difficulty of communicating well in the language of the place of reception and legal status (as a citizen) hinder access to services. I also can undermine **trust between migrants and municipal agencies**, highlighting the need for inclusive and culturally sensitive approaches (Graauw, 2019).

Solidarity can influence the reception and integration of refugees. However, the **informality of actions** that make refugees depend exclusively on the solidarity of the local population to receive refugees is a sensitive barrier to structured governance (Bazurli, 2019; Dimitriadis; Ambrosini, 2022; Ibreck; Seeka, 2022). Some migration governance approaches present itself **barriers to the social participation** of immigrant groups in the city, as they are often considered passive subjects and clients of public services (Cappiali, 2019). Even though some studies point out that migrants improve the capacity for adaptation and diversity for host communities, there is often a clash between social values and the results of receiving immigrants' actions (Caponio; Scholten; Zapata-Barrero, 2019). It can lead to conflicts and barriers to governance and adaptation for immigrants.

2.3 Barriers in SC

The barriers and challenges faced by governance are part of the daily life of cities seeking more intelligence (Bello, et al. (2024). In the SC scenario, identifying the possible barriers involved in smart governance is of paramount importance to ensure the effectiveness of the actions (Popova & Popovs, 2023). In their study on the effects and externalities of smart governance, Popova and Popovs (2023) addressed the barriers in different aspects: (i) the relationship with the use of information and communication technology (ICT), (ii) the digitalization process, (iii) new strategic visions and (iv) the rigidity of government opinions. The same study considers six different elements that impact smart governance: "information, efficiency, citizen focus, transparency, digital exclusion and regulation"(Popova & Popovs, p. 1114, 2023). When designing and implementing SC initiatives in digital transformation, for example, unintended effects can occur and reinforce inequalities in the city being barriers to the development, so it is of paramount importance to pay attention to this regard (Pereira et al., 2020).

SC also faces **privacy concerns in the massive collection of data**, the **dominance of ICT multinationals** over global urban policies, the exclusion of socially vulnerable groups in digital transformation processes, insufficient urban development, the imposition of ready-made and centralized (top-down) governance models, which together amplify inequalities (Caragliu & Del Bo, 2019). Moolngearn and Kraiwanit (2024) points out the lack of suitable financial resources for planned initiatives and policies is the most important barrier a SC can face. It is therefore crucial that stakeholders, especially governments, support cities with resources. Colding, Barthel and Sörqvist (2019) suggest **resilience** is an indispensable enabler and that it is often necessary to **apply analogue solutions combined with technological** ones to preserve democracy and respect public choice, while also calculating the costs of automation for learning and human resilience.

In an article on barriers and facilitators in global South SCs, Bello et al. (2024) highlight challenges related to integrated urban transformation, socio-economic equity, governance and infrastructure where critical interventions are still needed to break down these obstacles. The study also points to 20 barriers (Bello et al., 2024). The main barriers include: **lack of social awareness**, **digital exclusion** (lack of access to technology), **resistance to change**; **fear of digitalization**, **social exclusion** and **gentrification**, **lack of qualified human capita**l, **high cost of urban infrastructure** (operation and maintenance), imbalance of investments and **lack of resource sharing** (Bello et al., 2024).

3. Method

This qualitative and exploratory study was carried out as a multiple case study on the local migration governance networks of two cities: Porto Alegre, Brazil and Cape Town, South Africa. We choose two cities classified smart in global south emerging countries. The data collection techniques employed were in-depth interviews, observation and document analysis. The interview protocol was built on existing literature and was face and content validated by experts from universities in both countries.

Initially, migration governance networks the actors and organizations were mapped and then were contacted by email and LinkedIn. We also used the snowball technique. From May 2023 to August 2024, we collected in-depth interviews with 25 migration experts, (civil servants, managers, universities and third sector workers) (Table 2). The interviewees are listed from I1 to I25, to ensure anonymity. There were 7 interviews in Cape Town and 18 interviews in Porto Alegre. The average interview time was 64 minutes, and all the interviews were recorded (in person or virtually using the Google Meet platform). The interviews were conducted in Portuguese or English and verbatim transcribed.

To triangulate data and according to Richardson's (2012) recommendations, we analysed documents and made observations. 9 documents, including laws, reports and documents from institutions in both cities, were collected during the same period as the interviews. The documents are identified as D1 to D9. The observations were non-participant in Cape Town and non-participant in Porto Alegre (at the Porto Alegre Local Migration Conference which took place in March 2024). For the observations, a field diary was kept with notes and photographs for researcher's use.

Tab. 2 - List of interviewees

Interviewd	Smart City	Sector	Time
I1	Cape Town	University	52min56s
I2	Cape Town	Third Sector	1h4min
I3	Cape Town	Private sector	30min19s
I4	Cape Town	Third Sector	40min23s

Source: Research data (2025)

To analyse the data, we opted to carry out content analysis following the recommendations of Bardin (2016). As mentioned above, the interviews were transcribed so that all the data was in text form, after which the statements of the interviewees and the texts of the documents were coded in a systematic way. NVivo 15 software for Windows was used.

4. Cases

The two local migration governance networks studied are in Porto Alegre, Brazil and in Cape Town, South Africa. Porto Alegre has several SC initiatives, especially in governance, such as the Participatory Budget, which was set up over thirty years ago and is still in operation today (Porto Alegre, 2020). Cape Town is one of South Africa's capital cities and is considered resilient when it comes to promoting disaster mitigation actions and stands out when it comes to sustainability and poverty reduction (UN-Habitat, 2022). Cape Town has many SC initiatives (Bright Cities, 2022).

Brazil and South Africa apply the 1951 Convention on the Status of Refugees (United Nations General Assembly, 1951). Brazil has it own law on migration (Brazil, 2017). The Ministry of Justice is largely responsible for the migration issue, but it works in conjunction with other national bodies. CONARE is responsible for deciding on refugee requests (Ministry ff Justice and Public Security, 2025). In 2024, the Ministry of Justice set up the National Forum of Migrant, Refugee and Stateless Leaders (Fomigra) (Ministry of Human Rights and Citizenship, 2024), and local, state and national stages of the National Conference on Migration, Refugees and Statelessness (Comigrar) were held. South Africa started follows the 1951 Convention after Apartheid ended and has been a member of the Organization of African Unity (OAU) Refugee Convention since 1995. In South Africa, it is the Department of Home Affairs and the Refugee Reception Offices (RRO), located in the country's capitals (including Cape Town), that are responsible for carrying out the legal steps of reception, although RRO Cape Town remained closed for some periods while refugees continued to arrive in the country (Johnson, 2022). Porto Alegre is home to approximately 30,000 to 35,000 refugees of various nationalities, most of whom are displaced from the Global South-South Cape Town has approximately 400,000 foreigners, including a large number of refugees of various nationalities, especially from central and southern Africa.

5. Analysis and Discussion

The findings regarding the data collected through interviews, documents and observations, which had already been coded and related to the theoretical framework, were organized into three different topics. In this way, it was possible to examine the barriers to local migratory governance in both cases studied, as well as the possibilities for building social cohesion.

5.1 Governance context

First, it is interesting to consider that Brazil has been receiving refugees for a longer period of time, while South Africa actually started taking in refugees after the end of the Apartheid regime. Brazil is also considered to be a transit country, as the entry of foreigners is much easier than in other Latin American countries, for example (IOM BRAZIL, 2017). The process of applying for refuge is different in the two countries. In Brazil, it is an electronic process through digital government platforms such as GOV.BR, Sisconare and Sismigra, where the migrant applicant registers their information, receives communications and can monitor the status of their process (Ministry ff Justice and Public Security, 2025). In South Africa, the process is more analogue, and it was only after the pandemic (in 2020) that the refugee application form began to have a digital version (pdf) that is sent by email to the competent body (I1 to I7). And there are only a few cities in South Africa that receive this documentation, Cape Town being one of them. But it is very difficult for applicants to get to one of these offices, as there are only five in the whole country (I1, I2, I4, I5 and I7). The Cape Town office had been closed since 2012 to new applicants, so it was not possible to apply (Johnson, 2022), and the Cape Town RRO only reopened in 2023.

Although the agency responsible for carrying out the legal steps of protection, reception and documentation in Cape Town remained closed for some periods, refugees continued to arrive in the country (Johnson, 2022). The decision to close was made at national level (I1- I7). This closure had a direct influence on Cape Town's migration governance network and prompted a series of advocacy actions by civil society for the reopening of the RRO, which not only mobilized the governance network but also changed the dynamics in the city. In this sense, local migration governance in Porto Alegre is not directly involved in documentation and registration, and the Cape Town network had to manage the issue of documentation by thinking about how to make new applications in neighbouring RROs viable.

The local migratory governance network in Porto Alegre is part of a context in which there are more multi-level interactions (I8-I25). whereas the one in Cape Town has less interaction between the different levels of government, for example. In the Brazilian context, there are a greater number of institutions involved in the reception and integration of refugees. The level of proximity and dialogue with public bodies at the different levels is an aspect that can be extremely relevant to the barriers and success of the actions that the local level proposes to undertake. It should be noted that in both cities there is a massive presence of NGOs, religious organizations and immigrant associations, as well as the presence of universities actors.

5.2 Barriers

In terms of the aspects that influence and are part of the dynamics of local migratory governance networks, sixteen different barriers were found, classified into three different levels: structural and managerial, social and cultural or political.

Lack of infrastructure and financial resources are management barriers that have a direct impact on the governance network and the scope and success of the actions undertaken. The lack of infrastructure is more related to the city itself, when it has an adequate reception system, either with hostels or specific orientation spaces for immigrants, for example. In both cases, NGOs as well as legal practice centres linked to universities end up voluntarily playing the role of providing guidance on documentation, basic items and information pertinent to the first steps of reception (I1, I12, I22). In Porto Alegre, for a brief period, there was an immigrant shelter (Zero Hora, 2021) which closed due to a lack of resources (I8, I14 and I24). The underutilization of existing resources, for example, where in Porto Alegre there are empty buildings that could be renovated and used as hostels for immigrants (i20) expresses how practical and (even low-cost) solutions could be implemented to increase reception capacity.

The lack of training and **awareness of procedures**, especially among civil servants, can become an obstacle to accessing services, even in cities where migration governance is more structured. The lack of staff to assist migrants and refugees, especially staff fluent in the languages most spoken by migrants, is pointed out as a barrier. In Cape Town, for example, the translators at the Department of Home Affairs are all volunteers, and it can happen that on a day when there is more demand for translation services in a particular language, the translator for that language is not present (I1, I2, I4, I7). In Cape Town in particular, there is a great deal of dependence on solidarity efforts and volunteers (who are often foreign students doing university practical) (I2, I4).

The **lack of resources** is a critical barrier and has the potential to impact on the emergence of other barriers. Moolngearn and Kraiwanit (2024) consider the lack of resources to be the most critical barrier in a SC. In addition to the lack of infrastructure, some actions of the governance network may have to be discontinued due to lack of funds. Stürner (2020), among other aspects, discusses the demand for more resources from the federal level to the local level because the local level is, in fact, the space where public policy is applied, which is in line with I14's statement. However, in Porto Alegre, even with the approval of a municipal law establishing a migration policy (D9), there is no binding budget, which prevents specific actions for immigrants and refugees from being funded from the public budget. And without a budget, it is difficult for laws that have been passed to be translated into concrete actions to welcome and integrate people. I24's statement about the approval of a law without the

subsequent approval of binding funds demonstrates the need for migratory governance to have political strength, because when the time came to define financial resources, they were not approved.

The governance networks receive transfers from the federal government, but in both cases the resources used come more from donations and transfers from international agencies. In other words, most of governance actions and projects are also funded by the IOM and UNHCR, which in turn receive funds from the signatory countries and then distribute them among the territories. It is worth noting that after a wave of anti-immigration speeches around the world, in January 2024 the US government announced the suspension of transfers for UN actions with migrants and refugees; this decision will have a direct impact on the actions funded by the UN in Brazil (Lima, 2025). With this budget cut, both migratory regularization actions, humanitarian assistance, protection, health, technical support, migratory advice and the development of integration policies and plans will be affected in cities across the country, including Porto Alegre.

The **discontinuity of actions** in both cases ends up being a barrier that also stems from a lack of staff, infrastructure and resources, as well as political issues. I16 mentions the reduction in the capacity of actions due to a lack of resources and then the discontinuity of actions. For Ibreck and Seeka (2022), discontinuity is strongly linked to the belief that with donations and solidarity actions, it is not so necessary for the government to invest its own public resources because, in the imagination, there are already enough resources. As a result, there is no effective public policy, and the scope and continuity of actions and programs are undermined. It's interesting to note that solidarity can be seasonal and, in more vulnerable places, for example, it can be less effective because people with fewer resources may donate less. The most critical example of the consequences of a lack of continuity of action concerns the closure of the refugee reception offices (RRO) in Cape Town and the lack of local infrastructure in South Africa, which ended up accumulating applications and renewal requests, detention of undocumented people and a series of negative effects (I1 to I7). The decision was taken by the federal government citing a lack of resources and the RRO only reopened after joint advocacy actions (Johnson, 2022).

Lack of migrant's documentation, or even expired documentation, specially makes it difficult for immigrants to access education, health and social assistance, which reveals the knock-on effect of lengthy or poorly designed administrative processes (electronic or otherwise). As a result, the administrative burden is also a more strongly perceived barrier in Cape Town in relation to the documentation process. The lack of supply or access to public services (including security, employment and housing) leaves migrants in situations of extreme vulnerability. In this sense, I1 gives an example of the administrative burden and lack of documentation in Cape Town, where it is difficult to register children with their parents' names due to the parents' lack of documents, which leads to a situation of statelessness (which also violates fundamental rights). Thus, it is possible to see that administrative complexity directly affects the inclusion of immigrants and can also contribute to reinforcing social vulnerability. Most refugees are at a higher level of social vulnerability (UNHCR, 2024). It is therefore necessary for the governance network to pay attention to the need to modify processes so that they are more efficient, comprehensive and simplified.

There are **levels of institutional voids** and a **lack of multi-level coordination** in reception and integration in both cases. In the Brazilian case, the role of each level in relation to immigrants is still a little more defined and, due to the trend towards decentralization, the city has greater responsibility. In Cape Town, on the other hand, most decisions seem to be taken at the national level without alignment with the local level. In this sense, the institutional arrangements of the countries also have an impact on the local governance network. Gaps in the dialogue between the local and national levels can push immigrants and refugees into spaces where access to information and public policies is precarious, affecting this population group's enjoyment of health, education and employability services, for example, which is in line with the studies by Skodo and Zanzuchi (2023).

Failures in e-government systems or the **lack of digitization** are perceived as barriers because, even with the use of ICTs, some systems are not available in accessible and intuitive language and are used by a population group that may find it more difficult to use the technology. Despite the potential of ICTs to digitize processes (Przeybilovicz & Cunha, 2024), the implementation of technologies in migration regularization procedures can remain limited because they are generally the responsibility of federal governments. In Brazil, the process of applying for refuge is entirely electronic, carried out through three systems (GOV.BR, Sisconare and Sismigra), but these systems can present some flaws and require a higher level of digital literacy (I22). In South Africa, on the other hand, there is no e-government initiative in the refugee application process, which leads to a longer waiting time for documents to be registered and issued and a greater possibility of failures (I1, I3, I7). These aspects have an impact on the local level because documentation is important for refugees to be able to regularize their status and access the public services they need.

Lack of data and lack of knowledge management are also challenges faced in both cases. SC studies emphasize the importance of data-based decision-making (Popova & Popovs, 2023). There are no precise figures on the number of refugees living in each of the cities. This situation hinders the generation of data on the migrant population and knowledge about the problems faced in local migration governance. As many reception actions are

voluntary, there are no integrated systems where actors can record information.

Language and cultural barriers are factors that hinder the actions of the governance network. Without good infrastructure, language barriers can make immigrants even more socially vulnerable. When asylum seekers arrive asking for protection, they usually don't speak the language of the host country/region. I18 exemplifies how specific cultural practices, such as the consumption of salty tea in Haiti, can impact the health of migrants when there is no education or adequate communication. With a lack of proficiency in the local language, refugees end up experiencing what Svensson (2023) calls the dynamics of the "speaking subject" and the "other", where the capacity for interaction between natives and immigrants is limited, which influences integration and social cohesion. According to Valera et al. (p.13, 2022) the term social cohesion has its origins in fundamental questions about the elements that bind people to each other and to society as a whole and that motivate them to be part of it". The lack of language and cultural translation hinders the integration of immigrants into the community. Caponio et al. (2019) addressed diversity management, which is often overlooked in governance strategy. In this sense, the governance network needs to be prepared and able to offer language teaching and translation services. It is interesting to note that when there is a larger influx of a group or population, there may be an established community that is willing to help interpret the necessary information so that the refugees can make their first steps in the host city. In Porto Alegre there are significant communities of Haitians, Venezuelans and Warao (indigenous Venezuelan refugees), and in Cape Town of Somalis, Congolese and Sudanese, for example.

The existence of different types of prejudice: xenophobia, racism, sexism, homophobia and ableism, which also have an impact on local migration governance. I2 brings up an interesting notion which highlights that immigrants and refugees are not a homogenous population and that they have different needs. It is interesting to note that Cape Town receives many LGBTQIA+ refugees, the terminally ill and the disabled, given that in their communities of origin homosexuality is considered illegal, disability brings stigma and social exclusion, and illness makes it impossible to support a family (I2, I3, I4, I5). Thinking that refugees have the same needs masks the different vulnerabilities they face, such as disability or persecution due to sexual identity, making it difficult to respond adequately to their needs.

All this diversity without a consolidated welcoming infrastructure brings more challenges for governance. And sometimes society's prejudices are extended to immigrants and refugees, who end up experiencing racial slurs, xenophobia and other types of prejudice (I1, I2, I6, I7, I9). This situation can be aggravated when the economic situation in the host country is not so favourable. This is in line with the studies by Myers et al. (2024), who say that the local population fears that refugees will increase competition in the job market. Thus, the social situation can also influence the population's dynamics of identification and solidarity and therefore increase xenophobia. I1's account of the use of migrants as "scapegoats" for government failures shows how xenophobia can be a political instrument that perpetuates narratives that blame migrants for structural problems such as unemployment and a lack of quality public services.

Digital exclusion and **low levels of digital literacy** are also present as barriers. Whether in the direct actions of local migratory governance or in broader actions, it is necessary to consider that some digital governance or ICT application initiatives can reinforce social vulnerability. Digital transformation processes often end up excluding some population groups (Menegotto et al., 2020). I22 highlights how digital platforms are not intuitive or accessible for immigrants, especially for those who lack basic knowledge, exacerbating barriers to accessing documentation and public services. Immigrants face difficulties in understanding and navigating digital processes (I1, I6), such as sending forms or using emails. The lack of digital literacy leaves them vulnerable to errors and delays, compromising their access to rights. Digital exclusion goes against the transformative potential of SC (Pereira et al., 2020), which should promote inclusive access to technologies.

To overcome this barrier, it is necessary to simplify the systems, carry out training and capacity building and provide accessible technical support to the actors who are directly linked to the use of e-government tools. In this sense, Colding et al. (2019) talk about the need to combine analogue and technological tools according to different needs. It is interesting to note that artificial intelligence and chatbots may not meet the needs and specificities of refugee care, especially when they are not available in several languages and may contribute to reinforcing vulnerability. It is also interesting to look at the intersectionality of barriers. Cultural and linguistic barriers, for example, amplify prejudice and digital exclusion, creating overlapping challenges. For example, a lack of language skills affects navigation on digital platforms, while cultural prejudices make it difficult to welcome migrants into institutional spaces.

Ambiguities have a direct impact on the actions of migration governance or are derived from the actions of migration governance at various levels. The absence of a clear commitment to migration issues is delicate, especially in systems where decisions depend on political leadership to move forward. Top-down governance, mentioned by I2, can create a vacuum when the central authority does not prioritize migrants. There is often a need for judicialization due to omissions and delays in resolving cases (I5). There seems to be a disconnect between the existence of laws favourable to migrants and the implementation of public policies that offer practical support.

According to I22, although the city "opens the door" to migrants, it does not guarantee an effective welcome. This reflects the existence of protection but also the fact that reception is still weak.

As I24 pointed out, even with recent regulatory frameworks, assistance to migrants depends predominantly on civil society. The dependence on civil society to receive and refer migrants' points to the lack of a solid public infrastructure. This gap can be accentuated by neoliberal visions that tend to transfer the responsibilities of the state to private initiative, as pointed out by I24. Paradoxically, the difficulty expressed by the administrative burden, the backlog of applications and the lack of efficient documentation for applicants and refugees can cause other problems. In this case, many individuals are undocumented due to a lack of efficient state registration capacity. In Cape Town, the large number of pending refugee and renewal applications, scheduled for future years, exposes immigrants to serious risks, such as detention for lack of valid documentation. The lack of administrative capacity may reflect poorly structured public policies or a lack of financial resources. This condition of ambiguity not only reduces migrants' adaptive capacity but also intensifies their social and economic exclusion (Huq & Miraftab, 2020; Norman, 2021). Although often associated with institutional and legal factors, ambiguity also manifests itself in social and economic dimensions, contributing to precarious living conditions (Zapata-Barrero, 2023). In addition, it can reinforce nationalist, xenophobic or racist narratives, further exacerbating marginalization and perpetuating structural inequalities in host cities (Caponio et al., 2019) (Caponio; Scholten; Zapata-Barrero, 2019).

5.3 Reflections on the possibilities for achieving social cohesion for immigrants and refugees

It is considered that at the local level it is possible to closely (and simultaneously) examine the availability or unavailability of public services, the different dynamics, access to resources, the power relations involved in governance, society's prejudices and the social and political conflicts involved in local migratory governance. Based on the barriers experienced by the local migratory governances studied, it is clear that it is possible to increase the strategies that can have an impact on actions to welcome and integrate immigrants and refugees.

According to the studies by Taran et al. (2016) on the governance agenda for refugees and immigrants, welcoming involves thinking about equal treatment and opportunities and the prohibition of discrimination (whether through legislation, planning, policy or practice) in cities. It is considered important to connect immigrants and refugees to society because being part of the collective of life in society is closely linked to producing social cohesion. Social cohesion helps combat xenophobia since in a cohesive society there are higher levels of solidarity and belonging. Spicker (2014) argues that inclusion and social cohesion are aspects of the same social construction. Therefore, integrating immigrants and refugees into society is part of the list of lasting solutions sought for this population group (Taran et al., 2016). In their book on social cohesion in Latin America, Valera et al. (2022) proposed a political agenda of social cohesion for equality, sustainability and resilience that involves: guarantees of well-being and universal, comprehensive and sustainable social protection systems, social inclusion and social labour policies, policies for a culture of equality based on equality and the strengthening of democratic institutions for trust. In this sense, we propose a framework based on the barriers and the possibilities of interventions that can promote social cohesion for migrants (Table 3).

Tab. 3 - Actions that promote social cohesion for immigrants and refugees in smart cities

Barriers	Potential interventions
Language and cultural barriers	Ideation of programs that encourage linguistic and cultural exchange between immigrants and refugees and all population groups in the city. Expansion of cultural mediation actions focused on immigrants
Prejudices	Educational campaigns in schools and awareness campaigns promoting diversity and inclusion; anti-discrimination training (on different types of prejudice) for civil servants and members of the community. Creating and enforcing legislation on xenophobia and racism
Institutional voids and lack of multi-level coordination	Creation of specific municipal bureaus or sectors, councils and inter-institutional committees to deal with issues pertaining to immigrants as well as to enable the coordination of actions between different levels of government and organizations
Administrative burden and corruption	Propose improvements and standardization of processes; think strategically about how to simplify and computerize administrative processes and implement/or strengthen transparency and control systems to reduce episodes of corruption
Digital exclusion and digital literacy	Offer or expand free internet access points, data packages and technological devices in community centers; promote digital literacy courses to ensure digital inclusion of immigrants and reduce connectivity bottlenecks and participation in social life in the city.
Lack of infrastructure, financial resources and discontinuity of actions	Expansion of partnerships and establishment of shelter and documentation infrastructure. Creating references for migrants. Seeking effective funding to maintain essential infrastructure. Inclusion of actions pertinent to reception in budget laws to guarantee access to resources and expansion of public policies that are also related to the integration of immigrants create long-term action plans

Lack of social participation	Establishing consultative and participatory community councils that can be inclusive and where immigrants and refugees can express their needs and contribute to local decision-making. Promoting and encouraging volunteering and participation in community events
Knowledge and data management	Development of data collection and analysis systems to inform decision-makers, policymakers, governance actions and the general population. Adopt data-based decision-making. Publicize information on the migration agenda to the city's population.
Legal and social ambiguities	Revision and harmonization of legislation to ensure clarity and protection for immigrants and refugees. Prioritize the creation of guiding policies. Involve more experts in migration and social integration to develop and implement effective policies

Source: authors (2025)

These strategies can facilitate integration and strengthen ties between immigrants, refugees and local society, reducing social inequalities and promoting a more hospitable and inclusive environment in cities.

6. Final Remarks

Aiming to identify barriers experienced by the local migration governance network in two SC located in the Global South and reflect on the possibility of increasing social cohesion for immigrants and refugees, this article mapped different barriers (management, infrastructure, socio-cultural and political). It was possible to see that the barriers are interconnected with each other and there are many ambiguities (legal, social or political) that make it difficult for governance to work. Politics are also a factor that influences governance, and institutional voids can even be a strategy to deal with the migration issue in a more effective way.

Even though the cities of Porto Alegre and Cape Town are considered SC, the economic and social context of the local population must be taken into account, which can also face challenges in the area of human rights. Brazil is located on the most unequal continent in the world and South Africa is considered the most violent country in the world. There are also issues of racial prejudice, xenophobia and other types of discrimination in both countries. Brazil, which went through an intense process of colonization and enslavement of immigrants from the African continent, and South Africa, which was also colonized, experienced an Apartheid system for decades (which only ended in 1996). These aspects also influence social dynamics and wicked problems.

Continued efforts and a critical increase in resources are essential to guarantee the rights and dignity of refugees. Smart governance can support migration governance where the use of technology, collaboration and participation tools can be enhanced. However, due to the context of the sensitive data involved in working with refugees, in addition to proposing the use of ICT tools, a cautious and judicious approach is needed, as the aim is not to increase surveillance of migrants, but to use the tools to improve migratory governance in the context of SC.

Finally, in addition to governance barriers, even after being documented and welcomed, refugees can experience difficulties that affect their access to public services and structural benefits in the urban apparatus (which can be more easily accessed by citizens, tourists and other categories of migrants), so thinking about inclusion that leads to social cohesion is important. In this sense, a framework was proposed to think about the possibilities of strengthening social cohesion, which can also lead to overcoming the barriers faced by local migratory governance. As a limitation, we did not interview government actors from Cape Town's migration governance network. Durable solutions may require specific capacities of local migration governance in this sense, and as future research we recommend investigating the impact of underreporting the number of immigrants and refugees in cities of the global south. Looking at the maturity of governance in terms of the continuity of reception and integration actions; analysing discourses and different interests and possibilities of coalition.

Track 17: Social Media and Government - Democratic challenges, regulation, uses of platforms, and actors' behavior

Track Description

In recent years, we have learned about the risks for governments and political institutions posed by social media. At the same time, innovation capabilities have emerged from the latest evolutions of social media and government. Among other issues, TikTok, virtual reality, and other social platforms and areas have abruptly emerged as global players in the entertainment sector, prompting government and other actors to engage with new audiences and social groups. Besides, some political and public institutions' challenges remain in the process of evolution. Some key aspects include polarization of the public sphere, growing claims about the potential harm of social media to our democratic communities, or the potential limitations of institutional communications with citizens due to a lack of trained human resources and government specialists. This track focuses on digital technologies that enable integration, are people-centric, and create open platforms for collaborative multi-user co-creation of services and products. Particularly, the post-COVID-19 has forced government, private, and non-profit agencies worldwide to find new ways to deliver services, and this is especially important using social media technologies. In addition, the track was open to other aspects of governments' service delivery and social media, including theoretical and conceptual advancements, methodological and data innovations, and case- and practice-based implications arising from diverse contexts.

Abstract. Social media platforms have globally transformed governance, serving as vital tools for real-time communication, transparency, and public engagement. These platforms are widely used in South Africa for government-citizen communication and engagement. Still, their application in citizen-based monitoring (CBM)—a participatory governance mechanism that enables citizens to monitor public service delivery and hold governments accountable—remains unrealized. Despite South Africa's relatively high internet penetration rate of 68% and widespread social media adoption, systemic, institutional, and socio-economic barriers hinder its use for CBM. This study explores the factors influencing the potential adoption of social media for CBM in South Africa, offering insights into the opportunities and constraints shaping this emerging governance tool. Using a mixed-methods approach, the research incorporates qualitative data from interviews with government officials, media representatives, and civic organizations alongside quantitative findings from a citizen survey. The study identifies critical barriers, including unequal access to digital infrastructure, limited digital literacy among citizens and government officials, the absence of policy frameworks for social media governance, and socio-economic disparities perpetuating a digital divide. Moreover, trust deficits between citizens and government institutions present significant challenges to adopting social media for participatory monitoring. However, the research also highlights enabling factors, such as growing digital adoption, isolated cases of innovative practices, and an increasing recognition of social media's potential to enhance governance accountability. This study contributes to the discourse on digital governance by examining the factors influencing social media adoption for CBM in South Africa. It provides actionable recommendations, including investing in digital literacy programs, strengthening infrastructure, and fostering trust through participatory policy frameworks. By contextualizing South Africa's experience within the broader African governance landscape, the research lays a foundation for future strategies to harness social media's potential in bridging the gap between citizens and governments through monitoring and accountability initiatives.

Keywords. Social media, citizen-based monitoring, digital governance, public accountability
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1063

1. Introduction

The global digital revolution has significantly reshaped governance, with social media platforms like Twitter, Facebook, and WhatsApp emerging as vital tools for enhancing transparency, accountability, and real-time citizen engagement in public administration [1; 2]. In countries such as the United Kingdom and Canada, governments have successfully integrated these platforms to improve responsiveness and facilitate participatory policymaking [3; 4]. These tools have redefined citizen-government interaction, enabling engagement in governance processes that were previously

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

inaccessible to many. However, in developing contexts like South Africa, the potential of social media remains largely untapped—particularly for citizen-based monitoring (CBM), a mechanism through which citizens monitor service delivery and hold government accountable. While global examples like SeeClickFix in the United States and social media engagement by Australia's Department of Human Services highlight how digital tools can enhance CBM and improve service responsiveness [6; 7], the same cannot yet be said for South Africa, where structural and socio-economic challenges limit effective adoption.

Despite a 68% national internet penetration rate and widespread social media use, particularly via WhatsApp and Facebook, South Africa's application of these platforms for CBM remains underdeveloped [8]. While digital platforms have proven effective for crisis communication—such as during the COVID-19 pandemic—inequities persist that hinder broader engagement. Urban areas report internet connectivity above 85%, while rural areas remain significantly underserved, with just 40% connectivity [10]. High data costs, compounded by low digital literacy—only 28% of South Africans report confidence in using online tools—further inhibit participation, especially among low-income and rural populations [8; 9]. These disparities restrict access to social media-based governance tools for those who most need to monitor public services. Moreover, trust deficits between citizens and the state—stemming from perceptions of inefficacy or political manipulation of digital platforms—create an additional barrier to adoption [10; 13]. Thus, while South Africa demonstrates strong potential for digital governance, it also faces distinct socio-political and infrastructural barriers that must be addressed for CBM to become a transformative tool.

Learning from global best practices in digital governance, such as Sweden's integration of open data platforms with social media and Denmark's policy frameworks enabling citizen oversight [2; 4], South Africa has a clear opportunity to improve its CBM systems. However, the fragmented nature of its e-governance policies and lack of institutional preparedness hinder this transition [11; 12]. A focused examination of the systemic, institutional, and socio-economic factors shaping the adoption of social media for CBM is therefore both urgent and necessary. This study responds to that need, offering an in-depth exploration of the barriers and enablers of digital CBM adoption in South Africa. By combining global comparisons with a localized analysis, it highlights not only the gaps but also the potential pathways for reform. In doing so, the study contributes to a broader understanding of how social media can be meaningfully integrated into participatory governance in resource-constrained environments and sets the foundation for more inclusive, accountable, and responsive service delivery in South Africa.

2. Preliminary Literature Review

The global expansion of social media for governance has led to the emergence of citizen-based monitoring (CBM) platforms designed to enable citizens to track public service delivery and provide real-time feedback. Examples include FixMyStreet in the UK, Adaa in Saudi Arabia, Ushahidi in Kenya, SeeClickFix in the US, and GovChat in South Africa, each showcasing different ways of integrating social media into participatory governance [14; 15; 16; 17; 18]. These platforms demonstrate how structured digital feedback mechanisms can enhance transparency and accountability. However, their success is often contingent upon strong institutional capacity, robust digital infrastructure, and well-defined policy frameworks. For example, while Ushahidi successfully aggregated reports during Kenya's 2013 elections using social media and SMS, the delayed government response and reliance on donor funding highlighted sustainability challenges within institutional governance contexts [16; 19].

Platforms like SeeClickFix and GovChat similarly show the promise of social media in enabling real-time citizen reporting and enhancing government responsiveness [17; 20]. Yet, challenges persist—particularly in developing countries—where governments are often hesitant to fully embrace these tools due to fears of criticism and lack of institutional readiness [21]. In South Africa, municipalities

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

frequently use social media for one-way communication rather than interactive engagement, reducing the potential for meaningful citizen participation [22]. The Nigerian #EndSARS movement provides another relevant example, where although social media was critical in exposing abuses, the lack of formal government mechanisms for digital feedback limited the long-term governance impact [23]. These cases underscore that while social media has democratizing potential, its effectiveness is shaped by political will, institutional culture, and governance structures.

In South Africa, barriers such as digital divides, low digital literacy, and the absence of cohesive e-governance policies further undermine the use of social media for CBM. With internet penetration at only 40% in rural areas compared to 85% in urban centres, and just 28% of South Africans expressing confidence in using digital platforms, accessibility and competency remain serious challenges [21; 22; 24; 25]. Additionally, without standardized frameworks for managing social media-driven monitoring, public officials struggle to process citizen feedback, eroding trust in digital initiatives [14; 15; 26; 27]. These limitations discourage citizen engagement and reinforce scepticism about the effectiveness of social media in holding the government accountable. Existing literature tends to emphasize technological and participatory dimensions of CBM but often neglects the structural and socio-political conditions required for scalability. This study addresses these gaps by examining the systemic, institutional, and socio-economic factors that shape social media adoption for CBM in South Africa. It situates the South African experience within global trends and offers targeted policy insights for improving digital participatory governance.

3. Analytical Framework

This study employs an integrated analytical framework combining the Technology Acceptance Model (TAM), the Participatory Governance Framework, and Institutional Theory to unpack the systemic, institutional, and socioeconomic factors influencing the adoption of social media for CBM in South Africa. TAM, developed by Davis (1989), focuses on perceived usefulness and ease of use as key adoption drivers, which is especially relevant in South Africa's context of digital divides and affordability constraints, where marginalized groups often lack the digital literacy needed to navigate complex platforms [14; 15; 16]. Government officials, meanwhile, must balance the potential benefits of public engagement against risks such as misinformation, inadequate institutional capacity, and weak policy alignment [17]. Although case studies from Kenya and the Philippines show that social media can effectively enhance CBM, their success depends on institutional readiness—something South Africa currently lacks [18; 19]. The Participatory Governance Framework emphasizes trust and responsiveness as prerequisites for meaningful engagement, yet South African platforms like GovChat struggle with follow-through, reinforcing citizen distrust and limiting participation, particularly among disadvantaged communities [14; 22; 23; 24]. Institutional Theory further explains how fragmented municipal strategies, incoherent policies, and bureaucratic inertia inhibit the widespread adoption of digital tools. In contrast to countries like South Korea and Saudi Arabia—where platforms like Adaa are supported by structured governance policies—South Africa's inconsistent approach to digital governance continues to stall implementation [15; 17; 26; 27; 28]. Collectively, these frameworks provide a holistic view of the barriers and opportunities shaping social media's potential for inclusive, participatory governance in South Africa.

4. Methodological framework

A mixed-methods approach was adopted to comprehensively investigate the systemic, institutional, and socio-economic factors influencing the adoption of social media for CBM in South Africa. This approach aligns with the study's aim to capture both quantitative and qualitative insights into stakeholders' perceptions and the contextual challenges of leveraging social media as a tool for participatory

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

monitoring. Combining quantitative surveys and in-depth interviews allowed for a holistic analysis of diverse stakeholder perspectives, ensuring a robust foundation for the study.

4.1 Survey Design

The research utilized a carefully constructed sampling strategy to ensure representativeness across South Africa's nine provinces, accounting for urban and rural distinctions. From an initial target of 6912 participants, with 384 allocated per province, the study surpassed expectations by securing 7282 responses. The sample reflected the country's diverse socio-economic and demographic contexts, capturing perspectives from both digitally connected urban areas and under-resourced rural communities. Approval from the University of Johannesburg's ethical review board confirmed adherence to rigorous ethical standards in research design and execution. Structured surveys incorporating closed-ended questions were employed to gather quantitative data on citizens' awareness of CBM, perceptions of social media use for CBM, preferences for CBM tools, and involvement in participatory monitoring efforts. The survey questions were designed to evaluate participants' familiarity with public service monitoring and their perspectives on using social media platforms for governance. Statistical methods were applied to analyze patterns and correlations, offering insights into regional and socio-economic disparities in social media adoption for CBM. These data formed the foundation for exploring systemic challenges such as the digital divide, trust deficits, and perceptions of institutional responsiveness.

4.2 Interview Design

To complement the quantitative data, 12 in-depth interviews were conducted with key stakeholders, including government officials (4), representatives of community-based organizations (CBOs) (4), and members of community media (4). The interviews provided rich qualitative insights into the nuances and complexities surrounding social media adoption for CBM. Open-ended questions allowed participants to share their experiences, challenges, and opportunities related to social media integration in participatory governance. The qualitative approach uncovered stakeholder-specific perspectives on institutional readiness, socio-economic barriers, and citizen engagement dynamics. The interviews addressed questions that could not be fully explored through quantitative surveys, including the institutional capacity to handle social media-driven feedback, trust issues between citizens and government entities, and specific regional or organizational barriers to CBM implementation. Secondary data sources, including academic literature and practical reports on CBM, citizen engagement, and social media governance practices, were consulted to contextualize and enrich the findings. This triangulated methodology ensured a comprehensive understanding of the systemic factors affecting the adoption of social media for CBM in South Africa.

4.3 Contextual Relevance

The mixed-methods design offered a nuanced understanding of how systemic barriers—such as digital divides and socio-economic inequalities—intersect with institutional challenges to influence social media adoption for CBM. The quantitative survey provided broad patterns and generalizable insights, while the qualitative interviews added depth by capturing stakeholders' lived experiences navigating these challenges. Together, these methods enabled the study to identify specific institutional reforms, policy recommendations, and technological adaptations necessary for integrating social media into CBM frameworks within South Africa. By combining these diverse data sources, the study ensures a comprehensive analysis of the factors affecting social media's role in participatory monitoring, contributing to the discourse on digital governance and citizen engagement in developing contexts.

5. Findings and discussions

This section presents the study's results, which aim to explore the factors influencing the adoption of social media for CBM in South Africa.

5.1 Ownership and Accessibility of Social Media

5.1.1 Ownership of Social Media Accounts

The findings reveal a high prevalence of social media account ownership among respondents, with 83% reporting active accounts across various platforms (as illustrated in Figure 1). This high percentage underscores the potential for leveraging social media as a tool for CBM in South Africa. Among the platforms used, WhatsApp emerged as the most popular, followed by Facebook and Twitter, reflecting patterns consistent with global trends in platform adoption for communication and engagement purposes [28; 29]. Urban respondents reported higher ownership rates than their rural counterparts, with 92% of urban residents owning at least one social media account, compared to 68% in rural areas. This disparity is largely attributable to differences in access to internet infrastructure and affordability, as noted in the literature on digital divides in South Africa [30; 31]. Urban areas benefit from higher broadband penetration and more reliable network connectivity, while rural areas face challenges such as limited mobile network coverage and high data costs [32]. These findings align with the analytical framework, particularly Institutional Theory, which highlights how systemic inequalities in digital infrastructure can shape technology adoption for governance purposes [33].

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

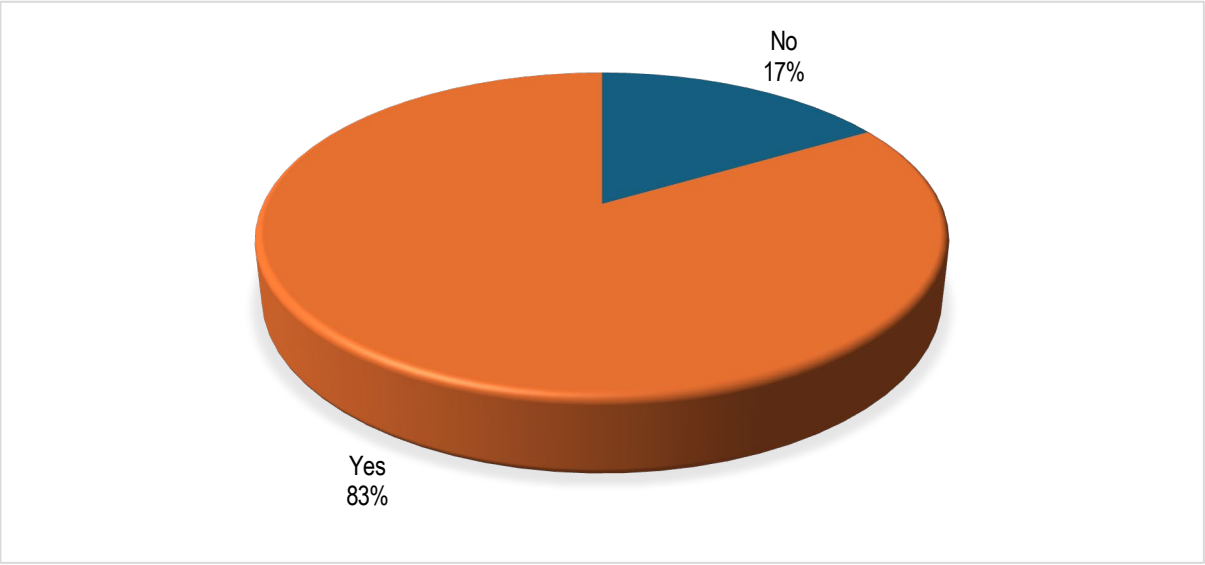

Figure 1: Percentage of respondents who have a social media account

Source: Author's own construction (2023)
N = 7282

Age and education levels further influenced ownership rates (see Figure 2). Respondents aged 18–35 exhibited the highest levels of social media account ownership (95%), while individuals over 55 reported significantly lower rates (48%). Similarly, respondents with tertiary education were likelier to own social media accounts than those with only primary or secondary education. These patterns suggest that digital literacy is critical in facilitating social media adoption, as younger and more educated individuals are generally more comfortable navigating digital platforms [29; 30]. This finding echoes the TAM, which posits that perceived ease of use and perceived usefulness are key determinants of technology adoption [34]. In this case, individuals with higher digital literacy are more likely to perceive social media as accessible and valuable for communication and monitoring.

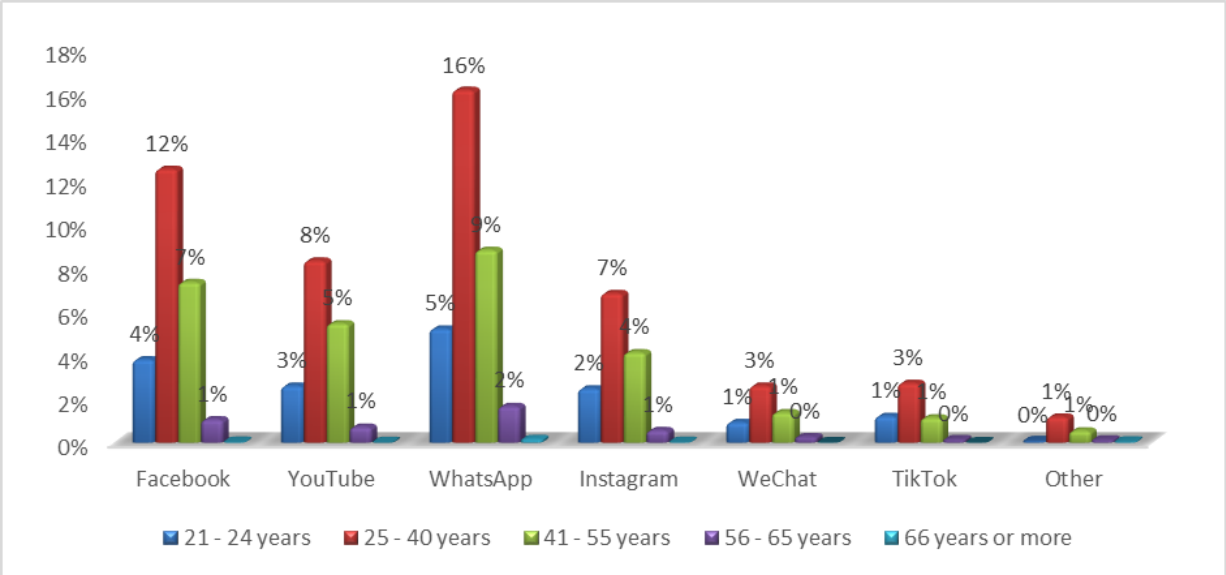

Figure 2: Ownership of social media platform by age

Source: (Author's own construction, 2023)
N = 7282

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The data reveal notable regional variations in social media platform preferences across South Africa, with respondents in Gauteng and the Western Cape—areas with better internet access—favouring platforms like Twitter and LinkedIn for professional engagement, while those in Limpopo and the Eastern Cape predominantly use WhatsApp due to its low data requirements and accessibility on basic smartphones [28; 32; 35]. This pattern reflects global trends indicating that platform adoption is shaped by local context and resource availability. High social media ownership among urban, young, and educated users offers a promising base for CBM initiatives; however, the persistent digital divide, driven by urban-rural disparities and socio-economic inequalities, remains a critical barrier [36; 37]. To ensure equitable adoption, targeted strategies must focus on expanding digital infrastructure, lowering data costs, and implementing robust digital literacy programs in underserved areas. These findings underscore a key tension outlined in the analytical framework: while social media holds significant potential for participatory monitoring, its effectiveness is limited by systemic inequalities and institutional readiness. As emphasized in the Participatory Governance Framework, trust, inclusivity, and institutional support are essential for transforming social media into a legitimate CBM tool [20; 29]. Thus, ownership alone is not enough—real impact requires addressing issues of access, trust, and policy coherence through comprehensive governance reforms [30, 31, 38].

5.1.2 Accessibility to Digital Infrastructure

Access to digital infrastructure is a foundational requirement for adopting social media in CBM, yet the study reveals persistent disparities across demographic and geographic lines. As illustrated in Figure 3, only 35% of respondents reported having internet access in their dwellings, while 8% explicitly lacked access, and an additional 57 respondents did not provide a response—likely indicative of connectivity challenges. This data underscores ongoing structural barriers to digital inclusion in South Africa's governance landscape [39; 40]. Younger respondents (aged 25–40) showed the highest levels of connectivity (17%), reflecting their relative digital fluency and alignment with the TAM, which posits that perceived ease of use and usefulness drive adoption [42]. In contrast, respondents above the age of 55 exhibited significantly lower levels of access, consistent with findings from Mawela (2017) and Loader & Mercea (2011), which highlight generational gaps in digital engagement [41]. However, access alone does not guarantee participation in CBM; other factors—such as distrust in institutions and doubts about the efficacy of digital reporting—remain critical barriers. These findings point to the need for targeted, age- and education-sensitive interventions to promote both digital literacy and civic engagement across all age groups [43].

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

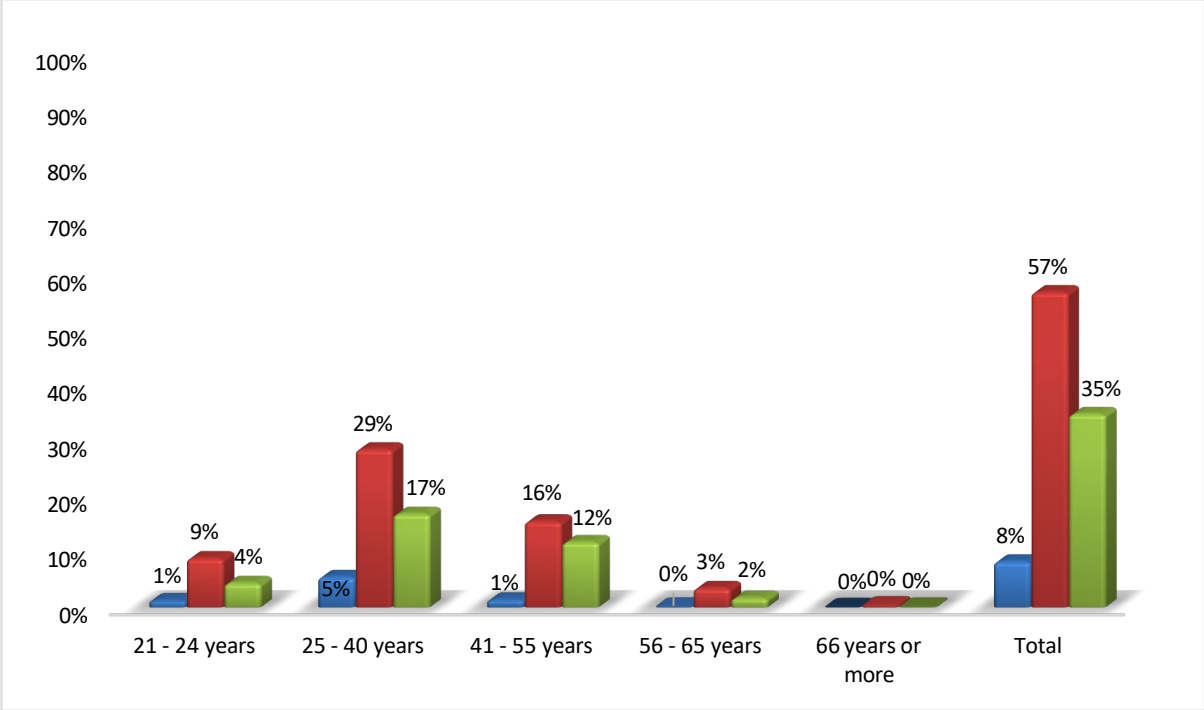

Figure 3: Internet connection in the dwelling

Source: Author's own construction (2023)
N = 7282

Geographical disparities compound these challenges, with urban respondents reporting significantly higher internet access than those in rural settings. This reflects a broader national trend in South Africa, where rural areas face systemic infrastructural deficiencies, limited broadband coverage, and unaffordable mobile data prices that severely constrain connectivity [44; 45]. According to Institutional Theory, such infrastructural limitations represent deeper organizational and systemic obstacles that hinder the equitable adoption of digital tools for governance [46]. Furthermore, the data show that respondents with tertiary education were more likely to report internet access, reinforcing the link between digital connectivity and socio-economic advantage [47]. Provincial patterns also reveal stark inequalities: Gauteng and the Western Cape showed far higher rates of internet penetration compared to under-resourced provinces like Limpopo and the Eastern Cape [48]. These findings suggest that without significant investment in broadband expansion, affordable data packages, and localized digital literacy training, social media will remain an exclusive rather than inclusive CBM mechanism. Strategic interventions at both national and provincial levels are essential to ensure that digital governance frameworks are equitably accessible to all citizens, especially those in underserved regions [49; 50].

5.2 Perceived Usefulness of Social Media for CBM

5.2.1 Perceptions of Social Media's Role in Monitoring

The findings present a mixed outlook on the perceived usefulness of social media for CBM in South Africa. According to survey data (see figure 4), 33% of respondents found social media to be accessible and practical for monitoring public services. In comparison, 21% disagreed, indicating that a substantial portion of participants either lack confidence in its effectiveness or face systemic barriers to its use. The remaining respondents expressed uncertainty or neutrality, which likely reflects limited exposure to or understanding of the use of social media for CBM purposes. This aligns with studies suggesting that

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

many citizens in developing contexts are only beginning to grasp digital platforms' role in enhancing governance [39; 40]. Furthermore, younger respondents were more likely to express confidence in social media's accessibility for monitoring. In comparison, older respondents and rural participants appeared less optimistic, likely due to challenges such as limited digital literacy, lack of infrastructure, and high data costs, which persist as significant barriers [41].

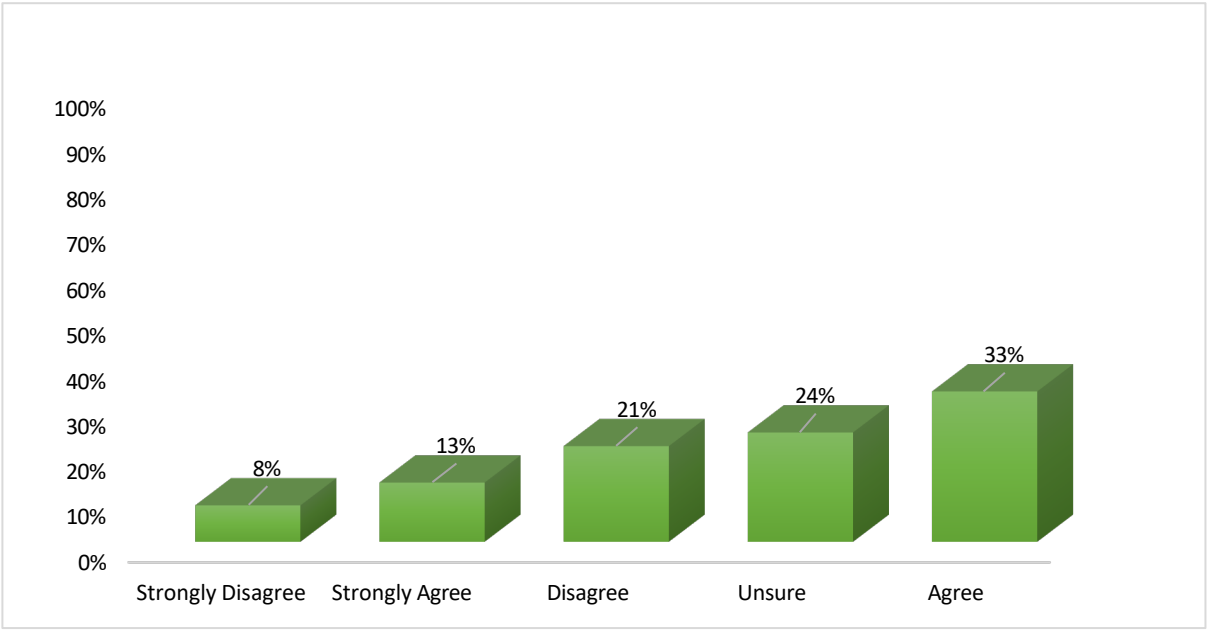

Figure 4: Perception of ease of access of monitoring service delivery via social media
Source: Author's own construction (2023)
N = 7282

When asked about the perceived effectiveness of social media for monitoring public services, 37% of respondents agreed that it is an effective tool. In comparison, 16% disagreed, and the remaining participants expressed neutrality (see Figure 5). These findings suggest that while social media's potential for CBM is recognized, doubts remain regarding its practical application. This skepticism could be attributed to systemic issues such as misinformation and institutional unresponsiveness, both of which are identified in existing research as critical barriers to the adoption of social media for governance purposes [39; 40]. Additionally, urban respondents expressed higher levels of agreement regarding social media's effectiveness than their rural counterparts, a disparity reflecting ongoing infrastructural and socio-economic inequalities [40].

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

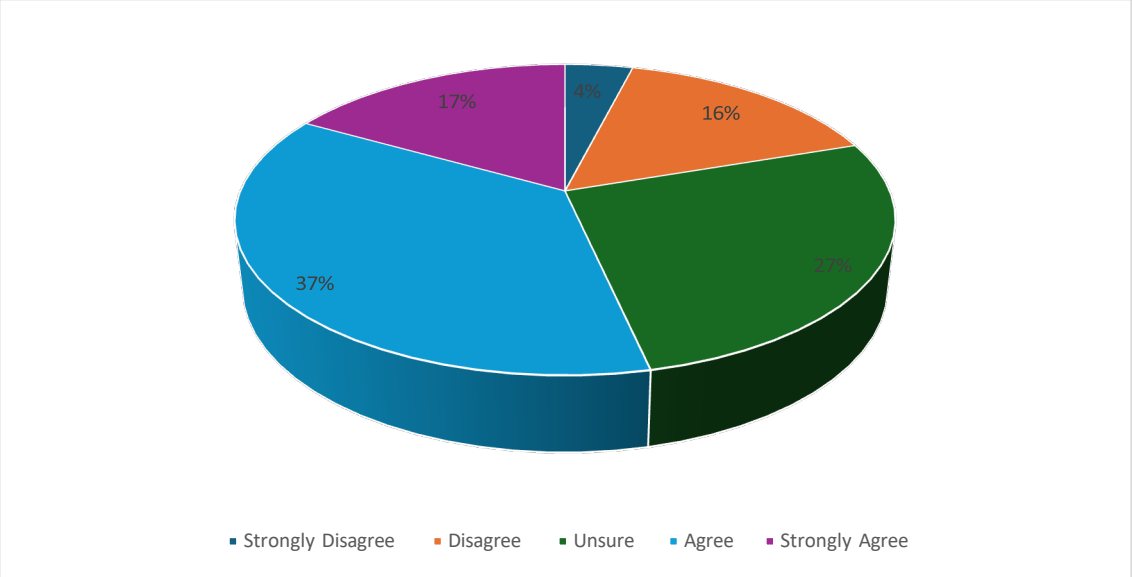

Figure 5: Perceptions of the effectiveness of monitoring service delivery via social media
Source: (Author's own construction, 2023)
N = 7282

Insights from interviews added depth to these survey findings, providing a nuanced understanding of stakeholder perceptions. Government officials, for example, acknowledged the potential of social media for real-time feedback but expressed reservations about its effectiveness due to challenges such as misinformation and resource limitations. CBOs were more optimistic, highlighting social media's role in amplifying community voices and bridging gaps between citizens and government entities. However, they also pointed to resource and digital literacy constraints as obstacles to fully utilizing these platforms for CBM. Local media representatives emphasized the speed and reach of social media, particularly in disseminating information to underserved communities, but noted the challenges of combating misinformation and maintaining credibility.

Table 2: Stakeholder Perspectives on Social Media for CBM

Stakeholder Group	Perceived Benefits	Perceived Challenges	Illustrative Quotes
Government Officials	- Allows for real-time citizen feedback	- Misinformation undermines credibility - Resource constraints and institutional capacity limitations	"False narratives often escalate quickly" (CRE3).
CBOs	- Amplifies marginalized voices	- Resource constraints in mobilizing digitally excluded populations - Challenges engaging rural and low-literacy populations	"Social media provides a platform for communities to highlight issues" (JRE10).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Local Media	- Rapid dissemination of local issues to the community - Enhances awareness of public service failures	- Struggles to maintain credibility due to misinformation	"Social media quickly informs communities about local issues" (HRE8).

The generational and regional disparities observed in the survey data (see figure 6) are consistent with global trends, where younger and urban populations tend to perceive digital tools as more accessible and effective due to higher levels of digital literacy and infrastructure availability [30; 33]. These disparities likely contribute to the skepticism expressed by older and rural respondents, who face more significant barriers to digital participation. Additionally, the neutrality expressed by a considerable proportion of respondents may reflect the limited institutionalization of social media in governance, as highlighted in the literature. The absence of structured processes for addressing citizen feedback on social media likely undermines confidence in its effectiveness, a finding corroborated by the views of government officials, who pointed to resource and policy gaps as key challenges.

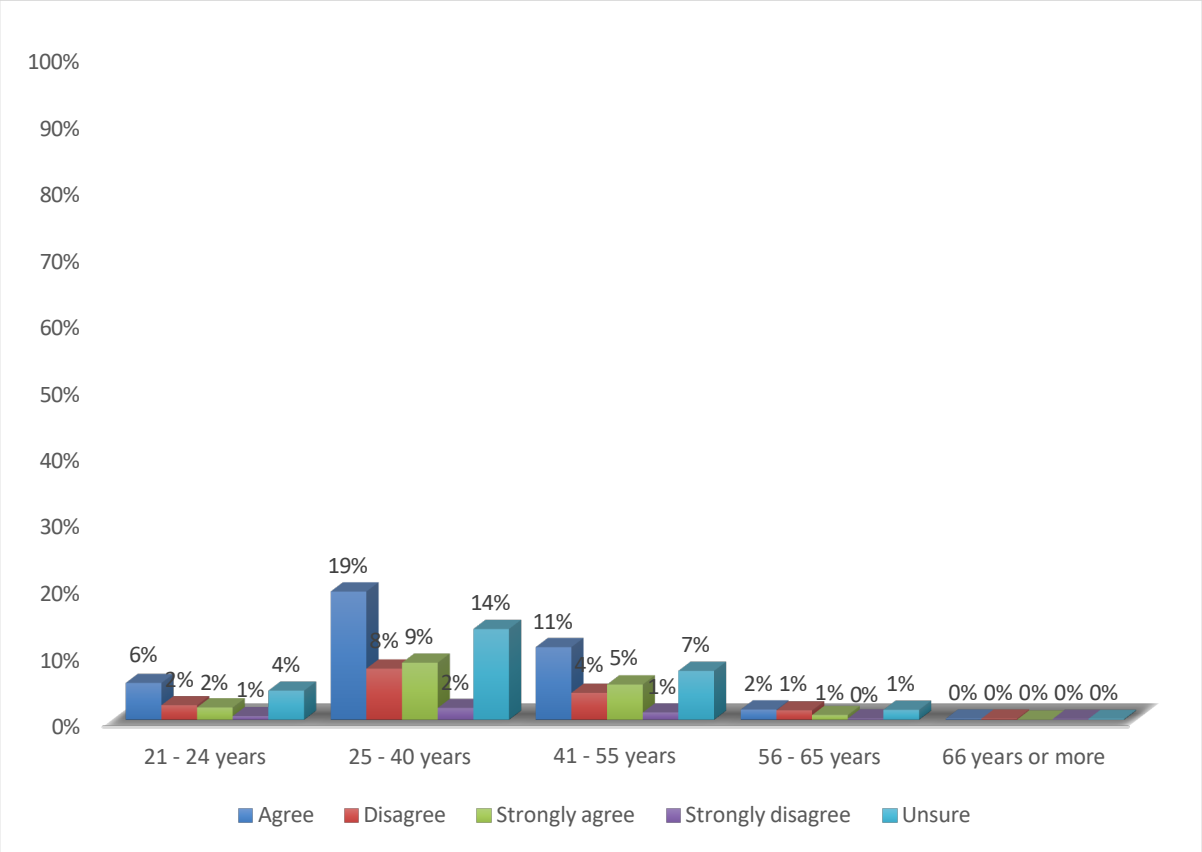

Figure 6: Social media as an effective tool for monitoring by age
Source: Author's own construction (2023)
N = 7282

On the other hand, CBOs and local media representatives demonstrated a more positive outlook on social media's role in CBM, emphasizing its participatory potential. However, their perspectives also underscored the need to address digital literacy and access disparities to maximize the reach and impact of these platforms. These findings suggest that while social media holds significant promise as a tool for CBM, its perceived usefulness is shaped by systemic barriers and stakeholder-specific challenges, as noted in prior research. The contrast between optimistic and skeptical views highlights the complexity

of integrating social media into CBM frameworks and the necessity of addressing underlying disparities to realize its potential fully.

5.2.2 Barriers to Social Media Use for CBM

The study identifies a range of systemic, institutional, and socio-economic barriers that hinder the adoption of social media for CBM in South Africa. Key challenges include trust deficits, fear of surveillance, government unresponsiveness, authenticity concerns, privacy issues, misinformation, digital literacy gaps, and the persistent digital divide. As summarized in Table 3, these barriers interact to create an environment where citizens—particularly those in marginalized communities—are reluctant or unable to engage meaningfully in digital monitoring processes. Respondents expressed deep skepticism toward government intentions, viewing digital initiatives as performative rather than substantive. Statements like "citizens feel their complaints are often ignored" (JRE10) and "people hesitate to engage online because they fear being monitored" (HRE8) reflect broader concerns about government transparency, data misuse, and retaliation. These concerns are compounded by weak privacy safeguards and South Africa's history of service delivery failures, making social media an untrusted space for civic engagement [41; 42; 43; 44; 45].

Table 3: Thematic Summary of Barriers to Social Media Use for CBM

Barrier	Description	Interconnected Effects
Trust Issues	Low trust in government and institutions undermines citizen participation.	Reduces citizen willingness to engage in CBM initiatives.
Fear of Surveillance	Fear that social media monitoring could lead to retaliation or misuse of data.	Discourages citizens from reporting issues via social media.
Lack of Responsiveness from Authorities	Authorities often fail to act on issues raised by citizens, leading to frustration.	Erodes confidence in the impact of citizen-based monitoring.
Authenticity Concerns	Difficulty verifying the credibility of social media content discourages engagement.	Undermines trust in the platform as a reliable medium for monitoring.
Privacy Concerns	Concerns about data protection and misuse hinder citizens' willingness to participate.	Restricts citizens' participation due to safety and ethical concerns.
Digital Divide	Unequal access to technology creates barriers for marginalized communities.	Excludes disadvantaged groups, weakening representativity in CBM efforts.
Misinformation	False or misleading information circulating on social media reduces credibility.	Dilutes the effectiveness of valid concerns raised on social media.
Limited Digital Literacy	Limited understanding of social media tools restricts effective citizen participation.	Limits the use of digital tools in marginalized and rural areas.

Institutional shortcomings further exacerbate these barriers. Respondents highlighted the lack of capacity within government structures to respond effectively to digital feedback, with CRE3 noting, "posts rarely lead to actionable outcomes because we lack the capacity to process them systematically." Without structured mechanisms or adequate training, public agencies struggle to turn digital input into policy or service improvements, reinforcing citizen disengagement [47; 48]. Additionally, the prevalence of misinformation diminishes the perceived reliability of social media, with GRE7 remarking that "misinformation makes it harder for citizens to trust any information, even if it's accurate" [49; 50; 51]. Privacy concerns—especially among older and rural respondents—were frequently cited, as many people are unsure how their data will be used and protected (IRE9) [52; 53]. The digital divide also remains a formidable obstacle, with high data costs and poor rural infrastructure excluding large segments of the population from digital participation [55]. Collectively, these barriers emphasize the urgent need for robust data protection, increased institutional responsiveness, digital literacy initiatives, and infrastructural investment to ensure that social media can fulfill its promise as an inclusive CBM tool.

5.3 Enabling Factors for Social Media Adoption in CBM

The adoption of social media for CBM in South Africa is supported by a range of enabling factors that go beyond digital access to include psychological, social, and institutional dynamics. Key enablers

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

identified in this study include perceived ease of use, perceived usefulness, social influence, and trust in the platform, all of which are contextualized within South Africa's socio-political landscape. WhatsApp and Facebook emerged as dominant platforms due to their user-friendly interfaces, particularly among younger demographics. As Respondent IRE9 noted, "WhatsApp is easy to use, even for people who are not tech-savvy," aligning with TAM's emphasis on usability as a core adoption driver [66]. Perceived usefulness was another strong enabler, with WhatsApp groups being used to raise community issues quickly and efficiently—paralleling the use of FixMyStreet in the UK [67]. In addition, social influence played a motivating role, especially among youth groups. As JRE10 stated, "If everyone is using it to communicate with government, people will follow," reflecting the growing normalization of social media as a tool for civic engagement [68].

Enabler	Description	Illustrative Examples	Stakeholder Perspectives
Perceived Ease of Use	The simplicity of using social media platforms facilitates adoption among users, especially younger demographics.	Platforms like WhatsApp and Facebook, known for their intuitive interfaces, dominate usage in South Africa.	"WhatsApp is easy to use, even for people who are not tech-savvy" (IRE9).
Perceived Usefulness	Social media's utility in raising awareness, sharing information, and reporting issues enhances its appeal.	WhatsApp groups are used to report community service delivery problems directly to local stakeholders.	"It's useful for quickly raising issues that affect the community" (GRE7).
Social Influence	The role of peers and social networks in encouraging the use of social media for CBM.	Youth groups promoting social media campaigns for governance accountability in urban areas.	"If everyone is using it to communicate with government, people will follow" (JRE10).
Sense of Belonging	Social media fosters a sense of community by connecting citizens with shared concerns.	Local WhatsApp groups discussing community challenges and solutions.	"It makes us feel connected to others who care about the same issues" (HRE8).
Trust in the Platform	Confidence in the credibility and reliability of platforms to facilitate engagement and deliver results.	Platforms like Twitter are seen as credible tools for disseminating real-time updates and amplifying voices.	"Twitter gives a platform to make issues visible to everyone, including officials" (CRE3).
Access to Technology	Increasing penetration of smartphones and affordable data packages enabling broader use of social media.	High smartphone ownership rates among younger demographics; mobile networks improving coverage in rural areas.	"Most people in the community have smartphones now, even in rural areas" (BRE2).
Positive Social Norms	Growing cultural acceptance of social media as a legitimate platform for engagement and monitoring.	Social media is increasingly viewed as an expected channel for citizen feedback.	"People expect the government to use social media now; it's becoming normal" (FRE6).
Relative Advantage	Perception that social media provides unique benefits over traditional CBM methods like in-person reporting.	Social media allows for real-time updates and engagement, unlike manual complaint forms.	"It's faster and easier than going to an office to file a complaint" (DRE4).
Competitive Pressure	Peer pressure within communities and among government agencies to adopt social media as a tool for governance.	Municipalities adopting platforms like GovChat to remain competitive with modern governance trends.	"Departments feel they need to use these tools because others are" (CRE3).
Ability to Connect	Social media enables citizens to easily interact with government, peers, and stakeholders.	Platforms facilitate direct communication with local officials and community leaders.	"Social media helps us reach people who can actually make a difference" (JRE10).

Trust in platforms like Twitter, valued for real-time updates and public visibility, was another enabler, as emphasized by Respondent CRE3: "Twitter gives a platform to make issues visible to everyone, including officials," echoing experiences in cities like Seoul [69]. Sense of belonging and ability to connect were also essential, with respondents reporting that social media fosters community cohesion and enables direct communication with officials and peers. Respondent HRE8 shared, "It makes us feel connected to others who care about the same issues." Broader enablers like access to technology, positive social norms, relative advantage over traditional reporting, and competitive pressure among municipalities also contribute to adoption. These factors collectively illustrate that while infrastructure remains essential, social and institutional perceptions are equally critical for enabling social media integration into CBM frameworks.

5.4 Intersection of Access, Perception, and Institutional Readiness

The adoption and effectiveness of social media for CBM in South Africa hinge on the interconnected dynamics of access, public perception, and institutional readiness. Survey data show that only 35% of respondents have home internet access, while 8% explicitly lack connectivity, exposing persistent digital inequalities that disproportionately affect rural and low-income communities. High data costs and poor network coverage in underserved areas severely limit digital participation, as noted by government official CRE3: "Without stable internet access, these platforms can never reach their full potential." This digital divide reflects the systemic constraints emphasized by Institutional Theory, which argues that unequal access to infrastructure reinforces broader socio-economic disparities [70]. Consequently, the citizens who experience the worst service delivery are often the least able to participate in digital monitoring efforts, undermining the inclusivity and effectiveness of CBM.

Equally important are citizen perceptions of social media's utility and institutional capacity to act on feedback. Although 33% of respondents believe social media is a practical tool for public service monitoring, 21% remain skeptical due to concerns over misinformation, lack of responsiveness, and privacy risks. As HRE8 put it, "People don't trust that their complaints will be taken seriously," underscoring how past inaction erodes trust. This aligns with the Technology Acceptance Model (TAM), which highlights that perceived usefulness and institutional responsiveness are central to adoption [71; 72]. Institutional readiness is also a critical factor: government officials cited a lack of clear protocols, training, and coordinated policy frameworks as barriers to operationalizing social media for CBM. As ARE1 stated, "There is no clear protocol for handling citizen feedback received through social media." The fragmented implementation of platforms like GovChat reveals that despite some promise, CBM effectiveness is limited by inconsistent governance structures [73; 74]. To harness the full potential of social media in governance, South Africa must address digital access, improve public trust, and implement coherent, scalable e-governance strategies.

6. Implications of Findings

The findings of this study reveal that the adoption of social media for CBM in South Africa is shaped by a complex interplay of systemic, institutional, and socio-economic factors, with significant implications for digital inclusion and participatory governance. Digital access remains a critical determinant, as higher connectivity among urban populations enables greater engagement, while rural and low-income communities remain largely excluded—reinforcing the structural inequalities identified in Institutional Theory. This exclusion threatens the legitimacy and effectiveness of CBM efforts by sidelining the very groups most affected by poor service delivery. Simultaneously, public perception of social media's usefulness is undermined by widespread distrust in government, misinformation, and a lack of institutional responsiveness—factors that align with the Participatory Governance Framework, which stresses that trust and visible action are essential for sustained citizen engagement. Institutional readiness further constrains CBM potential, with the study identifying fragmented municipal policies, insufficient training, and the absence of standardized feedback mechanisms as core challenges. As platforms like WhatsApp and Twitter become increasingly embedded in civic life, concerns around surveillance, privacy, and content credibility underscore the contested nature of digital spaces. To avoid reinforcing existing power asymmetries, the study argues that social media must be integrated into CBM through targeted reforms—expanding access, building trust, enhancing institutional capacity, and embedding clear governance protocols that ensure meaningful, inclusive, and accountable digital participation.

7. Conclusion and Future Research Directions

Social media has emerged as a powerful tool for communication, engagement, and participatory governance, yet its application in CBM remains constrained by systemic, institutional, and socio-economic barriers. The findings of this study illustrate how digital inequalities, trust deficits, and institutional unpreparedness collectively shape the feasibility of social media as a governance tool in South Africa. While the increasing adoption of social media presents opportunities for enhancing citizen engagement, the persistent reluctance of government institutions to embrace these platforms for accountability mechanisms reflects broader governance challenges. The study highlights how access

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

disparities exclude marginalized populations from meaningful participation in CBM, reinforcing pre-existing inequalities in digital governance. Furthermore, the absence of clear institutional protocols, combined with fears of surveillance and misinformation, limits these platforms' perceived credibility and effectiveness in holding public institutions accountable. However, the study also identifies enabling factors—such as the growing normalization of digital engagement, the influence of peer networks, and the demonstrated potential of localized social media-driven initiatives—that suggest a pathway for broader adoption if systemic barriers are addressed. These findings align with global experiences, where the success of technology-driven CBM initiatives has depended not just on access to digital platforms but also on institutional willingness, public trust, and structured policy interventions. The South African context underscores the need for governance frameworks that do not merely incorporate social media as a supplementary communication tool but integrate it into structured participatory governance models. Without addressing digital divides, strengthening institutional capacity, and fostering public confidence, social media-driven CBM initiatives risk being ineffective or reinforcing governance asymmetries. As digital technologies continue to evolve, future research and policy efforts must remain focused on aligning digital inclusion, regulatory frameworks, and institutional responsiveness to ensure that social media can function as a meaningful tool for accountability rather than just a symbolic platform for engagement. Future research should explore the scalability and sustainability of grassroots and citizen-led initiatives—such as community WhatsApp groups—as formal mechanisms for participatory governance within CBM frameworks.

8. Recommendations

Several targeted recommendations must be implemented to address the systemic, institutional, and socio-economic barriers limiting the adoption of social media for CBM in South Africa. First, strengthening trust through transparent engagement processes is essential, given the widespread skepticism about government responsiveness. Establishing formal mechanisms where authorities publicly acknowledge citizen feedback, provide updates on actions taken, and create clear follow-up processes will enhance credibility. Additionally, proactive communication addressing surveillance and data privacy concerns is necessary to reassure users. Institutional capacity must also be improved, as findings highlighted resource and skills deficits among government officials managing social media interactions. Training programs should equip officials with the ability to engage with citizens effectively, while dedicated CBM units within municipalities or provincial departments can standardize and streamline responses. Developing clear operational guidelines for CBM-related social media use will further improve institutional coherence. Another critical aspect is mitigating misinformation, as the spread of false information erodes trust in CBM platforms. Collaborative efforts between government bodies, civil society, and social media platforms should establish verification mechanisms and fact-checking processes. Public education campaigns on identifying credible information and integrating artificial intelligence moderation tools can also help mitigate misinformation risks. Additionally, privacy concerns must be addressed through robust data protection policies aligned with global best practices, with clear public communication ensuring citizens understand how their data is safeguarded.

Beyond institutional readiness and trust-building, expanding digital access remains a fundamental requirement, particularly for rural and low-income populations. The study's findings reinforce the need for targeted interventions to address digital disparities. Policymakers should explore partnerships with telecommunications providers to introduce subsidized data packages for CBM engagement, particularly through platforms like GovChat. Establishing community internet hubs and mobile data subsidy programs will further ensure that marginalized populations can participate meaningfully in digital governance. Furthermore, localized and citizen-led initiatives should be leveraged to strengthen CBM at the grassroots level. Existing informal monitoring mechanisms, such as community WhatsApp groups, can be scaled into formalized governance processes through municipal support, funding, and technical assistance. Tools tailored to user needs, particularly multilingual and disability-accessible platforms, should be prioritized to ensure inclusivity. Additionally, social media should be strategically leveraged to amplify marginalized voices, with municipal authorities actively monitoring community-driven digital campaigns and hashtags to incorporate citizen feedback into service delivery planning. Establishing formal collaborations with crowdsourcing platforms that aggregate citizen concerns can further enhance the effectiveness of CBM. These recommendations align directly with the study's findings, providing actionable steps to overcome barriers, enhance institutional responsiveness, and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

foster greater trust in the use of social media for CBM in South Africa. By addressing these challenges, the potential of digital platforms to improve transparency, accountability, and participatory governance can be fully realized.

Flying chairs, heated takes: a discourse analysis of audience comments on the São Paulo Mayoral debate across five major YouTube news channels

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 26 May 2025

Abstract. The 2024 São Paulo mayoral election sparked intense political discourse, particularly following a highly publicized altercation during a live debate on September 15. The incident, in which candidate José Luiz Datena struck Pablo Marçal with a chair, led to widespread discussion on social media, particularly on YouTube. This study investigates the dynamics of online discourse surrounding this event, focusing on audience engagement and sentiment across five major YouTube news channels: UOL, Folha de São Paulo, CNN Brasil, Poder360, and Itatiaia. Using a discourse analysis approach adapted from Teixeira et al. (2018), we collected and categorized 500 top-ranking YouTube comments, classifying them into four primary categories: Humor, Support, Criticism and Protest, and Neutral. A second layer of analysis further refined support and criticism, differentiating between pro-Datena, pro-Marçal, and general political dissatisfaction. Our findings reveal that humor was the dominant response across all platforms, suggesting a tendency toward memefication and satire in Brazilian digital political discourse. However, significant polarization was observed, with Datena receiving both overwhelming support and the highest level of criticism across outlets. Media framing influenced audience reactions, as outlets with in-depth coverage fostered broader critiques, while those with shorter, sensationalist clips amplified polarized sentiments. This study contributes to research on political communication and social media discourse by demonstrating how digital platforms mediate political controversies and shape public perception. The results highlight the role of algorithmic content curation in reinforcing ideological divides and fostering emotionally charged interactions. By offering a systematic analysis of audience reactions, this study provides insights into the evolving nature of digital political engagement in Brazil and lays the groundwork for future research on media framing and discourse analysis in online environments.

Keywords. Social media and politics, Discourse analysis, YouTube, Mayoral election, Political polarization.

Research paper, DOI: https://doi.org/10.59490/dgo.2025.989

1. Introduction

Brazil is the largest country in South America and has a population of nearly 213 million inhabitants[1]. Internet usage there grew rapidly, with 84% of the population aged 10 online at least once in the last three months (nic.br, 2023b; União Internacional de Telecomunicações, 2020). This represented a significant increase from

[1]https://tinyurl.com/5e4n8b85

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

a 34% share in 2008, highlighting the dramatic expansion of internet access in the country. Access quality in Brazil is unequally distributed, according to Castello, 2024, with wealthier regions in the South and Southeast having better access than the Northeast, North, and Central-West regions, which experience slower and less reliable internet connections. This disparity reflects long-standing socioeconomic and infrastructural differences across the country.

São Paulo is the wealthiest and most populous state in Brazil, with over 45 million residents[2], and also has the best connectivity (nic.br, 2023a). It is located in the southeastern region of the country. The state is home to Brazil's main industries and serves as a focal point for political and economic events that hold national significance and impact. The mayoral election in the state's capital, also named São Paulo, is often seen as a proxy for national political trends, foreshadowing potential alignments, movements, and rising political stars.

The 2024 mayoral election was deeply divided in the initial round. For weeks during the campaign leading to October 6, three candidates remained close in the polls[3], repeatedly exchanging leads while holding between 20% and 30% of voter's intentions each. The incumbent mayor, Ricardo Nunes of the centrist MDB party, and personally aligned to far right former president Jair Bolsonaro, sought reelection. His direct challengers were Guilherme Boulos of the left-wing PSOL party, with ties to current president Lula, and Pablo Marçal of the PRTB, a populist outsider and former career coach who resisted categorization.

José Luiz Datena, of the center-right PSDB party, a well-known Brazilian television host of sensationalist crime shows, was among the candidates polling low[4]. Datena, in spite of being a household name, held a dubious reputation as a candidate, after announcing his candidacy for public office and then withdrawing four times over the past few decades, besides shuffling affiliations among eleven parties[5].

On Sunday, September 15th, the debate broadcasted exclusively on TV Cultura took an unexpected turn after Mr. Marçal provoked Mr. Datena by referencing a sexual harassment allegation against him, which Mr. Datena dismissed as unproven and slanderous. The altercation escalated, with Mr. Datena referring to Mr. Marçal as a "little bandit" and Mr. Marçal calling Mr. Datena a "coward." Debate footage next shows Mr. Datena approaching Mr. Marçal and striking him with a chair, leading to the debate's interruption and Mr. Datena's expulsion from the premises.

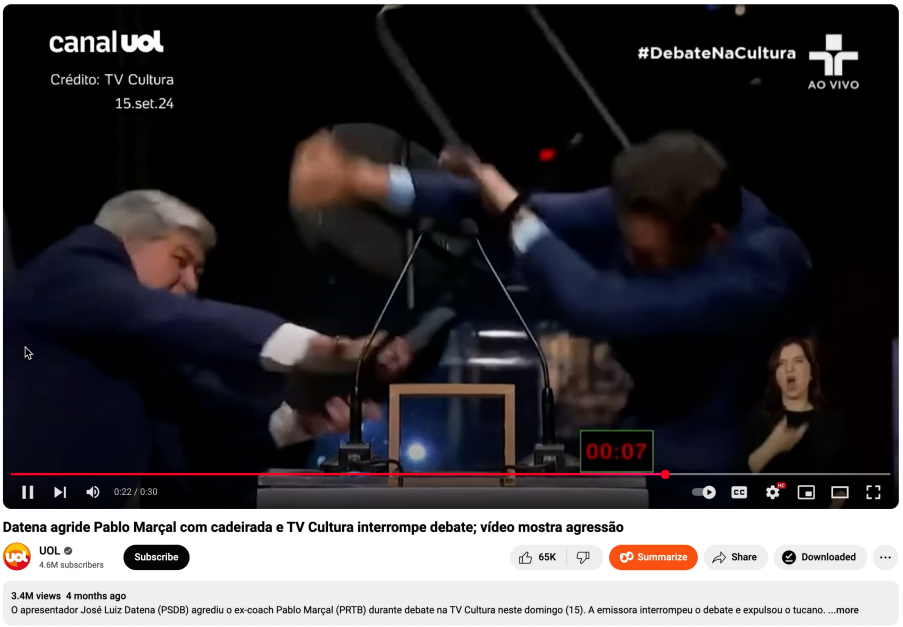

Fig. 1 – Moment when José Luiz Datena hits Pablo Marçal with a chair during transmission

The incident garnered widespread attention and sparked discussion across various social media platforms, with different camera angles and video clips of varying lengths circulating widely. It also became a national news story, portrayed either as a deplorable example of the state of political debate in Brazil or as a quasi-comedic sketch, with protagonists and antagonists assigned and placed in direct conflict within spontaneous narratives. The varied responses piqued our research interests as an interdisciplinary group featuring computer science and communication scholars.

This study investigated the dynamics of online discourse in Brazil, focusing on how viewers and internet users engage with and shape debates on digital platforms. Specifically, the research examines how the online community reacts to and participates in discussions sparked by controversial or noteworthy incidents, as reflected in their comments and interactions on platforms such as YouTube.

The research methodology employed a multifaceted approach. First, the study examined how five distinct media outlets reported on YouTube the "Cadeirada" (Chair strike) incident as it became known. This enabled a comparative analysis of how different media sources framed the event and potentially influenced public perception. Second, the research collected and analyzed viewer comments accompanying these media publications on YouTube. Specialized tools and a tailored script were developed to gather and organize the data from the YouTube API. Furthermore, a pre-existing classification methodology was refined and applied to categorize the different types of online discourse observed in the viewer comments. This systematic approach enabled the researchers to identify patterns, trends, and dominant themes within the online conversation. By visualizing and presenting these findings, the study aims to stimulate further discussion and understanding of online discourse patterns in Brazil.

The remainder of this paper is organized as follows. Background and related work are presented in Sections 2 and 3. Section 4 describes the methodology used, and Section 5 presents a visual analysis of one case study about a political episode that happened in Brazil in 2024. Section 6 presents our final remarks and goals for future research.

2. Background

The selection of channels prioritizes companies headquartered in Brazil, centered in the Southeast region. It is important to highlight that the channels collected on YouTube did not have broadcasting rights, being the only official images of the debate, from a single channel, TV Cultura (as previously mentioned). Next, we provide a brief description of the channels to situate their scale and relevance. UOL is considered "the largest Brazilian content, technology, services, and payment methods company"[6] having started its activities in 1996. Folha de São Paulo defines itself as "one of the largest and most influential national daily newspapers"[7] and is part of the Folha Group, one of the main Brazilian media conglomerates[8], with non-editorial connections to UOL. CNN's national branch presents itself as "the first news channel in the country to debut first on digital and then on television"[9], having begun broadcasting in 2020. Poder 360 is an internet-native vehicle launched in 2017, a spinoff of a blog by journalist Fernando Rodrigues previously hosted on UOL[10]. Ultimately, Radio Itatiaia is the neighboring state's main radio station and one of the three most important in the country, founded in 1952 and featuring a mix of news, commentary, and sports[11].

The video collection process involved: 1) Defining a search string "datena agride pablo marçal com cadeirada" (translation: datena strikes pablo marçal with a chair); 2) Inputting it into YouTube in early November 2024; 3) Selecting videos posted by journalistic or media company sources to maintain journalistic ethical balance. We arbitrarily set a limit of five videos and excluded videos from the original broadcaster, TV Cultura. The collected posts came from the five YouTube channels: UOL, Poder 360, Rádio Itatiaia, Folha de São Paulo, and CNN Brasil. 4) Collect information about the selected posts, videos, their production, and metadata such as title, duration, updated number of views, and channel SocialBlade ranking. 5) Organize a chart sorted by the video's number of views. 6) Collect and organize comments using our scripts for further analysis. A summary of the findings related to the posts is presented below.

Outside of CNN, none of the media companies that published these videos specializes in television or television news, in spite of having a YouTube channel and live broadcasts. This mostly explains the lack of a news story format and the presence of a video snapshot in 4 of the 5 videos. In these, the duration ranges from 21 to 30 seconds and is centered on the provocations that Mr. Marçal makes moments before being attacked. Little is shown after the chair is thrown as well.

The video edited by Poder 360 has a duration of a little more than six minutes and takes a different approach, as it adds other moments outside the debate broadcast. Edits videos made by the candidate's advisors on the debate corridors and some views, apparently, of spectators who are in the audience at a higher point of view than the transmission. There are no voiceovers, nor narrative captions, or subtitles, and the picture frame shifts from horizontal to vertical according to the source. Although technically simple, it provides a sense of the moments that preceded the chair attack itself, allowing the viewer to observe that the provocations made by the candidate Marçal had already been causing friction backstage. This suggests that the accusations thrown at Mr. Datena were premeditated, although the Poder 360 video does not make a conclusion or evaluation that points to this. The style is similar to videos made by fans at music concerts that combine an edition of hundreds of shots made independently. Here we have an attempt to offer viewers a backstage view that seeks to complement and visually explain what other vehicles have not been able to do.

The titles focused on the denotative characteristics of the actions depicted, avoiding value judgments or addressing the public identity of the candidates. This approach is justified as the media coverage targets an audience already familiar with the municipal election campaign. Based on an analysis of these videos, we can confirm that all news and media companies have adopted a balanced stance regarding the events that transpired during the debate, even if Poder 360's approach could be defined as richer than the others, as is featured more background shots.

3. Related Work

YouTube's algorithms have transformed the ways information is curated and consumed, reshaping cultural and sociopolitical dynamics. Rieder et al., 2018 provide a foundational analysis of the platform's ranking mechanisms, demonstrating how visibility is modulated by a combination of user engagement metrics, platform priorities, and cultural context. Their study identified three key patterns in ranking: stability, "newsy" content spikes, and hybrid morphologies. Stable patterns reflect long-standing popular content, while "newsy" spikes capture sudden bursts of interest in trending topics. The hybrid patterns, combining features of both, illustrate how YouTube dynamically adapts recommendations to reflect user behavior and external events. This nuanced understanding of algorithmic patterns shows that YouTube is not a passive distributor of content but an active mediator of attention. Further, the study revealed a preference for YouTube-native content—often from independent creators—over mainstream media outlets. This preference underscored the platform's role in fostering alternative narratives, including controversial or niche voices, by rewarding content that maximizes watch time and engagement. The privileging of native content highlights how the algorithm aligns with

YouTube's commercial goals of increasing user retention and advertising revenue, often at the expense of neutrality or diversity.

Complementing this technical analysis, Bishop, 2020 delves into the emergence of algorithmic "experts" who guide creators on how to optimize visibility on YouTube. These experts act as intermediaries, decoding the platform's opaque recommendation system and offering strategies to navigate it effectively. However, their advice is often grounded in a meritocratic narrative that overlooks structural inequalities in content creation and visibility. For instance, creators who lack resources or access to data analytics tools may struggle to compete, despite employing the same optimization techniques. Bishop also critiques the subjective and selective nature of algorithmic expertise. While these experts frame their strategies as objective and data-driven, they often reinforce the biases embedded within YouTube's algorithm, such as prioritizing advertiser-friendly content. This dynamic further entrenches inequalities by privileging certain types of content—typically mainstream or sensational—over others, limiting the diversity of voices on the platform. The study calls for a more critical understanding of how YouTube's ecosystem shapes creator behavior and amplifies certain narratives, contributing to broader discussions on algorithmic accountability. These studies show that YouTube's algorithm is not neutral—it actively shapes what content gets seen and how creators and audiences interact with the platform.

YouTube's recommendation system is designed to increase user engagement by suggesting content similar to what users have previously watched, aiming to maximize viewer satisfaction. This real-time feedback loop tailors videos to match individual interests, considering factors such as watch time, engagement (likes, comments, shares), relevance, and user history [12] In 2024, YouTube began testing an endless scroll feature for full-length videos, similar to TikTok's format, allowing users to swipe up to discover new content. This change aims to enhance content discovery and support audience growth for new creators. However, it raises concerns about diminishing creators' control and prioritizing immediate engagement over community-building and quality [13].

YouTube's role in political discourse and polarization has been a topic of global research. García Marín, 2023 examined how YouTube's recommendations vary across topics, finding that while the algorithm doesn't consistently push users toward extreme content, some themes, like COVID-19 and far-right politics, are more polarizing. Their findings align with studies like Bail, 2022, which show that YouTube can deepen political polarization by reinforcing ideological preferences. However, other research, like Rasmussen and Petersen, 2022 suggests that YouTube often steers users toward more mainstream content, acting as a moderating force in some cases. In the U.S., researchers found that YouTube's algorithm amplifies political biases by showing content that aligns with users' existing beliefs. The platform amplified his conservative and reactionary messages while sidelining content from other candidates, contributing to the spread of polarized narratives. These findings illustrate how YouTube's algorithm can adapt to different political contexts, influencing public opinion and voter behavior.

In Brazil, the 2018 presidential elections provided a vivid example of how YouTube's algorithm influences political discourse. Reis et al., 2020 highlight how the platform's recommendation system acted as a powerful tool for disseminating conservative narratives, with a strong bias toward Jair Bolsonaro's campaign themes. Through a systematic analysis of over 764,000 video recommendations, their study showed that content aligned with Bolsonaro received disproportionate visibility, dominating search results and reinforcing anti-leftist and anti-human rights rhetoric. This was achieved through "semantic galaxies" — clusters of interconnected videos that created echo chambers favoring Bolsonaro's messaging while marginalizing opposition voices. The study revealed that algorithmic recommendations are shaped by a combination of user activity, platform design, and external campaign strategies, including the use of bots and coordinated digital marketing. Channels such as Jovem Pan News and Verdade Política played pivotal roles in amplifying Bolsonaro's visibility, further illustrating the interplay between traditional media, digital influencers, and YouTube's algorithms. Similarly, another study by Reis et al., 2019 emphasized that YouTube's algorithm was instrumental in prioritizing videos critical of Bolsonaro's opponents, such as Fernando Haddad and Lula, even when the search terms directly referenced those candidates. This suggests that the platform's recommendation system was not neutral but actively modulated visibility in ways that favored specific political ideologies.

De Albuquerque and Rodas, 2022 explored how YouTube's recommendation algorithm contributes to polit-

[12] https://tinyurl.com/2r652yv6
[13] https://tinyurl.com/3mktwc55

ical radicalization by creating ”information systems” customized for each user. Their study shows that the algorithm keeps users on the platform longer by suggesting content that matches their preferences. During the 2018 Brazilian elections, this led to the promotion of far-right ideas, especially those supporting Jair Bolsonaro. The researchers conducted an experiment simulating new users and found that even when starting with non-political content, the algorithm eventually directed users to political and polarizing videos, reinforcing echo chambers and spreading false information.The study explains that YouTube's system connects different topics to guide users toward specific types of content. This process creates a kind of ”synthetic reality” where users are exposed mainly to ideas that the platform thinks will keep them engaged. This behavior benefits YouTube financially, as it increases ad revenue, but it also risks undermining democracy by limiting diverse perspectives and amplifying extreme views.

4. Research Methodology

To perform a comparative analysis of the different sources of media, we used, as a basis, the research methodology presented by Teixeira et al., 2018. In their work, the authors proposed a taxonomy for discourse analysis to help understand the intent and types of Twitter (now called X) users' conversations about political scandals. Since our focus is on YouTube comments, we made some refinements.

Our study examines five distinct media outlets that reported on YouTube about the “Cadeirada” (Chair strike) incident. The selection criteria were based on popularity and influence, regional representation, and journalistic credibility, prioritizing channels with significant audience engagement in Brazil. To ensure unbiased analysis, we excluded videos from TV Cultura, the original broadcaster of the debate, to focus on secondary media framing. This approach allows a comparative analysis of how different media sources shaped public perception of the event.

Our methodology for analyzing and comparing comments from different YouTube channels is structured in steps. The process begins with data collection, carried out individually for each channel, ensuring the information is organized independently. Each channel's 100 most relevant comments were then selected and subjected to peer review. Finally, the resulting data was uploaded to an interactive online dashboard, which provided visual tools to facilitate comparative analysis between channels. These steps are detailed below.

For **data gathering**, we used a script written in Python, whose main purpose is to consume Google's YouTube Data API, receiving the comments of a given video and saving the gathered data in a CSV format. We used CSV, Requests, and Re libraries to develop the script, using requests to communicate with Google's API and get the raw data, to which we applied regex and replace functions to regularize the CSV file, ensuring its integrity. Finally, we used the CSV library to persist the gathered data in a CSV file, with its main advantage being that it has total compatibility with spreadsheets such as Excel, allowing for better data analysis in the future. The script is available on our GitHub[14] and can be used for collection in other contexts. You must download the script and insert the video link with your YouTube API Key, for which you can expect a response to your request in a formatted CSV file.

Following the steps of Teixeira et al., 2018, in the **data selection**, we focused on the 100 most influential comments of each channel (CNN, FolhaSP, Itatiaia, Poder 360, UOL). The query parameters included the 100 most relevant comments per video, as ranked by YouTube's algorithm, ensuring a focus on the most engaged discussions. The script also collected metadata such as timestamps, user engagement metrics (likes and replies), and comment text. While using YouTube's ranking system provides valuable engagement-driven insights, it also introduces selection bias, as comments with fewer engagements may be overlooked. Future research may explore alternative selection methods, such as random sampling or timeframe-based collection, to enhance representativeness.

Then, comment categorization was done using an online and collaborative spreadsheet. Two reviewers separately analyzed each comment, classifying it into one of the four proposed categories: Humor, support, criticism and protest, and neutral. In the context suggested in this work of discourse analysis, the category “News” introduced in the original work is not applicable. The News category was relevant in the context of X, since users would mention facts by liking them to news on the web, which is not something that occurs in YouTube channels. *Humor* refers to comments in a joking tone. *Support* refers to those who promote one of the speakers

[14] https://github.com/DAVINTLAB/DGO-2025

(or candidates in our case study). *Criticism and protest* are those comments that present dissatisfaction with an exposed fact or situation. *Neutral* are comments that are indifferent or the position could not be inferred from the comment.

After the primary classification, a second level of categorization was introduced to identify the polarization of support and criticism. Support was further classified into pro-Datena and pro-Marçal, while criticism was divided into critiques of Datena, critiques of Marçal, and general dissatisfaction with the political climate. This refinement allowed for a deeper understanding of how different audience segments reacted to the event and how media framing influenced discourse. The results provide insight into echo chambers within digital political discussions, aligning with prior research on political discourse on social media.

To help the **content analysis**, we have developed an interactive dashboard with some simple visualizations that are available online[15]. First, you need to upload the files, both the file containing all the data gathered and the spreadsheets with the classifications; you can submit as many files as you want, just make sure to have both files so the app can work in its intended way. Then, you can analyze a variety of charts that include charts such as a stacked bar chart displaying the classification proportions in the files, a detailed pie chart for each video displaying its in depth classifications, a bar chart for the comments per video and a dashboard that allows to identify the top users commenting in each video as well as the users who commented on the most amount of videos, helping identify potential bots or spams. The dashboard ensures that results are accessible and interpretable, reinforcing transparency in data presentation. Future improvements may include natural language processing (NLP) techniques to complement manual classification and enhance scalability.

This methodology presents some limitations. The reliance on YouTube's ranking system means that less-engaged comments may not be included. Manual classification introduces subjectivity, even though we used multiple reviewers and inter-rater agreement metrics to mitigate this issue. Additionally, the analysis focuses on five media outlets, which may not fully capture the broader discourse on YouTube. To address these challenges, we ensured transparency in classification, maintained strict reviewer independence, and incorporated a validation process. Regarding ethics, we strictly adhered to research guidelines by only analyzing publicly available comments, not storing any personally identifiable information, and following ethical standards for digital data collection and content analysis.

5. Case Study

The selected time frame for collection corresponds to December 5th, 2024. As mentioned in the methodology, the top 100 comments in each video were selected, and the comparison focuses on those comments. This stacked bar chart illustrates the categorization of YouTube comments by type (Neutral, Criticism and Protest, Support, and Humor) across different news outlets (CNN, FolhaSP, Itatiaia, Poder360, UOL).

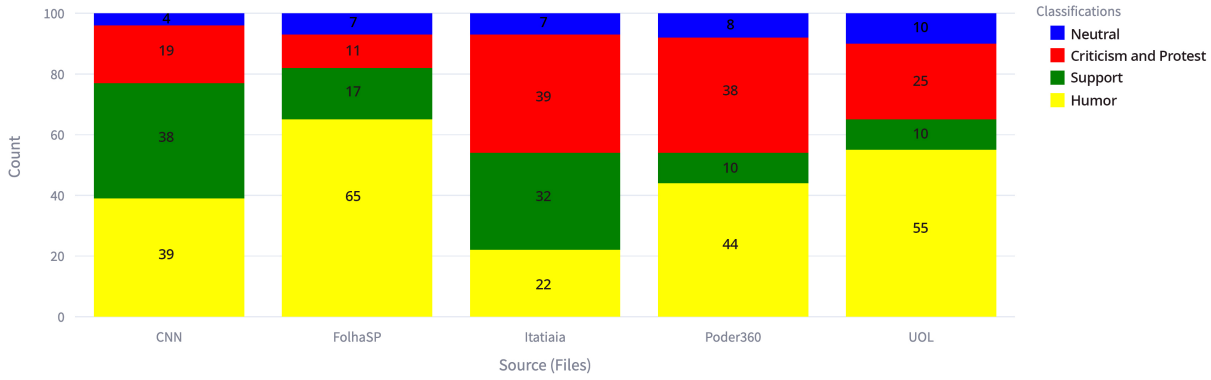

Fig. 2 – Categorization of YouTube comments by type.

The chart reveals a relatively consistent distribution of comment types across all five news outlets (CNN, FolhaSP, Itatiaia, Poder360, and UOL). Each outlet features all four categories: Humor, Support, Criticism, and Protest, and Neutral. However, slight variations exist, particularly in the proportions of Criticism and Protest,

[15] Link omitted due to double-blind review.

and Humor. Criticism and Protest (red category) are prominently represented in all outlets but slightly more prevalent in Itatiaia and Poder360, indicating that these platforms might have attracted more viewers dissatisfied with the incident or its coverage. The Humor category (yellow) consistently accounts for a significant portion of comments across all platforms, but for Itatiaia, and it is higher in Folha SP and UOL. This may indicate that the public generally perceived the event as comical or absurd in most outlets. Another conjunction relates to the fact that Folha SP and UOL are the channels that are most popular and garnered the highest number of views in the respective videos. This aligns with the conclusions on Teixeira et al., 2018, which observed humor's prevalence during controversial events. Humor often serves as a way for online audiences to navigate discomfort with contentious or absurd events. In this case, the physical altercation during a live debate likely struck viewers as both shocking and ludicrous, leading to widespread joking commentary. The methodological framework's inclusion of humor captures the way contentious events, especially in the political arena, are quickly "memefied" in the digital sphere. The predominant presence of humor suggests that, regardless of the media outlet, viewers engaged in a shared cultural practice of trivializing the event, perhaps as a critique of the political figures or as a means of diffusing tension. This was more visible in the highest viewed videos, suggesting a trend in humorous behavior in mainstream outlets.

The Support category (green) maintains a balanced presence across platforms but appears marginally lower in Poder360 and UOL, suggesting these outlets might have less content or framing that aligns with supportive narratives. The Neutral category (blue) has a minor presence across all outlets, signifying that most users engaged in subjective discourse rather than neutral observations.

The Criticism and Protest category is the second most prominent, reflecting a significant portion of viewers expressing dissatisfaction, either with the actions of individuals in the incident or the broader context. We also analyzed the focus of the comments (pro-Datena, pro-Marçal, or general), but we will delve into this section later in this analysis. The smaller presence of Support and Neutral comments suggests limited backing for specific actors or purely factual discussions. This could indicate polarization, with viewers gravitating toward humor or critique rather than neutrality or outright support.

Each media outlet likely influenced the tone of the comments based on how they framed the incident in their video titles, descriptions, and focus. For instance, Poder360's more detailed coverage, including "behind-the-scenes" footage, may have attracted a higher proportion of critical or investigative discourse, as viewers reacted to contextual revelations rather than just the chair-throwing moment. On the other hand, outlets like UOL and Itatiaia, which focused on concise clips of the altercation, may have encouraged comments emphasizing humor or immediate emotional reactions.

The dominance of Criticism and Protest in outlets like Itatiaia, suggests that their audience may perceive the event as emblematic of broader issues, such as the decline of political discourse or the sensationalism of media coverage. Conversely, CNN Brasil, despite being known for its international credibility, exhibits similar trends to domestic outlets, showing that even global brands may not escape the polarized and humor-driven engagement patterns of local audiences in such events.

The substantial representation of Criticism and Protest reflects widespread dissatisfaction among viewers, either directed at the individuals involved in the altercation or the broader political and media landscape. This aligns with the study's methodology, which emphasizes identifying critical patterns in online discourse. Viewers may have used the comment sections not only to critique the behavior of the candidates but also to express frustration with what the incident symbolized an erosion of professionalism in politics or sensationalism in media coverage. The prominence of criticism in certain outlets suggests that specific audiences are more likely to express discontent.

The differing proportions of comment categories across outlets may point to the formation of echo chambers. Each platform's audience appears to engage with the incident in ways that reflect their broader ideological leanings and expectations of content from that outlet. The findings also suggest that while media outlets strive for balanced reporting, their framing decisions—such as what to highlight in video titles or how much context to provide—play a significant role in shaping public perception and discourse. Outlets like Poder360, with richer contextual content, may foster more critical and layered discussions, while concise clips from UOL and CNN might lead to quick, emotionally driven reactions. The data also highlights cultural nuances in Brazilian digital discourse. The strong presence of humor highlights a tendency to approach political controversies with a mix of irreverence and satire, a recurring theme in Brazilian online interactions. This cultural lens enriches

the findings by connecting them to broader behavioral patterns in the country's digital ecosystem.

While we were working on the general classifications, we also noticed that it would not be possible to get an accurate grasp of the political discourse polarization if we did not understand who the audience was supporting and criticizing. So, differently from our inspired methodology from Teixeira et al., 2018, we had to create a second step - after the categorization of Humor, Support, Criticism and Protest, and Neutral, we moved to understand where the polarization was in each channel.

For the support distribution, we had two sub-categories: supporting Datena and supporting Marçal. The support distribution across the five news outlets (CNN, FolhaSP, Itatiaia, Poder360, and UOL) highlights significant polarization in audience alignment with either Datena or Marçal. One important factor to mention in this part of the analysis is that we ware considering percentages to get a grasp of the general climate among videos, but we may also need to consider the absolute numbers, as different videos received a distinct proportion of "support" categorized comments. For CNN, we categorized a total of 38 support comments, Folha SP 17, Itatiaia 32, and Poder 360 and UOL 10 comments.

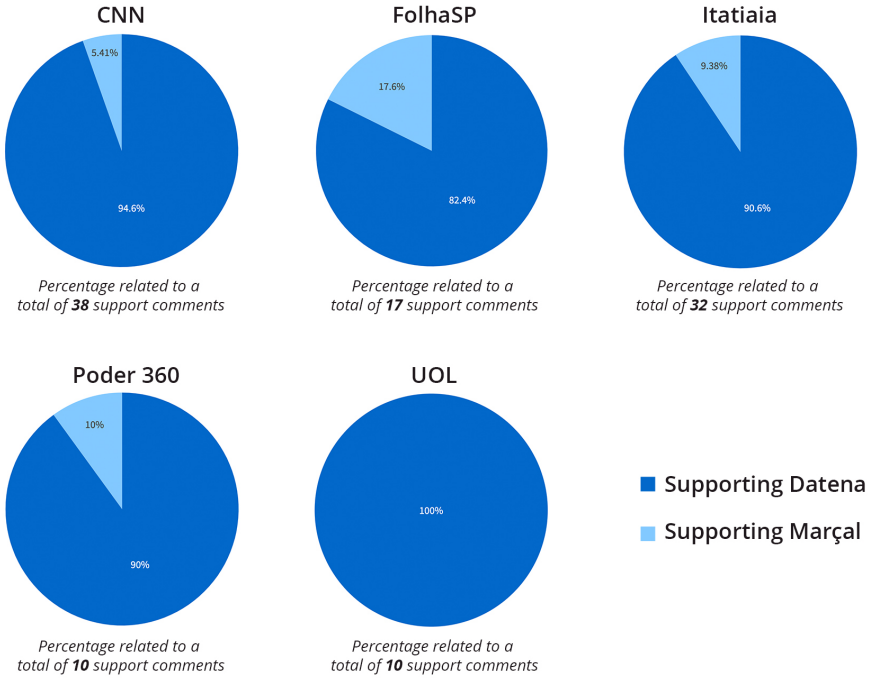

Fig. 3 – Support distribution.

At CNN, a striking 94.6 percent of comments expressed support for Datena, while only 5.4 percent backed Marçal. This overwhelming preference for Datena suggests that either the framing of CNN's content or the platform's general audience heavily leans toward his narrative.

FolhaSP displayed the highest percentage of Marçal supporters, but it still follows the general trend from the other channels. With 82.4 percent of the comments supporting Datena and 17.6 percent favoring Marçal, this relatively higher proportion of support for Marçal compared to CNN indicates that FolhaSP's audience encompasses a broader range of opinions, possibly influenced by the outlet's content presentation or a more diverse audience demographic.

At Itatiaia, the polarization was strong, with 90.6 percent of comments supporting Datena and only 9.4 percent favoring Marçal. Similarly, Poder360 showed a significant lean toward Datena, with 90 percent of comments expressing support for him and 10 percent backing Marçal. These patterns align closely with the trend observed on CNN, where audiences predominantly sided with Datena.

UOL had an interesting 100 percent support to Datena. This particular piece of data, however, represents only 10 percent of the total comments in the categorized section. This means that we cannot affirm that UOL has more viewers inclined to Datena, since the sample is too small. On the other hand, when compared to CNN's

data, out of 38 comments in the support category, 32 were classified as in support of Datena. In terms of absolute numbers, it is more significant than UOL's.

Overall, the analysis reveals that Datena dominated the support across all platforms, with his backing ranging from 82.4 percent (FolhaSP) to 94.6 percent (CNN). This consistent pattern indicates either his broader appeal or the influence of media framing in shaping audience perceptions. On the other hand, Marçal received his highest support from FolhaSP (17.6 percent), which also emerged as the least polarized outlet. It is also worth mentioning that, out of the 500 analyzed comments, roughly 1/5 represented support (totaling 107), and the vast majority supported Datena, totaling almost 20 percent of the entire base analyzed. This means that the most popular and supported comments overall were supporting the candidate who hit his opponent with a chair during the live transmission. That, however, did not offer him a significant advantage in the Mayoral run. In an electoral poll performed after the event, Marçal lost 2 percent of his preference, and Datena got 2 percent more - but that could also be part of the error margin present in the poll [16]. The online repercussion was not enough to change tides for the candidate.

Looking into the Criticism and Protest category, we also created sub-classifications to help us understand the role of polarization in the discourse. In the comments, we noticed not only that the audience was supporting one or the other candidate, but also generally criticizing the situation and the political climate. For this reason, we decided to create three sub-categories: criticizing Datena, criticizing Marçal, and general critics. The next images represent the comparison of each media channel.

The distribution of criticisms across media outlets reveals key insights into audience polarization and dissatisfaction. At CNN, the majority of comments (52.6 percent) were general criticism, while 26.3 percent targeted Marçal. Criticism for Datena accounted for 21.1 percent of comments, indicating a mix of dissatisfaction with both candidates and the broader political context. This suggests that CNN's framing of the event resonated negatively with viewers, especially regarding Datena's actions, though there was also notable criticism of Marçal and the overall situation.

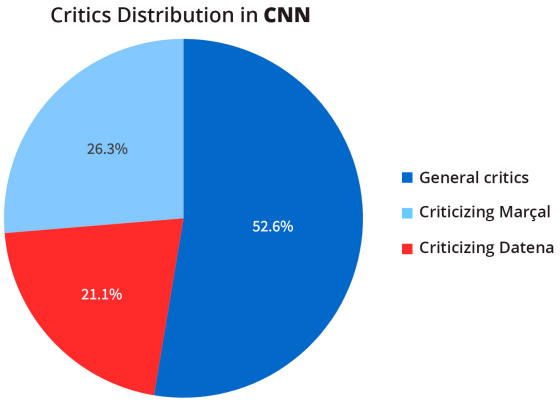

Fig. 4 – CNN distribution of criticisms.

FolhaSP showed a more unbalanced criticism distribution, with 45.5 percent General, 18.2 percent at Datena, and 36.4 percent categorized as criticism towards Marçal. This slightly higher proportion of criticism of Marçal suggests that FolhaSP's audience might be more inclined to critique the overarching political climate and the specific candidate.

[16] https://tinyurl.com/3km7dzdb

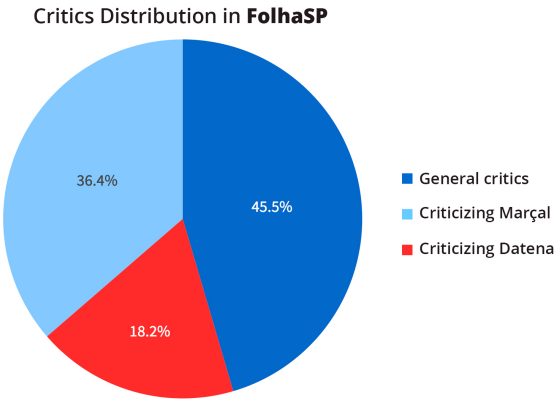

Fig. 5 – FolhaSP distribution of criticisms.

At Itatiaia, criticism was more evenly distributed among the three categories. Criticism of Datena accounted for 30.8 percent, Marçal received 33.3 percent, and general criticism made up 35.9 percent of comments. This even split indicates a less polarized audience compared to other outlets, with dissatisfaction spread equally across candidates and the broader situation. Itatiaia's audience appears to have a more diverse set of opinions, reflecting varied reactions to the event. Another important observation here is related to the origin of Itatiaia as a news channel - differently from the others, it is from the state of Minas Gerais (also the state where Pablo Marçal is originally from). Even though the Mayoral elections were in São Paulo, because it is the largest city in Brazil, their outcomes are influential on the whole country. However, the origin of the news channel might have influenced the audience type, while we cannot affirm it for certain, it could be another explanation for this outcome.

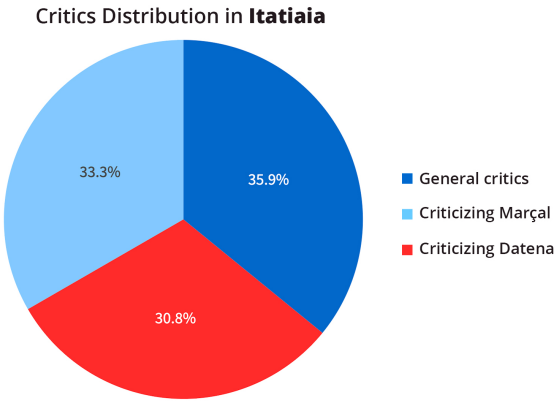

Fig. 6 – Itatiaia distribution of criticisms.

Poder360 followed a similar pattern to FolhaSP, with 23.7 percent of comments criticizing Datena, 36.8 percent targeting Marçal, and 39.5 percent expressing general criticism. Poder360's audience displayed significant dissatisfaction with the political context, suggesting that the outlet's coverage encouraged broader critiques rather than focusing narrowly on the candidates.

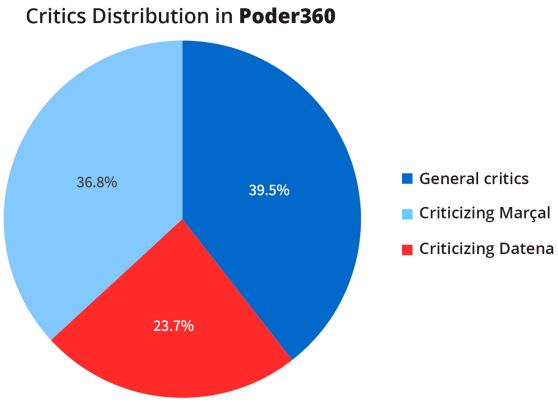

Fig. 7 – Poder360 distribution of criticisms.

UOL's audience exhibited the highest number of general criticism, with 20 percent of comments criticizing Datena, 20 percent targeting Marçal, and another 60 percent offering general criticism. The high proportion of general criticism shows that the audience was not leaning towards a specific candidate - instead, they were more generally upset about the political context.

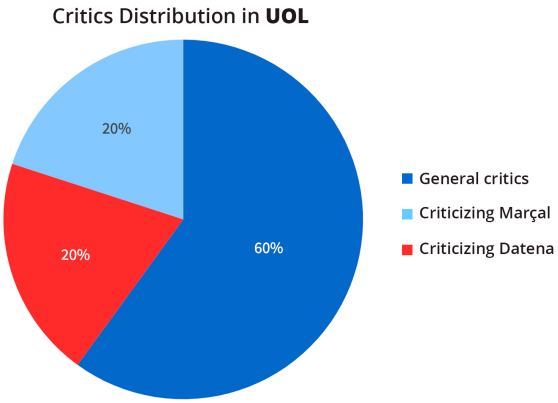

Fig. 8 – UOL distribution of criticisms.

General criticism was most prevalent on UOL, CNN and FolhaSP where broader dissatisfaction with the political climate was evident. Folha SP' and Poder 360's audiences had a slightly higher dissatisfaction towards Marçal, though. These findings suggest that media framing played a significant role in shaping audience reactions, with certain outlets encouraging a broader critique of the situation while others focused attention on individual candidates.

The combined analysis of support and criticism shows a complex reaction from the audience toward Datena and Marçal. Datena received more support than Marçal across all platforms, with outlets like CNN, UOL, and Itatiaia showing over 90 percent supportive comments for him. This mix of reactions suggests that while many people support Datena, likely because of his public persona or political alignment, others were dissatisfied with his actions during the debate, such as the chair-throwing incident. The event likely divided viewers, with some defending him and others strongly opposing his behavior.

According to the theoretical framework, digital platforms like YouTube play a key role in shaping these reactions. Media outlets frame events in ways that influence how audiences perceive them, and YouTube's algorithms amplify content that gets strong reactions, whether positive or negative. This means Datena's dramatic actions during the debate likely drew both supporters who agreed with him and critics who disapproved. Interestingly, on platforms like CNN and UOL, many comments also criticized the overall situation or the state of politics rather than just the candidates. This shows that some viewers were frustrated with the broader

political climate, not just the individuals involved.

In simpler terms, the mix of strong support and criticism for Datena reflects how polarizing figures create both loyal fans and vocal opponents. The way media outlets reported the event and how YouTube promoted content played a big role in shaping these reactions. It highlights how digital platforms encourage debates that often focus on the most dramatic or controversial aspects of events.

6. Final Remarks

This study explored how people engaged with a controversial political debate during São Paulo's 2024 mayoral election by analyzing YouTube comments across five major news outlets. We used a refined version of Teixeira et al., 2018 methodology to categorize comments into Humor, Support, Criticism and Protest, and Neutral, with additional sub-categories for support and criticism. The findings showed strong audience engagement, characterized by a mix of humor, support, and criticism, reflecting the polarized nature of the incident and the broader political climate in Brazil.

The first goal was to understand how audiences engaged with political discourse on YouTube. Humor emerged as the dominant category, showing how people used jokes and satire to respond to the absurdity of the chair-throwing incident. This aligns with Teixeira et al., 2018, who found that humor plays a key role in helping people process political controversies. Platforms like YouTube amplify this tendency by providing space for playful, yet meaningful, public discussions, as Herring, 2005 explains in the context of computer-mediated discourse.

The second objective was to identify patterns of support and criticism. Datena consistently received the most support, with over 90 percent of supportive comments on outlets like CNN and UOL. However, he also faced the highest level of criticism across all platforms. This mix of support and criticism highlights a polarized reaction where some audiences align with Datena's public persona while others strongly disapprove of his actions during the debate. This finding reflects research by Reis et al., 2019 and Reis et al., 2020, which showed that digital platforms often amplify such ideological divides. It also underscores the performative nature of online political discourse, where people express loyalty but are not afraid to voice disapproval.

The third objective examined how media framing shaped audience responses. The way outlets presented the debate significantly influenced the tone of the comments. For example, Poder360's in-depth coverage, including behind-the-scenes footage, generated a more balanced criticism ratio among general, Datena, and Marçal, while CNN and UOL's shorter, more sensational clips amplified polarized reactions focused on the candidates' behavior. This reflects findings by Rieder et al., 2018, who demonstrated how platforms amplify emotionally charged content to drive engagement. These framing decisions highlight the power of media in shaping public discourse.

This study aligns with key ideas from computer-mediated discourse analysis Herring, 2005 and content analysis Bardin, 1977. These frameworks emphasize how technology, language, and social dynamics shape online discourse. By refining Teixeira et al., 2018 taxonomy to include sub-categories for support and criticism, we captured the nuances of how people reacted to the debate. YouTube's design, which allows for detailed discussions compared to platforms like X, made it possible to identify more complex audience behaviors. The study also supports research by Bishop, 2020 and De Albuquerque and Rodas, 2022 on how algorithms amplify polarized narratives and create echo chambers, which further fueled the mix of humor, support, and criticism.

The case allowed other interesting analyses and developments with regard to the way in which the vehicles and, consequently, their audiences position themselves. The five different channels using images from the same broadcast, only varying the time and format of the cuts of the same event, subjectively reveal their communication strategies. Another interesting finding in this particular part of the analysis was the fact that Folha SP, which is the largest media channel in São Paulo (and its audience is presumably mostly from the state), had the highest number in the Humor category. Itatiaia, the channel from another state, Minas Gerais, had a more critical approach in the audience comments. It is almost as if the population from São Paulo did not believe in its candidates and the seriousness of the Mayoral election, preferring to laugh about it, rather than criticize it. Instead of the traditional way of showing discontentment with protest, results indicate that they preferred humor to demonstrate it. However, a potential limitation of this study is the ideological orientation of each

analyzed YouTube channel, which may attract audiences with specific political leanings. Thus, the comments reflect the viewpoints of each platform's audience rather than a representative sample of the general electorate.

Overall, this study shows how digital platforms like YouTube are not just neutral spaces but actively shape political discourse through their design and media content. It highlights how humor and polarization dominate online discussions, offering valuable insights into the dynamics of Brazil's digital public sphere and laying the groundwork for future research.

Abstract. This study addresses two central questions: (1) What enabling factors associated with information disorder are identified in the literature? and (2) Which of these factors manifest in anti-vaccine Telegram communities in Brazil, facilitating the spread and normalization of related disinformation? Combining a systematic literature review with empirical analysis of nearly 10 million posts from Brazilian conspiracy theory groups on Telegram (2016–2024), the research identifies 18 enabling factors—classified into sociopolitical and informational ecosystem dimensions—that contribute to information disorder. Of these, 11 are empirically observed in the analyzed Telegram communities. Drawing on both qualitative and computational methods—including time series, content, and link analysis—the study proposes a conceptual model that illustrates how these conditions interact and reinforce one another, creating an environment in which disinformation can flourish. The findings contribute to ongoing theoretical analyses on the sociotechnical dynamics of disinformation.

Keywords. Disinformation, Information Disorder, Anti-vaccine, Telegram
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1064

1. Introduction

Disinformation has become one of the most pressing challenges of our time, undermining not only the integrity of information ecosystems but also social cohesion and the foundations of democratic governance. While various taxonomies and definitions have been proposed (Celliers & Hattingh, 2020; Kapantai et al., 2021), much of the existing research remains fragmented—often focused on specific platforms, actors, or mechanisms in isolation. This limited scope constrains our understanding of the full life cycle of *information disorder*, a term encompassing disinformation, misinformation, propaganda, conspiracy theories, and other phenomena that pollute the information environment. As proposed by Ricard et al. (2025), this cycle is shaped by motivated agents, technological affordances, and broader structural conditions.

We argue that addressing information disorder requires a more holistic approach—accounting for the broader social, political, and economic factors that allow disinformation to take root and spread. Prior research suggests that certain enabling conditions—such as public health crises (Pickel et al., 2022; Edwards III, 2020), sociopolitical instability, and declining trust in institutions (Dowling & Legrand, 2023; Kweon, 2023)—foster environments in which disinformation flourishes. These factors not only make societies more susceptible to disinformation but, as part of a feedback loop, are often exacerbated by it, reinforcing the very tensions that allowed it to emerge in the first place.

This study addresses two guiding questions: (1) What enabling factors associated with information disorder are identified in the literature? and (2) Which of these factors manifest in anti-vaccine Telegram communities in Brazil? We focus on Telegram due to its central role in hosting ideologically driven, loosely moderated communities that have become key hubs for health-related disinformation. During the COVID-19 pandemic, anti-vaccine narratives gained significant traction in Brazil—frequently amplified by political figures, religious leaders, and health influencers. These narratives have since persisted and expanded, undermining public trust in routine immunizations, including childhood vaccines. As a result, combatting vaccine-related disinformation has become a public health priority for Brazil's federal government.

To address these questions, we adopt a mixed-methods approach that combines a systematic literature review of 95 scholarly articles with an empirical analysis of nearly 10 million posts from public Brazilian Telegram groups (2016–2024). The study identifies and analyzes 18 enabling factors—across sociopolitical and informational dimensions—and proposes a conceptual model illustrating how these conditions interact to support the spread and normalization of disinformation. The findings aim to contribute to theoretical debates on the sociotechnical dynamics of disinformation while offering practical insights for the design of more effective public policy responses.

2. Methodology

This study employs a mixed-methods design that integrates a systematic literature review with empirical analysis. These complementary methods strengthen the validity of the findings and allow for a multidimensional examination of information disorder and its enabling conditions.

2.1 Systematic Literature Review

The systematic review followed a rigorous and transparent protocol. Keyword selection was guided by established disinformation typologies, covering the phases of creation, dissemination, and impact. Searches were conducted across four academic databases—Web of Science, Scopus, SciELO, and AIS—applying thematic and temporal filters (2016–2024), as well as quality thresholds (Q1 by SJR). A double-blind screening process narrowed the initial pool to 95 peer-reviewed articles, which were then coded using MAXQDA software. Figure 1 shows the screening flow of the studies analyzed.

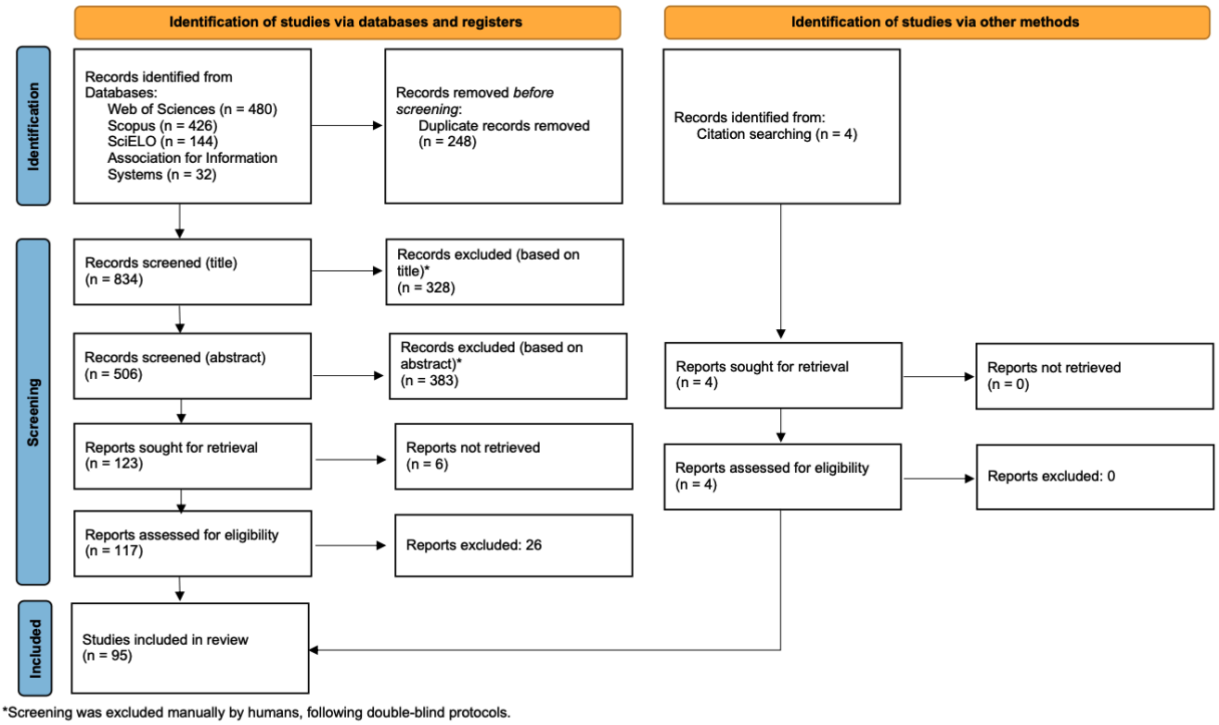

Fig. 1 - PRISMA Diagram

From this analysis, we identified 18 enabling factors that contribute to information disorder, grouped into two main dimensions: Sociopolitical Enabling Factors and Informational Ecosystem Enabling Factors. The first dimension includes the following factors: (i) Lack or loss of trust, (ii) Crises and periods of uncertainty, (iii) High levels of political polarization and ideology, (iv) Populism, (v) High levels of affective polarization, (vi) Social tensions, (vii) Historical traumas and grievances, (viii) Geopolitical tensions, (ix) Economic hardship, and (x)

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Religion. The second category of factors include: (xi) Decline of traditional journalism and disintermediation, (xii) Fragmentation into partisan niches and audiences, (xiii) Infodemic, (xiv) Attention economy, (xv) New monetisation models, (xvi) Endogenous vulnerabilities of digital media, (xvii) Media consumption habits, and (xviii) Digital divide and unequal access. These 18 factors form the conceptual foundation for the empirical analysis and are discussed in detail in the subsequent sections.

2.2 Telegram Empirical Analysis

Guided by the enabling factors identified in the literature, we conducted an empirical analysis using a dataset of 10 million posts from Brazilian Telegram communities focused on conspiracy theories, spanning May 2016 to November 2024. The data were collected using TelegramScrap, an open-source tool developed by one of the authors and made publicly available with documentation for replication. The tool is publicly available, along with a whitepaper detailing its code and usage (Silva, 2023). From an initial pool of over 42 million posts from 1,612 public Latin American Telegram groups, we filtered 10,732,257 posts from 968 Brazilian communities, representing 69.8% of the dataset. Selection criteria included language, relevance of keywords, and thematic focus. All data were drawn from public groups and anonymized in accordance with Brazil's General Data Protection Law (LGPD).

Web scraping was conducted using customized Python scripts and libraries such as *requests*, *BeautifulSoup*, *Telethon*, and *gspread*. Communities were retained only if they showed consistent patterns of conspiratorial or disinformation-related activity. Posts under 10 characters or without semantic value were excluded. After processing, two core datasets were constructed: Dataset A: 10.7 million posts from general Brazilian conspiracy communities, and Dataset B: 2.2 million posts from communities explicitly focused on health disinformation (e.g., anti-vaccine, off-label drug promotion), which we refer to as "Health-related Telegram Communities (HRTC)" ahead.

This approach allowed us to trace the presence and evolution of key enabling factors across time, themes, and engagement metrics. Analyses included: Narrative and thematic mapping through keyword frequency and time series; Engagement metrics, including views, shares, and reactions; and Link-based analysis to identify dominant external domains and assess fragmentation. For enabling factors less directly measurable via quantitative metrics—such as loss of trust, populism, historical grievances, economic hardship, and grassroots information flows—we conducted qualitative observations.

3. Results: Enabling Factors of Information Disorder

3.1 Conceptual Framework

Despite a growing body of research on disinformation, there remains a lack of holistic frameworks that capture disinformation's full life cycle—from enabling sociopolitical and informational factors to impacts on society. Relatedly, while considerable attention has been paid to individual-level and psychological susceptibilities—such as cognitive biases or affective polarization—less emphasis has been placed on the broader structural dimensions that underpin information disorder.

To address this gap, we draw on the *Information Disorder Framework* (Ricard et al., 2025), that offers a holistic approach to explain how socio-political and informational vulnerabilities can be leveraged by agents of information disorder—whether politically, ideologically, or financially motivated—to strategically craft disinformation narratives responding to their interests. These narratives are disseminated through a range of tactics, impacting both the information ecosystem and society at large.

As part of this study, we focus on the first stage of the above-mentioned framework: the socio-political and informational ecosystem enabling factors of information disorder. The model posits that these factors are actively exploited by motivated agents of disinformation, who tailor narratives to resonate with existing grievances and societal divisions. Below, we outline findings from both the literature review and the empirical analysis, seeking to answer two central questions: (1) What enabling factors associated with information disorder are identified in the literature? and (2) Which of these factors manifest in anti-vaccine Telegram communities in Brazil, facilitating the spread and normalization of related disinformation?

3.2 Literature Review

This study focuses on just one of the phases of the conceptual framework presented above, the enabling factors that allow disinformation to take root and circulate. These conditions are categorized into two broad categories: (i) sociopolitical enabling factors and (ii) informational ecosystem enabling factors. The objective here is to synthesize how these factors are defined and discussed across the literature, in order to refine the conceptual model introduced above and offer a more comprehensive understanding of the structural foundations of

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

information disorder.

While our scope is limited to research in political science, public administration, and international relations, it is important to note that psychological and cognitive factors—such as motivated reasoning (Jiang, 2023; Enders & Smallpage, 2019), conspiratorial thinking (Yair et al., 2024; Martini et al., 2022), confirmation bias (Heckler & Ronquillo, 2019), and authoritarian dispositions (Yendell & Herbert, 2022)—are frequently cited as individual-level drivers of susceptibility to disinformation. However, such factors were intentionally excluded from our analysis, as this study prioritizes structural and collective mechanisms over individual predispositions.

The following typology summarizes the 18 enabling factors identified in the literature, categorized by their sociopolitical and informational dimensions. These factors provide the foundation for the subsequent empirical analysis of Brazilian Telegram groups and inform the development of the conceptual model described above.

Socio-political Enabling Factors

This category refers to the social, economic, political, and cultural conditions that disinformation actors can exploit to exacerbate existing societal divisions. It is consistently identified in the literature as a foundational dimension of information disorder. Historical grievances, political tensions, and cultural cleavages are frequently instrumentalized, shaping persuasive narratives that anchor and legitimize disinformation.

Lack or loss of trust: The erosion—or absence—of trust in key institutions is one of the most widely cited enabling factors of disinformation. Declining trust in government (Islam et al., 2023; Dowling & Legrand, 2023; Zimmermann, 2020), public institutions (Koc-Michalska et al., 2023), and the media (Freiling et al., 2023) reduces societal resilience and renders populations more susceptible to misleading narratives. Critically, trust erosion functions both as a condition that enables disinformation and as a consequence of its spread, reinforcing a feedback loop that deepens democratic fragility.

Crises and periods of uncertainty: Disinformation thrives in moments of social, political, or health-related crisis. The literature documents a marked increase in conspiracy beliefs and disinformation susceptibility during the COVID-19 pandemic (Kweon, 2023; Pickel et al., 2022). Edwards III (2020) emphasizes that global uncertainty heightens public anxiety, which disinformation actors exploit. These dynamics are especially visible in electoral periods, where pre-election uncertainty amplifies public vulnerability (Karekwaivanane, 2019).

High levels of political polarization and ideology: High levels of political polarization—whether ideological or affective—consistently correlate with increased exposure to and circulation of disinformation (Faris et al., 2017, cited in Keller et al., 2020; Jian, 2023; Lombana-Bermudez et al., 2022; Jungherr & Rauchfleisch, 2024). Mauk and Grömping (2023) link disinformation exposure to shifting beliefs about electoral legitimacy. Outside the electoral context, De Zuniga et al. (2023) show that different types of polarization—affective, ideological and perceived in society—play a negative role in political persuasion through socio-digital media. Research also finds that conservatives tend to be particularly susceptible to accepting and sharing disinformation (Guess, Nyhan & Reifler, 2020, as cited in Hughes and Waismel-Manor, 2021; Kweon & Choi, 2023; Enders & Smallpage, 2019; Jungherr & Rauchfleisch, 2024).

High levels of affective polarization: Defined by intense identification with one's political group and hostility toward out-groups, affective polarization increases susceptibility to disinformation that aligns with partisan worldviews (Jenke, 2022). Importantly, Jenke notes that even politically sophisticated individuals are vulnerable when content reinforces their in-group identity. Hate speech and "us vs. them" narratives, as described by Ndahinda and Mugabe (2024), are examples of this dynamic, particularly in ethnically or politically charged contexts, such as that of the Democratic Republic of Congo.

Populism: Populism both enables and is enabled by disinformation. Populist governments are associated with environments where disinformation circulates more easily (Arceneaux & Truex, 2023; Massari, 2018, as cited in Lôbo & Bolzan de Morais, 2019). Studies also suggest that belief in disinformation fosters support for populist leaders (Serani, 2023), while populist rhetoric often includes narratives conducive to misinformation, such as anti-elitism or anti-scientific sentiment (Kweon & Choi, 2023).

Social tensions: Disinformation often targets emotionally charged social issues—such as minority rights, gender roles, or race relations—amplifying polarization and outrage (Bjola & Papadakis, 2020; Balfour, 2020). Studies show how racial tensions (Yendell & Herbert, 2022; Gunther et al., 2019; Pickel et al., 2022), gender norms (Stabile et al., 2019), and broader societal inequalities are weaponized to generate conflict and undermine consensus.

Historical traumas and grievances: Disinformation narratives frequently invoke historical traumas to heighten

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

emotional impact and legitimacy. This includes both local and international examples, such as narratives among Vietnamese-American communities (Nguyen et al., 2023) or appeals to long-standing geopolitical distrust, as seen in Russian-Western tensions (Perl et al., 2018).

Geopolitical tensions: Disinformation narratives are often anchored in geopolitical tensions, such as the conflicts between NATO, the US, Russia and Ukraine (Bolton, 2021). These types of narratives are used to promote specific agendas or foreign interference (Dawson & Innes, 2019).

Economic hardships: Economic precarity, including unemployment, inflation, and sanctions, can intensify social frustration and reduce critical engagement with information sources. These grievances are frequently mobilized to build disinformation narratives that position specific groups or institutions as responsible for economic decline (Kermani, 2023; Hughes & Waismel-Manor, 2021).

Religion: Religiosity—particularly in its authoritarian or fundamentalist forms—is linked in the literature to increased susceptibility to disinformation and conspiratorial beliefs (Yendell & Herbert, 2022; Czech, 2022). Religious frameworks can operate as moral and political systems resistant to scientific or empirical counter-narratives, further entrenching disinformation (Hidalgo, 2022).

Informational Ecosystem Enabling Factors

These factors refer to structural weaknesses in the way information is produced, disseminated, and consumed—often shaped by technological affordances, market logics, and shifts in media habits. The weakening of traditional journalism and the consolidation of fragmented, algorithm-driven media environments that prioritize inflammatory narratives that feed the “attention economy” have altered the flow of information in ways that facilitate the spread and credibility of disinformation.

Infodemic: The sheer volume of online content—often referred to as the "infodemic"—creates challenges for information discernment. As Maati et al. (2023) note, information overload can overwhelm users, blurring the line between credible and misleading content and increasing cognitive fatigue.

Attention economy: In the digital era, information disorder is fueled by the "attention economy," which rewards content that maximizes user engagement. Algorithms—acting as gatekeepers—prioritize sensationalism and emotionally charged narratives over accuracy, systematically favoring divisive content that drives traffic (Torreblanca, 2023; Bolton, 2021; Wu, 2016).

New monetization models: Driven by the logic of the attention economy, platforms’ automated advertising systems not only permit but actively encourage the creation of websites that resemble legitimate media outlets (Torreblanca, 2023). These sites blend authentic news stories with misleading content to attract audiences and capture advertising revenue.

Decline of mainstream journalism and disintermediation: The diminishing role of traditional journalism—once the primary gatekeeper of verified information—is widely recognized as a key enabling factor (Dahlgren, 2018, cited in Bolton, 2021). As Torreblanca (2023) explains, this disintermediation has displaced professional editors and fact-checkers, allowing unverified content to circulate freely. While this shift has democratized information access, it has also increased exposure to misleading or harmful narratives (Balfour, 2020).

Media consumption habits: The relationship between media consumption habits and vulnerability to disinformation is complex and not fully agreed upon in the literature. Some studies suggest that consuming news via social media increases vulnerability to disinformation due to the platform’s structure and the prevalence of misleading information (Bjola and Papadakis, 2020; De Zúñiga, 2023; Keller, 2020). Others emphasize that indirect exposure may be similarly problematic (Gadjanova et al., 2022).

Fragmentation into partisan niches and audiences: The current information landscape is increasingly fragmented, with users engaging primarily within ideological "echo chambers" (Mauk & Grömping, 2024; Lombana-Bermudez, 2022; Krafft & Donovan, 2020). This segmentation reinforces pre-existing biases, reduces exposure to diverse viewpoints, and facilitates the uncritical circulation of disinformation.

Endogenous vulnerabilities of digital media: Digital platforms introduce unique vulnerabilities that facilitate rapid and targeted disinformation. The speed, personalization, and emotional resonance of content in socio-digital environments make it particularly potent. Torreblanca (2023) and Vićić and Gartzke (2023) emphasize how the immediacy and interactivity of digital media personalize content consumption, heightening individual susceptibility. Chernobrov (2022) further highlights dimensions such as intimacy and emotional

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

proximity that make users more vulnerable.

Digital divide and unequal access: Inequitable access to the internet and digital tools also shapes exposure to information disorder. In contexts such as Ghana, the digital divide creates a distinction between direct and indirect internet users, with the latter often relying on secondhand information shared by family or community members (Gadjanova et al., 2022). Limited connectivity and digital literacy compound vulnerability by reducing users' capacity to verify or contextualize content.

3.3 Empirical Analysis

To complement the literature-based typology of contextual vulnerabilities, we conducted an empirical analysis of over 10 million public posts shared in Brazilian conspiratorial Telegram groups between 2016 and 2024—including 2.2 million posts specifically from Health-Related Telegram Communities (HRTC). The aim was to assess how the vulnerabilities identified in the literature manifest in real-world disinformation ecosystems. Focusing on Telegram, one of the most active platforms for disinformation circulation in Brazil, this section examines how sociopolitical and informational vulnerabilities are referenced, reinforced, or exploited over time. The findings offer empirical grounding for the conceptual model and demonstrate that these enabling factors are not only theoretical constructs, but actively leveraged in disinformation campaigns.

Socio-political Enabling Factors

Lack or loss of trust: Although no direct empirical test was conducted for this factor, the scale and persistence of conspiracy theory communities on Telegram—reaching over 2.5 million users—already reflect a broader climate of institutional distrust. Data from the Edelman Trust Barometer show significant fluctuations in institutional trust in Brazil from 2016 to 2024, with media trust dropping from 54% in 2016 to 41% in 2019. Government trust followed a more complex trajectory: starting at 21% in 2016, rising thereafter, but falling again in 2022—an election year—to just 34%, before slightly recovering.

Crises and periods of uncertainty: We analyzed publication frequency in HRTC to evaluate surges in content during two key periods: (1) the COVID-19 pandemic (2020–2021) and (2) the 2022 general elections. As shown in Figure 2, both periods corresponded with sharp increases in activity—rising from 3,184 posts in January 2020 to 17,322 in January 2021, and peaking at 141,848 in January 2022. Importantly, post-election publication volume stabilized at a significantly higher baseline than pre-pandemic levels (e.g., 42,376 posts in January 2024 vs. 3,184 in January 2020). These findings support the notion that crises and electoral uncertainty act as catalysts for information disorder.

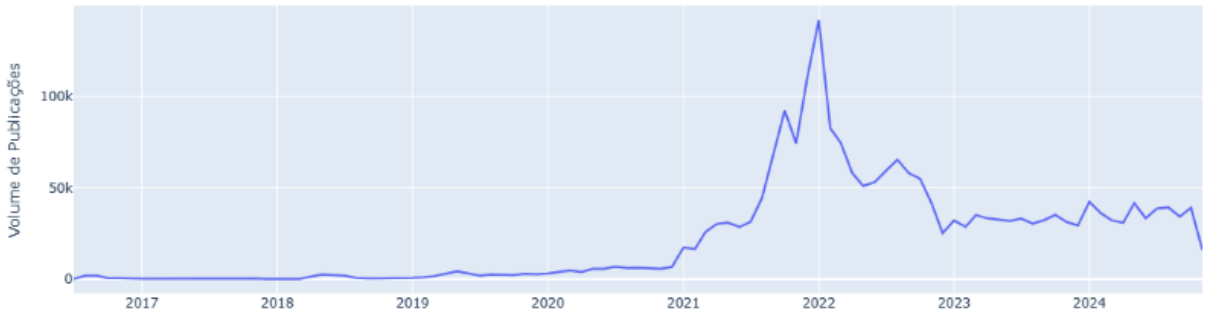

Fig. 2 - Monthly Publications in Health-related Telegram Communities (HRTC)

High levels of political polarization and ideology: To assess this factor, we conducted keyword-based semantic filtering within the HRTC dataset. More than 21% of posts (475,830) included terms linked to political affiliation or ideological bias. As shown in Figure 3, prominent keywords included "against covid," "covid vaccine," "government," "Brazil," and "United States"—frequently used in narratives alleging that authorities were concealing effective treatments or promoting globalist agendas. These narratives spiked notably during the 2022 election period (Figure 4), reinforcing the connection between political polarization and disinformation, and echoing the earlier findings on the role of Crises and periods of uncertainty.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Fig. 3 - Word Cloud illustrating Political Polarization and Ideology Terms in HRTC

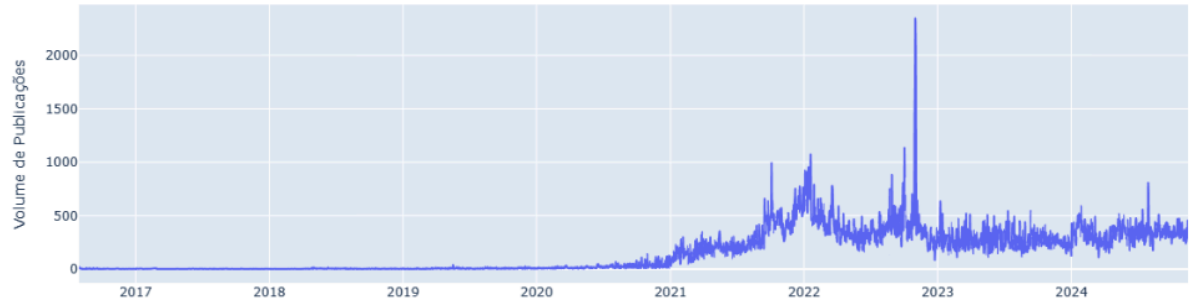

Fig. 4 - Daily Publications Including Terms Associated with Political Polarization and Ideology in Health-related Telegram Communities (HRTC)

High levels of affective polarization: We also examined how anti-vaccine content conveyed hostility toward perceived out-groups, using keyword-based filtering focused on political ideologies, social identities, and polarizing narratives. Over 13% of posts (293,522) in HRTC reflected affective polarization, frequently referencing the "new world order"—often linked to the "covid vaccine" and framed as part of a global plan to undermine "family" values (Figure 5). The term "Time" also appeared as a rhetorical device to create urgency and mobilize audiences. Like political polarization, affective polarization intensified around the 2022 elections (Figure 6), underscoring its role in reinforcing disinformation narratives.

in HRTC

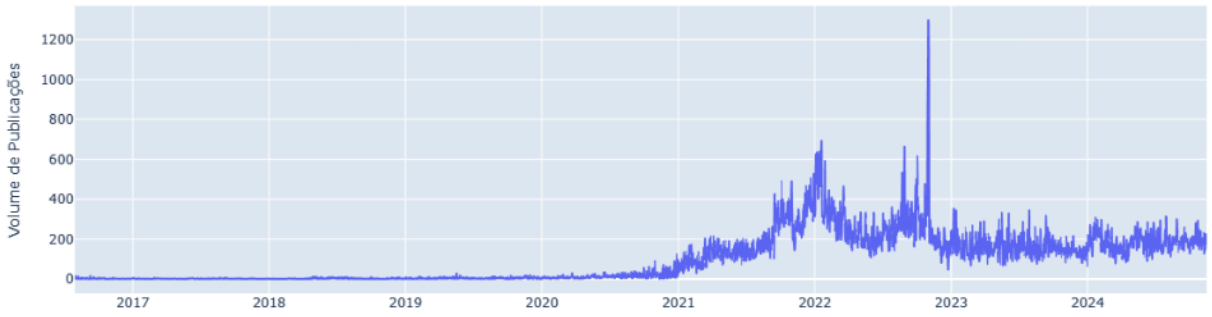

Fig. 6 - Daily Publications Including Terms Associated with Affective Polarization in Health-related Telegram Communities (HRTC)

Populism: Considering that assessing populism at scale would require a tailored methodological approach—such as discourse analysis or computational text classification—, no dedicated empirical experiment was conducted for this factor. Nonetheless, discourse patterns in the HRTC dataset suggest a populist framing. The term "elite" appeared 9,817 times, often within narratives portraying a powerful group allegedly suppressing natural or miraculous cures while coercing the public into accepting harmful vaccines. This rhetorical style aligns with the anti-elitist sentiment characteristic of populist discourse.

Social tensions: Disinformation often exploits social divisions, identity-based grievances, and cultural tensions to heighten emotional resonance and deepen polarization (Bjola & Papadakis, 2020; Vićić & Gartzke, 2024). To examine this dynamic, we analyzed the intersection of anti-vaccine narratives with moral and identity-based agendas in HRTC posts. Keywords were grouped into categories such as Racism and Ethnic Issues, Homophobia and Gender, Machismo and Women, Human Rights, Morality and Cultural Values, and Violence and Crime. Nearly 8% of posts (175,286) included terms associated with these themes. As illustrated in Figure 7, frequently occurring words such as "woman," "life," "family," and "thank God" suggest efforts to frame vaccine resistance within moral or religious discourses—indicating how disinformation narratives in Brazil are often intertwined with broader cultural and ideological fault lines.

Fig. 7 - Word Cloud illustrating Terms associated with Social Tensions in HRTC

Historical traumas and grievances: No quantitative experiment was conducted for this factor, as our methodological approach does not allow for the depth and specificity required to capture such nuanced dynamics on Telegram. Analyzing historical trauma would likely require isolating particular events and tracing their resonance within defined subgroups—an approach that is difficult to implement on a fragmented, pseudonymous platform like Telegram. Nevertheless, prior research supports the enabling role of historical grievances in the spread of disinformation. For example, vaccine resistance in Acre, Brazil, has been linked to local incidents of alleged harm from HPV vaccines (Pinheiro, 2022), while vaccine hesitancy among African-American communities in the U.S. is often rooted in a legacy of structural racism and unethical medical practices (Willis et al., 2021).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Geopolitical tensions: To study this factor, we analyzed how frequently anti-vaccine content was framed through political or geopolitical narratives, such as foreign influence or threats to national sovereignty. Unlike other analyses, we reversed our usual method by identifying health-related terms within "Globalism" and Geopolitics focused Telegram communities. Keywords were grouped into four categories: Pandemic and Vaccination; Off-Label Treatments; Anti-Vaccine Narratives; and Institutions and Authorities. Results show that over 15% of posts (104,297) in these communities connected anti-vaccine discourse to geopolitical frames—such as portraying mandatory vaccination as part of a "communist" or "fascist" agenda. Terms like "plandemic," "deep state," and "vachina" (a portmanteau of vaccine and China) were common, illustrating how global political tensions are embedded within localized disinformation narratives (Figure 8).

Fig. 8 - Word Cloud illustrating Terms associated with health in "Globalism" and Geopolitics Telegram Communities

Economic hardships: This factor was not empirically tested due to the lack of user demographic data. Without socioeconomic indicators, we can not assess how financial precarity may enhance susceptibility to disinformation.

Religion: Religious thinking—particularly in its dogmatic or fundamentalist forms—has been widely identified as an enabling factor of disinformation (Czech, 2022; Hidalgo, 2022; Yendell & Herbert, 2022). Among the sociopolitical vulnerabilities analyzed in HRTC, religious framing emerged as the most prominent. A comprehensive keyword-based thematic analysis—including terms related to Christianity, Afro-Brazilian religions, Orientalism, Judaism, and Islam—found that over 26% of posts (586,786) contained one or more religious references. The volume of such content increased significantly after the onset of the COVID-19 pandemic (Figure 9). As with the Political polarization and ideology analysis, some of the most frequent keywords were "chlorine dioxide," "against covid," and "covid vaccine" (Figure 10). These terms often appeared in narratives portraying chlorine dioxide as a "miraculous" alternative to vaccines, framed within faith-based appeals.

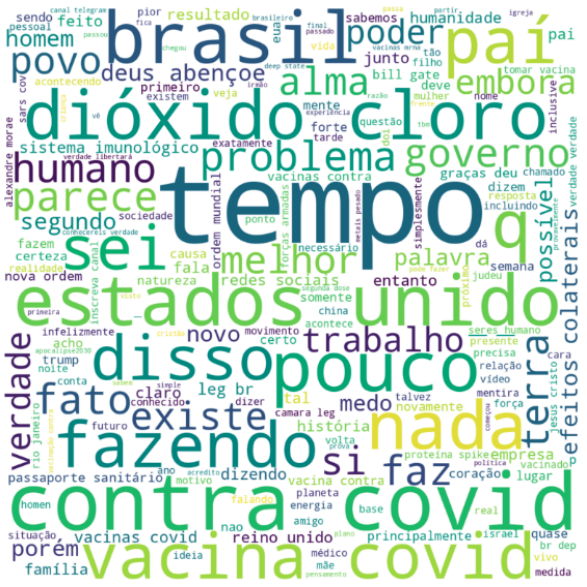

Fig. 10 - Word Cloud illustrating Terms associated with Religion in HRTC

Informational Ecosystem Enabling Factors

Infodemic: To assess the scale and dispersion of health-related disinformation, we analyzed the presence of health-related terms across the full dataset of over 10 million posts (Figure 11). Nearly 13% (1,356,611) contained health misinformation, often framed through conspiracy theory narratives. As shown in Figure 12, these posts were distributed across a wide range of communities. While anti-vaccine groups predictably accounted for the largest share, health-related disinformation was present across all thematic categories of conspiracy-oriented Telegram channels. This suggests that such content is not confined to niche spaces but circulates broadly across disinformation ecosystems. The sheer volume and diversity of topics—ranging from "covid vaccine" to "new world order," "deep state," "Lula government," and "Nazi communist"—highlight how these narratives converge and proliferate within an overloaded and chaotic digital environment.

QAnon	37,415	9.40%			

Fig. 12 - Volume of Health Disinformation Publications in all Communities from the Database

Attention Economy: No empirical analysis was conducted for this factor, given that it is structurally embedded in platform logic and opaque by algorithmic design. Nonetheless, other aspects presented here—particularly the dominance of virality over interaction—offer indirect evidence of engagement-driven visibility.

New Monetization Models: Aligned with the logic outlined in the previous factor, we did not conduct an empirical analysis of monetization dynamics. Additionally, emerging monetization models—such as those used by disinformation websites that mimic legitimate outlets—fall outside the scope of the Telegram communities analyzed in this study.

Decline of Mainstream Journalism and Disintermediation: To explore the diminishing role of traditional journalism and the rise of alternative content flows, we analyzed the proportion of links shared within HRTC that pointed to social media versus other web domains. Social media platforms accounted for 53% of all shared links (453,531), while 47% (407,225) linked to websites such as blogs or news portals (Figure 13). This pattern underscores the shift away from traditional gatekeepers, with platforms now serving as primary conduits for information exposure and circulation.

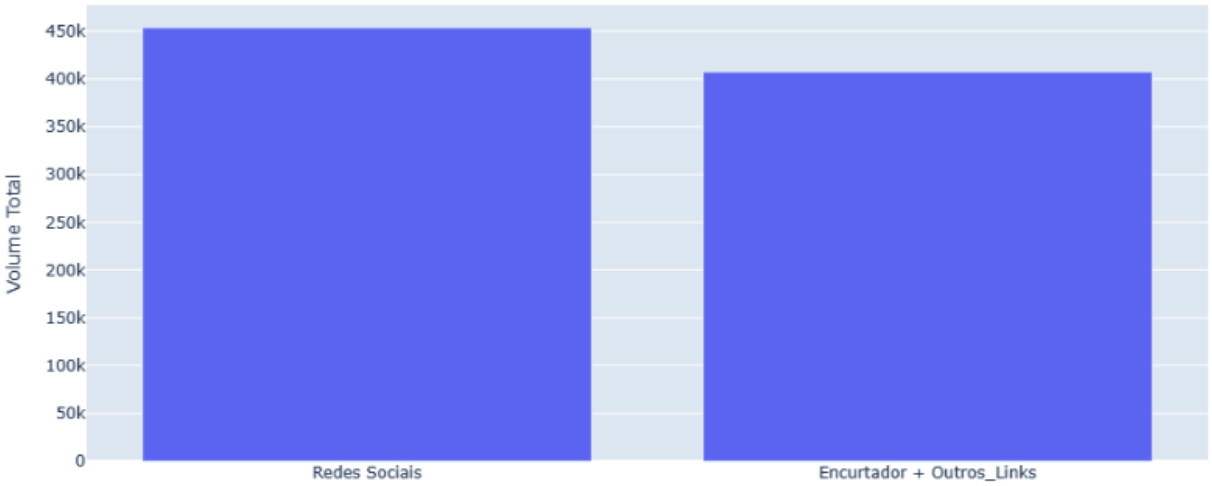

Fig. 13 - Volume of Publications with Links to Social Media and Shorten URLS / Other links in Health-related Telegram Communities (HRTC)

Media consumption habits: As noted in the literature review, the relationship between media consumption habits and information disorder is nuanced and multifaceted. Our findings reflect this complexity, with media consumption patterns in HRTC pointing to a fragmented, multi-platform ecosystem spanning both algorithmically mediated platforms (YouTube, Instagram, TikTok, Facebook, etc.) and private messaging apps like Telegram and WhatsApp. As shown in Figure 15, Telegram and YouTube were the most frequently linked platforms (164,083 and 157,184 links, respectively), together accounting for over 920 million views and 7.6 million shares. This suggests that health disinformation is primarily consumed through audiovisual and closed-loop channels—emphasizing intentional engagement within ideologically cohesive communities, rather than incidental exposure to diverse perspectives.

Fragmentation into partisan niches and audiences: Niche partisan outlets and websites tend to reinforce pre-existing beliefs rather than broaden the debate, fostering echo chambers and facilitating the spread of disinformation (Mauk & Grömping, 2024; Krafft & Donovan, 2020). To examine this dynamic, we mapped and classified the most frequently shared domains—excluding links to social media platforms—into four categories: mainstream media, partisan media, institutional websites, and e-commerce/other. The results (Figure 14) show that 75% of the most circulated domains belong to partisan media outlets, while the remaining 25% are distributed among institutional or government websites, mainstream news sources, and off-label e-commerce platforms. Notably, only five of these domains were associated with traditional media outlets (e.g., Globo and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Revista Oeste) or mainstream institutions (e.g., Instituto Butantan, PubMed, and the Brazilian Senate). The overwhelming prevalence of partisan and alternative sources suggests that information consumption in these health-related communities is shaped primarily by ideological segmentation, with users gravitating toward content that affirms their existing views.

Fig. 14 - Top #20 Domains Circulated in Health-related Telegram Communities (HRTC)

Endogenous vulnerabilities of digital media: We explored how Telegram's platform structure itself enables disinformation diffusion by analyzing outbound links in HRTC posts. While many links led to external platforms like YouTube, the majority redirected users to other Telegram groups—demonstrating a self-reinforcing architecture that keeps users within a closed information loop (Figure 15). Engagement metrics further emphasize this dynamic: of the recorded interactions, shares (202,134,432) vastly outnumbered comments (155,986) and reactions (563,849). This suggests that disinformation spreads primarily through passive replication rather than critical dialogue. Users act less as evaluators of content and more as amplifiers within a high-velocity, closed-circuit network.

Platform	Volume	Views	Reactions	Shares	Comments
Telegram	164,083	544,756,218	290,369	5,251,922	80,865

Fig. 15 - Volume of posts with links to Social Media in Health-related Telegram Communities (HRTC)

Digital divide and unequal access: We did not conduct empirical testing for this factor, as it requires demographic and access-related data beyond the scope of this dataset. However, prior literature strongly links limited digital access and literacy with increased exposure to second-hand, unverifiable information—particularly in regions with high reliance on interpersonal or offline information flows.

4. Discussion

Based on the 18 enabling factors identified in the systematic literature and explored in the empirical analysis, Tables 1 and 2 present a systematization of the analysis, integrating both theoretical and empirical insights. Notably, we found empirical evidence for 11 out of the 18 factors identified in the literature, suggesting that (1) socio-political and ecosystem vulnerabilities indeed contribute to information disorder, and (2) they are significantly present in anti-vaccine discourse in Brazilian Telegram communities. Although the feedback dynamics between vulnerabilities and disinformation were not the primary focus of this article, our findings underscore the importance of adopting a holistic and systemic approach to the problem.

Indeed, we observe that certain socio-political vulnerabilities may simultaneously function both as facilitators and consequences of disinformation. For example, lack of trust in institutions is widely recognized as a factor facilitating the spread of disinformation, yet it is also one of the most frequently cited outcomes of sustained exposure to disinformation (Dowling & Legrand, 2023; Kweon, 2023). Similarly, while high levels of political polarization intensify the circulation of false or misleading content, enhanced polarization is also a deliberate outcome of many orchestrated disinformation campaigns. Other vulnerabilities, while not displaying the same cyclical pattern, still illustrate how enabling vulnerabilities are leveraged by agents of information disorder. For instance, our findings suggest that both social and geopolitical tensions are used to frame anti-vaccine discourse

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

in Brazil.

Turning to the informational ecosystem enabling factors, the findings confirm that a weakened information environment can both enable and sustain disinformation. Overall, the infodemic — the overwhelming volume of information in today's digital societies — which blurs the line between credible and misleading content (Maati et al., 2023), acts both as a condition for and an impact of information disorder. As anticipated, the decline of mainstream journalism and disintermediation — driven by the rise of digital platforms and changes in media consumption behavior — together with platforms' affordances both contribute to information disorder.

Tab. 1 - Overview of Socio-political Enabling Factors.

Enabling Factors	Reference in the Literature	Empirical Finding
Lack or Loss of Trust	Loss of trust in the government (Islam et al., 2023; Dowling & Legrand, 2023), in public institutions (Koc-Michalska et al., 2023), and in the media (Freiling et al., 2023) enables information disorder.	No direct test conducted; presence of 2.5M users in conspiracy communities indicates trust erosion. Edelman Barometer data shows fluctuating trust in government and media (2016–2024).
Crises and Periods of Uncertainty	Crises –such as the COVID-19 pandemic– and moments of uncertainty –particularly election periods– act as catalysts for information disorder (Kweon, 2023; Pickel et al., 2022; Edwards III, 2020; Karekwaivanane, 2019).	Temporal analysis shows peaks of publications in 2021 and 2022, suggesting that the COVID-19 pandemic and the 2022 elections amplified the information disorder context in Brazil.
High Levels of Political and Ideological Polarization	Political polarization intensifies the spread of disinformation (Faris et al., 2017; Jungherr & Rauchfleisch, 2024; De Zuniga et al., 2023), with conservatives being more susceptible (Guess et al., 2020).	21.4% of HRTC posts (475,830) included politically polarized terms, linking health discussions to narratives that a "communist" government was hiding treatments, such as the "miracle cure" or the "dioxide of chlorine." Peaks align with the 2022 elections.
High Levels of Affective Polarization	Emotional identification with political groups and hostility toward opponents increase susceptibility to disinformation (Jenke, 2022; Ndahinda & Mugabe, 2024).	13.2% of HRTC posts (293,522) connected health topics to conspiracy narratives such as the "new world order," linking them to the destruction of traditional values such as "family" and "children".
Populism	Populist governments encourage the spread of disinformation, and belief in conspiracy theories increases support for populism (Arceneaux & Truex, 2023; Serani, 2023).	No empirical test was conducted, but the word "elite" was found 9,817 times in HRTC), with narratives often portraying an elite that allegedly hides miraculous medicines and cures while coercing people into vaccination.
Social Tensions	Amid disputes over narratives, disinformation exploits race, gender, and identity divisions (Bjola & Papadakis, 2020; Vićić & Gartzke, 2024).	7.9% of HRTC posts evoked "moral agendas", and terms such as "minorities," and "culture war".
Historical Traumas and grievances	Disinformation narratives use past historical traumas and social tensions to spread and legitimize disinformation (Nguyen et al., 2023; Perl et al., 2018).	No empirical test conducted.
Geopolitical Tensions	Disinformation narratives can exploit geopolitical conflicts to promote agendas of conspiracy based on prejudices and stereotypes (Zhao et al., 2024; Dawson & Innes, 2019).	In geopolitical and "globalist" communities, 15.2% (104,297 posts) linked health-related disinformation to theories such as the "plandemic".
Economic Hardships	Economic crisis and unemployment are exploited to fuel disinformation narratives (Kermani, 2023; Hughes & Waismel-Manor, 2021).	No empirical test conducted.
Religion	Authoritarian religiosity and	26.4% of HRTC posts (586,786) used

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

	fundamentalism increase belief in conspiracy theories, reinforcing resistance to scientific evidence (Yendell & Herbert, 2022; Czech, 2022).	religious framings, e.g. “miracle cures,” often Christian or syncretic narratives.

Tab. 2 - Overview of Informational Ecosystem Enabling Factors.

Enabling Factors	Reference in the Literature	Empirical Finding
Infodemic	Volume of information makes it difficult to distinguish between reliable and misleading content, and this confusion creates more space for disinformation (Maati et al., 2023).	13% (1.36M) of full dataset posts contained health disinfo, interwoven with other conspiracies like flat earth and "New World Order" conspiracies.
Attention Economy	Algorithms—acting as gatekeepers—prioritize sensationalism and emotionally charged narratives over accuracy, systematically favoring divisive content that drives traffic (Torreblanca, 2023; Bolton, 2021; Wu, 2016).	No empirical test conducted.
New Monetization Models	Advertising-driven revenue models incentivize misleading or sensationalist content disguised as legitimate news, exploiting algorithms to attract clicks and blurring the line between fact and fiction (Wu, 2016; Torreblanca, 2023).	No empirical test conducted.
Decline of Mainstream Journalism and Disintermediation	The rise of social digital media and the loss of traditional gatekeepers have expanded the spread of unverified content (Dahlgren, 2018; Torreblanca, 2023).	53% of HRTC posts links direct users to social media platforms, versus 47% to external portals, highlighting the predominance of social media platforms in information circulation.
Media Consumption Habits	The usage patterns of both direct and indirect exposure shape users’ vulnerability to disinformation, though the relationship remains contested in the literature.	Fragmented and multi-media ecosystem, dominated by Telegram and YouTube. The prominence of long-form and intra-platform sharing suggests intentional, ideologically-aligned consumption, rather than incidental exposure.
Fragmentation into Partisan Niches and Audiences	Vehicles and niche partisan portals reinforce pre-existing beliefs instead of pluralizing the debate, forming echo chambers and engaging in disinformation (Mauk & Grömping, 2024; Krafft & Donovan, 2020).	Within HRTC, 75% of top domains shared are partisan media; only 25% link to mainstream or institutional sources.
Endogenous Vulnerabilities of Digital Media	The speed, scale, and personalization of social digital media make individuals more susceptible to disinformation (Chernobrov, 2022; Torreblanca, 2023).	Most-shared links were Telegram invites; 202M shares vastly exceed reactions/comments, suggesting virality through passive transmission, and demonstrating how disinformation networks reinforce themselves endogenously.
Digital Divide and Unequal Access	Indirect exposure among digitally excluded populations increases reliance on interpersonal (dis)information flows (Gadjanova et al., 2022).	No empirical test conducted.

5. Conclusion and Limitations

This study examined which socio-political and informational ecosystem vulnerabilities contribute to information

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

disorder and how they manifest in anti-vaccine Telegram communities in Brazil. Using a mixed-methods approach that combines a systematic literature review with large-scale empirical analysis, we identified 18 enabling factors and found empirical evidence of 11 of them in over 10 million Telegram posts. The results demonstrate that socio-political enabling factors—such as institutional distrust, high levels of polarization, and social tensions—and ecosystem information factors are strategically exploited within anti-vaccine discourse. Certain vulnerabilities are not only structural but cyclical: for example, loss of trust in institutions facilitates the spread of disinformation, which in turn further erodes trust. The study also finds that crises and periods of uncertainty, specially the COVID-19 pandemic and election cycles, serve as catalysts for the infodemic, accelerating the circulation of false and misleading content. From the perspective of the informational ecosystem, the study confirms that platforms like Telegram enable the amplification of disinformation due in particular to endogenous digital vulnerabilities and disintermediation. This is exacerbated by the declining trust in mainstream journalism and increasing fragmentation into partisan niches and audiences.

Importantly, this work contributes to a growing body of scholarship that reframes disinformation not simply as a problem of "truth" or technological advancements, but as a structural phenomenon embedded in broader socio-political and media systems. Addressing information disorder requires acknowledging the contextual vulnerabilities present in a given setting, understanding how they intersect, and identifying the full range of stakeholders needed to develop sustainable, multi-level responses. Our findings suggest that effective responses must go beyond fact-checking and digital literacy. Sustainable interventions must address the structural conditions—both socio-political and informational—that allow disinformation to take root and flourish. This may include rebuilding institutional trust and developing platform governance strategies that recognize contextual vulnerabilities that enable disinformation, but further research is needed.

Certain limitations must be acknowledged. First, by focusing exclusively on Telegram, the findings reflect the dynamics of a single platform characterized by minimal moderation and high user anonymity. While this choice enables in-depth analysis of a key disinformation hub in Brazil, it limits generalizability to other platforms. Second, the study does not include psychological or individual-level variables—such as cognitive bias or conspiratorial thinking—which may further influence user susceptibility. While this aligns with our focus on systemic vulnerabilities, future research could integrate micro-level analyses to better understand how personal factors interact with broader socio-technical enabling factors. Third, this article does not evaluate nor propose policy solutions. Instead, our findings lay the groundwork for future studies to propose policy interventions addressing the identified enabling factors –beyond the prominent measures such as media literacy– that could address information disorder from a more systematic perspective. Future research should explore how information disorder operates across multiple platforms, how it intersects with offline behaviors, and how structural and individual-level vulnerabilities interact.

Abstract. Deliberation is a basic term about reaching a decision through balanced discussion, which openly raises the issues of consensus and its achievement through communication. The current article aims at studying the quality of online deliberation between citizens and Russian authorities on social media in the conditions of global health crisis COVID-19. Indeed, the quality of online deliberation between citizens and authorities on public policy issues is traditionally explored in periods of social certainty and mainly in democratic contexts. However, when this problem is considered in times of crisis and out of democratic societies, there is a huge gap in political science. Indeed, studying the quality of deliberation in online sphere becomes more significant and simultaneously complicated in the context of the COVID-19 pandemic. To evaluate the quality of deliberation, we propose a methodology of content analysis based on the theories of democratic deliberation and cumulative deliberation as well. Also, we employ a medium-size case dedicated to discussing state measures of quarantine and self-isolation in the social network VK.com during March-May 2020 in Russia. These conversations were conducted on the state VK.com platform Stopcoronavirus.rf, which is the official information resource of the Russian Government on coronavirus control issues. In total, 5215 comments of both citizens and authorities were analyzed. As a result, the quality of social media deliberation between Russian authorities and citizens is described and assessed in such categories as participatory activity, (ir)rationality, argumentation, constructive politics, interactivity, (in)civility, (dis)agreement and striving for consensus. Generally, the paper contributes to a better understanding the phenomenon of deliberation in non-democratic societies like Russia, going beyond the Western liberal democracies where deliberation is investigated as one of the most important components in the process of making legitimate decisions. Also, our work shows how the digital interaction can be implemented in the conditions of COVID-19 crisis and whether the results of political dialogue between state officials and people on social media can be taken into consideration in the real process of public policymaking in non-democratic societies.

Keywords. Social media, online deliberation, deliberative quality, political interaction, civic engagement, COVID-19, Russia.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.988

1. Introduction

One of the constructive and effective forms of digital interaction between citizens and authorities in democratic societies is online deliberation, which represents a process of public, mutual, purposeful, rational, reasoned, respectful, equal discussion with the predominance of dialogic form of communication and the use of information and communication technologies (ICT), aimed at solving common problems and achieving consensus/cooperation

(Volkovskii & Filatova, 2022). Deliberation both between citizens and with authorities on public policy issues can take place on various digital platforms. Recently, the attention of researchers in the field of political communication and e-participation has been focused on social media as spaces where political discussions between citizens and with authorities are actively taking place (Alarabiat, Soares, & Estevez, 2016; Bolgov, Filatova, & Volkovskii, 2024). Research confirms that social media acts as a catalyst for online deliberation (Halpern & Gibbs, 2013), contributes to increasing citizens' involvement in politics (Haro-de-Rosario, Sáez-Martín, & del Carmen Caba-Pérez, 2018), allows to rapidly address current social issues to government structures and involve authorities into communications with different actors of public sphere (Volkovskii, Filatova, Bodrunova, & Bolgov, 2024). To understand how citizens communicate among themselves and with authorities in social media deliberation and how they reach consensus and overcome differences, it is necessary to analyze the quality of deliberation.

The quality of online deliberation between citizens and with authorities on public policy issues is traditionally studied in periods of social certainty (Volkovskii, Filatova, & Bolgov, 2023). However, when this problem is considered in times of crisis (war, terrorism, pandemic), i.e. "a threat that is somehow perceived as existential" (Boin't Hart, & Kuipers, 2018), especially in hybrid and non-democratic countries as China, Singapore, Russia, Belorussia, there is a huge gap in political science. Indeed, studying the quality of deliberation in online sphere becomes more significant and simultaneously complicated in the context of the COVID-19 pandemic. First, the COVID-19 crisis markedly changed the model and content of political communication in general as (1) political leaders, scientific experts became the main figures of communication and key actors in policy responses, while citizens' communications became less considerable for decision-makers; (2) the influence of media increased as they gained more control and power to construct and manipulate the agenda and public opinion; (3) the negative role of social networks associated with dissemination of fake news, myths, conspiracy theories, boosted (Lilleker, Coman, Gregor, & Novelli, 2021). Whereas it is impossible to confirm whether false information was an acute problem or a major result of the raised use of social media, there were, nevertheless, public clashes between political factions, low political trust in government (Lilleker, Coman, Gregor, & Novelli, 2021). Secondly, the COVID-19 pandemic was, definitely, an existential threat that caused a colossal number of human deaths. One of the central roles in leveling the negative impact on people's lives and society's activity was played by the political communication of authorities with citizens, which should have been reduced to the following principle: 'the right message at the right time from the right person can save lives' (Reynolds & Quinn, 2008). Social media allowed the authorities to interact directly and in a deliberative way with people during the COVID-19 pandemic, which could lead to a clearer understanding of the problems people faced and, ultimately, to greater trust in state institutions. In addition to timely and reliable public information spread by government, deliberation between citizens and authorities on social media was also relevant as people could present their problems, propose solutions, and give feedback on certain policy initiatives. Consequently, it becomes highly demanding to study not only the models and methods of political communication between authorities and citizens in times of crisis, but also the quality of deliberation, ways to reach consensus and overcome disagreements. The reason is that they can affect the level of political trust, the quality of digital interaction in general and the resolution of the crisis or the prolongation, aggravation of its impact. Thirdly, some studies on authoritarianism confirm that when citizens face crises that pose a great personal threat, they prefer to trade their democratic rights and freedom for personal security (Altemeyer, 1996; Amat, Arenas, Falcó-Gimeno, & Munoz, 2020). In the face of threat, ruling elites propose certain strategies and implement various methods, including deliberative ones, to restore security and order, which may contribute to the activation and stabilization of authoritarianism (Filsinger & Freitag, 2022). Accordingly, it is important to examine how countries without a long liberal-democratic tradition use deliberation in the digital environment to strengthen the regime, overcome conflicts, and address dissent and the actors expressing it in times of crisis.

Thus, the current article aims at studying the quality of online deliberation between citizens and Russian authorities on social media in the conditions of the COVID-19 crisis. The paper contributes to a better comprehending the phenomenon of deliberation in hybrid/non-democratic regimes, going beyond the Western liberal democracies where deliberation is studied as one of the most considerable components in the process of making a legitimate and balanced decision. Also, our study shows how the digital interaction can be implemented in the conditions of the COVID-19 crisis and whether the results of political dialogue between state officials and people can be taken into consideration in the real process of public policymaking in non-democratic contexts. In order to evaluate the quality of deliberation, we propose a methodology of content analysis based on the theories of democratic deliberation (Habermas, 1996) and cumulative deliberation (Bodrunova, 2021). Deliberation is a basic term about reaching a decision through balanced discussion, which openly raises the issues of consensus and its achievement through communication. S. Bodrunova's concept contradicts J. Habermas's concept only in the way, in which communication participants search for consensus and how public opinion is formed in the online environment: in a cumulative way where participants can express themselves in a free manner without observing the normative principles laid down in the theory of deliberation, or according to the principle of a round table where everyone expresses his/her opinion in compliance with all the principles and rules of deliberation. As a result, we set three dimensions of empirically assessed parameters: (1) participatory (in)equality; (2) (ir)rationality: on/off-topic talk, presence/absence of argumentation, and elements of constructive politics; (3) (non-)dialogicity: interactivity, (in)civility, and (dis)agreement patterns. For this research, we employ a medium-

size case dedicated to discussing measures of quarantine and self-isolation in the social network VK.com during March-May 2020 in Russia. These conversations were conducted on the state VK.com platform Stopcoronavirus.rf, which is the official information resource of the Russian Government on coronavirus control issues. In total, 5215 comments of both citizens and authorities were analyzed.

Research question: What are the characteristics regarding the quality of deliberation between citizens and Russian authorities on public policy measures on social media in the period of the COVID-19 pandemic?

The remainder of the paper is structured as follows: Section "Theoretical Background" provides a review of theoretical works on online deliberation as a form of e-participation of citizens in politics and usage of social networks in the period of various crises, including both democratic and authoritarian contexts. Section "Empirical Data" describes sampling and its principles, while Section "Methodological Approach" sheds light on the methods. Section "Results" provides the findings according to the RQ. Section "Discussion and Conclusion" summarizes the paper by discussing the results, limitations of research, and future avenues for studies in the field of online deliberation in the conditions of crises.

2. Theoretical Background

2.1 Digital interaction between citizens and authorities via social networks

Overall, there is a wealth of research showing that social networks have led to profound changes in the way people and organizations communicate and share information. A solid overview of research on social media usage by government bodies is presented in the work of N. DePaula and E. Dincelli (2018). It says that early work on social media usage by state authorities saw social networks as "tools for transparency" and "anti-corruption tools" [200], which could be used for "civic co-production" and "mass collaboration" (Linders, 2012; Mossberger, Wu, & Crawford, 2013). The distributed nature of these technologies and their adoption by the general public has shown that social media can be used to disseminate important information about state activities (Bertot, Jaeger, & Grimes, 2010), to maintain a dialogue with citizens (Bonsón, Torres, Royo, & Flores, 2012) and, in general, to enable communication functions that contribute to the public good (Lee & Kwak, 2012). Also, social media are increasingly used in crisis communication (DePaula & Dincelli, 2018), which is more outlined in the section 2.4.

As using social media becomes more popular and necessary among the global population, government agencies are making extensive use of these platforms in their digital activity (DePaula & Dincelli, 2018). Social media have become tools that enable to accomplish the goals of transparency, participation, and collaboration, despite the problems correlating with rise of disinformation on social media, "echo chambers," proliferation of 'algorithmic control', etc. In academic literature, unjustifiably little attention has been paid to the multifaceted nature of state communication and research on how the interaction between government and society takes place in social networks. It happens due to the fact that governments serve more as disseminators of information and are highly regulated bodies, and their approach to social media is determined by political guidelines. However, there are still some studies arguing that social media are not only tools for democratic transparency and citizen participation, but also tools for self-presentation, exchange of symbolic gestures and marketing of products and services. Therefore, most of governments uses social media for symbolic and presentational purposes. The articles by N. DePaul and E. Dincelli (2018) discuss the nature of social media interaction in a governmental context. Considering the recent literature on affective nature of social media and affective nature of politics more broadly, the authors find that reactions on social media are skewed towards affective and symbolic content and, thus, potentially unsuitable for deliberative or rationalized discussions and interactions. However, some research indicate that social media may become a potential platform for deliberative interaction between citizens and government bodies (Nigmatullina, Bodrunova, Rodossky, & Nepiyushchikh, 2023; Volkovskii, Filatova, Bodrunova, & Bolgov, 2024), although there are many factors influencing the quality of deliberation.

.2.2 Deliberation between citizens and authorities in a (non-)democratic context

The concept of deliberation is about equality and avoidance of domination in expressing and sharing individual preferences (Gastil, Black, & Lawra, 2008; Jonga, 2012). It also comprises (1) transparency and accessibility of information flow that may help participants of deliberative process learn and better comprehend a situation and each other (Nabatchi, 2010); (2) adequacy and reliability of information presented in the forms of statistics, surveys, objective measurements that go beyond individual biases (Habermas, 1984). Hence, such characteristics of information and its types can make a discussion more effective for the process of making decisions (Gouran & Hirokawa, 1996). The inclusiveness and responsiveness are key conditions as they allow citizens to perform as both the authors and addressees of certain solutions or proposals. Interestingly, inclusion and mutual respect, on the one hand, are outcomes of deliberation and, on the other one, prerequisites for it (Beauvais, 2020). The core values of deliberation, according to Habermas, are communicative rationality and legitimacy (Habermas, 1984).

Many theorists and empirical researchers have recently joined the thought of aggregation of preferences and processes by which preferences and broader values that shape them are formed in public deliberation (Shapiro,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

2003). It seems extremely necessary to highlight the relevance and benefits of deliberation for citizenry, society and government as well. Thanks to deliberating, community's social capital increases, since more people consider deliberation as a civic activity (Fishkin, 1995), constitutional order legitimacy explicitly grows as people have an opportunity to express their views and understand that order by exchanging their opinions (Chambers, 1996; Gutmann & Thompson, 1996), public actions and decisions made both individually and collectively have a greater supporting for responsive government representatives (Gastil, 2000). As a result, citizens become more enlightened about their own and others' needs and experiences, can better resolve deep conflicts and be more involved in political participation, which can be implemented digitally via social media.

Nowadays, enormous amount of research is concentrated on investigating online deliberation and its different aspects as design, technical affordances, results, process, effects. Our recent literature review on online deliberation allowed us to detect a few directions that certainly should be developed in the future (Volkovskii, Filatova, & Bolgov, 2023). The first one correlated with exploring online deliberation and its quality in the conditions various crises (pandemic, war, natural or technogenic catastrophes, ecological crisis). The second venue was about understanding what online deliberation represents and what negative effects it may have on citizens and civic engagement. Indeed, there is a tone of definitions, and the majority of researchers concentrates on studying good sides of online deliberation, while negative consequences are remaining unexplored enough. The third direction touched citizens' motivation and intentions to participate in online deliberation, tools and benefits proposed by government agencies to increase a level of civic engagement. One more direction can be correlated with studying the quality of online deliberation between citizens and government bodies towards valuable socio-political questions in non-democratic countries or hybrid regimes. As for Russia, there are some empirical works indicating on involvement of authorities into deliberation with citizens on social media (Nigmatullina, Bodrunova, Rodossky, & Nepiyushchikh, 2023; Volkovskii, Filatova, Bodrunova, & Bolgov, 2024). Some recent empirical results about authorities' responses to citizens' complaints or opposing positions towards the state in deliberative process reveal that a mechanical and bureaucratic way of communicating with citizens in comment sections significantly reduces the quality of deliberating as well as the level of civic trust towards government agencies and citizens' motivation to discuss particular problems and solutions with state authorities on social media (Enikeeva, Kulnazarova, Rafikov, & Shutman, 2023). Although some Russian studies show that discussions between citizens and authorities on the social media's state pages are more reasoned and polite compared to discussions on unofficial Internet forums or on the social media pages of Russian mass media (Filatova & Volkovskii, 2021; Volkovskii & Filatova, 2020, 2021, 2022; Volkovskii, Filatova, & Bolgov, 2022), it is not enough to understand the phenomenon of digital deliberation in a non-democratic context. In order to know what deliberation represents in countries without a long liberal-democratic tradition and why it is employed by authorities there, it is necessary to refer to the concept of authoritarian deliberation broadly elaborated in the Chinese political science.

Deliberative democracy theorists believe that deliberation is incompatible with authoritarian regimes because of imbalance in the distribution of power between civil society and ruling elites in governance and decision-making (He & Warren, 2011), but deliberation exists not only in democratic societies. This idea is reflected in the concept of deliberative authoritarianism, which presents a combination of deliberation and the permanence of power concentration (He & Warren, 2011). Thus, Baogang He introduced the term of authoritarian deliberation, referring to the Chinese political context as Chinese public discourse in decision-making is dominated by non-competitively elected leaders (He, 2006). Accordingly, the boundaries of political discourse are set by the state party, but this discourse is of deliberative nature, since citizens can collectively discuss problems, argue their positions, and propose solutions. Through deliberative practices, the government collects information about public discontent and political sentiment and uses it to build institutions for control and effective governance (Nathan, 2003). The combination of authoritarian governance and deliberative mechanisms has been studied and explored in detail in China where deliberation functions as an information resource through which authorities shape public policy and gain support from those they target, while having a monopoly on decision-making. In authoritarian regimes, it is the political elites that establish the subject and space for deliberative process. In China, for example, elites control discursive spheres and agendas, limiting public deliberation to pre-selected governance issues and avoiding non-approved venues and topics that could delegitimize the regime. In such a context, citizens have limited powers in specific areas of governance, ranging from negative powers of protest and obstruction to positive powers of some kinds of voice (in organized deliberative forums) (He & Warren, 2017). For the regime, too, this has consequences, namely there is a weakening of the autocrat's control over political discourse, but in exchange for other priorities – its own stability and survival.

Why might the development of deliberative interaction between citizens and with authorities be encouraged in authoritarian regimes? First, deliberation can co-opt political dissent and maintain social order. Second, deliberation can produce information about society and politics, allowing autocrats to avoid lapses in governance. Given the rapid development and innovation of the electronic sphere, authoritarian methods may become obsolete and conflict with the information resources needed for governance (He & Warren, 2017). Therefore, in this regard, more attention is paid to social networks that may function both as a catalyst for online deliberation and political disagreement (Volkovskii, Filatova, Bodrunova, & Bolgov, 2024). Thus, social media can be intensively utilized by authorities to monitor citizens' discontent and eliminate their dissents with government and its politics through

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

different methods, including online deliberation. Third, public deliberative practices promote transparency, thereby protecting the bureaucratic sector from allegations of malfeasance or corruption. Officials can learn to use the transparency and inclusiveness in decision-making that deliberation affords them to avoid or, at least, refute claims against them when decisions are unpopular with the public and address the needs of elites rather than citizens (He & Warren, 2017). Fourth, the deliberative process implies collective responsibility when it comes to losses and managerial lapses. Thus, by shifting the responsibility for its political failure to other actors (citizens or oppositional forces), the leadership can avoid being blamed by population. Deliberation acts as a political cover for actors making decisions. Based on the mentioned theses, we can conclude that deliberation can generate such a politically important resource for hybrid or authoritarian regimes as legitimacy, allowing autocrats to cleverly avoid conflicts and formation of protest moods in society. These conclusions may refer to the Russian context as well explaining why and how deliberation on social media can be used, but more empirical research is required.

2.3 Deliberation and social media in the context of the COVID-19 crisis

Social media are increasingly being used by authorities and health experts to disseminate health information to the public (Gough et al., 2017), especially during various health crises (Graham, Elizabeth, & Sejin, 2015). Given the speed at which information can be communicated to wide audiences, social media are particularly useful for rapid dissemination of data updates and warnings during crises (Eriksson & Olsson, 2016). Previous research on use of social media by authorities to raise public awareness of epidemics has been conducted in the context of the Zika fever outbreak (Vijaykumar, Meurzec, Jayasundar, Pagliari, & Fernandopulle, 2017), Ebola hemorrhagic fever (Strekalova, 2017), and the H1N1 swine flu pandemic (Liu & Kim, 2011). The COVID-19 pandemic was a major public health concern for policymakers and citizens around the world. Thus, the usage of social media by state officials reached unprecedented levels during the COVID-19 pandemic to maintain trust in scientific expertise (van Dijck & Alinejad, 2020). Although there is still insufficient knowledge about the extent to which the public trusts health experts and authorities, it is hypothesized that government communication during crises is most effective when it contains and broadcasts scientific and technical information (Herovic, Sellnow, & Sellnow, 2020). Social media platforms played a significant role in government communication with citizens as the pandemic led to a narrowing of the topical agenda on these platforms (Rauchfleisch, Vogler, & Eisenegger, 2021).

Social media generated a space for citizens, communities to interact and actively participate in sharing and refining relevant messages (Hyland-Wood, Gardner, Leask, & Ecker, 2021). Social media allowed public bodies to interact with people in a direct and deliberative way, which could lead to a clearer understanding of the issues people were facing and, ultimately, increased trust in government institutions. Rational and high-quality deliberation was essential for governments and administrations to effectively and legitimately address the extreme challenges posed by the COVID-19 crisis (Lavazza & Farina, 2020; Parry, Asenbaum, & Ercan, 2020). The policies, proposed by governments in response to the global health crisis, were based on assumptions about public opinion and constraints to which people must conform (Sibony, 2020). Although the COVID-19 pandemic increased reliance on scientific and technical expertise in problem solving and policymaking, such expertise could not resolve the moral and political dimensions of policymaking (Elstub et al., 2021). This could be done in a deliberative way (Brown, 2014). As citizens demanded quick action and decision making from authorities, the pandemic posed several challenges for online deliberation (Elstub et al., 2021): (1) whether digital environment was suitable for online deliberation or not; (2) predominance of emotional aspect over rational one; (3) growing incivility vs decreasing civility and tolerance between deliberators. Considering these challenges, it becomes clearer that reaching consensus in such conditions was more than ever a harsh task.

3. Empirical Data

3.1 The description of chosen case and period

On March 29, 2020, the Government of Moscow introduced a self-isolation regime due to the threat of rapid spread of coronavirus. By March 31, the authorities of 67 subjects of the Russian Federation decided to introduce a self-isolation regime for all residents on the territory of the regions. Self-isolation was defined as a strict recommendation to every Russian not to leave home for no particular reason, while emergency and quarantine regimes were not introduced. Air travel with other countries, including land checkpoints, was completely closed, except for flights to take people out. On April 15, e-passes for travel within a city were introduced in Moscow and in Moscow region: 1) working pass (issued once for the entire duration of restrictions), 2) for travel to medical institutions (one pass for each trip without restrictions), 3) one-time pass (for personal travel for one day not more than twice a week). However, on the very first day of the passes' validity, colossal queues were formed at the entrance to the subway, those standing in them did not observe any social distance, which caused mass dissatisfaction of Moscow citizens with the measures taken. On the other hand, all the above-mentioned measures made it possible to reduce the rate of spread of the virus and to prepare for the treatment of a large number of sick people. During the period of self-isolation, an overwhelming number of medical facilities throughout the country were adapted to treat patients with the infection, and doctors were retrained. Russia's closed-door schedule was extended until May 11 and lifted on May 12. In terms of the strength and severity of the COVID-19 crisis, it was one of the most severe phases of the crisis for Russian society as it was characterized by the most radical and high-

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

profile measures to combat the epidemic in Russia.

Social networks and the Internet became the main platforms where many people could publicly express their opinions and arguments, spreading them to a mass audience, familiarize themselves with various positions, including those different from the official one, and find both like-minded and opposing supporters. Many COVID-19 dissidents appeared who did not believe in the existence of COVID-19 and tried to convince the public otherwise, spreading myths and conspiracy theories, claiming that the crisis was created in the interests of WHO, billionaires and large pharmaceutical companies. In parallel, a group of COVID-19 alarmists emerged. They, on the contrary, declared all actions of the Russian authorities insufficient, incompetent and demanded a "Chinese version" with a complete ban on leaving the house for everyone and stopping of public transportation. Incivility and dissent existed not only in the online sphere, but also in public places, as cases of violence were recorded both against those who refused to wear a mask and those who demanded that others observe the measures.

3.2 The description of selected platform and discussions

Due to the problem of spreading fakes in mid-March 2020, the State Center for informing citizens about the situation with COVID-19 in Russia offered an official online resource for the public on the coronavirus pandemic (Stopcoronavirus.rf). In our work, we selected VK.com social network as it is more popular among Russians and more employed by Russian authorities than other networks. The platform Stopcoronavirus.rf in the social network VK.com was founded on March 16, 2020 by the Russian Government to inform citizens about coronavirus situation in Russia and measures proposed by authorities and experts to combat it. This group became the most popular government platform on COVID-19 in VK.com since the crisis began. Its number of subscribers amounted to about 502 thousand users from different regions of Russia and other countries. Since its founding, government bodies published posts about the coronavirus, offering citizens open access to commenting, so that people could communicate with Russian authorities online throughout all the period of COVID-19. The first post about COVID-19 in the community was published on March 16, 2020.

Online conversations were selected for empirical analysis based on the following factors: (1) they were conducted on a state platforms in VK.com between March 30, 2020 and May 11, 2021; (2) they dealt with COVID-19 pandemic issues, including regulatory measures; (3) open access to commenting on posts by both citizens and authorities; (4) the presence of responses (feedback) from Russian authorities to citizens' comments in online discussions; (5) the presence of at least one expression of dissent from citizens or authorities; (6) the number of comments in one discussion was at least 100 as they were automatically gathered . Totally, 5215 comments collected via programme software were manually analysed by two coders to determine the quality of online deliberation in this period.

It is worth noting that the community prescribed the rules of citizens' communication in the group, non-compliance with which was sanctioned by deleting the comment or blocking the user for repeated violations. In turn, moderation and proposed rules influenced the results of the deliberative analysis: mainly on such parameters as uncivil communication in relation to citizens and authorities, citizens' disagreement with state measures and authorities in general.

4. Methodological Approach

The study employs several approaches to assess the deliberative quality of online discussions. First, the Discourse Quality Index, widely used in modern deliberative research, which includes such criteria as participation, level of argumentation, argumentation content, respect, counterarguments, and constructive politics (Steenbergen, Bächtiger, Spörndli, et al., 2003). Second, an analytical approach to assessing discourse quality created by Yu. G. Misnikov (2011) who described seven thematically different discursive parameters to guide the coding of online discussion posts: participatory equality, argumentation, communication culture, assertion efficacy, interactivity, dialogicity, and thematic diversity. Thirdly, the concept of cumulative deliberation proposed by Russian professor S. Bodrunova (2021). This conceptual framework points to several non-deliberative features of user communication such as irrationality, simultaneity (and lack of order), non-dialogicity, potential inequality, permissible emotionality and even uncivil (within the law) speech, and non-consensual goal setting. Besides mentioned discourse analysis approaches, J. Stromer-Galley's approach is used to analyse agreement, disagreement and their types in the categories of argumentation and (in)civility (2007, 2009, 2015). These methodological approaches are combined to comprehensively assess the quality of deliberation. As a result, three dimensions are identified: 1) (non-)equal participation; 2) (ir)rationality: discourse on/off-topic; presence/absence and type of argumentation; elements of constructive politics; 3) (non-)dialogicity: interactivity; (in)civility and (dis)agreement.

(Un)equal participation. This parameter contains several coding categories describing the number of comments left by participants in a discussion thread. These were formulated based on the experience of previous studies (Filatova & Volkovskii, 2020, 2021): inactive (1 post), moderately active (2-3), active (4-5), very active (6-9) and hyperactive (10 or more).

(Ir)rationality. On/off-topic comments reflex whether communicators follow the topic determined in the beginning of talk or prefer discussing other themes out of the main one. The category of argumentation is borrowed from the work of Fischer and co-authors (2021), where several types of arguments were described and empirically

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

applied (see Table 1). This approach fits well with this work because it allows to establish an explicit difference in the types of arguments offered by the government corpus and ordinary citizens (inductive, deductive, casual, analogical reasoning, expressing uncertainty, questioning).

Table 1. Argumentation and its categories proposed by Fischer and his colleagues (2021)

Category	Description
Inductive	Personal examples, experiences, stories, and hypothetical examples can be used to inductively make a point
Deductive	Evoking expertise, statistics, or authoritative texts from one side, often to challenge the reasoning of another side
Casual	The reasoning is not always sound in the 'if/then' relationships in causal arguments: many participants may rely on a correlational relationship, not an actual cause-effect relationship. Correlational relationships imply an association, but with multiple potential causes
Analogy	Analogies compare two targets towards one context
Expressing uncertainty	The expression of uncertainty is a central source of pressure for participants undecided on the measure. Expressing uncertainty means that the reasoning is unauthoritative in nature as the group came to a decision
Question	A common communicative tactic participants use to express reasoning. Questions about evidence allow participants to add their opinion to the discourse in a nonthreatening, though sometimes confrontational, way

The measurement of constructive politics is of high relevance as it gives an opportunity to discover who constructs the political discourse and who proposes constructive solutions to tackle the issues and build consensus. The authors of DQI (2003) capture three codes which are also implemented in our research: (1) positional politics which means no compromise or consensus building between speakers who strongly belong to their own positions; (2) alternative proposal which does not cover the current agenda but fits another one; (3) mediating proposal that fits the current agenda.

(Non-)dialogicity. Interactivity means an interaction between users, which can be marked by two indicators (Filatova & Volkovskii, 2020): 1) mentioning one participant by another in a conversation (either by name or a link to a comment), 2) without mentioning the name of individual, but only by reference to the comment. The category of (in)civility is adopted from works of Misnikov as it has been successfully tested in our several recent works (Volkovskii & Bodrunova, 2023; Volkovskii & Filatova, 2023). The characteristics are distributed in two categories as we analyze comments of both government and citizenry. If we consider DQI (2003), there is a category of respect that can be similar to term of civility. However, there are three general codes (no respect; implicit respect; explicit respect) that make analysis of communication culture very narrow and unpresentable.

The categories close to constructive politics are agreement and disagreement. The works by Stromer-Galley (2007, 2009) proposed a systematic way to measure what happens during discussions. The article presented a simple procedure for coding and analyzing agreement and disagreement. Agreement was understood as a signal of support with something said by a previous speaker. Agreement includes a comment containing explicit or implicit agreement with the statements of other users. Disagreement is understood as a statement that signals a contradiction with something said by a previous speaker, including a moderator. Messages are encoded as disagreement when they (1) diverge from general tone of discussion (considering a previous message in topic as a basic one), which indicates a heterogeneity in the topic; (2) clearly diverge from another commentator in the form of a name tag or response. Therefore, disagreement is encoded if at least one of two conditions is seen.

The methodology may contain the following components of analysis of agreement and disagreement, which are presented below:

(1) analyzing the presence and absence of agreement and disagreement, their frequency;

(2) the actor who expresses agreement or disagreement (citizens, authorities);

(3) the subject/object towards which agreement or disagreement is expressed (person, authority, policy measure);

(4) analyzing a type of disagreement in terms of two categories:

- argumentation (justified or unjustified);
- communication culture (civil (soft and bold) or uncivil).

Also, we distinguish different categories of agreement and disagreement based on components 2 and 3:

(1) (dis)agreement of citizens with citizens;

(2) (dis)agreement of citizens with authorities;

(3) (dis)agreement of citizens with policy measures;

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

(4) (dis)agreement of citizens with a topic of post and information;

(5) abstract disagreement of citizens (with citizens, authorities, world, etc.).

(6) (dis)agreement of authorities with citizens.

5. Results

(Un)equal participation. Analyzing participation of Russian authorities in communication with citizens, a colossally low number of comments was recorded (16 out of 5215, which was 0.31%). At the same time, a number of citizens' comments deleted by community moderators without explaining a specific reason (1.5%) was higher than a number of comments left by authorities. In turn, these comments could contain elements of disrespectful attitude towards authorities and disagreements about self-isolation and quarantine regime. This result indicates that Russian authorities preferred to solve problems in a non-deliberative way, removing user comments that could undermine the image of the authorities. It can be a trait of authoritarian deliberative practice.

(Ir)rationality. Overall, there was a low rate in the parameter of comments on topic, which was only 25.1%. However, not only the percentage of comments on topic was low, but also the overall level of arguments in discussions, which amounted to 9.11% (see Table 2). At the same time, arguments were predominantly made by citizens rather than by state officials. Thus, 9.03% was left by citizens, of which mostly were arguments of inductive character, i.e. personal examples, situations from life, reflections (6.44%). After inductive arguments, deductive arguments were used, i.e. references to statistics, normative-legal documents, studies of scientists, media and expert interviews (0.91%). The authorities used only deductive argumentation in their answers to citizens' comments (0.08%). The use of other types of argumentation was not recorded.

Table 2. Argumentation expressed by citizens and Russian authorities in online discussions (%)

Category	%	Types of arguments					
		Inductive	Deductive	Causal	Analogical	Expressing uncertainty	Questioning
General figures	9,11	6,44	1	0,59	0,58	0,19	0,31
Government's argumentation	0,08	0	0,08	0	0	0	0
Citizens' argumentation	9,03	6,44	0,92	0,59	0,58	0,19	0,31

As for constructive politics, Russian authorities preferred to keep silent and did not give practically any suggestions for solving problematic situations (0.04%), while, in comparison with authorities, citizens were very active in policy construction (3.22%) (see Table 3). The mediated suggestions that received the most from citizens were the ones that addressed the problems related to self-isolation and quarantine (1.78%). The number of alternative proposals that did not address the main topic of discussion was 1.44%. Only mediated proposals were recorded from authorities.

Table 3. Constructive politics in online discussions between citizens and Russian authorities (%)

Category	Types of constructive politics	
	Alternative politics	Mediating politics
General figures	1,44	1,82
Government	0	0,04
Citizenry	1,44	1,78

(Non-)dialogicity. The overall level of interactivity was quite high and amounted to 74.86%. However, the level of civility was not as high as the level of interaction of participants. The level of civility was only 0.21% and only towards other citizens (see Table 4). At the same time, the general level of uncivil attitude in the discussions was higher than the civil one. The rudest statements and insults from citizens (2.12%) were recorded in relation to other people (1.02%), then to the Russian authorities (0.33%), then in relation to the measures taken (0.1%) (see Table 4). In addition, citizens spoke negatively about other issues that could concern those who came from abroad and brought the infection (0.67%). It is important to note that this intolerant communication was abstract and indirectly addressed as this category of citizens was not present in the discussions. The authorities responded to citizens' comments in a neutral tone. In general, taking into account our previous research (Volkovskii & Bodrunova, 2023; Volkovskii & Filatova, 2023), rather low levels of disrespectful communication of citizens were recorded on the platform, since the rules of communication were prescribed in the community, comments were moderated by administrators, and the open presence of bots and trolls was not detected by citizens. This result indicates that moderation and rules of communication matter and may influence a deliberative process.

Table 4. Civility and incivility in online discussions between citizens and Russian authorities (%)

Category	%	Types			
		Towards topic	Towards citizens	Towards authorities	Towards other issues
General figures for civility	0,21	0	0,21	0	0
Civil tone of government	0	0	0	0	0
Civil tone of citizens	0,21	0	0,21	0	0
General figures for incivility	2,12	0,2	1,03	0,33	0,67
Uncivil tone of government	0	0	0	0	0
Uncivil tone of citizens	2,12	0,1	1,02	0,33	0,67

Regarding agreement and disagreement, the overall level of agreement (2.64%) was higher than the level of disagreement (0.36%) in the discussions (see Table 5). Most of the citizens agreed with each other (2.49%), while some agreed with the measures taken by government (0.15%). Agreement of citizens with authorities was not detected, whereas agreement of authorities with citizens was observed. It may reveal that authorities tried to raise their level of legitimacy and citizens' trust by confirming the views and arguments of people. As for disagreement, citizens mostly disagreed with each other (0.21%), while the level of citizens' disagreement with measures was the same as the level of other citizens' agreement with measures (0.15%). This may indicate that there were different views on these measures in society, but we cannot know the authentic indicators as they may be distorted. It was already mentioned earlier that Russian authorities deleted 78 comments from 5215 citizens, although these comments could have disagreements of citizens with other citizens, policy or authorities, which, in turn, could affect the interpretation of results. There was no direct disagreement between citizens and authorities, as well as no open disagreement between authorities and citizens. As for types of disagreement expressed by citizens, we detected a common communication pattern: unjustified, neutral/civil, bold disagreement (see Table 6).

Table 5. Agreement and disagreement in online discussions between citizens and Russian authorities (%)

Category of agreement	(%)	Category of disagreement	(%)
Agreement of citizens with measures	0,15	Disagreement of citizens with measures	0,15
Agreement of citizens with authorities	0	Disagreement of citizens with authorities	0
Agreement of citizens with citizens	**2,49**	Disagreement of citizens with citizens	**0,21**
Agreement of authorities with citizens	0,04	Disagreement of authorities with citizens	0
General figures	**2,64**	General figures	**0,36**

Table 6. Type of disagreement in online discussions between citizens and Russian authorities (%)

Type of disagreement	(%)
Justified	0,12
Unjustified	**0,25**
Neutral/civil	**0,35**
Uncivil	0,02
Soft	0,06
Bold	**0,29**

5. Discussion and Conclusion

The results of current analysis showed that during one of the most acute phases of the COVID-19 crisis, Russian authorities preferred to delete citizens' comments by implementing automatic moderation rather than responding to them. In other words, the priority was given to a non-deliberative strategy that may be close to censorship measures rather than a deliberative approach, which may indicate a tendency towards authoritarian practices of control over public sphere and deliberative process rather than a democratic one. This is a curious observation that motivates to continue conducting studies on ways, in which Russian authorities control deliberative process and public sphere in the digital environment, especially in social networks where they communicate directly with citizens. If we consider the problem in a global context, it is important to understand what practices of authoritarian control are used by non-democratic regimes in the online milieu and how they affect construction of

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

the digital public sphere both in times of crisis and social stability. Research in this area is mainly presented in Chinese political science where the concepts of authoritarian deliberation, consultative authoritarianism and deliberative authoritarianism are studied in detail (He, 2014; He & Warren, 2011, 2017). As for Russian research, there is still no empirical evidence based on the concept of authoritarian deliberation. Our study tries to analyze the modern deliberative process in Russia through prism of this concept, however, more theoretical review and empirical results are necessary to confirm the authoritarian character of deliberation in Russia.

Summarizing our results, we can see that the quality of online deliberation on the Stopcoronavirus.rf platform was clearly low: a low percentage of comments on topic, a low percentage of argumentation, a low percentage of civility, a high percentage of incivility, and a low percentage of striving for consensus. This outcome is confirmed by our previous studies on the quality of deliberation in social networks (Filatova & Volkovskii, 2021; Volkovskii & Filatova, 2021, 2022; Volkovskii, Filatova, & Bolgov, 2022), as well as by literature that we used in the theoretical part (Elstub et al., 2021). Indeed, the levels of rationality, argumentation, and polite communication are falling, while the levels of intolerance and irrationality are rising. However, the issue of growing disagreements between citizens and authorities during the crisis remains controversial as our research has not detected this. We can assume that the political context influences the degree and form of disagreement expressed by citizens regarding authorities and their policies. To better understand this issue, it is worth referring to the concept of authoritarian publics proposed by F. Toepfl (2020), who distingushes three types of publics: uncritical publics, policy-critical publics, leadership-critical publics. One of his studies, which deals with exploring authoritarian public sphere in various undemocratic countries, reveals what types of publics exist (Toepfl & Litvinenko, 2021). In Russia, all three types of publics are present, but uncritical public prevails over two others. In contrast, in China, two types of publics are identified (uncrticical and policy-critical), while, in North Korea, only one type of public is determined (uncritical). Based on these data, it is possible to assume that, after all, the crisis has a lesser effect on the level of political disagreement in society than the political context, in which this society finds itself. On the one hand, our results can facilitate the development of Toepfl's concept as we determine different types of disagreement and, accordingly, various types of critisizing publics showing the ways how disagreement can be publicly expressed and worked by state officials. On the other hand, this encourages us to conduct research involving various cultural and political contexts.

There is a significant question raised by our research: is online deliberation with Russian authorities real or is it an imitation of deliberation controlled by the authorities to monitor public opinion? The answer is ambigious as it depends on a theoretical context, through which we get the asnwer. From positions of democratic deliberation and deliberative democracy, the deliberative process on the platform of the Russian Government in the social network VK.com can be described as symbolic, that is, online deliberation is imitative in nature and is aimed at fulfilling the tasks and testimony required by the authorities, not citizens, although deliberation is a citizen–oriented process (Abdullah & Rahman, 2015). In our empirical analysis, the imitation nature of deliberation was indicated by the parameter of constructive policy: citizens offered more solutions, both alternative and mediated, and also sought consensus more actively than Russian authorities. Online discussions did not capture the true desire of authorities to solve the problems of Russian population as communication of Russian authorities was aimed at calming and distracting citizens. It is obvious that the proposals of citizens regarding self-isolation and quarantine measures were not taken into account by Russian authorities when developing the policy. However, from positions of authoritarian deliberation and deliberative authoritarianism explaining the objectives that can be accomplished by authorities thanks to deliberation, we cannot indicate on symbolism of deliberative practice as it potentially may satisfy the goals Russian authorities may pursue: cooptation of people expressing disagreement or elimination of public complaints, stabilizing the regime and legitimazing the public policy in the period of the COVID-19 crisis. Definitely, more research has to be conducted in order to continue this discussion.

As for limitations of our research, we can list a few of them. First, we take one country case, although the practice of deliberation exists in other countries, both authoritarian and democratic ones. Secondly, the discussions in only one Russian social network VK.com are analyzed, although deliberative process took place in other Russian social networks (Odnoklassniki) and messengers (Telegram). In this regard, it is hard to generalize the data obtained and formulate the general theoretical principles, which could be used in subsequent studies. Nevertheless, in our opinion, this study has an important applied sense for Russian political science and for the field of deliberative studies in a global context, especially in times of authoritarian renaissance. Thirdly, the number of platforms could be expanded to understand which authorities communicated with citizens and how. Fourth, research methodology. The number of parameters for analyzing the deliberative quality of discussions can be expanded, and their characteristics can be detailed. The data analysis was carried out manually, although it can be automated and performed by a computer program or with the help of artificial intelligence in the future. Research in this area is already underway by scientists (Shin & Rask, 2021), including our efforts (Filatova, Volkovskii, & Begen, 2020). This will speed up the process of data collection and analysis, letting avoid human errors and false interpretations.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 21 May 2025

Abstract. The increasing use of social media (SM) in political campaigns has raised concerns about electoral irregularities, such as unauthorized voter solicitation and the use of sound trucks. Monitoring and enforcing electoral regulations manually are time-consuming and prone to inconsistencies, highlighting the need for automated solutions. A major challenge in automating the detection of electoral violations is the lack of sufficient labeled data. Additionally, the effectiveness of Generative AI in addressing this issue remains underexplored, especially regarding its ability to create synthetic data and enhance detection accuracy. In this context, this study aims to assess the potential of Generative AI in identifying electoral irregularities on SM, focusing on two common violations in the 2024 Brazilian municipal elections: voter solicitation and the use of sound trucks. The goal is to evaluate whether synthetic image generation, combined with AI-based visual analysis, can improve the identification of such infractions. We first generate synthetic images using Imagen 3, Stable Diffusion, and FLUX, identifying Imagen 3 as the most effective in producing realistic and visually coherent images. Then, we test the ability of three AI models—Gemini 2.0 Flash, Llama 3.2 Vision, and PaliGemma 2—to detect electoral violations in both real and synthetic images. To enhance detection accuracy, we apply different prompting strategies, including basic, chain-of-thought, and detailed prompts. Our findings show that Gemini 2.0 Flash performs best, particularly when using detailed prompts. Also, synthetic images help mitigate data scarcity, improving model training and evaluation. Overall, the study demonstrates that Generative AI, combined with optimized prompt engineering, can significantly enhance the accuracy of detecting electoral irregularities.

Keywords. Generative AI, electoral irregularities, SM, election monitoring, online campaigns
Research paper, DOI: https://doi.org/10.59490/dgo.2025.990

1. Introduction

Since the emergence of social media (SM) platforms, these communication tools have served dual purposes - facilitating personal interactions while functioning as professional instruments for commercial profiles and advertising (Kent & Li, 2020). The political domain has become deeply embedded in these digital spaces. Brazil's 2018 presidential elections demonstrated social media's remarkable capacity to influence and even predict electoral outcomes (Brito & Adeodato, 2023). Subsequent academic research has focused on correlating political figures' social media engagement with electoral performance (Brito & Adeodato, 2022).

While not the sole determinant of electoral success, social media's impact on voters is undeniable. Political campaigns employ targeted strategies to promote candidates and platforms, aiming to persuade voters and secure electoral support (Gomes, 2001). However, such campaigns must comply with electoral legislation. The scale of Brazil's 2024 municipal elections - with over 460,000 candidates - presents unprecedented monitoring challenges. According to the Superior Electoral Court (TSE), nearly 90,000 complaints about irregular campaign materials were filed during this election cycle(Superior Electoral Court, 2024), highlighting the limitations of manual oversight by a single

institution.

This study addresses these challenges by employing Generative AI to identify electoral violations in social media content. Our methodology progresses through three phases: comprehensive data collection, synthetic data generation, and image analysis using Large Language Models (LLMs) - an approach that fills a significant gap in existing literature (Grimmer & Stewart, 2013).

We implemented three LLM models (Gemini, Llama, and PaliGemma) to analyse campaign materials from prominent political figures including President Lula, former President Jair Bolsonaro, and Olinda mayoral candidates Mirella Almeida and Vinicius Castello. While our research began with authentic campaign posts, the limited availability of violation examples from the TSE's open data portal necessitated supplementing our dataset with synthetic images generated by Imagen 3, ensuring robust machine learning analysis (Clemmensen & Kjærsgaard, 2022).

The remainder of this paper is structured as follows: Section 2 reviews relevant literature, Section 3 details our methodological approach, Section 4 presents our findings, Section 5 discusses these results, and Section 6 concludes with recommendations for future research in this emerging field of electoral monitoring technology.

2. Background and related works

This section presents the fundamental concepts and reviews the main works related to the detection of infractions in electoral campaigns, presenting topics for contextualization of the study. Four topics will be detailed, such as: Use of social networks in the political context, Applications of Generative AI in SM and government, Prompt engineering and review of related works.

2.1 Use of social media in a political context

In recent years, SM has been consolidating itself as essential tools in various fields, transforming itself into communication channels between politicians and the public (Howard & Kollanyi, 2016). Studies indicate that positive perceptions acquired through SM can indirectly increase political participation outside of SM (Kwak et al., 2018). Therefore, the adoption of SM as political tools can enhance the electoral process in beneficial ways, reducing barriers between the public and information.

On the other hand, the internet and SM present significant counterpoints and difficulties. SM enhances the dissemination of hate speech and fake news (Lazer et al., 2018). Furthermore, research shows that platforms such as Twitter (currently X), where abusive interactions between users are common, marginalize moderation. By analysing thousands of interactions in several countries, Falkenberg concluded that the platform contributes to political abuse, in addition to personifying moderators as enemies and intensifying political polarization (Falkenberg et al., 2024).

The way SM is used can also influence election results (Brito & Adeodato, 2022), even allowing for attempts to predict them through sentiment analysis and engagement metrics(Brito & Adeodato, 2023). In the Brazilian context, the 2018 elections serve as an example, in which former president Jair Messias Bolsonaro achieved high engagement on SM—his campaign's focus—and successfully won the presidency (Brito et al., 2019).

2.2 Applications of generative AI in social media and government

In SM, generative AI has been widely used for content personalization, automated post moderation, and the creation of increasingly sophisticated chatbots. Platforms like Facebook, Twitter, and Instagram employ advanced machine learning models to generate personalized recommendations, filter hate speech, and even create synthetic content, such as images and texts, to boost user engagement (Ferrara et al., 2016; Ian Goodfellow et al., 2016). Additionally, there is growing concern about the use of AI to generate deepfakes and spread disinformation, sparking debates on the regulation and governance of these technologies in the digital environment (Danielle K. Citron & Robert Chesney, 2019).

In the government sector, generative AI has been explored to optimize communication with citizens, automate bureaucratic processes, and even assist in the development of public policies. Intelligent chatbots are used to provide information on public services, while AI models can analyse large volumes of data to identify patterns in social policies, predict demands, and improve administrative efficiency (Sun & Medaglia, 2019). Furthermore, during election periods, AI has been used to monitor political campaigns and detect potential irregularities in advertisements, as seen in initiatives aimed at automating the oversight of online electoral content (Woolley & Howard, 2018). Straub points out that the use of AI by these institutions can go beyond technological issues but may also involve normative divergence, where deviations in social perceptions and ethical and legal acceptability can occur. Furthermore, the literature on the use of AI in this context remains highly fragmented, reflecting the complexity of the topic.

Despite its significant potential, the implementation of generative AI in both SM and government faces considerable challenges. Issues such as data privacy, algorithmic bias, and the need for transparency in automated decision-making are critical topics that require multidisciplinary debate (Hongladarom, 2023; Roy, 2017). Moreover, AI

regulation is still in its early stages in many countries, necessitating a balance between technological innovation and ethical oversight to ensure that the application of these tools does not compromise fundamental rights or democratic integrity (Floridi et al., 2018).

Thus, the intersection of generative AI, SM, and public governance remains a dynamic and evolving field of research, demanding interdisciplinary approaches to understand its impacts and develop effective strategies for its responsible use.

2.3 Prompt engineering

Prompt engineering is a critical discipline in the study and application of generative AI models. As demonstrated in our study and corroborated by the work of Knoth et al. (2024), the formulation of prompts can be the difference between superficial results and deep, contextualized analyses. Moreover, prompt engineering sometimes requires a deeper understanding of the domain in which it is being applied. The construction of prompts may demand knowledge in linguistics, psychology, and computer science (Haupt et al., 2024).

This variation aligns with the findings of Knoth et al. (2024), who highlight the importance of carefully formulating prompts to maximize the effectiveness of generative AI models. Previous studies, such as those by Ettinger (2020), have already demonstrated that language models are highly sensitive to the input they receive and that small changes in structure, tone, or vocabulary can lead to significantly different responses. This sensitivity reinforces the need to consider prompt variation as a critical factor in generative AI studies, as it directly influences the quality, accuracy, and relevance of the generated outputs. Therefore, prompt construction should be approached with attention to linguistic, contextual, and technical nuances, considering that different formulations may serve distinct objectives or yield varying results.

2.4 Related works

Studies such as those by Ajayi & S.a. Adesote (2016) and Olesya Tkacheva (2013) demonstrate how digital platforms and innovative approaches are redefining citizen participation in detecting irregularities. In Nigeria, the combination of mobile devices and social media enabled ordinary citizens to document and expose fraud during the 2011 elections, creating a new paradigm of transparency. In Russia, crowdsourcing emerged as a democratic alternative to the traditional media monopoly in electoral monitoring, decentralizing oversight power.

In Brazil, initiatives like the TSE's Pardal system represent important advances, but they still rely on manual analyses that result in delays and subjectivity in evaluating complaints. This technical limitation contrasts with the current scenario, where the sophistication of fraud demands swift and precise responses. Meanwhile, research such as that by Santana et al. (2024) explores the potential of visual analysis but remains limited to image categorization, lacking the capability to identify critical elements such as evidence of illegalities in electoral campaigns on social media.

Simultaneously, the emergence of generative AI introduces new complex challenges. Works like those by Schmitt & Flechais (2023)and Ferrara (2024) highlight the dual role of these technologies: while they can be powerful tools against disinformation when used by democratic institutions, they also become dangerous instruments in the hands of bad actors, capable of producing convincing deepfakes and large-scale disinformation campaigns.

This multifaceted scenario reveals an urgent need: to develop automated systems specialized in detecting specific electoral irregularities, combining the speed of computational analysis with the thematic precision that existing studies have yet to achieve. While solutions like Pardal remain manual and approaches like Santana's are too generic, there is clear room for innovations that can fill this critical gap in preserving electoral integrity.

3. Methodology

The objective of this work is to detect possible electoral infractions on politicians' social networks, using generative artificial intelligence in image analysis, with the purpose of automating the process of detection and initial screening of images to then be validated by humans. To achieve this goal, we defined the following research questions:

RQ1 - Which generative AI models and prompting strategies work best to generate images that represent scenarios of possible electoral infraction?

Given the difficulty of finding datasets with electoral irregularities, the first research question focuses on creating synthetic images for this purpose. As presented in section 2.3, the variation in prompts and models significantly impacts the results generated.

RQ2 - Which generative AI models and prompting strategies are most efficient in identifying electoral infractions in different contexts, such as real and synthetic images?

Aiming to identify the efficiency of models and prompts in detecting electoral violations. Various generative AI

models, combined with different prompt strategies, will be evaluated to determine which approaches are the most accurate and reliable in analysing both real and synthetic images.

RQ3 - Does the use of more detailed prompts in generative AI models positively impact the accuracy of detecting infractions in images?

This research question provides an additional outcome by discussing the impact of more detailed prompts on detection results. It will investigate whether including more specific and contextualized descriptions in the prompts improves the models' ability to identify electoral violations with greater accuracy.

To answer the research questions, we structured and proposed a methodology composed of 3 main steps. The steps are: (i) Data collection; (ii) Generation of synthetic images using Artificial Intelligence; (iii) Automated Analysis.

3.1 Data collection

The data collection involved gathering images of potential electoral violations shared on social media between August and October 2024. This timeframe covered both the municipal campaign (focusing on the two main candidates from Olinda, Pernambuco) and the presidential campaign, analysing content from candidates Lula and Bolsonaro during both election rounds. The goal was to compile a representative and diverse database for validating the artificial intelligence models.

The analysis was based on posts from the social media platform Instagram, which was selected due to its prominence in visual content sharing and widespread use in political campaigns. The images were collected manually through screenshots, a method that allowed for direct and precise selection of relevant material.

The post selection criteria focused on two specific electoral violations: (i) irregular vote solicitation, covering instances such as inducing votes through illegal promises or benefits; and (ii) improper use of sound trucks, including excessive promotion or usage outside legally permitted timeframes. Thus, the analysed images represent concrete cases of these violations, enabling a targeted and well-supported assessment.

A total of 450 images were collected, distributed evenly among the following categories: (i) Images with possible voter request violations: 150 images that contained banners, pamphlets, posts or content that could be interpreted as a direct voter request, such as “vote for” or “elect [candidate’s name]” (ii) Images without violations: 150 images that contained items related to the political context, but with no apparent evidence of possible violation of electoral legislation (iii) Images with possible violations involving sound trucks: 150 images of events, marches and motorcades in a political context containing sound trucks, which could be interpreted as possible irregular propaganda.

During the collection process, we identified a limitation regarding the availability of images that could be interpreted as a possible violation containing sound trucks. This scenario may occur due to the low visual record of these practices on social networks. To overcome this difficulty, we chose to complement the database with synthetic images, generated through generative artificial intelligence models, as described in the following subsection.

3.2 Synthetic data generation

Because of the difficulty in obtaining sufficient images related to violations involving sound trucks, it was necessary to complement the database using synthetic images. This step aims to create images that represent realistic scenarios, capable of simulating possible violations. We divided the generation process into three main steps: (i) Selection of AI models capable of generating images, (ii) definition of prompt strategies, and (iii) validation of the generated images.

Three Generative AI models were tested: Imagen 3, Stable Diffusion, and FLUX. These models were chosen based on their popularity and ability to generate realistic images. Among the choices, we kept only one private model (Imagen 3), due to the high cost of APIs aimed at generating images such as OpenAI's DALL-E 3. Each model was tested and ranked based on its ability to create visually consistent images that met the context of possible violations provided in the prompts, and were free of bugs, distortions, or artifacts.

To guide the generation of images, three prompt strategies adapted to the image generation context were tested for each model: (i) Zero-shot: a basic command describing the image, without adding prior context or examples. (ii) Chain-of-thought: starting with a simple initial description and then adding layers of details and context to enrich the analysis. (iii) Detailed prompt, containing, in addition to the image description text, creative restrictions such as artistic style, and technical restrictions such as field of view, lighting, and camera angle.

Each model generated 20 images per prompt, totalling 180 images. These images were manually classified according to visual coherence, whether they characterized a possible violation of the law and the absence of errors, such as distortions and artifacts. After analysing the generated images, the Imagen 3 model, together with the Zero- shot prompt strategy, presented the most satisfactory results. Thus, the use of this approach allowed the selection of the

model for the creation of the 150 final synthetic images related to possible violations involving sound trucks.

The following presents the prompts employed for each of the three image generation techniques.

```
Create a picture of a political rally in Brazil. The scene should feature a moving vehicle equipped with loudspeakers,
with a charismatic (female) Brazilian politician above the vehicle delivering an enthusiastic speech to a crowd of
voters on a city street. The main focus should be on the politician, who should be clearly visible, and on the
interaction with the crowd. The image should capture the moving vehicle, the loudspeakers, the politician's
expression, and the crowd, conveying an atmosphere of enthusiasm and energy.
```

Fig. 1 – Zero-shot prompt.

```
- Create an image of a political rally in Brazil.
- Include a  moving vehicle equipped with loudspeakers.
- Position a charismatic (female) Brazilian politician on top of this vehicle, giving an enthusiastic speech.
- Include a crowd of voters surrounding the vehicle on a city street.
- Focus on the politician and his interaction with the crowd.
- Capture the movement of the vehicle, the speakers, the politician's expression, and the emotions of the crowd.
- Create an atmosphere of excitement and energy.
```

Fig. 2 – Chain-of-thought prompt.

```
Artistic Style: Realistic photography with vibrant and dynamic tone.

Creative Restrictions:
- Mandatory: A charismatic (female) Brazilian politician, on top of a vehicle with loudspeakers, addressing a crowd on a city street. The
politician must be in focus.
- Prohibited: Fantasy or science fiction elements.

Technical Parameters:
- Depth of field: Shallow, with a soft blur in the background to highlight the politician.
- Lighting: Natural daylight, with vibrant colors and soft shadows.
- Camera angle: Eye level, with a slight downward angle to include the politician and the crowd in the same scene.

Main Prompt:

Create an image that follows the restrictions and technical parameters above, within the vibrant realistic photography style. The moving
vehicle, the speakers, the politician's expression and the crowd's emotions must be well captured, conveying an atmosphere of enthusiasm and
energy. Generate variations of the scene with different angles and times of day, while maintaining technical constraints and parameters.
```

Fig. 3 – Artistic Style + Creative restriction + Technical parameters prompt.

3.3 Image analysis

This stage aims to evaluate the performance of generative artificial intelligence models in detecting potential electoral infractions on SM. The problem was treated as a binary classification task, meaning the models were trained to classify images into two categories: "with infraction" or "without infraction." To do this, three models were tested: Gemini 2.0 Flash, Llama 3.2 Vision, and PaliGemma 2, selected for their advanced visual analysis capabilities across various scenarios.

We employed three open-source AI models with complementary technical characteristics: PaliGemma 2, Gemini 2.0 Flash, and LLaMA 3.2 Vision. Our selection criteria considered not only model accessibility but also their distinct architectures, enabling robust comparative analyses. We chose Google's PaliGemma 2 (Steiner et al., 2024) for its specialized image analysis capabilities as an optimized vision-language model (VLM). From the same developer, we selected Gemini 2.0 Flash (Shrestha Basu Mallick & Logan Kilpatrick, 2025), a more computationally efficient multimodal model, allowing us to contrast different approaches within the same development ecosystem.

For external comparison, we included Meta's LLaMA 3.2 Vision (Grattafiori et al., 2024), an open-weight model that, while also designed for visual processing, features a distinct architecture with three specialized components: image encoder, image adapter, and video adapter. This combination enabled us to analyze both different implementations of models with similar purposes (PaliGemma 2 and LLaMA 3.2 Vision) and contrast same-developer models with different specializations (PaliGemma 2 and Gemini 2.0 Flash).

This diverse selection was intentional, encompassing models ranging from highly specialized computer vision solutions to more generic multimodal architectures, all within the scope of technologies accessible to the research community. Our approach allowed us to evaluate how different architectures and specializations impact the detection of electoral violations in visual content - the primary focus of our study.

Two prompt strategies were employed (written in English, the primary language of these AI models): (i) Simple prompt: containing only the fundamental elements of electoral legislation applicable to the image category; (ii) Detailed prompt: including, beyond the legal requirements, an elaborated description contextualizing potential cases

and scenarios, highlighting relevant details such as 'Vote request banner featuring the candidate's name and number.'

Below we present two English-language prompts used to detect irregular use of vote solicitation.

Example of a simple prompt:

```
You are an intelligence expert specializing in identifying possible electoral infractions related to explicit requests for votes, according
to Brazilian legislation. Analyze the image provided and determine if there are elements that indicate a possible direct or indirect
request for votes, in violation of the legislation.
Consider the following rules:
Explicit request for votes:
- Visible phrases or messages that contain direct references to the request for votes, such as 'Vote for [candidate's name or number]'.
Prohibited period:
- Any explicit request for votes is prohibited outside the period authorized by the Electoral Court, especially on election day.
Based on these conditions, answer with a single term:
Yes, if the image provided contains evidence of a request for votes in violation of electoral rules.
No, if the image does not present elements that indicate an infraction.
Note: Consider only the visual aspects of the image and not speculate beyond what is explicitly visible. Answer only with one word yes or
no, without a period or line breaks
```

Fig. 4 – Simple prompt.

And also the example of the more detailed prompt:

```
You are an intelligence specialist in identifying possible electoral infractions related to explicit or indirect requests for votes,
according to the rules of Brazilian electoral legislation. Analyze the image provided based on the following criteria:
Explicit request for votes:
- Are there direct phrases such as 'Vote for [candidate's name or number]' or 'I'm counting on your vote'?
- Do the advertising material or elements in the image display the candidate's name, number or slogan associated with a message asking
for votes?
Context of the propaganda:
- Is the request for votes being made in prohibited places, such as polling stations, schools or public offices?
- Is there evidence of the distribution of promotional materials (flyers, stickers or gifts) containing requests for votes in prohibited
contexts?
Prohibited period:
- Does the image suggest that the request for votes is taking place on election day, when any form of propaganda or request for votes is
strictly prohibited?
- Are there characteristics in the image (such as date or setting) that indicate disrespect for the period authorized for campaigns?
Abuse of power or illicit solicitation:
- Is the request for votes being made in exchange for benefits, such as money, gifts or promises of advantages, constituting illicit
solicitation of votes?
Answer with a single term:
Yes, if the image provided presents any of the elements above, indicating a possible electoral infraction related to the request for
votes.
No, if no element observed in the image constitutes an electoral infraction.
Note: Consider only the visual aspects of the image and not speculate beyond what is explicitly visible. Answer only with one word yes or
no, without a period or line breaks
```

Fig. 5 – Detailed prompt.

To evaluate the models' performance, we conducted tests using both prompt strategies on two specific categories of electoral images, as defined by the TSE (Superior Electoral Court) Resolution. The first category involved vote solicitations, regulated by Article 3 of said resolution, which establishes the legal parameters for explicit vote requests during campaigns. The second category concerned sound trucks - vehicles equipped with powerful sound systems designed to reach large distances and attract public attention, whose usage is specifically governed by §3 of Article 5 of the same resolution.

For each test, we employed a carefully balanced set of 300 images - 150 that potentially constituted violations of the aforementioned provisions and another 150 that were fully compliant with electoral regulations. As evaluation metrics, we used four well-established measures in AI system analysis: Precision, Recall, Accuracy, and F1-Score. The entire classification and evaluation process was anchored to the cited electoral legislation articles, thereby ensuring the legal relevance of our analyses and conclusions.

For those not familiar with machine learning, here is a brief explanation of the metrics used: (i) Precision: measures the proportion of correct classifications among all the positive predictions made by the model. For example, if the model identified 100 images as "with infraction," Precision indicates how many of those actually had infractions;

(ii) Recall: measures the proportion of real positive cases that were correctly identified by the model. For example, if there are 150 images with infractions, Recall indicates how many of those the model was able to detect; (iii) Accuracy: measures the proportion of correct classifications (both positive and negative) in relation to the total number of images analysed; (iv) F1-Score: is a robust metric that combines Precision and Recall, balancing the two. It is particularly useful when there is an imbalance between classes (e.g., many images without infractions and few with infractions).

All these metrics range from 0% to 100%, with 100% being the ideal value, indicating that the model made all the correct classifications. The F1-Score is particularly important because it takes into account both Precision and Recall, making it a more reliable measure for evaluating performance in imbalanced scenarios.

4. Results

The results presented in the section are organized to answer the research questions defined previously, addressing the main findings of the study.

4.1 Research Question 1

When exploring the use of Generative AI to create synthetic images that represent possible electoral violations, more specifically in the scenario of sound trucks, three generative AI models were evaluated: Imagen 3, Stable Diffusion and FLUX, with a focus on image quality and a balance between closed and open-source models.

The models were evaluated on three main criteria: visual coherence, whether it characterizes a possible violation and visual bugs or artifacts. The table (Table 1) below summarizes the performance of the models in each of these aspects.

Model	Visual Coherence (%)	Absense of artifacts (%)	Possible Infrigement (%)
Imagens 3	98,33%	98,33%	100%
FLUX	98,33%	81,67%	100%
Stable DIffusion	90%	66,67%	98,33%

Tab. 1 - Image generation verification metrics

Google's proprietary model, Imagen 3, excelled in all criteria, with the highest score for coherence (98.33%) and absence of artifacts (98.33%), demonstrating a high level of realism. The FLUX model presented good quality but fell below Imagen 3 in the absence of artifacts category, while Stable Diffusion obtained the lowest scores, being considerably inferior in the absence of artifacts category.

In addition to the model tests, we used three prompting strategies, detailed in the methodology section, to observe how each approach can influence the quality of the generated images. The following table (Table 2) distills the impact of each prompt on the previous categories, visual coherence, absence of artifacts and possible violation.

Model	Prompt Strategy	Visual Coherence (%)	Absense of artifacts (%)	Possible Infrigement (%)
Imagen 3	Zero-shot	100%	100%	100%
Imagen 3	Chain-of-thought	100%	100%	100%
Imagen 3	Detailed-prompt	95%	95%	100%
FLUX	Zero-shot	95%	75%	100%
FLUX	Chain-of-thought	100%	80%	100%
FLUX	Detailed-prompt	100%	90%	100%
Stable Diffusion	Zero-shot	75%	60%	95%
Stable Diffusion	Chain-of-thought	95%	75%	100%
Stable Diffusion	Detailed-prompt	100%	65%	100%

Tab. 2 - Image generation verification metrics per prompt

As illustrated above, the different prompting strategies did not have a significant impact on the Imagen 3 model, which remained consistent throughout the tests. The FLUX model performed well in terms of visual coherence and significantly improved in the absence of artifacts as we used more detailed prompts, going from 75% with the zero-shot prompt to 90% with the detailed prompt. Finally, the Stable Diffusion model performed worst overall, although coherence improved when using the detailed prompt, the absence of artifacts worsened as the model received more instructions.

Also shown below is an example of a synthetic image, as illustrated in Fig. 1, which displays an image generated by the Imagen 3 model.

Fig. 6 - Synthetic image artificially generated by model Image 3

We also have examples of natural images that were collected from the social media accounts of the respective politicians, such as Mirella Almeida in **Fig. 7** and Vinicius Castello in **Fig. 8**.

Fig. 7 - Campaign image of candidate Mirella Almeida.

Fig. 8 - Political campaign image of candidate Vinicius Castello.

Therefore, generative AI can prove effective in creating synthetic images that simulate real scenarios of electoral infractions in a coherent manner, with each model interacting differently with the prompt strategies. In particular, the Imagen 3 model proved to be the most capable in generating images in the context of the study (Image 1),

contributing to the identification of irregular behavior in electoral campaigns.

4.2 Research Question 2

The analysis of the Visual Generative AI models used to identify violations in the vote-calling and sound truck scenarios showed significant variation in terms of performance. To assess which of the models was most effective, we used accuracy, precision, recall and F1-Score metrics, which allow for a comprehensive analysis of each model's ability to correctly detect violations, in addition to minimizing classification errors.

The models tested were Gemini 2.0 Flash, Llama 3.2 Vision and PaliGemma 2. The table below (Table 3) summarizes the results of each model, highlighting the metrics for the category of violations with sound trucks.

Model	Prompt Strategy	Accuracy	Precision	Recall	F1-Score
Gemini 2.0 Flash	simple	68%	95%	39%	55%
Gemini 2.0 Flash	detailed	99%	98%	100%	99%
Llama 3.2 Vision	simple	59%	97%	19%	32%
Llama 3.2 Vision	detailed	78%	92%	61%	73%
PaliGemma 2	simple	82%	92%	68%	79%
PaliGemma 2	detailed	89%	96%	81%	89%

Tab. 3 - Visual Analytics Verification Metrics – sound trucks

The Gemini 2.0 Flash model achieved the best performance in detecting infractions related to sound trucks. The detailed prompt strategy was essential for obtaining superior metrics; however, since artificially generated images were used from a model of the same family (Imagen 3), this factor may have influenced the results.

Llama 3.2 Vision presented low results using simple prompt, with 59% accuracy and an F1-Score of 32%. However, when providing the greater context of the detailed prompt, there were significant improvements, with accuracy rising to 78% and F1-Score to 73%. The PaliGemma 2 model presented significant results with both simple and detailed prompts, presenting F1-Scores of 79% and 89% respectively. As an open-source model from the Google family, the possibility of overfitting in PaliGemma 2 should also be considered.

Model	Prompt Strategy	Accuracy	Precision	Recall	F1-Score
Gemini 2.0 Flash	simple	82%	90%	72%	80%
Gemini 2.0 Flash	detailed	89%	88%	91%	90%
Llama 3.2 Vision	simple	72%	96%	46%	62%
Llama 3.2 Vision	detailed	82%	94%	67%	79%
PaliGemma 2	simple	63%	93%	28%	43%
PaliGemma 2	detailed	70%	91%	45%	60%

Tab. 4 - Visual Analytics Verification Metrics – vote request

The table above (Table 4) presents the metrics for the vote request infraction category. Again, the Gemini 2.0 Flash model stands out, showing an F1-Score of 80% and 90% for the simple and detailed prompts, respectively. For this type of infraction, only real images were used.

Next, the Llama 3.2 Vision model shows more consistent results for this dataset, increasing from 62% to 79% F1-Score when using the detailed prompt. PaliGemma 2, which performed well for the sound truck infraction, stands out negatively here, with an F1-Score of 43% for the simple prompt and 60% for the detailed prompt.

Based on the results presented, the Gemini 2.0 Flash model was the most effective in identifying electoral violations in both contexts analysed. Despite the possible overfitting observed by the metrics in the sound truck violation, the results based on real images related to the vote request violation showed a positive result.

The superior performance of Gemini 2.0 Flash in terms of accuracy, precision, recall and F1-Score shows that the model can be a good choice for the task of detecting violations in social networks, especially in the domain of images

related to vote request violations. The other models, Llama 3.2 Vision and PaliGemma 2, although effective, have some limitations in the balance between precision and recall, and can be used as an alternative depending on the specific needs of monitoring violations.

4.3 Research Question 3

The generative AI models used for visual verification performed significantly better when analysing images using a detailed prompt, as can be seen in the table below (table 5), which compares the F1-Scores of the analyses performed on the two types of infraction.

Model	Context	F1-Score (Simple Prompt)	F1-Score (Detailed Prompt)
Gemini 2.0 Flash	Vote Request	80%	90%
Llama 3.2 Vision	Vote Request	62%	79%
PaliGemma 2	Vote Request	43%	60%
Gemini 2.0 Flash	Sound Truck	55%	99%
Llama 3.2 Vision	Sound Truck	32%	73%
PaliGemma 2	Sound Truck	79%	89%

Tab. 5 - Visual Analytics Verification Metrics – F1-Score focus

Regardless of the model used, the analysis using a detailed prompt led to an average improvement of approximately 23%. Even eliminating the Gemini 2.0 Flash F1-Score in the sound truck database due to suspected overfitting, the average improvement is still high, reaching 19%. This increase can be related to the fact that the generative AI models were able to better interpret the graphic elements of the generated images, reducing the number of false positives and false negatives.

In addition to the F1-Score, the accuracy values (Table 4) were also higher in the analysis of images using detailed prompts. In the case of the Gemini 2.0 Flash model for the vote request category, the accuracy increased from 82% to 89%. On the other hand, the models showed a tendency for accuracy to drop when using detailed prompts, decreasing by approximately 1% to 2%, which, although not a significant loss, may indicate that extremely detailed prompts or prompts with too much information can make the model more inaccurate.

We can see that the results obtained confirm that the use of more detailed prompts in image analysis positively impacts the F1-Score for detecting electoral violations in images. These findings suggest that, in order to seek to improve monitoring systems for electoral campaigns, it is essential not only to think about training robust AI models, but also to ensure adequate prompt engineering that maximizes the context of these models up to the threshold between too little and too much information.

4.4 Summary of results

The results of this study were organized around the three research questions defined above, providing an analysis of the effectiveness of different prompting strategies and generative AI models in the context of detecting violations. The main findings are presented below.

Research Question 1: The generation of synthetic images through generative AI has proven to be effective in simulating scenarios of electoral violations. Among the models tested (Imagen 3, Stable Diffusion and FLUX), Imagen 3 presented the best performance, achieving 98.33% visual coherence and absence of artifacts. FLUX showed a significant improvement in the absence of bugs and artifacts when using more elaborate prompts. Stable Diffusion, on the other hand, obtained inferior results in all the criteria evaluated.

Research Question 2: In the visual verification for detecting violations, the Gemini 2.0 Flash model was the most effective, standing out in metrics such as accuracy, precision, recall and F1-Score in both scenarios analysed. However, possible overfitting was observed in the analysis of infractions involving sound trucks, due to the use of synthetic images generated by Imagen 3, from the same family of models. Llama 3.2 Vision showed a significant improvement when using more detailed prompts, while PaliGemma 2 showed inconsistent performance, with good results on synthetic images, but inferior performance in the analysis of real images.

Research question 3: The use of more detailed prompts positively impacted the performance of visual verification

models. On average, the F1-Score increased by 23% when using detailed prompts, with improvements highlighted in the vote request category. Furthermore, accuracy values also improved, especially in Gemini 2.0 Flash, which reached 89% accuracy in the analysis of real images. However, a slight drop of 1% to 2% in the accuracy of the models was observed when using detailed prompts, indicating the importance of finding a balance in prompt engineering.

The results highlight that the combination of robust generative AI models and appropriate prompting strategies can bring improvements in the detection of electoral infractions. The findings also suggest the need for special care when working with synthetic data, to avoid problems such as overfitting and ensure greater reliability of analyses in real contexts.

5. Discussions

5.1 Technical implications

The results demonstrate the potential of generative AI in multiple tasks. The creation of synthetic images can complement the dataset for detection, while the AI models showed good effectiveness in analysing potential infractions. These advancements could help regulatory bodies automate the screening of suspicious content, reducing the need for exhaustive manual searches and increasing efficiency in detecting violations. Additionally, prompt optimization proved to be an essential strategy for improving the results obtained through the models.

5.2 Implications for society

The growing use of artificial intelligence (AI) in various sectors of society has raised concerns about the replacement of human labour by machines and the risks associated with automated decision-making. However, the application of AI in electoral monitoring represents a use case that can bring significant contributions to strengthening democracy. By automating the monitoring of illicit and harmful strategies, AI can help ensure that elections focus on the discussion of ideas and public debate, rather than being undermined by illegal practices.

The artificial intelligence models evaluated in this study, while demonstrating satisfactory results, still face significant challenges - particularly in accurately interpreting complex contexts and minimizing false positives that could lead to unjust accusations. These limitations, however, do not overshadow the transformative potential of this technology as an electoral oversight tool.

Since the implementation of the Pardal System in 2014 (Santos, 2023), which marked a turning point in digital electoral monitoring, the volume of visual content requiring analysis has grown exponentially. It is precisely in this scenario that AI emerges as a strategic resource for Brazil's Superior Electoral Court (TSE). By automating and enhancing the screening of this vast image repository, the technology not only accelerates processes but substantially improves oversight capabilities.

The benefits manifest in three complementary dimensions: first, it provides TSE with greater operational capacity to swiftly identify and sanction irregularities with robust evidentiary support; second, it strengthens democratic foundations by ensuring transparency and integrity throughout all stages of the electoral process; and third, it upholds the rule of law by guaranteeing strict compliance with Brazil's electoral legislation.

This convergence between technological innovation and electoral jurisdiction represents more than just methodological modernization - it constitutes an institutional advancement that simultaneously reinforces TSE's administrative efficiency and public trust in the democratic system. As algorithms overcome their current limitations through continuous learning, their role as allies in preserving electoral legitimacy will likely expand, always in accordance with the nation's legal framework.

5.3 Threats to validity

This study presents limitations that must be considered for an appropriate interpretation of the results. One of the main limitations is the focus on only two types of electoral infractions (vote request and sound truck), which does not allow for an evaluation of how well this approach generalizes to other types of infractions or more complex scenarios. Furthermore, the creation of synthetic images may introduce biases into the models used for visual verification, as the same models or architectures were used both to generate and to analyse the images.

Another important limitation is the image dataset used, which may not fully represent the diversity of electoral scenarios encountered in practice, thus limiting the generalization of the results. Additionally, the influence of detailed prompts must also be considered, as different formulations can generate significant variations in the models' performance, raising questions about the reproducibility of the findings. These factors highlight the need for future studies that expand the variety of infractions analysed and use more comprehensive and representative datasets.

5.4 Future works

Future studies could explore strategies to mitigate biases in synthetic images, either by diversifying generative

models or by incorporating more comprehensive real-world databases. Additionally, research into multimodal datasets - encompassing videos, audio recordings, and text alongside images - could provide richer contextual analysis and optimize detection model performance.

As this approach continues to improve and achieves higher accuracy levels, the techniques developed in this study could be deployed to significantly expedite the identification of electoral irregularities during campaign periods. This practical application would yield three key benefits: (1) accelerating electoral-legal processes for faster response to detected violations; (2) reducing the workload burden on analysts conducting manual verification; and (3) minimizing human errors and oversights, thereby enhancing overall system reliability.

6. Conclusions

Among the relevant studies, the work of Ajayi & S.a. Adesote (2016) stands out, exploring the use of social networks to identify irregularities in the Nigerian elections in 2011. The authors show that although the approach used at the time was manual monitoring of social networks, the importance of citizen participation in detecting irregularities was highlighted.

In a similar context, Olesya Tkacheva (2013) investigated the legislative elections in Russia in 2011, highlighting the use of Crowdsourcing as a monitoring tool. Unlike the study by Ajayi & S.a. Adesote (2016), Olesya Tkacheva (2013) emphasizes the independence of traditional media in the electoral surveillance process, in addition to pointing out the limitations of this approach, such as the lack of coordination and the absence of an automated system.

Advances in generative artificial intelligence enable new approaches to monitoring electoral campaigns. In this study, we investigated the use of Generative AI and its capabilities in computer vision to identify possible electoral infractions in images, focusing on cases of voter solicitation and the use of sound trucks. The objective was to evaluate both the feasibility of generating synthetic images and the effectiveness of different AI models in analysing these infractions.

To achieve these objectives, we started by collecting real images and generating synthetic images, using the capabilities of Generative AI to overcome the scarcity of data regarding infractions involving sound trucks. Soon after, different generative AI models with multimodal capabilities were tested in the analysis of these images, varying the prompt engineering strategies. These models were evaluated using metrics such as accuracy, precision, recall and F1-Score, thus allowing a comparative analysis of the performance of the different proposed approaches.

Related to the first research question, the results indicated that Generative AI is effective in generating synthetic images in the context of representing electoral infractions, with the Imagen 3 model being the most suitable. The detailed prompt strategy had a direct impact on the quality of the generated images, especially in open-source models such as FLUX, which showed a significant reduction in artifacts when receiving more precise descriptions.

In the second research question, we evaluated the effectiveness of generative AI models with computer vision capabilities in detecting violations. The Gemini 2.0 Flash model showed the best overall performance, especially in the analysis of real images, which suggests that it is the most reliable option for practical application among the models tested (in addition to Gemini 2.0 Flash, Llama 3.2 Vision and PaliGemma 2). However, we observed possible overfitting effects when testing the same model on synthetic images, reinforcing the need for an adequate balance between real and synthetic data.

Finally, the results related to the third research question demonstrated that the use of more detailed prompt strategies significantly improves the accuracy of detecting violations, presenting an average improvement of 23% in the F1-Score. However, a slight drop in accuracy was identified with more detailed descriptions, between 1% and 2%, suggesting the existence of a threshold between information made available to AI to avoid errors in image classification.

This work contributes to the area of digital monitoring and generative artificial intelligence applied to the electoral process, indicating that AI can assist regulatory bodies in identifying irregularities through images. In addition, the importance of balancing synthetic and real data was highlighted, as well as the need for well-structured prompt engineering. As future work, we suggest tests with multimodal databases, which can combine analysis of videos, audios, texts and images, in addition to exploring methods to reduce biases in synthetic images by exploring the diversification of models used in the image generation stage or using larger real databases.

Track 18: Sustainable and Ethical Public Service Co-Creation

Track Description

The track aimed to provide insights into how these approaches can promote social cohesion, reduce inequalities, and create resilient public administration systems that effectively address diverse societal needs. The growing complexity and evolving requirements of public services pose significant challenges for the public sector, including issues of citizen satisfaction, trust, and limited resources. There is a rising demand for more personalized, citizen-centric services and a shift from viewing policy-making and public service delivery as top-down processes. This track delves into the comprehensive phenomenon of public service co-creation, encompassing both analog and digital forms, in which citizens and stakeholders actively participate in defining, designing, and evaluating public services. The track explores the interplay between traditional methods and digital innovations, including the impact of digital tools and AI in facilitating co-creation. It also examines how digital and AI technologies can enhance public value by improving service quality, broadening opportunities for participation, and ensuring that services align with diverse citizen needs, all while upholding ethical standards and ensuring sustainability.

Abstract. This study focuses on developing and validating the key parameters of Artificial Intelligence (AI) -enabled co-creation integrated into evidence-based policymaking. We critically analyzed prior research to ensure a participatory, data-driven, and iterative policymaking process. We identified essential parameters shaping AI-enabled co-creation processes in public sector organizations (PSOs), including legal conformance, sustainability, and ethics. The parameters were validated and refined through a workshop with experts from academia and technology organizations, contributing to the development of a conceptual model structured around four interconnected co-creation phases: 1) co-commissioning; 2) co-designing; 3) co-delivering; and 4) co-assessing. Our study contributes to both theory and practice. Concerning theory, it positions AI-enabled co-creation as a core institutionalized process within evidence-based policymaking rather than a standalone participatory practice. It also introduces a key conceptual distinction between digital co-creation, where digital tools facilitate participatory processes, and digital public service co-creation, where digital solutions are the co-creation outcomes. Concerning practice, the study provides a structured framework for integrating co-creation into policymaking, aligning AI-enabled mechanisms with four identified policy co-creation phases. The framework offers policymakers and public administrators actionable guidance on designing adaptive, stakeholder-driven, AI-supported policy solutions

Keywords. Co-creation, Evidence-based policymaking, Artificial Intelligence, Public sector.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.991

1. Introduction

Several European policy declarations, such as the (Tallinn Declaration, 2017), place users' needs at the center of service design, and encourage the use of digital tools to strengthen the users' participation. In addition, the (Berlin Declaration, 2020) urges policymakers to draw from the lessons learned during the COVID-19 pandemic to achieve a sustainable digital transformation that serves citizens, businesses, and society. These declarations highlight the need for sustainable, ethical, and digital co-creation in policymaking, i.e. creating rules, regulations, and guidelines to address specific issues or achieve defined objectives by governments or other institutions. The increased availability of data, research, and a growing public focus on results have expanded policymakers' ability to assess whether public investments achieve their intended outcomes and to make informed choices. When policymaking is rooted in systematic, evidence-based approaches that leverage available data and research for decision-making, it is referred to as evidence-based policymaking (Evidence-Based Policymaking Collaborative, 2016).

According to (Head, 2010a), reliable knowledge is the key instrument for advising decision-makers, taking decisions, and developing policies, and four key principles to support this approach are: 1) compiling rigorous evidence about what works, including costs and benefits; 2) monitoring and evaluating policy effectiveness; 3)

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

using evidence to refine and improve programs; and 4) fostering innovation through experimentation with new approaches. Head (2010a) also notes that integrating evidence into policymaking is a complex and multifaceted process that requires ongoing improvements, and closer integration with research is often "disappointing" (p. 78), i.e. the "hopes of large and rapid improvements in policies and programs […] have not materialized as readily as anticipated" (p.80). He, therefore, suggested that there are four enabling factors that must be included in any evidence-based policymaking process: high-quality information, professionals skilled in data analysis and policy evaluation, political and organizational incentives for using evidence-based analysis and advice, and mutual understanding between policy professionals, researchers and decision-makers.

(Fedorowicz & Aron, 2021) suggest that evidence-based policymaking can be strengthened by increasing the production of evidence, enhancing its use, and applying equity and justice to both evidence generation and decision-making processes. This emphasis on evidence-based policymaking aligns strongly with the concept of co-creation, i.e. shifting the focus of public service reform away from internal efficiency to creating value for citizens and service (Osborne et al., 2016). Co-creation research highlights its benefits for fostering citizen engagement and improving service delivery (Ansell & Torfing, 2021; Eseonu, 2022; Scognamiglio et al., 2023), but the knowledge of the enabling factors that contribute to successful co-creation processes and outcomes within PSOs is limited. Additionally, the role of co-creation within evidence-based policymaking remains underexplored.

At the same time, the increasing integration of digital tools, particularly AI, into co-creation processes introduces further complexities. While AI has the potential to enhance decision-making, stakeholder collaboration, and service delivery, it also raises transparency, fairness, data privacy, and other ethical concerns. These issues are often overlooked, leading to the erosion of public trust, reinforcing societal inequalities, and other risks. To address these challenges, there is a critical need to explore how ethical governance can be embedded within co-creation frameworks. Furthermore, ethical co-creation should not only deliver immediate value but also contribute to long-term societal, economic, and environmental objectives. However, research on co-creation for sustainable policymaking is underdeveloped. There is limited investigation into processes that generate enduring outcomes and their alignment with sustainability objectives and limited research on how AI-enabled co-creation can be systematically embedded into the policymaking cycle by PSOs. Additionally, the absence of standardized guidelines and legal frameworks further complicates realizing ethical and sustainable co-creation.

This study has two objectives to address this gap: to identify and define the key parameters of AI-enabled co-creation for evidence-based policymaking; and to develop a conceptual model that integrates AI-driven co-creation with policymaking processes. To this end, we carried out a critical analysis of previous research to identify and define the key parameters of AI-enabled co-creation in evidence-based policymaking. We also organized an expert workshop involving academic and technology professionals to validate the parameters uncovered by the research analysis and develop the conceptual model of AI-enabled co-creation for evidence-based policymaking.

This work makes some important contributions. First, it advances the understanding of AI-enabled co-creation in evidence-based policymaking by proposing an integrated policymaking process that aligns AI-driven co-creation mechanisms with four interconnected policymaking phases. Second, it highlights AI's role in enhancing evidence collection, stakeholder engagement, and decision-making responsiveness in each phase. Also, the findings emphasize the importance of distinguishing between digital co-creation and the co-creation of digital public services in PSOs, addressing the challenges of integrating AI into these processes and achieving effective outcomes. Third, the study provides a structured framework for policymakers and administrators to design adaptive, user-centered, and data-driven public policies, strengthening participation, trust, and effectiveness of such policies.

The remainder of the paper is structured as follows. Section 2 outlines the theoretical background and concepts underpinning the identification of the conceptual model's key parameters. Section 3 provides information on the research design and methods. Section 4 presents the identification and validation of the key parameters and the development of the conceptual model. Section 5 concludes with the main findings, limitations and research plans.

2. Background and concepts

The public sector is facing an increasing demand for citizens-centered services and policies (Wiktorska-Święcka, 2018), aligned with their specific needs and circumstances (Bovaird & Loeffler, 2012). A shift is becoming visible, policy-making and public service delivery can no longer be seen as unilateral processes (Needham, 2008), and the government should no longer be seen as the sole public service and public value provider (Brandsen et al., 2018). The dominant view of citizens as passive consumers of public sector outcomes has been replaced by a view of citizens as co-creators (Osborne, 2018; Voorberg et al., 2017). This clearly outlines the growing need to allow citizens to actively participate in defining appropriate public services, shaping policy-making processes and influencing their outcomes. As mentioned above, four enabling factors to be included in evidence-based policy-making are high-quality information, skilled professionals, political and organizational incentives, and the mutual understanding between the stakeholders involved (Head, 2010). Co-creation can support this by considering misdirected stakeholder involvement, exclusion of the key actors, and reduced authority among public officials

(Edelmann & Virkar, 2023). Ethical data governance, stakeholder coordination, and transparent accountability are essential to preventing excessive personalization, information overload, and unclear decision-making. Failure to address these issues may undermine future engagement (Edelmann & Mureddu, 2023). Strong political and managerial leadership is crucial to fostering citizen-centric, co-creative governance (Meijer, 2016; Osborne, 2006).

This section addresses the first objective, to identify and define the key parameters underpinning AI-enabled evidence-based policymaking in the context of co-creation. Parameters, a term common in mathematics, computer programming and AI, are the variables in a model, system or function to help define the expected behavior and performance. They can be adjusted, e.g., during a training process to minimize prediction errors. These parameters and the sections covering them are public sector co-creation (Section 2.1), co-creation processes and outcomes (Section 2.2), and five sections on public sector co-creation and: digital tools (Section 2.3), AI (Section 2.4), evidence-based policymaking (Section 2.5), sustainability (Section 2.6), and ethics (Section 2.7).

2.1. Public sector co-creation

The co-creation paradigm is becoming increasingly popular. It aims to transform the public sector from an authority and service provider into an arena for engaging citizens and public and private actors and mobilizing experiences, resources and ideas of a plurality for the design and production of public services and public policy (Osborne, 2018; Ostrom et al., 1978). Co-creation enhances public value by improving service quality, expanding participation, refining information accuracy, and increasing citizen satisfaction (Cordella et al., 2018). It can be structured into several phases, e.g. co-design, co-delivery, and co-evaluation or co-assessment, each having specific characteristics and operational mechanisms (Linders, 2012)(Jaspers & Steen, 2021). Other models introduce four phases: co-commissioning, co-designing, co-delivering and co-assessment (Loeffler & Bovaird, 2019). The co-design phase engages stakeholders in the creation and development of policies or services, including their perspectives in shaping the outcomes. The co-delivery phase fosters greater acceptance of public policies and services by involving stakeholders in their implementation (Sicilia et al., 2016). Lastly, the co-evaluation phase focuses on assessing the effectiveness of services post-delivery or policies/initiatives after the implementation, providing valuable insights for self-learning and adaptation. These phases aim to ensure user-centric experiences, increase trust in public administrations and enhance communication between service providers and users, enabling administrations to gather stakeholder data but also increase service users' willingness to accept and use the service. However, the sustainability of co-creation depends on ensuring adequate financial resources and institutional capacities, which are essential for ensuring continuous stakeholder engagement and their meaningful integration into decision-making (Misuraca et al., 2020; Rodriguez Müller et al., 2021a).

2.2. Co-creation processes and outcomes

A co-creation process allows "two or more public and private actors [to] solve a shared problem, challenge, or task through a constructive exchange of different kinds of knowledge, resources, competences, and ideas that enhance the production of public value […], or services, either through a continuous improvement of outputs or outcomes or through innovative step-changes that transform the understanding of the problem or task at hand and lead to new ways of solving it" (Torfing, et al 2019, p. 802). According to Torfing et al. (2019), co-creation is a process. It can also be seen as an outcome. Co-creation thus leads to the creation of effects that endure, even after the co-creation activity itself has come to an end (Jaspers & Steen, 2021), contributes to the development of collaborative practices in an organization, as well as user acceptance of public services and technologies. Edelmann and Steen (2023) show that according to the stakeholders, the co-creation of digital public services involves identifying technology needs and gaps, supporting innovation, capacity-building, and dissemination. Stakeholders point out that ensuring the sustainability of co-creation requires organizational change regarding technical support arrangements, organizational processes and developing expertise. At the same time, the relationship with external stakeholders must be developed and sustained, and all stakeholders must engage in continuous learning. It is also important to consider the technical or financial risks of co-creation, to address any bias appearing during the co-creation process and in the outcomes achieved (Edelmann & Virkar, 2023; Jacobs et al., 2018).

2.3. Public sector co-creation and digital tools

As analog public services remain widely used, non-digital co-creation tools continue to play a significant role, particularly in the early stages of service and policy design. These tools are especially prevalent for ideation and collaboration (Borum et al., 2014; Inie & Dalsgaard, 2017), leveraging interviews, surveys, focus groups, and meetings (Peters et al., 2021). However, PSOs increasingly adopt digital tools to deliver public services and broaden user engagement in co-creation processes (Edelmann & Pereira, 2024). The digitalization of PSOs offers a potential solution to co-creation, even when users are vulnerable or hard to reach (Jalonen et al., 2021). Digital tools have become integral to co-creation, enabling online debates, collaboration, and crowdsourcing, supporting new digital public services and informing policy-making (Edelmann & Mergel, 2021). These initiatives utilize forums, collaborative websites, SMS, mobile applications, online surveys, and other tools (Rodriguez Müller et al., 2021b). Moreover, digital technologies empower users to create, edit, and evaluate content (Kaplan & Haenlein, 2010), and facilitate interactions, facilitating the sharing of information, opinions, and interests (Khan et al., 2014). Within the

public sector, digital tools foster innovative approaches to processes that deliver public value (Lember, 2017). Their dynamic nature enables citizens to contribute data, participate in creating new products and services, and address resource constraints (Randma-Liiv & Vooglaid, 2019). Enhancing motivation to participate, encouraging contributions, and promoting shared decision-making add value for public stakeholders (Brandsen et al., 2018; Lember et al., 2019). However, digital tools do not deliver effective participation or collaboration alone (Kreijns et al., 2003). Power imbalances, knowledge gaps, digital literacy disparities and other social and organizational barriers hinder co-creation in PSOs (Ståhlbröst & Holst, 2017). Poor channels, inaccessible interfaces, unstructured data, etc. limit engagement (Mejlgade Lab, 2017; Popescul et al., 2024). Ethical concerns over privacy call for user-centered approaches to building trust (Edelmann & Mureddu, 2023). Digitalization may also reduce transparency in administrative processes, replacing human interactions with automated systems, and marginalizing citizens by treating them as data points rather than individuals with needs and rights (European Union, 2024).

2.4. Public sector co-creation and Artificial Intelligence

The use of AI enables public service innovation and citizen involvement in the co-creation process. As Misuraca et al. (2020) highlight, AI-supported co-creation can lead to cost savings, improved service quality, higher user satisfaction, greater inclusivity, and broader societal benefits. Key enablers such as leadership, financial resources, stakeholder engagement, and digital infrastructure (Edelmann & Mureddu, 2023) align with AI's capabilities to enhance public service co-creation. Numerous cases confirm AI's role in enabling co-creation across boundaries, fostering interaction between service providers and service users (Ali et al., 2022; Manser Payne et al., 2021; Rizun et al., 2023). (Rizun et al., 2025) also revealed a disproportionate and fragmented development of AI-supported co-creation, particularly in text analytics (TA) which is predominantly used in the co-design phase. This is due to the effectiveness of TA techniques such as content analysis and pattern recognition, along with question-answering systems that enhance consultation and ideation (Cortés-Cediel et al., 2023; Rodriguez Müller et al., 2021b). TA applications in the co-evaluation phase remain limited, primarily focused on sentiment analysis and feedback prioritization, facing the challenges of explainability, domain adaptation, and human oversight (Ojo et al., 2024). The co-delivery phase, hindered by underdeveloped theoretical and legal frameworks, lack of governmental accountability, and low awareness among practitioners, exhibits the least AI applications (Linders, 2012). Addressing these disparities is crucial for AI to support all co-creation phases, enabling a more holistic and effective public service model. However, challenges regarding data quality, sensitivity, completeness, and accessibility remain. While most studies focus on technical issues, ethical concerns such as bias mitigation, accountability, and transparency remain underexplored. This highlights the urgent need for best practices and regulatory frameworks to ensure that AI-enabled co-creation aligns with ethical principles, fostering trust, security, and governance (European Commission, 2021; van Noordt et al., 2023).

2.5. Public sector co-creation and evidence-based policymaking

Evidence-based policy promotes rigorous analysis of service and policy options to improve decision-making quality (Head, 2010b). While traditional decision-making features "bargaining, entrenched commitments, and the interplay of diverse stakeholder values and interests" (p.77), evidence-based policymaking incorporates "rigorous research evidence into public policy debates and internal public sector processes" (Head, 2010a). Integrating evidence into policymaking requires systematic mechanisms to enhance its effectiveness. In the public sector, evidence-based policymaking relies on two forms of evidence: 1) factual, statistical, and scientific data that assess whether policies and initiatives function effectively; and 2) contextual insights that evaluate how policies work across social groups and environments (Sanderson, 2002). Four evidence-based policymaking principles are: 1) compiling evidence on what works, costs and benefits; 2) monitoring and evaluating policy effectiveness; 3) using evidence to refine and improve programs; and 4) fostering innovation and experimentation in policymaking (Head, 2010). Strengthening evidence-based policymaking requires enhancing evidence production, improving research finding applications, and bringing equity to evidence generation and policy design (Fedorowicz & Aron, 2021). The emphasis on evidence-driven decision-making aligns with co-creation, i.e. stakeholders contributing information, experiences, and expertise collaboratively. In AI-enabled co-creation, citizens design, deliver, and evaluate public initiatives, connecting policymakers and society. Such co-creation serves two roles: 1) generating evidence that reflects real-world policy impact and stakeholder needs; and 2) leveraging AI-powered analytics to support responsive, data-informed governance (BPC Policy Center, 2019). At the co-design stage, co-creation integrates stakeholder perspectives, ensuring that an understanding of societal needs informs policy formulation. AI amplifies this process by analyzing large-scale datasets, forecasting policy impacts, and identifying challenges, allowing to tailor solutions to evidence-based insights**.** During co-delivery, collaboration between governments, organizations, and citizens enables real-time policy adaptation. AI-driven decision support systems help PSOs respond to evolving conditions and stakeholder feedback. During co-evaluation, co-creation fosters a learning cycle, where stakeholder input and AI-powered analytics enhance policy assessment, ensuring that policies remain relevant, responsive, and aligned with evolving priorities (Gertler et al., 2016). Embedding AI in co-creation allows policymakers access to context-specific, real-time insights that support transparent, accountable, and adaptive governance (Mahmoud et al., 2023). AI-driven analytics refines decision-making, justifies policy actions, identifies unintended consequences, and ensures inclusivity (Flores et al., 2022; Ojo & Rizun, 2021). Thus, AI-enabled co-creation enables evidence-

based policymaking, stakeholder engagement and institutional capacity for data-driven decision-making.

2.6. Public sector co-creation and sustainability

The expanding use of AI in PSOs has created opportunities to redefine interactions among public administrations, citizens, and stakeholders, contributing significantly to sustainability goals and fostering better governance. Sustainability is about supporting, maintaining, and preserving what is valuable (Türke, 2012). It endures over time, supported by collaborations, flexible processes, and citizens' involvement in co-creation, which collectively lead to valuable and lasting outcomes (Jaspers & Steen, 2019). The collaborative nature of co-creation fosters long-term value creation, responsiveness to diverse social needs, and enduring societal benefits; it aligns with sustainability (Thomsen, 2013). These principles resonate with the UN 2030 Agenda and the Sustainable Development Goals (SDGs), which emphasize stakeholder engagement, inclusiveness, and resource efficiency as essential pathways to sustainable development (United Nations, 2015). Facilitated by co-creation, evidence-based policymaking enhances sustainability by aligning immediate actions with long-term goals and addressing diverse needs through reliable data and ethical practices (Edelmann et al., 2023; Edelmann & Voigt, 2024). AI can support these efforts but needs an ethical focus to ensure transparency, accountability, inclusiveness, and building trust among the stakeholders (Edelmann & Virkar, 2023; Rizun et al., 2025).

2.7. Public sector co-creation and ethics

Organizations increasingly emphasize a shift from collaborative knowledge to co-creation, as the latter bridges the research-practice gap and increases stakeholder empowerment (Mahmoud et al., 2023). Co-creation should involve the end-users from beginning to end; this will impact the implementation and acceptance of the service by the end-users and increase trust in the provider (PSO). Such collaboration should be not only equitable but also ethical. Relevant frameworks include the Good Practice Principles for Data Ethics in the Public Sector, emphasizing the trustworthy use of data in digital government (OECD, 2021), OECD Principles for Managing Ethics in the Public Service to improve effective public sector governance (OECD, 2016), OECD recommendations aimed at anti-corruption and public sector integrity (OECD, 2022), or the Australian framework for professional conduct and public interest (NSW Public Service Commission, 2022). The European Court of Auditors found out that EU institutions have adequate ethical frameworks but there is no common EU ethical framework to govern the work of the Member States and their representatives. In 2019, the European High-Level Expert Group on AI presented the Ethics Guidelines for Trustworthy AI, highlighting that trustworthy AI should be lawful, ethical, and robust (European Commission, 2019). Whilst public participation is a legal right in Europe, and there are guidelines for conducting such participation, the same cannot be said for co-creation (Banisar et al., 2011; European Environment Agency, 2023; Giannelos et al., 2024; Pevkur et al., 2018).

2.8. Research gap

The analysis of existing literature documented in previous sections uncovered a broad spectrum of studies that: 1) explore the role of co-creation in public service delivery, emphasizing its potential for fostering citizen engagement and improving policy outcomes, and 2) investigate the integration of digital tools, particularly AI, in co-creation, highlighting its capacity to enhance decision-making, collaboration, and efficiency in policymaking. Conceptual insights derived from sections 2.1 to 2.7 are synthesized in Table 1.

Tab. 1 – Conceptual insights on AI-enabled co-creation for evidence-based policymaking

Label	Insight	Section
CI1	Co-creation should be understood as an iterative phase-based process relying on collaboration, feedback loops, and adaptation, generating tangible public value, such as improved service quality, strengthened trust, and greater inclusivity.	2.1
CI2	A comprehensive understanding of co-creation as both a process and an outcome is essential for effective public sector innovation and meaningful stakeholder engagement.	2.2
CI3	The intertwined social, organizational, financial, and technical challenges underscore the need for a systematic approach to integrating digital tools into co-creation processes.	2.3
CI4	Establishing a rigorous legal and regulatory framework that addresses potential risks, ensures that AI applications align with ethical principles and standards, and facilitates a seamless transition to effective AI-enabled public sector co-creation is essential.	2.4
CI5	Co-creation facilitates evidence-based policymaking, leveraging AI's transformative potential to enhance informed decision-making and stakeholder collaboration.	2.5
CI6	Achieving sustainability requires recognizing the continuity of the co-creation processes and outcomes, which address immediate challenges while fostering long-term societal benefits.	2.6
CI7	Whilst co-creation is often regulated by the regional, national and supranational legal frameworks, a dedicated ethical framework to guide co-creation practices is needed.	2.7

However, this analysis also revealed a significant gap in understanding how AI-enabled co-creation operates within PSOs and how it contributes to evidence-based policymaking. While co-creation has gained recognition in public service innovation, its role as a structured, integrating mechanism for participatory, data-informed, and adaptive policymaking remains underexplored. Despite the increased emphasis on evidence-based policymaking, where rigorous research, data availability, and systematic evaluation guide decision-making, the link between AI-driven co-creation and its impact on policy formulation, implementation, and evaluation remains unclear. Additionally, policy initiatives such as the Tallinn Declaration (2017) and the Berlin Declaration (2020) emphasize the importance of user-centered service design, participatory governance, and digital transformation in policymaking. However, existing research lacks a clear framework on how co-creation can systematically shape policies, ensuring that such policies are informed by diverse stakeholder inputs, AI-driven insights, and sustainability considerations.

3. Research design

To address the research gap uncovered in Section 2 and defined in Section. 2.8, this study explores the role of AI-enabled co-creation in PSOs to contribute to evidence-based policymaking. Its objectives are:

O1. To identify and define the key parameters of AI-enabled co-creation for evidence-based policymaking
O2. To develop a conceptual model that integrates these parameters, contributing to a structured framework for understanding co-creation as both a process and an outcome in evidence-based policymaking

The study adopted four steps to meet these objectives.

First, existing literature was critically analyzed to identify and define the key parameters of AI-enabled co-creation for evidence-based policymaking. The outcome is documented in Section 2 and synthesized in the form of seven conceptual insights in Table 1. In turn, these insights will serve as the foundation for defining the key parameters of an AI-enabled co-creation model in Section 4.1.

Second, a workshop involving experts from academia and technology organizations was organized to validate the literature-based parameters; the results are documented in Section 4.2. To help develop the conceptual model for AI-enabled co-creation for evidence-based policymaking, the results are also documented in Section 4.3. The workshop formula was selected to enable small group discussions, guided by a moderator, to gather experts' views on the parameters, the model, and any additional perspectives (Gottesdiener, 2002). The workshop formula is also commonly used in co-creation to reflect a democratic decision-making process (Andersen & Jæger, 1999). Specifically, the workshop was organized online in January 2025, bringing together nine experts from academia and technology organizations. Experts were invited from diverse fields, including public administration, academia, and technology organizations (see Table 2), ensuring a comprehensive, interdisciplinary perspective. A detailed presentation was provided to establish a shared understanding of the parameters and the model among participants. The parameters were based on the systematic literature review and (Rizun et al., 2025).

Third, to facilitate iterative discussions on the model and assess its applicability to real-world scenarios, workshop participants were asked to complete a structured questionnaire via Google Forms, designed based on the workshop presentation. The questionnaire comprised one closed and eight open-ended questions, designed to validate the key parameters of the conceptual model and gather expert insights. It began with a closed question to assess the experts' agreement with Edelmann and Virkar's (2023) definition of sustainability. Next, evidence-based policy was explored based on the outcomes by Head (2010). The experts were asked whether these outcomes fully captured the scope of evidence-based policymaking and invited to propose additional outcomes. Ethics in public sector co-creation was another focal point, with participants identifying the key ethical frameworks applicable to public administration. The questionnaire then addressed digital co-creation, asking respondents to highlight significant issues, suggest appropriate communication channels, identify key stakeholders, and propose potential funding sources for co-creation activities. The role of AI in public sector co-creation was another area of inquiry. Experts were asked to specify functions and processes that could be delegated to AI and to outline perceived challenges and risks associated with AI integration in co-creation efforts.

Fourth, from the workshop, the discussion protocol, memo notes, and expert survey responses were analyzed using thematic analysis (Naeem et al., 2023), a process for deriving conceptual models from qualitative research findings. The insights gathered from the workshop and questionnaire, serving as validation instruments, contributed to refining the model by incorporating experts' perspectives on its key parameters. The thematic analysis followed two stages. First, validating and refining the key parameters that form the foundation of the conceptual model. Second, developing the model by systematically mapping AI-enabled co-creation phases and their mechanisms onto the evidence-based policymaking process and integrating this process with the identified key parameters.

Tab. 2 – Profiles of the workshop participants

ID	Organization	Area of expertise	Years of expertise
E1	academia	Computational analysis, artificial intelligence, policy analysis, public service co-creation	23
E2	academia	Digital government, digital inclusion, sustainable development	20
E3	academia	e-Governance, in particular organizational change and digital transformation in public sector organizations, new ways of working, engagement practices, sustainability	25
E4	academia	New information/computation paradigms, trustworthy software infrastructures, citizen-centered digital services	25
E5	academia	Data modeling ontologies, e-governance, public administration, information systems interoperability	15
E6	academia	Computational linguistics, NLP, ML for text mining, responsible AI, disinformation, propaganda detection	30
E7	academia	Business administration, business process management, linguistics	10
E8	academia	Computer science, decision support systems, data mining, business process management	25
E9	academia	Education internationalization, project management, implementation of international projects	20

4. Results

This section addresses the second objective to develop a conceptual model that integrates identified parameters of AI-enabled co-creation for evidence-based policymaking, contributing to a structured framework that conceptualizes co-creation as both a process and an outcome in this context.

4.1 Conceptual model parameters

Based on the conceptual insights from the literature review (Section 2), five parameters of co-creation for evidence-based policymaking in PSOs were identified, providing the foundation for the conceptual model.

The first is the structure of the public policy and service creation process, represented as a continuous iteration of commissioning, designing, delivering, and evaluating (CI1). Adopting a "co-" approach – co-commissioning, co-designing, co-delivering, and co-evaluating – enriches this process by fostering collaboration, shared expertise, and leveraging diverse perspectives to enhance the quality and legitimacy of public decision-making.

The second parameter is the co-creation impact, emphasizing the tangible and structural effects of the process. Beyond being a key enabler and guiding principle, co-creation drives measurable public sector outcomes (CI2) by shaping overarching institutional and specific co-creation-related results. These include: 1) social impact by addressing the needs of diverse groups, including the vulnerable, by tailoring policies and services to their specific needs; 2) innovation by encouraging creative solutions that incorporate diverse stakeholder insights and leverage advanced technologies like AI; 3) efficiency by streamlining resource allocation and policymaking through participatory and data-informed processes; and 4) organizational transformation by facilitating cultural and structural changes within PSOs to adapt to dynamic societal needs.

The third parameter represents the enablers of evidence-based policymaking – leadership, financial support, stakeholder engagement, and technologies like AI (CI3), essential for operationalizing co-creation. While leadership, financial support, and stakeholder engagement provide the necessary governance, resources, and collaborative mechanisms, AI enhances the process by enabling predictive modeling, trend analysis, and improved stakeholder communication. Together, these enablers ensure that the co-creation process is structured and adaptive, empowering PSOs to address complex policy challenges.

The fourth parameter represents the core principles of co-creation for evidence-based policymaking – ethics (CI4), evidence-based decision-making (CI5), and sustainability (CI6), together ensuring that co-creation is participatory, impactful, and aligned with long-term goals. Ethics safeguards transparency, accountability, and inclusivity, fostering trust among stakeholders and reinforcing the integrity of the co-creation process within public sector governance. Sustainability underscores the continuity and adaptability of co-creation processes, ensuring their longevity and inclusiveness while driving the co-creation of sustainable policy outcomes that address immediate challenges and foster enduring societal benefits. Evidence-based decision-making ensures that co-creation is guided by reliable data and insights, strengthening the effectiveness and legitimacy of the process.

Finally, the fifth parameter makes sure that the entire co-creation framework for evidence-based policymaking in PSOs is underpinned by a strong legal and regulatory foundation (CI7) to ensure compliance, transparency, and accountability, particularly by responsibly integrating AI and other technologies. This foundation provides the structural integrity necessary for co-creation processes to produce meaningful results and flourish.

4.2 Validated conceptual model parameters

This section presents the results of expert validation of the parameters of AI-enabled co-creation for evidence-based policymaking proposed from the literature, allowing us to clarify, enrich and refine such parameters.

Core principle – Sustainability

Experts' insights enriched the definition of sustainability according to Edelmann & Virkar (2023), refining its applicability to AI-enabled public sector co-creation for evidence-based policymaking, leading to the following definition: "Taking into account that sustainability can be understood as meeting the needs of the present generation without compromising the ability of future generations to meet their own needs, sustainability should not only be about environmental and social impact but be adaptable to different contexts, retaining its value over time, leading to new ways of working in organizations, and include any artifacts created for the long term. Thus, sustainable processes and outcomes are those that have long-term benefits, where technology and AI act as key enablers, supporting new ways of working, enhancing efficiency and innovation, and ensuring long-term impact. To achieve sustainability, sustainable outputs must be defined beforehand, while mitigating risks such as bias and discrimination in digital technologies is essential to uphold fairness, inclusivity, and ethical co-creation".

Core principle - Ethics

An ethical co-creation framework must provide core values, standards of conduct, and accountability mechanisms: 1) transparency, accountability, fairness, and inclusion should be binding for all public employees and stakeholders involved in public sector co-creation, regardless of role or contract type; 2) while core values remain universal, ethical guidelines must adapt to different sectors, ensuring academic integrity and fairness in higher education, open engagement and trust in public administration, and data privacy, security, and bias mitigation in AI-enabled co-creation; 3) ethical frameworks must integrate rules of engagement, oversight mechanisms, and evaluation tools to ensure compliance and assess long-term impact; 4) ethical considerations should address both intended and unintended consequences, ensuring that co-creation processes account for future implications and the needs of directly- and indirectly-affected stakeholders (McKenna & Bargh, 1999). Experts also highlighted that existing ethical guidelines from research, innovation and AI could contribute to the ethical framework for co-creation (Dainow & Brey, 2021; Shneiderman, 2020, 2022; Thiebes et al., 2021). For a higher education context, ethical frameworks must focus on academic integrity, respect for intellectual property, fairness, inclusion, social responsibility and equality, and fair treatment of students and staff. The consequences framework, focusing on possible future effects of any course of action with consideration of directly- or indirectly-affected stakeholders (Gebru et al., 2021; Hardebolle et al., 2023; Reijers et al., 2018) may be particularly useful.

Enabler – AI and public sector co-creation

AI serves as a critical enabler for public sector co-creation by enhancing efficiency, automating repetitive tasks, and supporting evidence-based decision-making. Experts highlighted AI's role in: 1) process optimization, i.e. automating, monitoring, controlling, and adapting routine tasks and workflows; 2) data-driven insights, i.e. collecting, processing, and analyzing data, including sentiment analysis and scenario modeling; 3) decision-support mechanisms, i.e. providing evidence-based recommendations and simulating policy impacts; and 4) operational execution, i.e. assisting in communication, coordination, and execution of standardized processes. However, challenges in AI adoption within co-creation persist. Experts raised concerns about: 1) data quality and bias, as AI systems may draw on outdated or low-quality datasets; 2) transparency, security, and privacy risks in AI-driven decision-making; 3) over-reliance on automation, potentially reducing human oversight and accountability; 4) regulatory gaps, with a lack of governance frameworks for AI-based public services; and 5) public skepticism including unfounded fears and ethical concerns regarding AI's role in policymaking.

Enabler – Digital co-creation vs. co-creation of digital public services

Importantly, experts emphasized the need to clearly distinguish between digital co-creation and co-creation of digital public services, which imply different technological applications, stakeholder involvements, and governance structures. Digital co-creation refers to the use of digital technologies to enable co-creation activities. The outcome can be digital or non-digital. Digital co-creation emphasizes collaborative processes empowered by digital platforms, including participatory decision-making, citizen engagement, and collaborative problem-solving (Edelmann & Mergel, 2021; Rodriguez Müller et al., 2021b). This form of co-creation leverages digital tools such as crowdsourcing platforms, online forums, sentiment analysis, and social media to facilitate citizen participation

and improve service responsiveness (Brandsen et al., 2018). Digital co-creation includes five components: 1) technology as an enabler, i.e. digital tools supporting communication, collaboration, and decision-making, but not "prescribing" the nature of co-created public services (Lember, 2017); 2) stakeholder focus, i.e. inclusivity and accessibility for a diverse range of stakeholders (Bovaird & Loeffler, 2012); 3) ethical and governance principles, i.e. the organizations responsible for digital co-creation must adhere to ethical guidelines, ensuring data privacy, security, fairness, explainability, and human oversight (Edelmann et al., 2023); 4) sustainability and fairness, i.e. digital co-creation must support transparent, trust-based, and balanced collaboration, ensure that any biases are mitigated and decision-making is inclusive and participatory; 5) hybrid integration, i.e. digital tools should support virtual or face-to-face co-creation or involve physical co-creation efforts.

Co-creation of digital public services is an outcome-oriented process, where collaborative design, implementation, and refinement of digital solutions drive public sector service delivery and innovation (Linders, 2012). Unlike digital co-creation, where digital tools support participatory processes, the co-creation of digital public services focuses on building digital services. The process involves multi-sector collaborations, including partnerships between governments, private tech companies, and research institutions (Rodriguez Müller et al., 2021b). The services may include AI-powered administrative systems, digital identity verification, open data portals, smart governance platforms, etc. Key components of co-creating digital public services are: 1) technology as the core product, i.e. the results is the development of digital solutions, e.g. AI-driven services, digital governance platforms, and e-government applications (Torfing et al., 2019); 2) service innovation and scalability, i.e. developing new digital solutions that must be sustainable, adaptable, and accessible, ensuring long-term usability and cross-institutional integration (Wirtz et al., 2021); 3) regulatory and legal compliance, i.e. the development requires compliance with legal, ethical, and technical standards, ensuring security, transparency, and interoperability across PSOs (European Commission, 2021); 4) human oversight and trust-building, i.e. while AI-driven automation enhances service efficiency, the human intervention must remain central to validate AI-generated insights, prevent algorithmic biases, and ensure user trust in digital public services. Hence, by distinguishing between digital co-creation and co-creation of digital public services, our study underscores the diverse roles of digital technologies in public sector innovation. While digital co-creation helps engage citizens in service development in the broad sense, co-creation of digital public services focuses on the development and implementation of digital solutions.

Enabler – Co-creation channels of participation and communication

Effective co-creation requires context-sensitive, inclusive communication strategies that integrate traditional and digital channels to accommodate diverse engagement dynamics and stakeholder needs. Experts emphasized that no single channel is inherently superior; rather, the selection must be purpose-driven, contextually relevant, and aligned with accessibility principles. Traditional channels like public meetings, workshops, or printed materials foster deliberative engagement and trust-building in structured settings. Digital channels like social media, crowdsourcing platforms, or electronic coordination tools expand reach, facilitate real-time participation, and enhance analytical capabilities through AI-driven insights. Beyond communication modes, stakeholder composition is fundamental. Co-creation must intentionally engage a diverse ecosystem of citizens, policymakers, private sector actors, NGOs, technology firms, and academic institutions to ensure inclusive governance, equitable representation, and legitimacy. Prioritizing those most affected and investing in co-creation with them strengthens policy responsiveness, trust, and co-ownership of outcomes.

Enabler – Financial aspects of co-creation

Co-creation requires dedicated financial resources, but no additional financial burden should be placed on participants. A sustainable funding model should integrate multiple sources: 1) public funding – local, regional, and national governments should take the lead in financing co-creation initiatives; 2) private sector contributions – partnerships with businesses can provide funding, expertise, and technological support; and 3) international grants and foundations – funding from international organizations, NGOs, and philanthropic institutions can support long-term sustainability. Whilst the public sector should take the lead in implementing public sector co-creation, convincing them of the value and long-term benefits of such investments remains a critical challenge.

4.3 Conceptual model

Based on the workshop-produced insights, the process of AI-enabled co-creation for evidence-based policymaking was adapted from the process proposed by Head (2010) and operationalized to be iterative, participatory and co-created. Each co-creation phase was mapped onto specific evidence-based policy processes, demonstrating how stakeholder engagement, AI-driven analytics, and iterative policy refinement enhance transparency, inclusivity, and adaptability. Integrating AI into co-creation allowed PSOs to develop more informed, accountable, and citizen-centered policy decisions. Table 3 presents this integrated process, demonstrating how AI-enabled co-creation aligns with evidence-based policymaking across four phases: 1) co-commissioning vs. policy initiation; 2) co-designing vs. engaging, evidence-gathering, and policy planning; 3) co-delivery vs. policy delivery; and 4) co-assessment and co-evaluation vs. policy evaluation.

Tab. 3 – The process of AI-enabled co-creation for evidence-based policymaking

Co-creation vs. evidence-based policymaking	Co-creation phase	Evidence-based policy phase
Co-commissioning vs. policy initiation		
	Co-commissioning for early stakeholder involvement and addressing legal and ethical requirements	Identifying policy goals and challenges while aligning with stakeholder needs, assessing organizational readiness and addressing legal prerequisites
Co-designing vs. engaging, evidence gathering, policy planning		
Co-designing vs. engaging	Co-designing to facilitate meaningful participation and shared decision-making	Involving citizens, organizations, and experts in shaping the policy agenda through engagement activities
Co-designing vs. evidence gathering	Ensuring co-designed evidence, integrating diverse perspectives and experiences, and AI-driven analytics	Collecting qualitative and quantitative data to inform policy decisions
Co-designing vs. policy planning	Embedding co-design principles to iteratively shape responsive policies	Developing citizen-centric, sustainable, and inclusive solutions based on stakeholder input and evidence
Co-delivery vs. policy delivery		
	Embeds co-delivery for stakeholder involvement throughout the execution. AI-enabled communication channels enhance accessibility, helping build trust and securing buy-in	Implementing policies with mechanisms for tracking progress and adapting to unforeseen challenges
Co-assessment or co-evaluation vs. policy evaluation		
Co-assessment vs. options and appraisals	Enables co-assessment to ensure stakeholder-driven assessment and mitigate personal and political biases. The integration of AI-driven simulations and scenario modeling.	Assessing policy alternatives for feasibility, impact, and alignment with innovation, public trust, accountability, inclusivity and other outcomes
Co-assessment vs. decision and presentation	Co-creation fosters transparency by involving stakeholders in final decision-making. Digital platforms and explainable AI add credibility and broaden acceptance.	Selecting policy directions and ensuring transparent communication with stakeholders and accountability
Co-evaluation vs. evaluation and review	Institutionalizes co-evaluation to ensure continuous learning and adaptation. AI-driven analytics and engagement ensure adaptability and responsiveness.	Reviewing impact, integrating feedback, and refining policies iteratively

The conceptual model for AI-enabled co-creation for evidence-based policymaking is depicted in Figure 1. The model integrates the five parameters identified and validated throughout the study. It structures the policymaking process as an iteration of four integrated phases aligned with co-creation phases. The model also highlights critical enablers of evidence-based policymaking, including leadership, financial support, stakeholder engagement, and AI-driven tools, while reinforcing evidence-based decision-making, sustainability, ethics, and regulatory compliance as principles. Furthermore, it identifies co-creation outcomes as measurable public sector transformations encompassing social impact, innovation, efficiency, and organizational change.

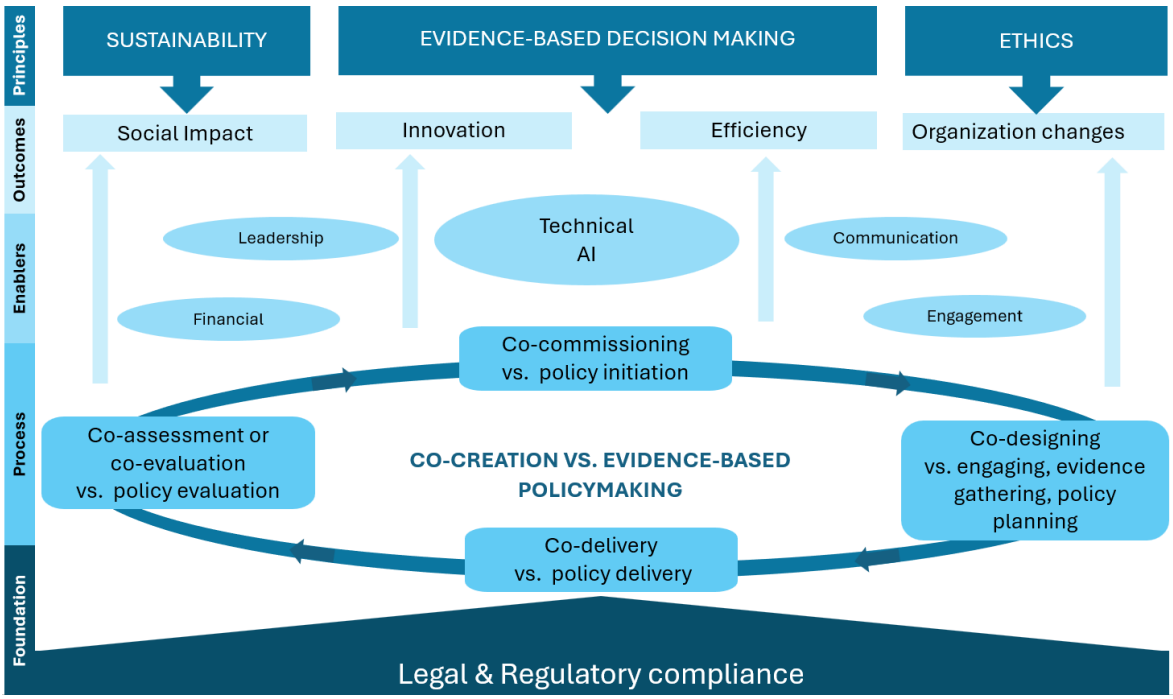

Fig. 1 – The conceptual model of AI-enabled co-creation for evidence-based policymaking

5. Conclusions

The main outcome of this study is the integration of AI-enabled co-creation and evidence-based policymaking within PSOs. The resulting conceptual model embeds co-creation into policy processes across four phases: 1) co-commissioning vs. policy initiation; 2) co-designing vs. engaging, evidence gathering, and policy planning; 3) co-delivery vs. policy delivery; and 4) co-assessment or co-evaluation vs. policy evaluation. The study makes theoretical, methodological, and practical contributions. The theoretical contribution is about advancing the understanding of co-creation as an integral component of evidence-based policymaking, embedding it in the structured and iterative policy process. The result highlights the interdisciplinary and multi-stakeholder nature of co-creation, emphasizing essential parameters such as sustainability, ethics, legal foundations, financial aspects, and digital governance required for its effective implementation in PSOs. The methodological contribution is about proposing a structured policymaking process, integrating AI-enabled co-creation across four interconnected phases, and making a distinction between digital co-creation (where digital tools enable participatory processes) and co-creation of digital public services (where digital solutions are the outcome of co-creation). The practical contribution is about providing a framework for integrating AI-enabled co-creation into policymaking processes, guiding policymakers and public managers in designing adaptive, user-centered, and data-driven public services.

The study has some limitations. First, while the conceptual model was validated through expert insights, further empirical research is needed to test its applicability across different PSO contexts and governance levels. Second, the dynamic nature of AI in co-creation processes presents ongoing challenges regarding ethical safeguards, regulatory compliance, and the evolving capabilities of AI-driven tools, which our model does not fully capture. Additionally, ethical concerns can go beyond AI, considering power dynamics and the risk of superficial participation. If not carefully managed, co-creation efforts may favor certain stakeholders.

Future research could explore strategies to prevent co-creation from becoming a symbolic exercise, ensuring genuine engagement and meaningful collaboration. Another challenge is the availability and quality of data. Similar to other domains, AI's effectiveness in co-creation depends on access to reliable and representative data; unfortunately, public sector data is often fragmented, biased, or difficult to access. Misinformation and security risks present ongoing challenges in digital co-creation. If not carefully monitored, AI tools can spread misinformation. Thus, strengthening security measures, improving misinformation detection, and building trust in AI-driven co-creation should be key priorities moving forward. Lastly, future research could further validate and refine the parameters of the conceptual model, conducting empirical testing and iterative evaluation to ensure its applicability and effectiveness in diverse public sector settings.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 21 May 2025

Abstract. Government actors promoting collaborative initiatives for a more inclusive and democratic society must understand that effective strategies for lasting social impact demand significant effort. Collaborative governance relies on the interaction between the government, private sector, and civil society. However, success is not guaranteed by collaboration alone, due to various factors can affect decision-making effectiveness. This article explores the key factors in collaborative governance, with a specific focus on social sustainability, to optimize governance practices. The field research was conducted using a qualitative approach through a case study in Porto Alegre city, Brazil. We conducted semi-structured interviews with 16 stakeholders, analysed documents, and performed direct observations. The study provides valuable insights for public managers and governments on effective strategies for addressing social issues and improving governance, aiming to enhance social sustainability and project efficiency. Additionally, it identifies factors for collaborative governance in the Latin America context.

Keywords. collaborative governance; social sustainability; decision-making; public policy; governance strategies; collaboration
Research paper, DOI: https://doi.org/10.59490/dgo.2025.992

1. Introduction

Collaborative forms of governance are strongly encouraged but require management that enables the proper involvement and representation of different interests from the initial agenda and activities planning (Broccardo, Culasso & Mauro, 2019). The collaborative process becomes an alternative to strengthen decision-making (Naffaa, 2017), whereas the dynamics of collaboration result in collaborative actions involving multiple stakeholders in the definition of policies, regulations, projects, or agendas (Broccardo, Culasso & Mauro, 2019). Although the government actors are interested in promoting collaborative projects to build a more open and democratic society, they should be aware that creating results with transformative and sustainable social impact requires efforts (Temmerman, Veeckman & Ballon, 2021).

The engagement of players from the private sector, society, or the general public in decision-making processes and structures (Bianchi & Rivenbark, 2021), with diverse communication, collaboration, and power delegation (Newig et al., 2017) is one the principles of Collaborative governance, which is defined by processes and structures of decision-making and management of public policies that involve people constructively to achieve a public purpose that would not be accomplished otherwise (Emerson, Nabatchi & Balogh, 2012). In collaborative governance, specific motivations drive participants to become involved, so it is essential to comprehend their impact on decision-making. This involves determining whether participants primarily aim to pursue their own interests or if they are seeking a better collective outcome. Their behavior influences the process throughout (Choi & Robertson, 2014b).

Although studies on Collaborative Governance extensively explore various dimensions such as models, antecedents, processes, outcomes, challenges, institutional structure, leadership, and the diversity of the groups involved (Bianchi, Nasi & Riverbark, 2021; Ansell & Gash, 2008; Emerson, Nabatchi & Balogh, 2012; Thomson & Perry, 2006), there is a significant gap in the literature regarding a deeper understanding of the aspects that influence decision-making in this context. Mosley & Wong (2021) address the legitimacy of the decision-making process, but there is still a lack of detailed analysis on how this process is constructed. Given these studies, it is

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

evident that the literature lacks a more detailed exploration of the specific factors that shape these decisions. This need is further highlighted by the research of Wang & Ran (2021), who emphasize the increasing complexity of the decision-making process in collaborative governance and the importance of understanding the elements that influence it.

This research has Collaborative governance as its subject, and its objective is to identify the related factors of a decision-making process in a social sustainability multi-stakeholder case, executed by the city of Porto Alegre (Brazil). The research question is: which factors can influence the decision-making process of a Collaborative governance focused on social sustainability? To achieve that objective, we applied a case study approach to understand the complex dynamics and interactions in the decision-making process in Porto Alegre City Hall (Brazil). This initiative aimed to create a public policy to qualify both formal and informal recyclable materials collection, as well as to improve solid waste sorting units.

This study contributes to practitioners and academics by providing them with a better understanding of how those involved in the collaborative process make decisions and communicate them, unraveling the Collaborative governance theme regarding the factors related to multi-stakeholder decision-making, and contributing to the development of broader theory in this field. Contributions to theory and knowledge are the factors that influence decision-making regarding collaborative governance in social sustainability with a focus on the Latin American context. It is a subject that heavily relies on context, and most of the main literature comes from the global north. Contributions to practitioners and managers depend on insights into public policies, particularly the steps of problem understanding and agenda definition. Contribution to society relies on a clear explanation of this complex social problem and its proper understanding.

In the next section, we will develop the conceptual foundation for our research by drawing from the literature to formulate propositions. These propositions will be validated or refuted in a case study conducted in Brazil (Cepeda & Martin, 2005). We emphasize the importance of conducting additional research on various forms of collaboration to evaluate the relevance of our theoretical argument and empirical findings. We conclude the article with suggestions for future research.

2. Theoretical basis

2.1 Collaborative Governance

Collaborative governance is a form of shared governance in which authority and responsibility for decision-making depend on an agency that must inform or consult other rights holders and stakeholders when planning or implementing initiatives (Borrini-Feyerabend et al., 2013). This governance model does not refer only to formal decisions and official laws, but also to formal processes and customary laws (Kossmann, 2015), indicating that the initiation and management of Collaborative Governance is not a one-time act, but a continuous process (Ulibarri et al., 2020).

In a collaborative process, public agencies work with other public and private organizations to develop or implement policies and programs (Ulibarri & Scott, 2017). In this way, collaboration increases opportunities for social learning among stakeholders, suggesting that they would be more capable of identifying and correcting incompatibilities with greater collaboration (Ulibarri, 2015). However, collaboration is linked to the process of dealing with varied perspectives, adopting new roles, and assuming multiple responsibilities in complex situations (Bradley & Arlati, 2022).

Governance practices are shaped by the interactions of different social actors, who often have diverse, conflicting, and antagonistic interests, viewpoints, and values, which governance must resolve or reconcile (Gutberlet, Besen & Morais, 2020). Political actors collaborate during decision-making processes in exchange for the exchange of their objectives into policies (Fischer & Sciarini, 2016). These processes can be simple or complex - they can vary according to the outcomes to be achieved and the reflections to be generated throughout the choices. A key question for those interested in developing effective Collaborative governance systems is: "how to facilitate the decision-making dynamics among diverse and interdependent stakeholders facing complex problems?" (Choi & Robertson, 2014a), as they participate in the governance process, often defined interests and histories of conflicts and alliances (Follador et al., 2021).

> Proposition 1: The complexity of the context changes the dynamics of the processes and makes the results unpredictable and difficult to control.

In contexts of multiple stakeholders, such as in collaborative governance, the goal is to bring together key stakeholders in an integrated dynamic of communication and decision-making. This approach is based on the recognition of the importance of equity and accountability in interactions among stakeholders, as pointed out by Almeida, Getschko, & Afonso (2015). Furthermore, Trimble et al. (2022) emphasize the need for well-defined and formalized roles, even if of a consultative nature, to ensure effectiveness and clarity in the decision-making process. This perspective highlights the importance of clear and accountable structures to facilitate productive dialogues

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

and equitable decisions in environments with multiple stakeholders.

> Proposition 2: Social problem's systematic understanding demands listening to all actors.

Interaction among stakeholders can create a trusting relationship among them, even if their goals are not fully achieved (Hovardas, 2021). Trust can be used as social capital to establish governance so that decisions can be made consensually (Panday, 2018; Ansell et al., 2020), although it requires the involvement of stakeholders (Kossmann, Behagel & Bailey, 2016). Furthermore, there must be a pre-established and consolidated degree of trust to allow participants to share knowledge among themselves and improve the performance of the collaborative process (Tonelli et al., 2018). It is imperative to dedicate efforts to enhance collaborative efforts and partnerships among all community stakeholders, focusing especially on integrating those who have been traditionally excluded from decision-making processes (Wang & Ran, 2023).

> Proposition 3: Previous trust among stakeholders is fundamental to reducing conflicts during decision-making.

An important characteristic that helps to distinguish Collaborative governance from traditional decision-making mechanisms is the relative balance of formal power among the various participants involved in the decision-making process (Choi & Robertson, 2014a). For Purdy (2012), Collaborative Governance is related to processes that seek to share power in decision-making with stakeholders to develop shared recommendations for effective and lasting solutions to public problems.

In the division of responsibilities and power, the act of governing becomes more complex, especially in the relationship between the democratically elected governmental authority and the social and private actors who grant power in decision-making related to public policies (Ferrarezi & Oliveira, 2012). Collaborative Governance processes must be planned to promote a substantial balance of power among stakeholders during deliberation and decision-making (Choi & Robertson, 2014b).

> Proposition 4: Actors who have centralized power in other spheres or decisions (such as in government) may not behave collaboratively in collective decision-making.

Governance practices are influenced by the interactions of various social actors, who may have conflicting interests. The importance of balance and trust in decision-making is emphasized, which should be facilitated by the development of mechanisms to manage the complexity and diversity of interests in collaborative decision-making. These aspects are essential for the creation of more effective governance systems, especially in the context of increasing social and environmental complexities.

2.2 Social Sustainability and Governance

Social sustainability can be defined as the resolution of basic needs, such as adequate housing and income; individual capacity or opportunity for learning and self-development; social or community capacity for the organizations and networks development, that promotes social interaction (Davidson, 2010). Although it is a well-established concept, the social dimension is the least developed among all concepts of sustainability, as academic research frequently focuses more on the environmental and economic dimensions (Beck & Ferasso, 2023). This can be explained by considering that identifying social impact can have positive and negative social consequences. The scope of social impact is daunting, which may explain why social sustainability the least well-established pillar of sustainability is compared to the more easily quantifiable economic and environmental impacts (Buchan et al., 2024).

Social sustainability should be recognized in a reliable and affordable manner along with general stakeholder support for the data collection and analysis, thus a good governance will promote sustainability in general and address social sustainability in particular (Pashaei Kamali et al., 2018). Collaborative governance projects should be able to build a wider and democratic society, although it requires action taking efforts at all levels, the government level included, to trigger outcomes with transformative and sustainable social impact (Temmerman, Veeckman & Ballon, 2021).

Pashaei Kamali et al. (2018) identified collaboration and participation as a sustainability necessary practice, with the stakeholder's involvement in decision-making process, which is obtained through discussions aimed at resolving conflicts. It is expected that social sustainability issues faced by society will expand the challenges of balancing local, national, and global goals and objectives, requiring a more collaborative approach to public policy development for long-term planning structures and tools (Picavet et al., 2023).

3. Methodological Procedures

The research used a single case study approach (Yin, 2015) to analyze the Todos Somos Porto Alegre program, a Porto Alegre City Hall initiative in Brazil. The program aimed to shift from social assistance to economic and social development by promoting the productive inclusion of self-employed recyclers through labor market training. This case was chosen for its elements of collaborative governance and stakeholder participation in public policy creation.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The study employed an interpretative qualitative approach, capturing participants' perspectives and integrating multiple data sources (Yin, 2016; Cepeda & Martin, 2005). Data collection involved document analysis, direct interviews, and observations, ensuring reliability through triangulation (Martins, 2008). Primary data were obtained from interviews with project participants conducted between October and December 2019 (see Table 1), while secondary data included program reports, meeting minutes, and media articles (see Table 2). Interviews followed a structured script validated by two researchers (Baxter & Jack, 2008) and were conducted in person or remotely via Skype and WhatsApp. Participants were selected based on their roles in the program's creation, formalization, and implementation (2012–2016), ensuring stakeholder representativeness. Sixteen stakeholders were interviewed until reaching saturation (Fontanella, Ricas & Turato, 2008). Interviews were recorded, transcribed in Portuguese, and selectively translated into English, preserving the original meaning.

Tab. 1 - List of interviewed stakeholders.

Institution	Role	Quantity	Approximate time length
City Council: responsible for the Law	Alderman author of the Law 10.531/2008 that institutes, in the city of Porto Alegre, the Gradual Number's Reduction of Animal Traction Vehicles[1] and Human Traction Vehicles Program	01	25 min
Porto Alegre City Hall: executioner of Public Policy	City Department of International Relations Office Chief	01	51 min
	City Department of International Relations Projects Coordinator	01	56 min
	Mayor of Porto Alegre during the Program	01	43 min
Private Company: Program Supporter	Head of Institutional Relations	01	28 min
University: Program follow up	Production and Transport Engineering Professor at UFRGS	01	15 min
Cooperative: Program coordinator	General Coordinator	01	47 min
	Consultation Letter drafting and coordination support in Project 2	01	01h 08 min
	Planning and Execution Program's Structurer	01	40 min
	Project 1 Coordinator	01	01h 25 min
	Project 2 Coordinator	01	01h 17min
	Author of Program's book	01	25 min
	Social Assistant	01	01 h 04 min
Rio Grande do Sul Public Ministry of Labor: actions follow up and support	Chief Prosecutor	01	31 min
Triage Unit: Program beneficiary entity	Triage Unit Leaders and "Fórum dos Catadores" from "Vila Pinto" and "Campo da Tuca" participants.	02	49 min
Total		**16**	**704 min**

The documents, listed in Tab. 2, allowed us to corroborate and increase the data evidence collected from other queried sources, so it provided us the necessary content for this case study contextualization, expanding and

highlighting the interviewee's speeches and the information gathered where the interviews and the non-participant observation, being frequently used along with other methods of data collection that offered us a more differentiated and dynamic conjuncture assessment that cannot be easily captured by traditional methods (Liu; Maitlis, 2010).

Tab. 2 - List of analysed documents.

Analyzed Documents Report

Document	Document's Purpose	Date
Law 10.531/2008 establishes, in the city of Porto Alegre, the Gradual Number's Reduction of Animal Traction Vehicles and Human Traction Vehicles Program	Establishes, in the City of Porto Alegre, the Gradual Number's Reduction of Animal Traction Vehicles and Human Traction Vehicles Program and provides other measures.	September/2008
Project Opening Term	Beginning formalization of Productive Inclusion Program implementing and Waste Pickers Productive Inclusion and Porto Alegre's Popular Recycling System Restructuring.	August/2012
Kick off Meeting Report	Report on a meeting held at Local Governance City Department of Porto Alegre City Hall.	August/2012
Braskem Social Investment Presentation	Project Presentation Containing: • General Information • Work Balance sheet • *Stakeholders* List • Developed Strategy • CVCA – *Costumer Value Chain Analysis* • Impact Matrix X Complexity	August/2012
The Implementing of Productive Waste Pickers Inclusion Program and The Restructuring of Porto Alegre's Popular Recycling System Work Proposal	Work proposal presented by "Cooperativa Mãos Verdes" containing the expected objectives and results for the program implementation phase.	August/2012
Scope Management Plan	Establishes as the project scope will be managed and sets how will be treated and controlled its changes.	September/2012
Action Plan Schedule	Lists the actions and those responsible for the program implementation with the planned dates.	February/2013
"Todos Somos Porto Alegre" Program's Implementing	Presentation containing an evaluation of the conducted work, the results of the program implementation phase and the next steps.	February/2013
Executive Committee Establishment Report	Executive Committee establishment and its initial referrals.	February/2013
Committee Tasks and Quality Management System (QMS)	Defines the meeting's systematic between the members of the stakeholder's network and the executive and operational teams, during the Program implementation.	March/2013
Productive Inclusion Program Presentation	Porto Alegre City Hall presentation on the "Todos Somos" Program.	June/2013
Meeting report	Reports of the meetings that occurred throughout the program.	2012 to 2016

The interviews were transcribed, coded, and analyzed using NVIVO v12 for Apple. Data from interviews and documents formed a corpus analyzed categorically according to Bardin (2009), enabling objective and systematic data collection. We started with an initial reading of the data to understand the information, followed by a detailed analysis for coding and categorization. The process included highlighting important sections and making brief

notes, connecting insights to the codes identified in the interviews and documents.

Afterward, we identified the factors that emerged from the interviews and influenced decision-making, making it possible to verify which factors had already been identified by the theory and which emerged from the analysis of the information (Flick, 2009).

4. Results

4.1 The Program Structure in Porto Alegre

Porto Alegre is the capital and largest city of Rio Grande do Sul, the southernmost state of Brazil. It has a population of approximately 1.5 million inhabitants and about 4.5 million in its metropolitan area, making it the twelfth most populous city in the country. Porto Alegre was founded in 1769 by a group of immigrants from the Azores Islands, Portugal. In 1989, the city became internationally known for being the first to implement participatory budgeting.

Aiming to modernize the city and improve traffic circulation in Porto Alegre, the capital of Rio Grande do Sul, as well as to advance strategies for preparing the city to host international events such as the 2014 FIFA World Cup, the City Hall decided to ban the circulation of wagons and waste pickers' carts in urban areas, in compliance with Law No. 10,531/2008. Additionally, the municipality sought to professionalize the informal waste sorting system by investing in and strengthening waste sorting units, introducing production goals and processing volume targets, and encouraging the formation of consortia and networks for materials processing and commercialization.

Following the approval of Law No. 10,531/2008 and the establishment of the Executive Committee for the Gradual Reduction of Animal Traction Vehicles (ATVs) and Human Traction Vehicles (HTVs) (Decree No. 16,638/10), it became necessary to implement a public policy for the productive inclusion of waste pickers and the restructuring of sorting units in Porto Alegre. To this end, the public policy known as Todos Somos Porto Alegre (a name chosen by the Waste Pickers Forum) was carried out through a 26-month-long program. This initiative involved multiple stakeholders, including City Hall departments, the Brazilian Development Bank (BNDES) as the funding agency, NGOs engaged in outreach to the waste picker population and sorting centers, social and community leaders, private entities, and, crucially, the waste pickers themselves—the primary beneficiaries of the policy.

The program's main premise was to create work alternatives considering the gradual phasing out of ATVs and HTVs. Other key objectives included street-level outreach to waste pickers, offering individualized support and referrals, strengthening the sorting unit network, and providing legal and institutional backing to enhance their operational capacity and production scale. The focus of the program shifted from a social assistance approach to one based on economic and social development, emphasizing income generation and popular education as a productive force.

In terms of governance, the program's strategic and political coordination was led by the Executive Committee, which defined roles and responsibilities for governance functions and oversaw actions to consolidate an integrated support network. This included organizing continuous improvement seminars, and committee meetings, structuring the external evaluation process, and managing the communication plan aligned with governance activities. The support network comprised the Technical-Operational Coordination unit and individual Project Working Groups. These groups worked closely with service providers and operational teams that directly interacted with the target population. In turn, the target population also maintained dialogue with the Integrated Support Network and the Waste Pickers Forum.

A collaborative network was established so that Porto Alegre City Hall, together with other public and private organizations, could develop and implement the public policy, in line with recommendations by Ulibarri and Scott (2017). Based on the formulation of strategies, activities, and goals, Morse and Stephens (2008) emphasized that such processes should begin with a core group of committed stakeholders. Once the outcomes and strategies are defined, the collaboration moves to the implementation phase, in which agreements and action plans are developed through a set of mutually supportive initiatives. To ensure the continuous improvement of the program, executive committee seminars and meetings were held, alongside the development of the external evaluation framework and the management of the integrated communication plan.

4.2 Decisions influencing factors

4.2.1 Complexity

Complexity can be defined as the presence of numerous interconnected and interactive elements that impact the behaviour of a system (Casti,1986). The definition of Casti is particularly relevant in the public context, as it demonstrates the challenge of predicting the outcomes of an action or decision.

In the analysis of the program documents, complexity was evaluated by constructing a complexity matrix. This approach considers the need for a holistic understanding of the different actor profiles, as well as the diverse demands and needs of the population that necessitate a range of actions, projects, and competencies. The importance of developing a personalized service policy to assess and handle each waste picker case, particularly

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

considering significant complexities, is also emphasized.

Complexity was a factor highlighted by the interviewees, considering the context of the Todos Somos Program and the situations experienced, particularly in relation to the withdrawal of the ATVs and HTVs from circulation. The program's increased complexity was associated with the waste picker's carts and wagons, as shown in Figures 1 and 2. This was due to the diverse audience, many of whom relied on carts or wagons to support their families. However, in some cases, these vehicles were also used to sustain drug addiction.

> *We had two problems with Todos Somos, one, the complexity of the waste picker's itself, their profile, people who mostly do not have an organization, many are homeless, there's always an exploitative group behind them, only a few are independent, the majority live in a vicious cycle of drug involvement, not all of them, but most of them, that's a problem. (E01).*

Fig. 1 - A man pulling a Human Traction Vehicle in the city of Porto Alegre.

Fig. 2 - A man riding an Animal Traction Vehicle in the city of Porto Alegre.

Interviewee no. 10 reports that Todos Somos was a complex program, and there was the need to understand the context of waste pickers and screening units to establish the necessary strategies, "*align things with people, could have time to reason and bring ideas, it is not in the heat of fire that a complex decision is made*" (E10).

The living conditions of waste pickers were a complex problem that needed to be addressed in the Todos Somos

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Porto Alegre Program. The families depended on garbage collection work to live, which was also degrading work. The activity involved sorting the collected garbage in informal sorting units or in their homes, which led families to literally live among the garbage, not to mention the use of heavy human traction strollers, pulled up and down the city, often with children inside.

4.2.2 Systemic comprehension

For Maani (2016), systemic understanding is the key that frees mental models and paves the way for accepting exchanges in a multi-stakeholder decision-making process, being the first step towards a systematic understanding of the problem. However, in a decision-making process, in some cases, information is gradually presented, and problems are unstructured (Gontijo & Maia, 2004).

Municipal governments should collect suggestions and opinions from all stakeholders in projects on behalf of cities, however, citizen participation should be simplified (Bolivar, 2018), for example, through forums. Nevertheless, Ulibarri and Scott (2017) pointed out that high-capacity collaborative decision-making forums may not be the most inclusive in terms of incorporating all network players into decision-making, but they are institutions where a subset of key network players is heavily involved (stakeholders offering particularly relevant information, maintaining key resources, and being critical to achieving successful results).

In the analysis of the Todos Somos Program documents, we observed that there were practices, methods, and project management tools, that provided the necessary formalism which allowed the development and management of a program of this nature. The Program adopted a management model, so they could manage all phases of ongoing projects, identify risks, reduce difficulties and resistance at each program stage, and apply production engineering tools aiming the production of social benefits, as reported by one of the interviewees, "this project, in my opinion, was the first time that a method was used to solve a social problem, so the chances of getting it right were good, and if we continued, much better" (E4).

In the Todos Somos Program, the topics discussed in the meetings were recorded in reports and the agenda was previously established, the information was obtained from the working groups and provided support so the decisions could be made, and errors minimized. The structuring and analysis of the information were aspects highlighted by all interviewees regarding the systemic understanding of this issue, being mentioned even by the members of the Waste Pickers Forum. Interviewee 3 highlighted that the Executive Committee, in some situations, participated in the Waste Pickers Forum and held open meetings with waste pickers, due to the lack of self-employed waste pickers' representatives. These mechanisms allowed the collection of information for decision-making and for the program to move forward with the planned actions.

4.2.3 Relationship among stakeholders

In decision-making, all stakeholders need to be involved for the process to be effective (Edmunds and Wollenberg, 2001), though in some moments might have conflict situations, which may be a resource or a liability during collaboration (Ansell & Gash, 2008). There are many conflicting interests among stakeholders, but they must adjust their preferences through deliberation and dialogue (Choi & Robertson, 2014a).
During the interviews, respondents were asked if conflicting situations occurred and how the relationship between those involved in the program and 12 (twelve) of the 16 (sixteen) interviewees reported that conflict situations, such as complaints to the Public Prosecutor's Office, informal recyclers' resistance to joining the Program, conflicts of ideological concepts among stakeholders that generated critical moments during the execution of the Program. Interviewee no. 9 recalls that conflicts and problems occurred daily and were mitigated due to the trust relationship established between those involved in the Program, especially within the Executive Committee and Working Groups. This relationship was possible due to the Executive Committee member's previous history of participation in other social projects, which, as Ansell & Gash (2008) said, contributes to raising the levels of trust among those involved and thus increasing the commitment, as substantiated by Interviewee no. 3 speech.

> *We had a very good team within the government, had a very engaged team within the government, I for example had a team within the government that I had to deal with, that maybe you will talk to. Sometimes there were many difficulties, but they were really aligned people who wanted to make it happen like us, so there was a lot of trust between us, we knew that even if we disagreed on something we were doing it over things we wanted to go the best way possible for the program's sake (E03).*

Interviewee no. 3 reports the trusting relationship established between stakeholders and the belief that they had over the Program's results. These aspects were fundamental to strengthening the relationship between those involved, even with the existence of conflicts that consequently influenced the decision's direction. Interviewee no. 14 notes that there was mistrust over a Public Power conducted the Program, being the role of the government leader responsible for the Todos Somos Program fundamental to promote the collaborative conduction of the program, through conversation and consensus. This aspect corroborates the research of Emerson, Nabatchi & Balogh (2012) that considers the trust positive influence in collaboration, seen as a mechanism for better understanding the problem and being an essential element to achieving consensus and meeting the needs of

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

stakeholders, especially in projects aimed at social sustainability (Beck & Ferasso, 2023).

4.2.4 Power

In collaborative governance, decision-making should be focused on collectively and on sharing with decentralized power, so that the involvement of multiple stakeholders allows legitimizing the decisions made (Emerson, Nabatchi & Balogh, 2012). Power should be shared among stakeholders during deliberation and decision-making, to develop shared recommendations for effective and lasting solutions to public problems (Purdy, 2012; Choi & Robertson, 2014b).

Not all interviewees could identify whether there were power relations between stakeholders involved in decision-making. Of the 16 (sixteen) interviewees, only 6 (six) mentioned a Centralized Power occurrence. In the opinion of four (4) interviewees, the power was decentralized, and shared among all those involved, both in the Executive Committee and in the Active Search team, as reported by Interviewee no. 3. In Interviewee 5's statement, when asked if there was anyone who had the final say in decisions, it is possible to observe that authoritarianism did not prevail in the decisions "We have to avoid that, that is authoritarianism, we didn't have that, we avoid it, not out of fear of making decisions, democracy should be the main foundation" (E05).

Interviewees no.10 and no. 4 reported that power was centered on the Government, in this case, the City Hall. However, they highlighted that the government seemed to be always willing to listen to all those involved opinions, with dialogue still prevailing. In the opinion of Interviewee no. 3, the power was centered in the Cooperative that supported the City Hall in the coordination of the Todos Somos Program, due to this stakeholder technical knowledge in relation to the Program and the influence it had in the Executive Committee.

It is important to emphasize that collaborative governance processes should be planned to promote a power balance between stakeholders during debate and decision-making (Choi & Robertson, 2014b).

4.2.5 Administrative Burden

The concept of administrative burden can be understood as the individual perception of policy implementation as a burdensome task. Often, this burden manifests as a repetitive, inevitable, and prolonged experience, imposing substantial challenges within the context of collaborative governance (Burden et al, 2012). Collaborative governance aims at decision-making based on deliberative consensus, however, there were some situations in which administrative burden was present just as required by any traditional model of centralized governance. During the interviews, the respondents were asked about critical situations they experienced during the program execution and what could have occurred otherwise, i.e., what could have been improved. Interviewees no. 2 and no. 11 mentioned the administrative burden situations handled with BNDES, the main financing source of the program, influencing the continuity of the program when Porto Alegre City Hall had a change of management due to the city's election, this aspect is supported by Purdy (2012), who concludes that in Collaborative governance processes that are convened by government agencies, the authority of the government is linked to its rights to establish and apply rules, while the authority of other actors stems from their right to participate in governance or to bring legal actions.

Interviewee no. 3 emphasizes the slowness of government movements, but this slowness is not related to decision-making, but rather to the realization of decisions, i.e., in the interviewee's words the slowness lies in 'putting the decision on the street, the internal processes needed, and the various assessments. This got in our way a lot, mostly when resources should be liberated so we could effectively execute what we had decided, so that was something we needed to improve. "*The situations encountered required the restructuring and reanalysis of information, making necessary some actions, goals, and schedule adjustments in the Program. Interviewee no. 3"*

5. Results discussion

The complexity of the program is manifested by the multiplicity of actors involved and the variety of their interests and living conditions. For example, waste pickers are not a homogeneous group; they have different stories and challenges, and this complexity increases when considering the logistics of their carts and wagons, which are essential for their work, but also involved in broader public and social policy issues.

The Todos Somos program faced the challenging task of reconciling these diverse factors, seeking to balance the needs and expectations of each stakeholder. This task is complicated by the unpredictable nature of these interrelated elements. As a result, strategies and policies that prove effective in one aspect of the program may not be suitable or effective in another, leading to unexpected and difficult to manage outcomes, corroborating Proposition 1 of this study "The complexity of the context changes the dynamics of the processes and makes the results unpredictable and difficult to control".

The emphasis on using practices, methods, and project management tools reflected a conscious effort to address social problems systematically and structured. The interviewees' reports reinforced the idea that the adoption of structured methods in solving social problems significantly increased the chances of success. By involving waste pickers and other relevant stakeholders in the decision-making process, the program not only gained a deeper understanding of the challenges faced but also promoted a sense of ownership and commitment among the

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

participants.

The Todos Somos Program exemplifies how the systematic understanding of social problems is intrinsically linked to the inclusion and listening to all actors involved, validating Proposition 2 of this research: “Social problem’s systematic understanding demands listening to all actors”. By integrating project management methodologies with the active participation of a variety of stakeholders, the program was able to effectively address complex social challenges, reinforcing the idea that listening to all actors is essential for the effective resolution of social problems. Effective and well-defined governance strategies likely improve not only social sustainability but also the interconnections of its dimensions (i.e., environmental, economic, and social). However, the stakeholders involved in the decision-making process must have a clear understanding of social issues (Pashaei Kamali et al., 2018).

In the Todos Somos Program context, the importance of trust among stakeholders was highlighted by how conflicts were managed and mitigated. The trust relationship within the Executive Committee and among the Working Groups played a key role in mitigating daily conflicts. This trust did not arise spontaneously; instead, it was built on shared experience and a history of participation in other social projects. As Ansell and Gash (2008) observed, trust contributes to elevating levels of commitment and collaboration among parties, facilitating the resolution of conflicts and more cohesive decision-making.

The initial distrust regarding the public power’s program management was overcome by the program leader's ability to foster constructive dialogues and seek consensus. This aspect aligns with the conclusions of Emerson, Nabatchi & Balogh (2012), who consider trust as an essential mechanism for better understanding problems and achieving consensus, especially in projects focused on social sustainability.

As highlighted in the literature, pre-existing trust among stakeholders is a factor in effective conflict management and the facilitation of collaborative decision-making (Panday, 2018; Ansell et al., 2020; Tonelli et al., 2018). However, in the studied case, trust did not occur previously among stakeholders, but during the execution of the program's actions. Instead, it was established during the implementation process, partially supporting Proposition 3: "Previous trust among stakeholders is fundamental to reduce conflicts during decision-making."

Collaborative governance prioritizes decentralized power, while power influences decision-making and the relationship among stakeholders involved in this process, sometimes can have a dynamic behavior, that is, fluctuating between centralized and decentralized power, and efforts must be focused so that power remains balanced among participants. In some cases, the Government initiates and coordinates policy networks and maintains great power over the nature and functioning of Collaborative governance, prevailing its opinion in decision-making (Eckerberg, Bjärstig & Zachrisson, 2015; Criado and Guevara-Gómez, 2021). However, the Todos Somos Program demonstrates that, even in a scenario where some actors may have more power (like the Government), the structure and planning of Collaborative governance, along with the willingness to maintain open dialogue and listen to all parties, can lead to effective collaboration.

Although power was centralized in the government, there was a continuous disposition to listen to all parties and maintain dialogue. This suggests that, even in a situation of centralized power, there can be a collaborative approach if there is a willingness to listen and engage all stakeholders, not confirming Proposition 4 of this study: “Actors who have centralized power in other spheres or decisions (such as in government) may not behave collaboratively in collective decision-making”.

In the initial literature analysis on collaborative governance, no elements of administrative burden were detected. However, in the context of the Todos Somos Program, interviewees reported facing barriers and redundancies in obtaining information, which necessitated a revision of the project structures. This situation illustrates how the government, or its public bodies, plays a critical role in structuring collaborations in the public sector. Administrative burden tends to emerge in contexts with multiple problems and can be more effective when the objectives are well-defined, supported by political backing, have adequate resources, and possess the autonomy to develop solutions based on specialized expertise, as suggested by Meier et al. (2019).

6. Conclusions

The analyzed case study emphasized the significance of trust among stakeholders in conflict management and collaborative decision-making. It highlighted the need for inclusive decision-making processes involving listening to all actors, including traditionally excluded ones, such as informal and organized recyclers. This contribution to society underscores the importance of trust in facilitating effective conflict resolution and decision-making. However, administrative burdens in governance can pose challenges that impact the effectiveness of social projects.

The study provides evidence supporting existing theories about the role of trust in collaborative governance (Ansell & Gash, 2008; Emerson, Nabatchi & Balogh, 2012), contributing to the understanding of how power dynamics affect collaborative governance (Eckerberg, Bjärstig & Zachrisson, 2015; Criado & Guevara-Gómez, 2021). Thus, it contributes to the existing literature on administrative burden and its impact on governance processes (Wanna, 2008; Meier et al., 2019). However, future research could examine projects in which pre-

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

existing trust among stakeholders has been identified, to determine whether this factor can mitigate conflicts that may arise during the decision-making process.

It is important to note a limitation in our study, as we were unable to contact some self-employed informal recyclers (beneficiaries of the program) during the interviews. These recyclers were not involved in the Waste Pickers Forum. This group represents an unorganized working class, many of whom do not have access even to a telephone or a permanent address. However, despite this obstacle, it was possible to identify the factors that influenced decision-making through interviews with the Program's contributors, including the recycling practices of the cooperatives (leaders of the Screening Unit and members of the Waste Pickers Forum) and other stakeholders.

This study provides practical insights for public managers on promoting effective strategies to address complex problems. It shows the importance of clear and well-defined governance strategies that enhance social sustainability and its interconnected dimensions. Additionally, the findings can be useful for the government and public sector organizations in organizing collaborative efforts, with the goal of reducing administrative obstacles and improving the efficiency of public projects.

Abstract. The rapidly growing popularity of digital services requires robust frameworks to identify and address associated ethical concerns. This paper presents a structured framework for assessing ethical concerns of digital services, offering a scalable and adaptable tool to assess concerns, including data misuse, cybersecurity, transparency, inequality, and sustainability. The framework employs a customized Delphi method to gather diverse expert insights, translating them into quantifiable metrics through a mathematical model. These metrics inform structured surveys, generating actionable outputs, including visual summaries, static recommendations, and AI-driven insights. To illustrate the framework's application, we detail its implementation in the context of electronic voting (e-voting). By addressing key ethical challenges, mainly privacy, transparency, and inclusivity, this use case demonstrates the framework's utility in analyzing complex digital services. The study highlights the importance of balancing technological innovation with ethical accountability, providing a practical approach to ensuring transparency and trust in public digital services.

Keywords. digital ethics, humanistic, AI ethics, ethical concerns, LLM
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1033

1. Introduction

As digital services become integral to modern society, addressing their ethical implications has become increasingly critical. For example the Facebook–Cambridge Analytica scandal in 2018 highlighted major ethical concerns regarding privacy and consent in digital services. Personal data from millions of Facebook users was collected without their explicit permission and used for political advertising, sparking global debates about data misuse and democratic integrity (The Guardian, 2018). Similarly, Google faced criticism when it was discovered that their Street View cars collected data from unsecured Wi-Fi networks during their image capture process. This raised serious privacy concerns, as users were unaware that their data was being intercepted and stored (The Guardian, 2010; Wired, 2012). Another significant case is Clearview AI, which built a powerful facial recognition tool by scraping billions of images from social media platforms without user consent. This practice ignited concerns over mass surveillance, potential misuse by law enforcement, and the lack of transparency in how facial recognition data is gathered and applied (Hart, 2024; The Guardian, 2022). These cases collectively emphasize the urgent need for ethical oversight, informed consent, and accountability in digital services.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

This requires a comprehensive approach that spans the entire digital service lifecycle, encompassing design, development, and deployment, as outlined by (Cath et al., 2018). Building on these foundations, this paper presents a framework for assessing ethical concerns in digital services. The framework enables organizations to identify risks, implement actionable improvements, and expand on previous research in the field (Andreasyan et al., 2024; Teran et al., 2021; Wallimann-Helmer et al., 2021). The proposed framework utilizes a customized Delphi method (see subsection 3.2 and also previous work (Andreasyan et al., 2024)), fostering iterative discussions among experts to capture diverse perspectives rather than consensus. Unlike the traditional Delphi method, our version does not aim to achieve consensus among participants but rather to foster diverse perspectives that allow participants to reconsider their conclusions after hearing others' viewpoints. These expert insights inform structured surveys that allow service providers, such as Swiss Post employees, to evaluate their services against ethical criteria derived from expert input and scientific literature. A web-based application processes the survey responses to generate practical outputs, including visual summaries, tailored recommendations, and insights from a domain-specific large language model (LLM) (future development). These tools assist decision-makers in prioritizing and addressing ethical challenges. The framework serves two main purposes: evaluating ethical considerations for proposed digital services and diagnosing ethical issues in existing ones.

By focusing on critical ethical factors such as privacy, transparency, trust, and inclusivity, the framework promotes ethical accountability and fosters public trust in digital governance. These general ethical concerns (see subsection 4.2) align with the discussions in (Nabbosa and Kaar, 2020; Schoentgen and Wilkinson, 2021), which explore ethical issues in the digital era and societal digitalization. Figure 1 shows the results, namely consensus versus dissensus of the 75 responses of two customized Delphi methods after two rounds.

The results of these discussions are then integrated into a survey tool, where service providers, such as Swiss Post employees, can evaluate their own services based on ethical concerns raised by the experts and literature. A web-based application aggregates the survey responses and generates an output in the form of graphical summaries, recommendations with cited sources, and access to an LLM trained in the relevant domain to offer further insights into potential issues. Figure 2 illustrates the process flow of our framework. It provides an overview diagram highlighting key steps, including literature review, ethics assessment framework development, iterative evaluation, and finally generate ethical insights.

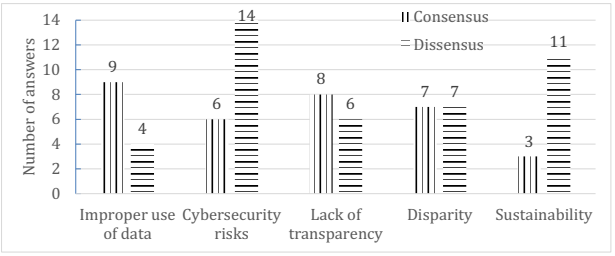

Fig. 1 – Survey results for two rounded customized Delphi method.

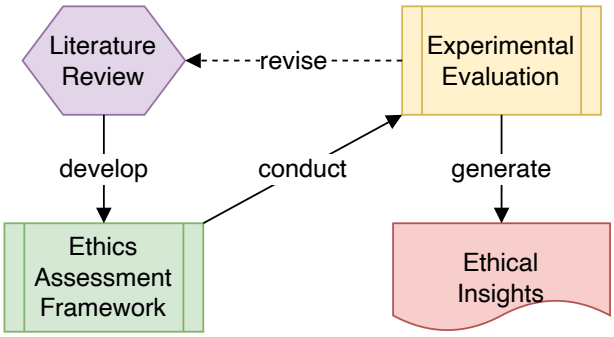

Fig. 2 – Process flow for identifying and analyzing ethical concerns in public digital services.

1.1. Public Services

In digital governance, public services stand at the forefront of societal well-being, requiring efficient delivery and a strong ethical foundation. As governments and organizations adopt new technologies to administer services—ranging from healthcare to education—balancing innovation with robust ethical standards becomes paramount, which is stated in international standard (Olszewska et al., 2022), that it is crucial to address ethical concerns during and from the beginning of the digital platform's development. As highlighted

by (Warner, 2023), public services play a crucial role in upholding societal values, necessitating transparent, inclusive, and accountable practices to maintain public trust.

We first examine the broader landscape of public services and emphasize the importance of aligning technological innovation with ethical principles to foster trust. We then delve into a specific application, the e-voting use case, which illustrates how our ethical evaluation framework can be adapted to safeguard critical democratic processes in the digital era. Future work will be dedicated to analyzing and implementing other public services (e.g., health and logistics, among others).

1.2. Evaluation Framework for Ethical Digital Services

We outline our ongoing efforts to develop a robust framework for evaluating the ethical concerns associated with digital services. This initiative builds upon our previous work, as outlined in (Andreasyan et al., 2024), which presented the theoretical foundation for addressing digital ethics challenges in public services, explicitly using the case of electronic voting. The current framework, conducted in collaboration with our implementation partner, Swiss Post, reflects our shared commitment to enhancing the transparency and trustworthiness of public digital services. Central to this mission is integrating expert insights and empirical data into a structured analytical process that supports creating and maintaining ethically sound digital solutions.

Our methodology begins with a diverse panel of experts participating in a modified Delphi method. Unlike traditional consensus-driven approaches, our adaptation of the Delphi method actively embraces a wide array of perspectives to ensure that differing viewpoints are captured and considered. This iterative process ensures that ethical standards are rigorously debated and refined. Following these expert panels, service providers complete structured surveys based on the ethical standards identified during the Delphi process. Responses are then processed through a Web-based application that consolidates the data into actionable insights, visual summaries, and tailored recommendations.

The systematic nature of our framework is designed to strengthen public trust in digital services, particularly within sensitive domains such as healthcare, education, and governance. The importance of ethical considerations in these areas is well-documented in the literature, with notable examples including the ethical use of digital trace data in education (Hakimi et al., 2021), the challenges of applying digital twins for personalized healthcare services (Huang et al., 2022), and the broader implications of digital innovation in public administration (Pakhnenko, Kuan, et al., 2023). Ethical lapses in these domains can significantly erode public confidence, making addressing these concerns from the design phase to deployment critical.

Through a cycle of expert-driven inquiry, data-gathering, and targeted recommendations, our framework aims to establish a scalable and adaptable model for ethical oversight that can be broadly applied to a diverse range of public digital services. By embedding ethical considerations into every stage of the process, we strive to create digital solutions that are functional, efficient, and aligned with the principles of fairness, transparency, and accountability.

1.3. Use Case: E-Voting

The first use case of our framework is in the context of e-voting systems by Swiss Post, a domain where ethical considerations are crucial. Electronic voting systems' integrity, transparency, and security are essential for protecting democratic processes and ensuring public confidence in electoral outcomes. By applying our framework to e-voting, we can identify and mitigate potential ethical risks such as data privacy breaches, voter manipulation, or transparency deficiencies.

In collaboration with the Swiss Post, we are currently developing this framework with their e-voting experts to evaluate and enhance the ethical aspects of their digital voting services. The process involves an iterative feedback cycle and refinement to adapt the framework precisely to the complexities of e-voting. This use case not only serves to demonstrate the framework's effectiveness but also sets a precedent for other digital services, such as e-health and logistics.

Through the e-voting pilot, we aim to establish a model for ethical digital governance that can be replicated and scaled across various public services. By focusing on critical issues such as privacy, security, and trust, the

framework supports creating e-voting systems that voters can trust. Moreover, this initiative aligns with global efforts to strengthen the resilience of democratic institutions against the challenges posed by digitization and cyber threats.

In conclusion, the development and application of our ethical evaluation framework represent a significant advancement in the governance of digital services. By proactively addressing ethical concerns, we can safeguard public trust and ensure that digital innovations in public services, like e-voting, are beneficial and secure.

Ultimately, this work addresses the following research questions: What ethical concerns and general ethical factors are important in the e-voting use case? How can a theoretical framework and user-friendly prototype address those ethical concerns and general factors?

2. Related Works

As digital services shape modern life, ethical design has become crucial. This section outlines advancements in evaluating digital ethics and reviews frameworks that offer structured approaches to addressing ethical challenges. These tools provide practical insights into embedding ethical principles in digital service design.

Our tool, the Swiss Digital Ethics Compass (SDEC), differs from others by focusing on twelve ethical concerns rather than general ethical factors. This approach builds on literature emphasizing ethics in technology design and governance.

Two prominent frameworks informed our work. The TEDS framework (Joisten et al., 2022) focuses on "technoethical" concerns, especially around data privacy and breaches. The AI Digital Tool Product Lifecycle Governance Framework (Ortega et al., 2023) emphasizes embedding ethics and compliance by design through human-centered principles and risk management.

Other valuable contribution includes the Digital Ethics Canvas (Hardebolle et al., 2023), which evaluates ethical risks through six key principles (e.g., beneficence, fairness, sustainability) (see Figure 3). It was positively received in evaluations with novices (N=26) and experts (N=16). The Ethics Canvas (Lukianets et al., 2021), inspired by the Business Model Canvas (Osterwalder and Pigneur, 2010), guides users in identifying stakeholders and ethical concerns across three stages. The Data Ethics Canvas[1] helps organizations navigate ethical data use, while the Ethics Canvas[2] promotes responsible innovation across various project types.

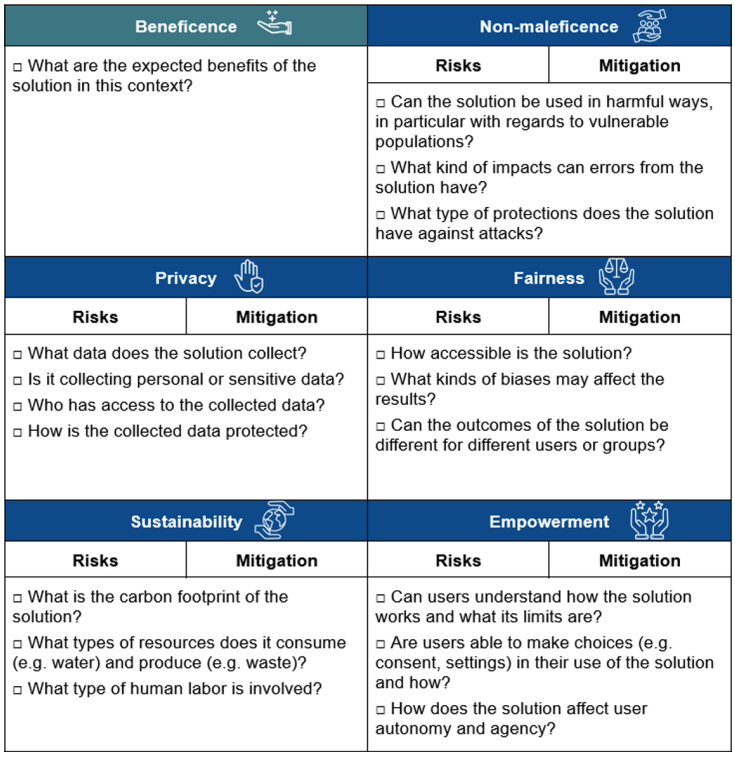

Fig. 3 – Digital ethics canvas (Hardebolle et al., 2023).

The ALTAI framework (on AI, 2020) offers a self-assessment for AI systems based on seven key requirements like oversight, safety, and transparency. In contrast, the AI4Belgium tool[3] focuses on an organization's readiness for AI deployment, covering infrastructure and strategic alignment.

[1] Data Ethics Canvas by the Open Data Institute (ODI): https://github.com/theodi/data-ethics-canvas
[2] The Online Ethics Canvas: https://www.ethicscanvas.org
[3] Online platform for assessing the trustworthiness of AI implementation: https://altai.ai4belgium.be/

In the Figure 4 is presented the AI System Ethics Self-Assessment Tool (Dubai, 2023) from Digital Dubai, which evaluates digital systems based on fairness, accountability, transparency, and explainability. It produces an ethics score based on system impact and mitigation measures.

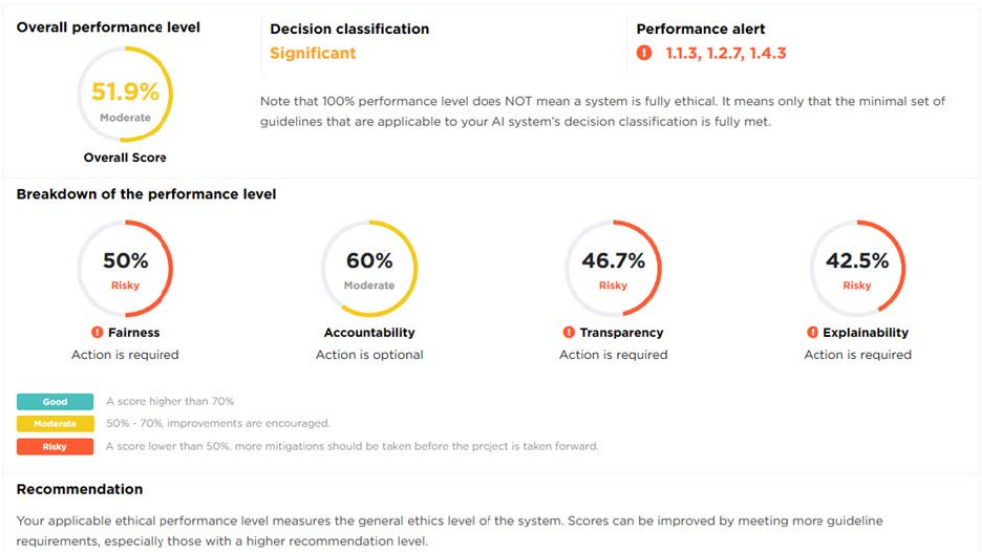

Fig. 4 – AI System Ethics Self-Assessment Tool (Dubai, 2023).

Our approach stands out by analyzing twelve ethical concerns found in our previous work (Andreasyan et al., 2024; Teran et al., 2021; Wallimann-Helmer et al., 2021):

- **Autonomy:** lack of decision-making ability due to external influence.
- **Discrimination:** unjustified differentiation for irrelevant reasons.
- **Domination:** actual or potential control over others.
- **Exclusion:** unfair denial of access to benefits.
- **Exploitation:** unfair advantage taken of individuals or groups.
- **Inequality:** unjustified unequal treatment or outcomes.
- **Justice:** biased or unfair distribution.
- **Privacy:** exposure without adequate protection.
- **Responsibility:** failure to acknowledge or prepare for negative impacts.
- **Trust:** weakened relationships among stakeholders.
- **Dignity:** disregard for human respect and rights.
- **Truth:** misrepresentation of identity or actions.

This approach enables deeper, context-specific evaluation of AI impacts, enhancing accountability and inclusivity. By addressing specific concerns often overlooked in traditional models, our framework promotes responsible and ethically grounded public digital systems.

3. Framework

This section outlines a comprehensive three-step process for evaluating ethical concerns in digital services. By integrating expert consultations, structured surveys, and advanced analytical tools, this framework ensures a robust assessment of critical issues such as privacy, transparency, and security. Leveraging proper methodologies such as the Delphi method and interactive web technologies facilitates informed decision-making while promoting explainability and transparency. The subsequent sections detail each step, supported by visual and technical insights, enhancing the ethical evaluation process. An overview of the process is provided in Figure 5.

3.1. System Architecture

Figure 6 illustrates the system architecture organized into two primary components: the user and technical layers.

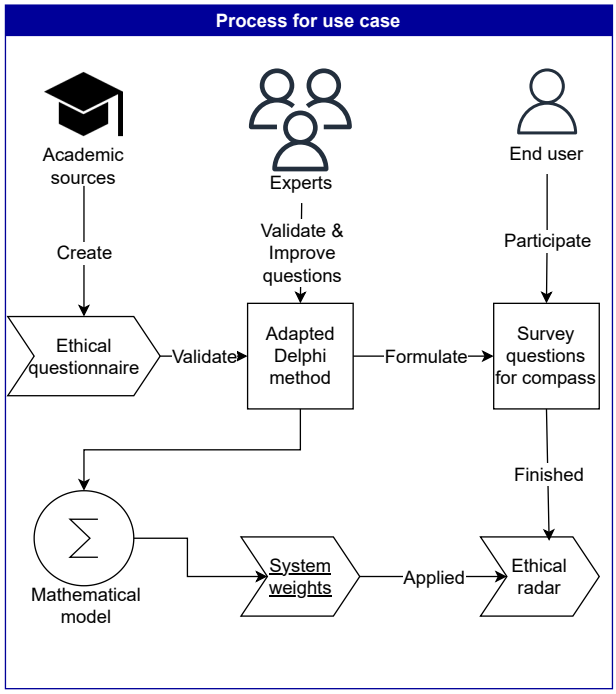

Fig. 5 – Overview of the framework's process for identifying and addressing ethical concerns in public digital services.

User Layer. In the user layer, a request and response system enables users, particularly internal Swiss Post employees, to complete surveys or seek clarification on ethical topics. The system then processes these inquiries and generates responses that assess ethical concerns and provide static recommendations. Additionally, users can interact with generative artificial intelligence (GenAI) to get extra information about the use case and digital ethics.

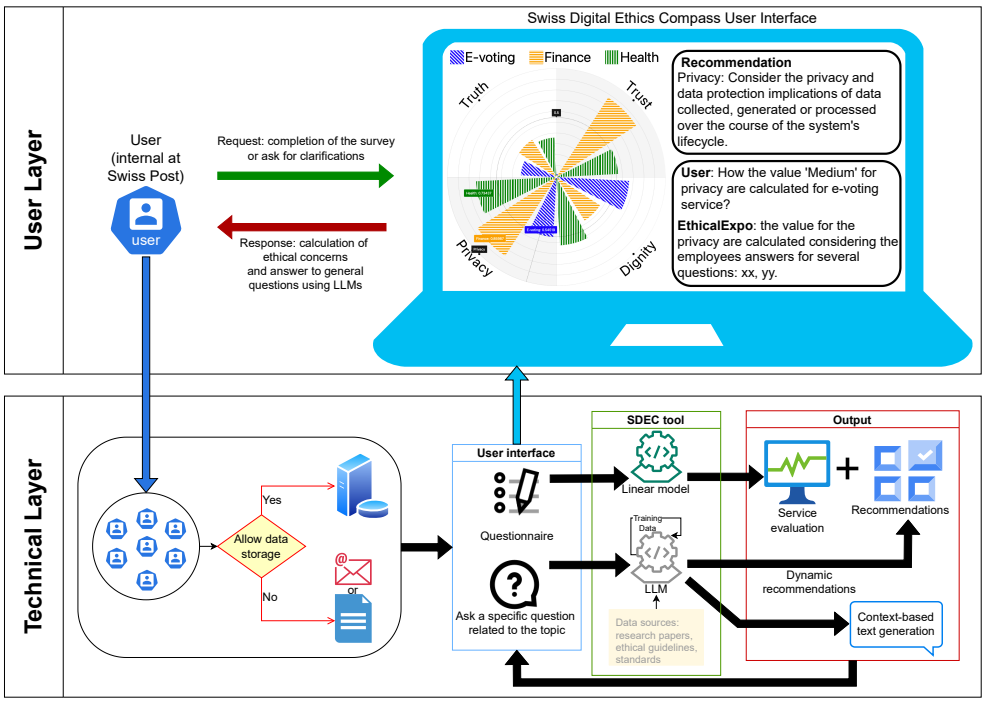

Fig. 6 – User and technical layers. Mock-up for the graphical interface of the smart radar, including static and dynamic recommendations.

Technical Layer. The technical layer begins with the user interface, where users can ask questions about ethical and compliance topics. The system employs a questionnaire format to capture the context of each query, prompting users to provide details relevant to their concerns. This information flows into an output module, which generates answers based on contextual text production, service evaluation, and dynamic recommendations. The data sources feeding into the GenAI modules include research papers, ethical guidelines, and standards, which were extracted from digital libraries such as ACM, IEEE, PhilPapers, and SprinerLink between 2010 and 2023 (Andreasyan et al., 2024; Teran et al., 2021). On top of LLM, retrieval-augmented generation (RAG) was built on academic literature identified within the development of this project. It interprets user questions and assists in ethical evaluations, while linear models are employed to refine response accuracy further. A recommendation component enhances this layer by giving users insights about privacy implications based on collected data. The framework is designed to support explainability and transparency, offering Swiss Post's internal users clear and contextualized responses to ethical questions related to data privacy and ethical standards. For instance, if a user would like to know more details on how the privacy rating of "medium" is determined for an e-voting service, the system provides a structured response. It includes referencing employee answers to relevant questions and offering transparency on how privacy values are computed.

Tab. 1 – Licensing and adaptability of various LLMs (* - with extra conditions) (MindsDB, 2024; UbiOps, 2024).

LLM	License	Commercial?	Adaptable?
Mistral	Apache-2.0	Yes	Yes
GPT-4	Closed Source	No	No
GPT-3	Closed Source	No	No
GPT-2	MIT	Yes	Yes
LLaMa 2	Custom LLaMa 2	Yes	Yes*
BART	Apache-2.0	Yes	Yes
BERT	Apache-2.0	Yes	Yes
Falcon	Apache-2.0	Yes	Yes
Falcon-180B	Custom Falcon	Yes	Yes*

LLM Framework Selection. Selecting an LLM framework was crucial for this project. Transparency and control were key drivers, leading to the adoption of an open-source LLM. This choice ensures visibility into the model's processes, allowing us to understand content generation and address ethical concerns. Such transparency aligns with our ethical AI practices and supports collaboration with the wider AI community. Data security and privacy were also vital. To avoid transmitting sensitive data to third-party providers, we chose a locally deployed solution. This minimizes the risk of data breaches and supports compliance with data protection regulations. Open-source LLMs offer technical flexibility, enabling customization to meet our ethical standards, such as allowing users to verify AI-generated content and supporting human oversight. Additionally, this approach avoids reliance on third-party infrastructure, mitigating risks related to data sovereignty and provider-imposed changes. In summary, our choice of an open-source LLM was based on transparency, privacy, flexibility, and control (Kukreja et al., 2024; Manchanda et al., 2024). This allows us to build a secure, customizable, and ethically aligned system. For the SDEC implementation, we choose the Mistral LLM framework[4].

Tab. 2 – Types and parameter sizes of various LLMs (MindsDB, 2024; UbiOps, 2024).

LLM	Type	# of parameters
Mistral	Decoder-only	7.24B, 46.7B
GPT	Decoder-only	124M, 350M, 760M, 1.3B, 2.7B, 6.7B
LLaMa	Decoder-only	6.74B, 70B
BART	Encoder-decoder	139M, 406M
BERT	Encoder-only	110M, 336M
Falcon	Decoder-only	7B, 40B

Mistral Technical Specifications. Mistral is a decoder-only, Apache-2.0 licensed model, making it commercially usable and highly adaptable. With parameter sizes of 7.24B and 46.7B, it balances performance and efficiency, competing with models like Falcon and LLaMa 2 while avoiding licensing constraints. Unlike closed-source models like GPT-3/4, Mistral enables customization and transparency, as detailed in Table 1. Ethically, Mistral's open license supports independent audits, bias detection, and safety improvements, in contrast to proprietary models. It avoids the restrictive terms found in models like LLaMa 2 and Falcon-180B, enabling ethical development and reducing risks of commercial lock-in. Mistral allows responsible fine-tuning to address bias and fairness. Its parameter efficiency supports sustainable AI development and makes it suitable for deployment in resource-limited environments Table 2. In summary, Mistral's open-source nature, adapt-

[4]Mistral LLM: https://mistral.ai/news/mistral-nemo

ability, and strong technical and ethical features position it as a superior alternative to closed or restricted models (Poszler et al., 2024).

3.2. Workshops with Experts

The experts have been chosen in the following way to provide diverse opinions. P2 and P5 was directly related to the e-voting team, but the rest were from different departments (see list of expert profiles in Table 3). We begin with expert consultations , structured around a customized version of the Delphi method, as illustrated in Figure 7. The primary objective is to engage specialists in fields relevant to the digital service under analysis (e.g., e-voting) and foster an exchange of diverse perspectives. Particular attention was paid to ensure the quality and reliability of the consultations and to avoid potential pitfalls associated with expert interviews, as highlighted in (Döringer, 2021).

Tab. 3 – Background of experts in the survey.

ID	Profession
P1	Communication Specialist E-Government
P2	Team E-Voting Product Manager
P3	Accessibility and Corporate Social Responsibility Specialist
P4	Chief Information Security Officer
P5	Information Security Officer Trusted Interaction Services, E-Voting
P6	Professor on Soft Computing

To accommodate the requirements of digital environments and mitigate time constraints, we adapted the Delphi method to be conducted partially online. This adaptation provides significant flexibility, allowing participants to contribute asynchronously from various geographic locations while maintaining the method's iterative and collaborative nature. The Delphi method offers several distinct advantages, especially when research is scarce, ethically, or logistically complex or where conflicting evidence exists. As noted in (Nasa et al., 2021) and their work on its application within the healthcare sector, the Delphi method has become a critical tool for developing best practice guidelines through collective intelligence over the past decades. While in (Nasa et al., 2021), the authors emphasize consensus-building, our adaptation shifts the focus to capture a broad range of expert opinions. After each round, participants are encouraged to revisit and refine their views, addressing limitations identified in the literature (Nasa et al., 2021) and ensuring a robust collection of insights.

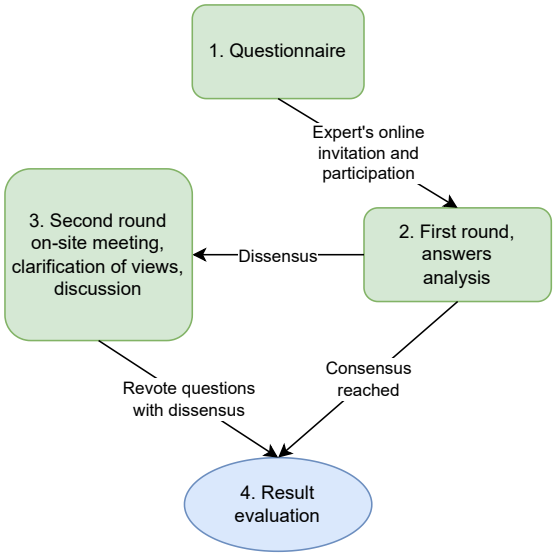

Fig. 7 – Workflow of our customized Delphi method.

For instance, in analyzing ethical concerns for e-voting services, experts were invited to deliberate on critical issues such as data privacy, voter anonymity, and fraud risks. These discussions were further enriched with insights from academic literature, including the emphasis on transparency, as discussed in (Enguehard, 2014). Together, these expert contributions and literature-based considerations form the foundation for the subsequent stages of the framework.

3.3. Survey Creation and Implementation

Once the expert discussions are complete, the concerns raised are distilled into a comprehensive survey aimed at service providers. This survey evaluates how the digital service is implemented from an ethical perspective. The questions cover multiple ethical factors related to the service, including the following:

- How is data privacy managed in the service?

- What measures are in place to ensure transparency?
- How does the service protect against malicious misuse?

The questions are grounded in expert opinions and existing literature to ensure a well-rounded assessment. End users, such as Swiss Post employees, interact with the survey through a web application designed specifically for this purpose. This app provides real-time feedback as the user answers each question.

3.4. Analysis and Recommendations

After completing the survey, users receive an analysis of their service's ethical concerns. The analysis includes:

- **Visualised Data**: A chart that summarises the levels of concern across different ethical domains (e.g., privacy, transparency, security).
- **Static Recommendations**: A list of suggestions for mitigating the identified risks, accompanied by citations from the relevant literature.
- **AI-driven Insights**: Users can use a service-trained LLM to explore further ethical implications and ask questions about specific issues.

Figure 8 provides an overview of these components in the evaluation process. The technical backbone of this framework involves leveraging pre-assessment surveys and interactive web technologies to deliver a seamless user experience.

An illustrative example from the forty-question framework demonstrates the computation of values for the smart radar is presented in Figure 6. To illustrate, consider the following question with predefined response options: *"Which authentication method is utilized in the service?"* The available choices are:

1. One-Time Password (OTP), level 2 domination, level 3 privacy
2. Multi-Factor Authentication (MFA), level 4 domination, level 5 privacy
3. Blockchain Authentication, level 3 domination, level 3 privacy
4. Biometric Authentication, level 8 domination, level 7 privacy
5. None

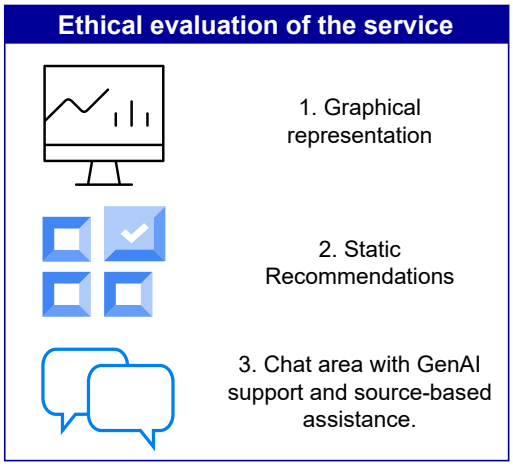

Fig. 8 – Overview of the ethical evaluation process, including graphical representation, recommendations, and AI-supported insights.

Each authentication mechanism influences ethical concerns, such as privacy, trust, and domination, as substantiated by scholarly literature (Druliac et al., 2024; Lauer, 2004; Trechsel et al., 2016). This question is accompanied by predefined static recommendations designed to enhance ethical compliance. Users receive tailored recommendations if the cumulative calculation across all questions exceeds a defined threshold (currently set at 0.6 out of 1). For example:

1. **Enhancing Privacy Protections:** To mitigate privacy risks, ensure that any personal data collected through MFA processes, such as phone numbers or email addresses, undergoes encryption and secure storage. This measure bolsters voter confidentiality and strengthens trust in the system (Lauer, 2004).
2. **Implementing Secure Authentication Mechanisms:** Combine multi-factor authentication (MFA) with a lightweight token-based OTP system to enhance security. Additionally, incorporate privacy-preserving techniques, such as hashing user identifiers, to reduce privacy threats (Druliac et al., 2024).
3. **Ensuring Secure Data Storage:** All personal data gathered during authentication must be encrypted and securely stored, ensuring confidentiality and integrity (Trechsel et al., 2016).

When users provide answers to questions, their selected responses determine concern levels associated with specific ethical factors. Based on expert opinions and literature, a concern score (1 to 10) is assigned to each answer for relevant ethical concerns. In this context, domination and privacy are two concerns commonly evaluated for such questions.

The scores are aggregated following a systematic procedure. The concern score contributes to a cumulative sum for each question for the respective ethical concern. The overall evaluation is calculated by summing the concern scores for each question and dividing by the total possible score. Assuming there are 20 questions, each with a maximum score of 10, the total maximum score for each concern is 200. If the cumulative score for privacy is 120 and for domination is 80, the evaluation is computed as follows:

$$\text{Evaluation (Privacy)} = \frac{120}{200} \times 100 = 60\% \tag{1}$$

$$\text{Evaluation (Domination)} = \frac{80}{200} \times 100 = 40\% \tag{2}$$

Based on the resulting percentage, the framework assigns fuzzy linguistic variables (e.g., *very high, high, neutral, low, very low*), which allow for more flexible and human-like reasoning by representing qualitative assessments rather than rigid numerical inputs. Figure 9 shows an example of the interface and the evaluation of ethical concern "exclusion" equal to "high risk." This is particularly useful in complex systems where expert judgments vary or when dealing with vague concepts such as ethics, trust, or risk.

By leveraging fuzzy logic, linguistic variables enhance interpretability and adaptability, leading to more realistic and context-aware evaluations (Zadeh, 1965, 2008). Furthermore, in Figure 9, a colored gradient is presented from *very low* to *very high* using a fuzzy index between (0:1). It indicates the overall ethnicity of the public digital services (see additionally Figure 6).

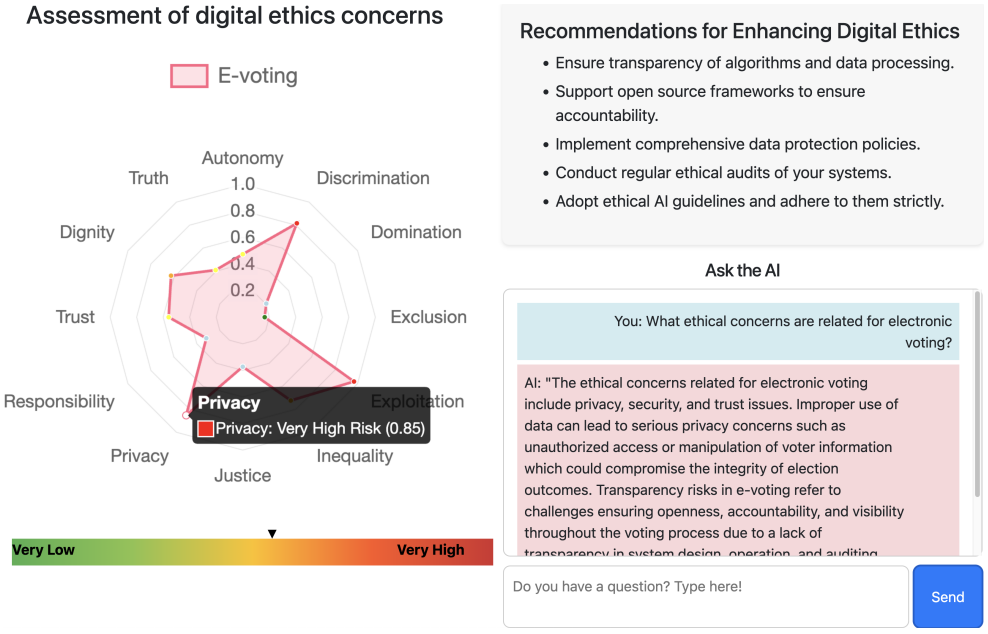

Fig. 9 – Swiss Digital Ethics Compass Interface.

Special Case Considerations: Not all questions adhere to the additive scoring model described in subsection 4.3. Certain questions are designed to assess the issue's magnitude rather than directly contribute to cumulative scores. For instance, consider the question: *"Specify the total number of eligible voters:"*

1. Less than 1k
2. 1k - 10k

3. 10k - 100k
4. 100k - 1M
5. More than 1M
6. None

This question evaluates the scale of the population affected and is used as a multiplier for related questions. By incorporating this proportionality, an issue's ethicality is scaled to reflect its broader societal impact.

The final scores for the smart radar are computed using the mathematical formula detailed in subsection 4.3 (see Equation 3). This comprehensive approach ensures that qualitative and quantitative ethicality dimensions are captured accurately. The threshold, which is set at the moment 0.6 out of 1, then the user gets the following recommendation:

1. Enhancing Privacy Protections: To mitigate privacy risks, ensure that any personal data collected through MFA processes, such as phone numbers or email addresses, undergoes encryption and is securely stored. This measure reinforces voter confidentiality and strengthens trust in the system's privacy safeguards (Lauer, 2004).
2. Implementing Secure Authentication Mechanisms: Employ multi-factor authentication (MFA) with a lightweight token-based OTP system to fortify security. Additionally, integrate privacy-preserving techniques, such as hashing user identifiers (e.g., phone numbers), to minimize exposure to privacy threats (Druliac et al., 2024).
3. Ensuring Secure Data Storage: All personal data gathered during the authentication process should be encrypted and stored securely, fostering trust by guaranteeing the confidentiality and integrity of voter information (Trechsel et al., 2016).

Once the user answers the question, he/she provides the system with a fact. Based on this fact, the level of concern is extracted. In this case, we use a table that maps each answer to the relative concern level from 1 to 10 based on experts' opinions, literature research, and logic. The values for smart radar are calculated utilizing a mathematical formula (described in subsection 4.3, Equation 3).

All final questions and static recommendations for the Compass can be found in the GitHub repository: [5].

4. Mathematical Model Development and Application of the Delphi Method

This framework employs a structured methodology combining mathematical modeling and the Delphi method to evaluate and address ethical concerns in digital services, specifically on e-voting systems. By integrating expert input, literature reviews, and iterative refinement, we quantify ethical challenges across five general ethical factors: improper use of data, cybersecurity risks, lack of transparency, disparity of treatment, and sustainability. The resulting framework provides actionable insights for stakeholders to improve service integrity (see subsection 4.2).

4.1. Methodological Overview

Our approach involves the following key steps (additionally, see Figure 5):

1. **Literature Review**: A comprehensive review of academic and industry sources was conducted to identify and understand ethical concerns in digital services. It included broad research on ethics in digital contexts and a focused analysis of e-voting systems. Robinson et al. explored ethical issues in e-voting security analysis, emphasizing vulnerabilities in system architectures (Robinson and Halderman, 2011). The authors outlined fundamental principles and requirements for a secure e-voting system, providing a framework for ethical considerations in digital voting (Gritzalis, 2002).
2. **Expert Discussions Using the Delphi Method**: Partnering with Swiss Post, we engaged six experts with diverse backgrounds. Leveraging the Delphi method (Linstone, Turoff, et al., 1975), a structured approach to achieving consensus among experts, we facilitated rounds of discussion to identify and evaluate critical ethical issues. The method, known for its iterative process of refining expert opinions (Dalkey and Helmer, 1963), enabled the experts to rate concerns on a scale from 1 (no concern) to 9 (maximum concern). It provided a robust, quantitative foundation for the model.

[5] Additional materials for the project: https://github.com/SwissDigitalEthicsCompass

3. **Weighted Evaluation System**: Based on expert input, we developed a mathematical model that calculates concern levels using weighted averages. These weights reflect the severity and importance of ethical risks and were normalized between 0 and 1 for consistency.
4. **Identification of Risk Scenarios**: A subsequent literature review focused on the e-voting domain to identify potential risk scenarios. For example, in (Lauer, 2004), the authors discussed the inherent risks of e-voting, highlighting the potential for breaches in security and voter trust. Insights from this review informed the development of targeted survey questions, ensuring the survey addressed critical vulnerabilities and ethical considerations in e-voting systems.
5. **User Survey Development**: A survey was created with 40 questions designed to evaluate the ethical and practical implications of e-voting services. In developing the survey, we tried to adhere to literature-proven methodologies for survey design and evaluation (Fowler Jr and Cosenza, 2009), ensuring a rigorous approach. The survey aims to collect data from end users and service developers, providing a foundation for refining the evaluation and addressing critical concerns in e-voting systems.
6. **Scoring and Concern Levels**: Survey responses are analyzed against a predefined table, assigning concern levels to each answer. These levels are aggregated to provide an overall evaluation of the service.
7. **Results Presentation**: Results are displayed on a dedicated website, offering static recommendations based on survey outcomes and a dynamic interface powered by a language model trained on scientific literature. The findings are also visualized using radar charts to highlight key concerns.

4.2. General Ethical Factors

The general factors are defined as five macro areas that serve as the foundation of our investigation (Andreasyan et al., 2024). This categorization was chosen to facilitate understanding and to group ethical concerns into specific categories, enabling a more focused and contextualized study. These factors are sufficiently broad to encapsulate all the ethical issues associated with e-voting systems. However, as noted in the conclusion in section 6, this framework is part of an iterative process and is subject to ongoing refinement. Future iterations, informed by expert input, may expand the number of factors to better address specific use case requirements.

Improper Use of Data. This factor evaluates risks related to data autonomy, privacy, and potential misuse of personal information. Expert ratings were used to develop a scale measuring the severity of data misuse concerns.

Cybersecurity Risks. Cybersecurity was assessed based on its role in ensuring privacy, trust, and fraud prevention. Weighted scores highlight the importance of robust authentication mechanisms and organizational accountability.

Lack of Transparency. Transparent communication and system comprehensibility were identified as critical factors for fostering trust and preventing exploitation. Numerical assessments informed recommendations for enhancing public trust in e-voting systems.

Disparity of Treatment. This factor addresses ethical concerns from unequal treatment, such as the digital divide and systemic exclusion. The model integrates expert evaluations to promote fairness and inclusivity.

Sustainability. Experts assessed environmental and economic considerations, including material reuse and cost efficiency. Sustainability scores were incorporated to balance ethical and practical priorities in e-voting systems.

4.3. Scoring and Explanation

The framework's scoring system for the end-user survey uses a formula designed to aggregate the concern levels derived from user responses. This method ensures that the results are normalized and accurately represent ethical risks. The calculation is defined as follows.

$$S = \frac{\sum_{i=1}^{n} C_i}{\sum_{i=1}^{n} M_i}. \tag{3}$$

where S is the normalized concern score. C_i represents the concern level for the ith question, derived from the user's response. M_i is the maximum possible concern level for the ith question. n is the total number of questions answered by the user.

Explanation. The numerator ($\sum_{i=1}^{n} C_i$) sums up the concern levels indicated by the user's responses across all survey questions. These levels are derived from predefined scales (e.g., 1 to 9) that measure the severity of ethical risks. The denominator ($\sum_{i=1}^{n} M_i$) represents the sum of the maximum possible concern levels for the same set of questions. The formula normalizes the score by dividing the actual concern levels by the maximum potential concern levels, ensuring it falls within a range of 0 to 1. A higher score indicates more significant ethical concerns across the evaluated dimensions. This normalized score provides a concise and comparable measure of ethical risks, enabling stakeholders to prioritize areas requiring intervention or improvement.

5. Results

We employed a customized Delphi method to explore ethical concerns in public digital services, focusing on an e-voting use case and engaging expert opinions through iterative discussions. This approach was designed to capture a broad range of insights rather than reaching a consensus, prioritizing diverse perspectives that could shape a nuanced ethical analysis. Experts evaluated ethical general factors such as improper use of data, cybersecurity risks, lack of transparency, disparity, and sustainability with ratings assigned to each ethical concern based on their perceived significance within the context of Swiss Post's e-voting service (see subsection 4.2). This method allowed experts to highlight key aspects, such as privacy, fairness, and transparency, regarding their impact on public trust and data security.

Further, after implementing the Delphi method, the findings were integrated into a structured survey, specifically assessing digital services on ethical concerns. Experts rated various concerns, from minimal to high significance, identifying risks like inequality, discrimination, and environmental sustainability related to e-voting, such as unequal access to digital infrastructure and the environmental footprint of on-site voting. These ratings contributed weighted factors that were essential in building a final model, a straightforward linear framework assigning weights to each question, enabling the classification of ethical risks. The resulting model, a functional tool for ethical analysis, offers quantifiable measures of ethical compliance, allowing Swiss Post to prioritize critical ethical factors within digital voting services. By systematically processing expert insights into weighted survey responses, we developed a robust framework highlighting ethical concerns, providing a scalable and adaptable assessment tool for evaluating ethical risks across other sectors and digital applications.

6. Conclusion

Our framework is currently in the research phase, with initial testing focused on Swiss Post employees as our target users. We are continuously refining the expert discussion process to ensure it yields actionable insights, and we plan to enhance the survey tool to allow for more robust data analysis. In the future, we aim to expand the framework to a broader audience, allowing for assessing ethical concerns in various digital services. **Iterative Refinement and Broader Applications**. While already effective for e-voting use cases, the current framework is designed for iterative improvement. Future iterations will include the following.

- **Expand Expert Participation**: Increasing the number and diversity of experts to reduce bias and enhance the model's robustness.
- **Refine Weights and Survey Questions**: Conduct additional Delphi rounds and review survey weighting mechanisms for greater precision.
- **Broaden Contextual Applicability**: Adapt the framework to other digital services, leveraging insights from diverse sectors.

This iterative methodology ensures the framework's continuous evolution, enabling it to address emerging ethical challenges in digital services with precision and adaptability in different sectors. The prototype in Figure 9 is under development. It is expected to complete its implementation considering ethical concerns related to digital platforms and GenAI. Afterward, user-centric evaluation with employees has to be conducted to evaluate ethical problems and interface usability. In conclusion, our framework provides a scalable and

adaptable solution to evaluate ethical concerns in digital services. Combining expert discussions, surveys, and automated analysis enables service providers to identify and mitigate risks proactively. Over the coming months, we aim to transition from research to full implementation, targeting a service release within the next few years. Furthermore, we will compare and evaluate different LLM frameworks and versions in our compass for different use cases. In addition, it is plannednned to implement linguistic summaries basedfuzzy logic using static recommendationstions and smart radar valueimproveprove explainability and interpretability by converting numerical patterns into natural language insights (Kacprzyk and Yager, 2001; Wrede et al., 2022). The implementation will focus on the development of an adaptive summarization model that generates context-aware linguistic interpretations.

Acknowledgment

Special appreciation goes to Christina Meyer and Sophia Ding from Swiss Post for their important role in advancing this work. We are also thankful to the reviewers, whose critical insights greatly enhanced the clarity and quality of the final manuscript. This project was funded by Innosuisse – Swiss Innovation Agency (project number 102.887 IP-ICT).

Track 19: Sustainable Public and Open Data Ecosystems for inclusive and innovative Digital Government

Track Description

Public and open data ecosystems promise the transformation of government data-driven actions, the fostering of public sector innovations, and the collaborative smartification of cities, society , and life, triggering value-adding sustainable development goals-compliant smart living and society 5.0. New research is needed to help public managers and politicians with (1) implementing emerging technologies and technological innovations, (2) improving the achievement of sustainable development goals for increasing transparency, participation, and cooperation, and (3) meeting the stakeholders' expectations, needs, regulations, and demands.

Abstract. The growth in Open Government Data (OGD) availability over the last decade offers significant potential for promoting transparency and improving operational efficiency in government. OGD can support the identification of inefficiencies and the extraction of process models through Process Mining (PM) applied to public service tasks. Various OGD portals, maintained by federal and subnational governments, provide access to diverse public datasets that can be explored for these purposes. Applying PM to OGD, however, requires addressing key aspects such as the tabular nature of data, variability in quality and standardization, and the frequent lack of process context. This study proposes a method to classify and evaluate OGD datasets based on their relevance and potential for process discovery. The method was applied to data from the Brazilian Federal OGD portal (dados.gov.br) to investigate whether OGD can be effectively used in PM tasks to identify processes and bottlenecks. The research involved steps of data collection, selection, and evaluation. Datasets were classified based on their potential utility and suitability for transformation into event logs. The results showed that 24% of the sampled datasets were considered relevant for PM, with 23% in dated tabular format and 1% already in event log structure. Moreover, 52% of the datasets addressed public policies, suggesting the potential of PM to reveal inefficiencies in processes that affect citizens. These findings demonstrate that, with structured evaluation criteria, PM can be effectively applied to public data. This research contributes by presenting an empirical and replicable method to support the evaluation and preparation of OGD for PM applications in digital government. The results reinforce the importance of adopting clear assessment protocols to broaden the use of OGD in understanding and improving public processes.

Research paper, DOI: https://doi.org/10.59490/dgo.2025.1041

1. Introduction

In the context of digital government, Open Government Data (OGD) is a transparency policy that enables broad dissemination of information on public services such as hiring, document issuance, and certifications (Jetzek et al., 2019). This dissemination seeks to enhance transparency and support external analyses that contribute to optimizing these services. Despite its potential, studies applying Process Mining (PM) to OGD remain limited and are considered rare (Rawiro et al., 2023), revealing a gap in the literature and the need for methodologies that leverage OGD to discover and improve public service processes. PM plays a key role in public administration by enabling process discovery and operational analysis based on real activity data. Its openness and adaptability present valuable opportunities to expand its application in the public sector.

Another challenge involves citizen engagement in data analysis (Barcellos et al., 2024). Improved methods are essential to facilitate access and interpretation of OGD, enabling more meaningful participation and con-

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

tributing to better public service processes (Lanoue, 2020). Accessible metadata can democratize analysis and promote broader involvement, helping to harness OGD's potential to identify and address service bottlenecks. In this context, bottlenecks refer to delays, rework, or inefficiencies in public service operations revealed through the process execution flow.

Recent research has explored the application of PM in various public contexts, such as improving processing times in birth registration in Indonesia (Febrianti, 2024), and in Brazil, analyzing judicial data to enhance the efficiency of the justice system (Unger et al., 2021). It has also been used to identify gaps, bottlenecks, and redundancies in regulatory processes proposed by the Federal Executive Branch (da Costa et al., 2020). However, the application of PM on OGD faces significant challenges due to availability, data quality and suitability for such analyses, like the lack of specific context that accompanies the data.

This study aims to assess these challenges by proposing a method for evaluating OGD datasets, available on OGD portals, in order to identify which datasets can be effectively used in PM tools, particularly to discover processes and address bottlenecks in public service operations. Our main Research Question (RQ) in this work is to verify whether OGD can be used to identify processes and their bottlenecks, which we divided into two Research Questions (RQs): (RQ1) "How to evaluate the application of OGD in PM tools to discover processes and bottlenecks in the public service?", and (RQ2) "What criteria are needed to select and prepare OGD for process mining?".

Our method was applied on the Brazilian Federal Government's open data platform. We observed a significant and varied data source indicating that our method offers an approach tailored to the complexities of government data (da Costa et al., 2020; Macedo & da Silva Lemos, 2024). In this context, the research was structured into three main phases: data collection, selection, and evaluation. During the collection phase, the open data portal to be used was mapped and defined, followed by the determination of the sample, collecting datasets, organization, and classification based on relevance. In the selection phase, a preliminary selection of datasets was carried out, where ranking criteria were established, calculated, and normalized for standardized comparison, leading to the selection of the highest-ranked datasets for testing in PM tools. In the final phase, the tests were executed, and the final evaluation was conducted.

Our work contributes by proposing a categorization for the data available on Brazilian government open data portals and to the practices of PM on OGD datasets, providing steps for the evaluation and preparation of datasets that facilitate the identification of processes and operational bottlenecks. From this work, researchers and professionals can evaluate and prepare OGD for PM analyses, to identify the inherent processes within the data and detect bottlenecks, thereby enhancing the understanding of the data and the efficiency of governmental processes. This paper has been structured as follows: a background of PM to process discovery and bottlenecks identification has been presented in Section 2. Literature review in Section 3. Our Method in Section 4. In Section 5 the analysis of dados.gov.br. Finally, the conclusions and future work in Section 6. Supplementary sections such as acknowledgments and appendix follow the main content.

2. Process mining to process discovery and bottlenecks identification on OGD

PM is considered the missing link between process science and data science, bringing process perspective and behavioral insights to machine learning and data mining (der Aalst, 2016). It can be applied across domains to identify processes and bottlenecks, supporting improvement efforts. By 2025, 80% of companies are expected to use PM in at least 10% of their operations (Kerremans et al., 2023), and by 2026, 25% of global companies should adopt PM tools (Kerremans et al., 2024). Google Trends data shows increased interest in "process mining" since 2019, especially in Brazil (Google LLC, 2024).

Event data, which provide details on when, where, and under what context specific activities occur, are crucial for PM. Despite the varied sources and forms of these data—from event logs to tabular datasets—aligning them with a process perspective remains a challenge (de Murillas et al., 2019; der Aalst, 2016). This is especially true for OGD, which often lacks detailed process context. The term "data without context" refers to the absence of crucial information about data origin, collection methods, and purpose, making analysis more complex. This is a specific challenge in PM on OGD, as there is usually no access to data originators for clarifications that could enrich interpretation.

From a digital government perspective, as PM continues to advance, its application in the public sector be-

comes increasingly strategic. Since the 1950s, digital government efforts have aimed to enhance transparency, efficiency, and citizen engagement. Parks (1957) emphasized that open government and access to information should be the norm in public administration worldwide. These initiatives sought greater accountability, driven by the goal of democratizing knowledge and increasing transparency (Barcellos et al., 2022; Corrêa et al., 2017). Supported by Freedom of Information (FOI) laws, OGD portals serve as key platforms to promote transparency, improve service quality, and enable citizen participation in democratic processes (de Oliveira et al., 2024).

To enable citizen participation through OGD, data must be accessible and interpretable (Barcellos et al., 2022). Challenges such as complexity, lack of standardization, availability, and format (Rajabi et al., 2023; Vasconcelos et al., 2020) hinder the effective use of OGD. Rajabi et al. (2023) note that most OGD portals do not adhere to Linked Data standards (Berners-Lee, 2006), while Vasconcelos et al. (2020) highlight inconsistencies that make preprocessing essential. Furthermore, public data is often statistical, such as census or demographic tables (Rajabi et al., 2023). Although standardized data improves understanding and decision-making (Heumann et al., 2024), PM requires more specific characteristics to be feasible: sequential event data with case identifiers, timestamps, and activity labels (Burke et al., 2024; der Aalst, 2016; Elkoumy et al., 2023).

These structural elements (caseid, timestamp, and activity) are mandatory for datasets to be used in PM. In this work, to test the datasets identified through our method, we selected ProM, Disco, and Celonis, three widely used tools in academia and industry (de Vasconcelos et al., 2024a). ProM, an open-source tool, is known for its flexibility and rich plugin ecosystem (der Aalst, 2016); Disco, developed by Fluxicon, stands out for its intuitive interface; Celonis leads the market with support for automated data entry and complex analytics (Kerremans et al., 2024). Despite the opportunities OGD offers for process discovery, applying PM techniques remains challenging, particularly due to data inconsistency and absence of context. The next section explores how these limitations are addressed in the literature.

3. Literature Review

Recent publications indicate a growing interest in digital government topics, including OGD. This trend was verified by a search in the Scopus database using queries related to broader themes connected to this study: digital government or open data (egov), digital government in computing (egov-comp), and process mining (pm)[1]. According to the retrieved data, publications in the egov category reached 5,851 in 2024, an increase of 7% compared to 2023, reinforcing the relevance of initiatives exploring the reuse of public data to improve government processes. Among the motivations found in the literature, we highlight the need for transparency (Corrêa et al., 2017), democratization of knowledge (Barcellos et al., 2022), reuse of public data (Rawiro et al., 2023), and the availability and interpretability of information (Barcellos et al., 2022).

To answer research questions RQ1 and RQ2, on identifying processes, bottlenecks, and assessing the quality of public data available on OGD portals, a literature review was conducted to identify exploratory studies and methodologies supporting the understanding, treatment, and standardization of OGD for PM. The search string used was: (“exploratory” OR “analysis” OR “categorization” OR “investigation” OR “application” OR “methodology” OR “process mining tools” OR “open data”) AND (“process mining” AND “government”).

Following structured steps inspired by Rapid Review principles (Cartaxo et al., 2020), studies were selected through mapping, filtering, and data extraction. Searches were performed in Scopus (Elsevier B.V., 2025), for its peer-reviewed content, and Google Scholar (Google LLC, 2025), due to its broad coverage. In Scopus, 45 articles were retrieved. In Google Scholar, with filters (2020–2024, peer-reviewed, excluding citations), 401 results were found. After reviewing titles, abstracts, and keywords, 47 articles mentioning “process mining” and “government data” were selected and fully read to ensure relevance. These studies supported the identification of research gaps and definition of this study’s scope.

The review revealed significant gaps in applying PM to OGD. One major challenge is the lack of methods for processing and selecting OGD for PM tools, especially when contextual information is missing (de Vasconcelos

[1]The data was retrieved from Scopus using the following queries to *egov*, *egov-comp* and *pm*, respectively: (i) TITLE-ABS-KEY((digital AND government) OR (open AND government AND data)); (ii) same as (i) but filtered by subject area “COMP”; (iii) TITLE-ABS-KEY(process AND mining). These strings represent broader research themes connected to this work and were not limited exclusively to OGD. The intention is to illustrate general trends relevant to the study.

et al., 2024a; Rawiro et al., 2023). Although some publications apply PM in public sectors, such as health, administrative workflows, resource optimization, compliance, and citizen services (Chen et al., 2023, 2024; da Costa et al., 2020; de Murillas et al., 2019; Dilmegani, 2024; Drakoulogkonas & Apostolou, 2021; Erdem & Demirörs, 2017; Ito et al., 2020; Rawiro et al., 2023; Unger et al., 2021; Zerbato et al., 2021), there is still a lack of methodologies for categorizing and evaluating data attributes required for PM (de Murillas et al., 2019; Zerbato et al., 2021).

Although PM requires event data, few studies address the transformation of OGD into event logs, an essential step for process discovery (de Murillas et al., 2019). The use of AI techniques to process event logs in the public sector also remains underexplored (Seeliger et al., 2019), and no study was found that comprehensively defines selection criteria or maps key data attributes for PM. Most public data originates from varied sources (databases, ERP systems, transaction logs, spreadsheets, or CSV files der Aalst, 2016) and is typically tabular, requiring transformation into event logs, a complex yet crucial process. Despite these challenges, PM techniques have shown value in the public sector. In Brazil, PM was used to analyze judicial data, improving justice system efficiency (Unger et al., 2021); to identify bottlenecks in regulatory processes within the Federal Executive Branch (da Costa et al., 2020); and to reduce processing times in birth registration (Febrianti, 2024). Still, limitations in infrastructure, trained personnel, and data quality remain critical barriers.

Therefore, some gaps were identified in literature review, like: (i) methods for processing and selecting OGD for PM tools, spatially handling data without context knowledge, (ii) methods for categorizing and evaluating data attributes for process analysis, (iii) studies focused on transforming data into event logs from governmental data, and (iv) the use of artificial intelligence techniques to process existing event logs, adapted to the objectives or needs of governmental organizations. However, in this work we focus is on these gaps (i) and (ii). Given this gaps identified, this study aims to address these challenges by proposing a method for evaluating OGD datasets to process discovery and bottleneck identification, contributing to the broader application of PM techniques in digital government.

Complementary to this, a previous study conducted a comparative analysis of the PM tools most commonly used in academia and the market (de Vasconcelos et al., 2024a). This study, based on a qualitative and quantitative evaluation of tool functionalities and various criteria, served as the foundation for selecting the tools applied here. Building on these findings, an empirically based study was conducted, starting with the choice of the OGD portal, followed by data collection, selection, and evaluation.

Although PM techniques have gained attention in various domains, their application to OGD remains limited, as discussed in Section 2. As identified in the literature review (Section 3), few studies address how to select and assess OGD for use in PM tools, particularly when the data lacks context or is inconsistently structured. These gaps motivated the formulation of this study's Research Questions, as presented in the introduction. The following section presents the methodological approach developed to address them, focusing on the collection, classification, and evaluation of OGD datasets, with particular emphasis on their suitability for process discovery and bottleneck identification.

4. Our Method

For the development of the research, Brazilian OGD was chosen as the source of the case study. The research was organized in steps to collect OGD from the Brazilian open data portal, to evaluate the datasets available on OGD portals: may these datasets can be used to identify processes and bottlenecks? This is our main Research Question (RQ). OGD-PM Evaluation Method (Open Government Data Process Mining Evaluation Method) was divided in steps into collection, selection and evaluation (Figure 1), with the aim of proposing a method for processing OGD datasets, as well as categorizing and selecting the datasets according to the attributes required for PM, covering gaps (i) and (ii). A visual overview of all these stages (Steps 1 to 3) is available online[2].

The choice of Brazilian data stems from the size and diversity of the country, which has a vast population, varied regional interests and numerous public institutions. Despite its potential, many Brazilian cities face limitations that hinder investment in information technology, as well as challenges in the knowledge and application of new technologies for the management and standardized availability of public data (Barcellos et al.,

[2]Visual summary of the OGD-PM Evaluation Method steps, provided in a mind map "Evaluating datasets of open government data for identifying processes".

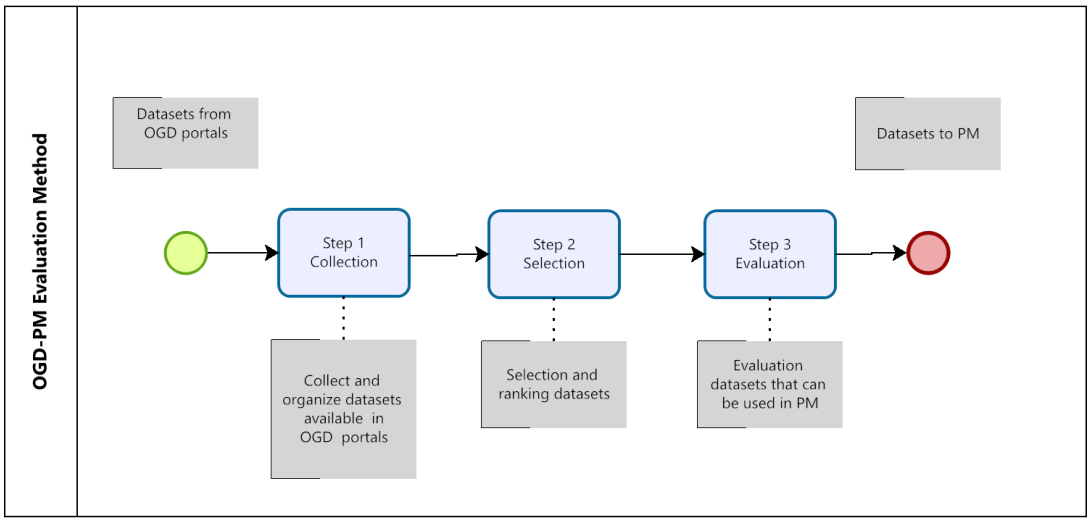

Fig. 1 – OGD-PM Evaluation Method (Open Government Data Process Mining Evaluation Method): Steps of evaluating datasets of open government data for identifying processes and bottlenecks.

2022). This scenario of large scale and diversity makes Brazil an ideal environment for investigating solutions that can improve the transparency and efficiency to population and government institutions. This diversity, combined with the frequent lack of structure in public datasets, makes Brazilian OGD a suitable field for empirical investigation. These characteristics justify its selection for the application of the proposed method, as presented in the Section 5.

4.1. Defining the portal and the sample

To clarify the development of our OGD-PM Evaluation Method (Figure 1), it is important to note that the approach was built empirically, based on exploratory testing and refinement. Initial tests were conducted using publicly available datasets already structured for process mining, allowing the authors to explore initial evaluation parameters and classification strategies. Subsequently, some OGD from ANEEL (the Brazilian Electricity Regulatory Agency) was analyzed[3], selected based on domain familiarity but without knowledge of the internal processes involved. These preliminary experiments are documented in *de Vasconcelos, 2024*. This enabled the identification of challenges typical of OGD, such as data without process context. The method was gradually refined throughout the experimentation conducted on datasets from the Brazilian open data portal.

Therefore, we need to analyze the extent to which the data made available on open data portals can be used in PM tools, to achieve the objective which is possible to apply discovery techniques of PM to OGD, to identify possible bottlenecks and propose improvements. To begin the study, the main Brazilian data repository portals were mapped for potential research. To do this, a search was carried out for articles in the Scopus database (Elsevier B.V., 2025) and the Google Scholar database (Google LLC, 2025) to find publications listing the main portals, in the same manner as the literature review (Section 3). At this point, the aim is to select a portal as the starting point for the Brazilian case study, based on the following search string: “brazilian” AND “open data portals” AND “government”.

The search returned a total of 508 papers, considering the results from 2018 to 2024. The abstracts were analyzed and those that mentioned “Brazilian open data portals” was selected. The research identified that there are independent Brazilian open data portals, but it was identified that dados.gov.br[4] and the Transparency Portal[5] are the main open data portals of the Brazilian Federal Government (Brazil, 2024a, 2024b; Macedo & da Silva Lemos, 2024), published by the Federal Government, various State and Municipal bodies. The Transparency Portal focuses on financial and budgetary data, providing transparency in the use of public resources.

[3] The RALIE dataset (Report on Monitoring the Expansion of Electricity Generation Supply - *Relatório de Acompanhamento da Expansão da Oferta de Geração de Energia Elétrica*) is composed of four open datasets available for download on the ANEEL open data portal here, with an interactive dashboard available here. All materials are in Portuguese.

[4] Open Data Portal (content in Portuguese): https://dados.gov.br/home

[5] Transparency Portal (content in Portuguese): https://portaldatransparencia.gov.br/

The dados.gov.br portal brings together a variety of datasets with diverse content, promoting the reuse of data for different purposes. Given the range of information and the aim of the research, dados.gov.br was chosen as the data source for this study.

Based on this, the information available on the Brazilian Federal Government's Open Data Portal - dados.gov.br (Brazil, 2024a) was analyzed, which provided 12,789 datasets verified on 14 March 2024. For statistical analysis of the data, a systematic representative sample of the population was carried out, with size calculated based in equation Eq.1, where n represents the selected sample size, N the population size referring to the dataset available on the portal, Z the standardized z-score value corresponding to a 95% confidence level (which in this case was 1.96), p the standard deviation of 50% to ensure the sample is sufficiently large, and e the margin of error set at 0.05, determining the maximum permissible error. Based on these parameters, the calculated sample size was 373 datasets to be collected from the portal.

$$n = \frac{N \cdot Z^2 \cdot p \cdot (1-p)}{Z^2 \cdot p \cdot (1-p) + e^2 \cdot (N-1)} \tag{1}$$

4.2. Cataloging the data obtained

The collection stage primarily involves defining the OGD portal, the sample, and the organization of the datasets, involving steps of mapping the OGD portals, defining the chosen portal, defining the sample, collecting the datasets, organizing the datasets and classifying them according to relevance, prioritizing event logs and tables with temporal data, ensuring a structured collection in line with the study's objectives. The data was organized with metadata information obtained from the OGD portal such as the "originating agency", "links" and "file names". As an important part of the proposed method, another metadata defined was the "categorization", established on the type of data collected.

Therefore, the datasets has been organized and categorized for the analysis and selection of data that are relevant to the objectives of this research. This information were created from the data collected to standardize information and not from a pattern defined on the portal. The description as shown in Table 1, according to the datasets available on the dados.gov.br open data portal: assimilating the title (i), the body responsible for the data (ii), the download link (iii), the name of the file (iv) and its categorization (v) in order to identify if the file refers to an event log (1), if there is a complete date that can be used as a Timestamp (2), if it consists a list of data or an information table (3), documents (4), if there is no file at all (5) or just a link to another portal (6). The full list of categorizing datasets can be found in online repository (de Vasconcelos et al., 2024c) of datasets and more information.

Tab. 1 – Description of the categorized datasets obtained from the Brazilian Federal Government's Open Data Portal - dados.gov.br[4]

Column	Name	Description	Domain of collected data
(i)	Dataset	Title of the dataset	Text
(ii)	Organization	Originating organization	Text
(iii)	Link	Link to the data on dados.gov.br	Text
(iv)	File	Name of the file	Text
(v)	Categorization	Categorization of the obtained dataset	(1) Event logs
			(2) Data table with date
			(3) Data table (list)
			(4) Documents
			(5) Nonexistent file
			(6) Nonexistent file - external link

Based on the categories defined in item (v), Table 1, in order to verify whether the datasets could be used in PM tools, the data obtained from the dados.gov.br portal was analyzed and classified as "Relevant" or "Not Relevant" for this research. Among these, only categories (1) and (2) were considered "Relevant" for this research, as they met the necessary conditions for process mining. The remaining categories were classified as "Not Relevant" due to lack of required structure or accessibility. The complete table with all the datasets and their relevance classification is available at the online repository[6] (de Vasconcelos et al., 2024b).

[6] Link for the complete table with the results of the analysis the data obtained from the dados.gov.br portal, classifying them as "Relevant" and "Not Relevant" for the research: open_data_sample.xlsx

Although categories (3), (4) and (6) could be more deeply analyzed and methods for transforming and adapting the data studied, we didn't go into this merit in the study, opting for more objective resources for the preliminary development of the research, choosing categories (1) and (2) as relevant. These decisions are grounded in the core requirements for PM, which include the presence of identifiable case identifiers, timestamps, and activities. Only datasets categorized as (1) Event logs and (2) Data tables with date were found to potentially satisfy these conditions, justifying their classification as "Relevant".

4.3. Definition of ranking criteria

In order to make a ranking of the selected datasets to classify them according to their score, criteria to assessment metadata from datasets were created according to the information (In), importance (I), difficulty (D) and ease (E) of manipulation. These criteria were developed empirically, based on the practical challenges faced during the development of the research, based on tests carried out with various datasets. In this way, the information contained in each dataset was qualified according to these criteria. The focus was to create criteria that reflect specific demands of process mining applications, and their structure was refined iteratively as the analysis progressed. Table 2 shows all the evaluation criteria and their domains used to carry out the study. In items 6, 7 and 8, the integer domain from 1 to 5 corresponds to 1 minimum and 5 maximum values. The criteria were refined iteratively as the study progressed and were specifically designed to support the identification of datasets most suitable for PM. Further information on this research can be found in an online repository (de Vasconcelos et al., 2024b).

Tab. 2 – Evaluation and qualification criteria for the selected datasets

Item #	In/I/D/E	Criteria	Domain
1	In	Number of records	Integer
2	In	Number of columns	Integer
3	In	Number of columns with dates	Integer
4	I	Part of the 17 Goals	Yes or No (1 or 0)
5	I	Public Policies prioritized by the PPA	Yes or No (1 or 0)
6	D	Difficulty based on the number of records	Integer from 1 to 5
7	D	Difficulty based on the number of columns	Integer from 1 to 5
8	D	Difficulty in identifying processes	Integer from 1 to 5
9	D	Records with perceptible issues	Yes or No (1 or 0)
10	D	Need to transform the data (columns to rows)	Yes or No (1 or 0)
11	E	Event log	Yes or No (1 or 0)
12	E	Data standardization	Yes or No (1 or 0)

The information criteria (In), which deal with the number of records (rows/instances), number of columns (features) and columns with dates (items 1, 2 and 3), received their nominal values identified in each dataset. Importance (I) was assessed on the basis of its significance for public policies (items 4 and 5), difficulty (D) on the basis of the complexity of manipulating the data (items 6 to 10) and ease (E) on the simplicity of using the data in mining tools (items 11 and 12). The importance of the data, as it is a subjective criterion, was measured based on belonging or not (Yes or No) to the 17 UN Sustainable Development Goals (ONU, 2015) and the public administration's priority public policies in the Multi-Year Plan (PPA) (Brasil et al., 2023). The numbered list of priorities can be found in the online repository (de Vasconcelos et al., 2024b).

The difficulty related to the number of records and columns (items 6 and 7) was calculated using the raw values previously stored as informational criteria (items 1 and 2). These values were sorted in ascending order, and a frequency distribution analysis was performed. Based on this, the values were grouped into five classes using a class interval method, which divides the full range of values into equal-width intervals (Montgomery & Runger, 2018). This approach facilitates transforming continuous variables into discrete difficulty levels. The difficulty rating for items 6, 7 and 8 ranged from 1 (least difficulty) to 5 (greatest difficulty). For the number of records, the classes were defined as follows: Class 1 for 1 to 300 records, Class 2 for 301 to 2,000, Class 3 for 2,001 to 4,000, Class 4 for 4,001 to 100,000, and Class 5 for more than 100,000 records. For the number of columns, Class 1 included datasets with 6 to 13 columns, Class 2 with 14 to 20, Class 3 with 21 to 27, Class 4 with 28 to 34, and Class 5 with 35 to 38 columns.

The criteria that identify the presence of noticeable problems in the records (item 9), the need to transform data from columns to rows (item 10), whether the file is an event log (item 11) and the existence of standard-

ization in the data (item 12) were evaluated individually, each receiving a "Yes" or "No" answer as appropriate. In order to properly rank the datasets, the results were normalized to standardize the results, the calculations used for normalization are described in Appendix A.

5. Analysis of dados.gov.br

The Brazilian OGD Portal – dados.gov.br(Brazil, 2024a), launched in 2012, is the central platform for accessing public data published by Brazilian government agencies. Each organization is responsible for its own data. The portal currently hosts around 14k datasets across diverse areas such as supply, administration, agriculture, fishing, communications, and national defense. Due to its volume, heterogeneity, and lack of standardization, dados.gov.br was chosen as the case study for this research, representing a realistic scenario to test the applicability of PM techniques to OGD in complex and large-scale environments. Based on the sampling method described in the methodology, 373 datasets were collected by selecting every 20th item from the portal's unordered list. All collected datasets are available in an online repository (de Vasconcelos et al., 2024c).

Based on the categories defined in Table 1, the datasets from dados.gov.br were analyzed and classified by their relevance to PM tools. The analysis presented practical challenges: each file had to be manually examined to identify potential processes, which was particularly time-consuming when dealing with large datasets with many instances and features (columns and records). Long files made it harder to detect distinct activities, requiring an iterative approach to narrow the focus. Additionally, the lack of standardization across datasets demanded constant transformations, increasing the workload in this phase.

As a result, most of the data was found unsuitable for PM tools, often due to corrupted files, empty links, or redirections to other portals. Some datasets consisted only of documents (e.g., PDF, DOC) or simple lists without timestamps. Although redirected portals may offer usable data, analyzing external sources was beyond the scope of this study. The proposed method focuses on evaluating data directly from the main OGD platform. Consequently, 24% of the sample (89 datasets) was deemed relevant, 23% in dated table format and 1% as event logs. The remainder was excluded. Details of this methodology are in Section 4.2, and the full relevance classification is available in de Vasconcelos et al., 2024b.

5.1. Preliminary selection of datasets

In the previous step, 89 datasets were identified as relevant to this research. However, analyzing all of them in depth would require considerable time and effort. Since this study represents an exploratory effort to demonstrate the feasibility and applicability of the proposed evaluation method, we opted to apply the method to a representative subset of this data. To select this subset, we used the Pareto principle (Koch, 1999), which suggests that a small portion of data can often yield most of the valuable insights[7]. We then selected 24 datasets for this analysis (just over 20% of the data considered relevant) as follows: all the "Event Logs" identified in the sample (4 datasets) and 20 categorized as "Data table with date". The selected datasets are listed in Table 3. The titles have been translated but the originals are in Portuguese.

Of the sets categorized as "Data table with date", the topic, update date (from 2020 to 2024) and origin of the data were taken into account, so that a maximum of three data sets from the same government agency were selected to ensure data variability. We then selected data from 16 different government organizations, such as: ANAC, ANATEL, ANEEL, ANVISA, BCB, CGU, FURG, IBAMA, IFBA, IFCE, INPI, MGI, PBH, TSE, UFG and UFRB.

Therefore, the 24 selected datasets were organized, analyzed individually according to each criterion defined in this section and the information obtained was recorded, as shown in Table 4. Table 2 shows all the evaluation criteria and their domains used to carry out the study. As part of the difficulty criterion (D), item 8, "Difficulty in identifying processes", the data from each dataset was analyzed in order to identify which process should be analyzed first. In addition, the key attributes were identified (mapping of "caseid", "timestamps" and "activities") which served as the starting point for each dataset. The time spent on this analysis was recorded. Finally, the average time for the initial analysis and mapping was 77 minutes, used to calculate the total analysis time.

[7] The Pareto Principle (Koch, 1999), also known as the 80/20 rule, states that 80% of relevant information can be obtained from 20% of the available data

Although no specific weight was applied to the criteria, it is recognized that an event log or certain information, such as “caseid”, “timestamps” and “activities” identified, are crucial to the study of the data. In addition, the data was selected from an initial sample of 373 datasets and subjected to various filtering steps in order to ensure a choice of the most up-to-date and relevant data possible. The normalization was calculated as shown in Appendix A.

5.2. Ranking of datasets

With the computed values, it was possible to identify that 52% of the selected datasets were classified as important for society because they are part of public policies, 55% present a degree of difficulty for manipulation in the mining tools and 44% show no apparent difficulty for use in the PM tools. Based on the criteria presented, the final classification of the data sets was reached. It was possible to identify that the 80th percentile is less than 6 (six), i.e. 80% of the data achieved a score of less than 6 (six) and 50% of the cases achieved a score of less than 5 (five). The normalized values and complete ranking data can be found in online repository (de Vasconcelos et al., 2024b). The result of ranking by normalized criteria (Appendix A) of selected datasets are described in Table 5.

Tab. 5 – Result of ranking by normalized criteria of selected datasets based on Informative Data (In), Importance (I), Difficulty (D), and Ease of Use (E). Table 2 shows details relating number 3 until 12 evaluation criteria.

#	Inf. (In)	Importance (I)		Difficulty (D)					Ease of use (E)		Classification	
Dataset	3	4	5	6	7	8	9	10	11	12	Score	Rank
258	1.00	1.00	1.00	1.00	0.75	1.00	1.00	0.00	0.00	1.00	7.75	1st
137	0.80	1.00	0.00	0.50	0.75	1.00	1.00	1.00	0.00	1.00	7.05	2nd

With this in mind, the three best-scoring datasets were selected for testing in the tools, namely: (i) 258 - Registered Diplomas, (ii) 137 - Computer Program Registration Requests (2020) and 356 - FURG - Registration of civil servants for Public Tenders, two from universities (UFG and FURG) and one from the INPI. 258 requires columns to be transformed into rows, the others don’t, and only 356 is an event log. The other event logs did not score well due to various problems found in the data. Although they are event logs, some did not have complete information, making it difficult to define a process to be analyzed (characterized only as a poorly identified event log with a lack of documentation). Another problem was the excess of instances (records), making these the main reasons for the low score of such datasets.

5.3. Evaluating the datasets and preliminary tests

Given the nature of OGD, which often lacks explicit processes, a preliminary evaluation was conducted to identify datasets with attributes (features) essential for process discovery and bottleneck identification. Al-

though the evaluation began early in the research, further analysis was needed before applying datasets to PM tools—such as verifying the presence of minimum required attributes and assessing whether the processes discovered made sense for each dataset. As this study focuses on evaluating datasets for process discovery, these initial tests helped confirm the potential use of the selected datasets.

To guide this assessment, datasets were examined based on their structural adequacy for PM, and availability of key attributes such as event identifiers, timestamps, and activity descriptions. These attributes play a fundamental role in enabling the reconstruction of process flows and the identification of inefficiencies. As a result of this evaluation, a subset of datasets was selected for preliminary testing using the PM tools Disco, ProM and Celonis, chosen to carry out the tests. In order to choose the most suitable PM tools for comparing the results proposed in this study, a previous study was used to evaluate the PM tools used in academia and the market (de Vasconcelos et al., 2024a). This study evaluated the tools using qualitative and quantitative criteria and ranked them, among other criteria, based on user adherence, relevance to the market and academia and objectivity in generating results. Another study that also served as a reference carried out an analysis, based on a structured methodology that allows the analyst to compare any number of PM tools using any number of comparative analysis criteria (Drakoulogkonas & Apostolou, 2021).

As for the content of the first dataset selected for testing, dataset 258, the results indicate that the data is clean, i.e. there are no records of bottlenecks or process deviations, only data that has been successfully completed. In addition, a comparative analysis between the tools shows that there is no significant difference in the tests, with the variation in average time between activities showing little difference between the discovery algorithms of each tool. In terms of use, it was found that loading data into the tools was considerably faster in the Disco and ProM tools. Dataset 137 was more complex, requiring re-analysis of the mapping; however, the process graph was successfully generated, and the information was clear. It was found that the process occurs relatively quickly, but with some deviations that increase the completion of cases. As for the comparative analysis of the content, the results showed a significant difference when calculating the average duration of the cases. As for the usage analysis, the data loading time varied greatly and required advanced analysis in the ProM tool. Figure 2 shows the process discovered and its bottlenecks in the three tools tested.

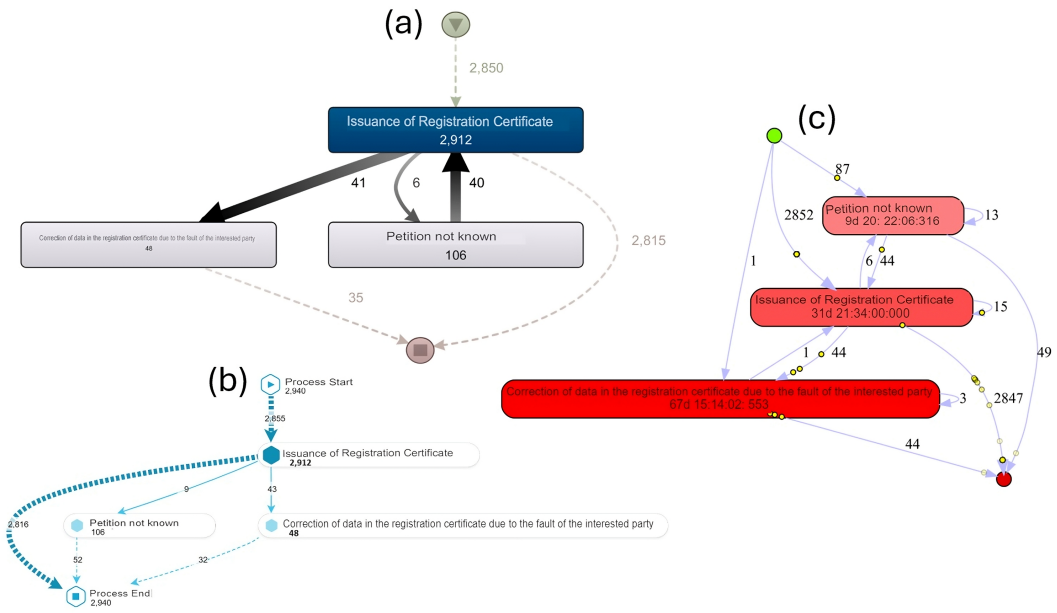

Fig. 2 – Process map discovered with dataset 137 - Computer Program Registration Requests (2020) in (a) in Disco, (b) Celonis and (c) ProM. These process maps highlight the issuance of registration certificates as the main activity, with variations in visualization and process details across tools. ProM emphasizes execution times, revealing a bottleneck in data correction (67 days), while Disco and Celonis focus on process flows and frequencies.

In the last experiment, dataset 356, the level of complexity increased considerably, marked by difficulties in understanding the data, lack of standardization, and re-analysis of the mapping. Analyzing the content, the data was only similar when an advanced analysis was carried out on the tools, and even then, with differences in the main activities and the longest average time. As for the use of the tools, ProM was the one that responded best to the complexity of this dataset. From these experiments, it was possible to see the difficulty in preparing this data, made available on open data portals, for testing in the PM tools. This is evident from the lack of reference documentation (hindering understanding) and the increased complexity given the amount of data found in the datasets (quantities of records and columns to be analyzed). Although challenging, the difficulty in pre-processing the data can be measured by ranking the datasets. In addition, despite the difficulties mentioned, it was possible to analyze the data, establish processes, identify bottlenecks, points of attention in the datasets and recommendations.

6. Conclusions and Future Work

This study addressed the challenges in evaluating OGD for PM applications, focusing on the collection, selection, and assessment of datasets. The findings highlight the difficulties in handling datasets without predefined context, a common characteristic of OGD, which requires structured evaluation criteria to determine their relevance and suitability for process discovery. It was possible to identify datasets with the necessary attributes for PM, demonstrating that, despite inconsistencies in data representation and quality, these datasets can be adapted for meaningful analysis. The study reinforces the importance of well-defined methodologies for assessing data structure, selecting relevant datasets, and verifying their adequacy for PM, ensuring that public data can be effectively used to understand and improve government processes.

This work contributes to the literature by addressing two gaps identified in the field: the lack of (i) methods for processing and selecting OGD for PM tools, especially when dealing with data without context knowledge, and also (ii) of methods for categorizing and evaluating data attributes to process analysis. The OGD-PM Evaluation Method responds to these gaps by offering a transparent and replicable procedure for assessing OGD datasets. While many existing studies apply PM to predefined event logs or within specific domains, this work offers a generalizable approach that can be adapted to varied OGD, including those without structured metadata or contextual information. This flexibility makes the method particularly valuable for advancing future research on OGD, supporting broader adoption of PM in digital government contexts.

The findings of this study provide a direct response to the proposed research questions. Regarding RQ1, the results demonstrate that OGD can be evaluated and applied in PM tools to discover processes and identify bottlenecks in public services. Despite the challenges of data inconsistencies and the lack of contextual metadata, the approach used in dataset selection and evaluation made it possible to identify relevant datasets and successfully apply them to PM analyses. In response to RQ2, the study established key criteria for selecting and preparing OGD, emphasizing the need for evaluation based on data suitability for PM. The research reveals that even in the absence of a predefined context, it is possible to extract meaningful insights from OGD when applying PM. These contributions reinforce the importance of methodologies for OGD analysis, ensuring its effective use in understanding and optimizing government processes.

Our work contributes to PM practices on OGD, providing steps for the evaluation and preparation of datasets that facilitate the identification of processes and operational bottlenecks. From this work, researchers and professionals can evaluate and prepare OGD for PM analyses, to identify the inherent processes within the data and detect bottlenecks, thereby enhancing the understanding of the data and the efficiency of governmental processes. The limitations of this research are primarily associated with the generalization of the results due to the diversity of the OGD and the categorization method applied, which may not capture all the nuances of the varied datasets. Moreover, the results may vary according to the quality and specific structure of the available data. Future research could extend the application of the proposed method to the full set of relevant datasets, allowing for broader validation and refinement of the evaluation framework. Additional studies may also explore datasets currently classified as not relevant, to assess the boundaries of their applicability to PM and further test the evaluation criteria. Expanding the method to include datasets accessed via external links and developing automated tools to support large-scale assessment and selection are also promising directions. These extensions may support more analyses, promoting a deeper understanding of how PM can be applied to improve governmental processes.

Acknowledgement

The authors would like to thank the Graduate Program in Computer Science at Fluminense Federal University (PGC/UFF) for the institutional support provided throughout this research, which were essential for the development and dissemination of this work.

Funding or Grant

This work was partially supported by the Brazilian National Council for Scientific and Technological Development (CNPq) under the Public Call No. 23/2018 – Academic Doctorate for Innovation Program (*Doutorado Acadêmico para Inovação* – DAI), grant number 161128/2019-0.

Data/Software Access Statement

All datasets used in this study are publicly available and were obtained from the Brazilian Federal Government's Open Data Portal (dados.gov.br). The full list of datasets analyzed, along with metadata, classification details, and the evaluation criteria used in the study, is available in the following repositories: (i) https://doi.org/10.6084/m9.figshare.25514884.v5 and (ii) https://doi.org/10.17632/x8sgcykthn.1.

Contributor Statement

Author 1 contributed to Conceptualization, Methodology, Data Curation, Investigation, Formal Analysis, Visualization, and Writing – Original Draft. Author 2 and Author 3 contributed to Conceptualization, Supervision, and Writing – Review & Editing.

Conflict Of Interest (COI)

Appendix A

Calculations for normalization

As each criterion for the selected datasets (Table 2) had its own way of scoring due to its characteristics, in order to make it easier to compare them and standardize them, it was decided to normalize the scores on a scale of 0 to 1. The overall score, which enabled the final classification of the data sets, ranged from 0 to 10, where 0 (zero) corresponds to a minimum value and 10 to a maximum value. For the criteria that assess difficulty, the score was 0 (zero) for the greatest difficulty, and 1 for minimum difficulty. Criteria 1 and 2 were used to generate 6 and 7 respectively, as seen in the previous section, so normalization was applied from criteria 3 to 12. Calculations for normalization were based on the following conversions, described in the table 6 and details can be found at de Vasconcelos et al. (2024b).

Tab. 6 – Normalization rules for criteria 3 to 12 items in Table 2 used to calculate final dataset scores.

Item #	Description and Normalization Rule
3	Number of columns with dates: normalized from 1 to 5 using $NumCol = \frac{Val_o}{VMax_o}$, where Val_o is the original value to be normalized and $VMax_o = 5$.
4	Data aligned with the 17 UN Sustainable Development Goals: 1 if yes, 0 otherwise.
5	Data aligned with priority public policies (Multi-Year Plan): 1 if yes, 0 otherwise.
6–8	Difficulty due to number of records, columns, and process identification: normalized as $Diff = 1 - \frac{Val_o - VMin_o}{VMax_o - VMin_o}$.
9	Data with no noticeable problems: 1 if clean, 0 if problems are found.
10	No transformation needed from column to row: 1 if not needed, 0 otherwise.
11	File is an event log: 1 if yes, 0 otherwise.
12	Standardized data structure: 1 if yes, 0 otherwise.

Data circulation between statistics agencies and journalists.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 26 May 2025

Abstract. This study investigates how data circulate between statistics agencies and journalists, with particular attention to the role of dissemination strategies—especially press releases—in shaping news production. While much of the literature addresses data production and use, the dynamics of data circulation remain understudied. Drawing on a case study of the statistical agency of the state of São Paulo (SEADE) in Brazil, the paper analyzes all news articles published in 2024 that referenced SEADE data. Articles were categorized according to the level of influence of press releases: full reproductions (verbatim replication), value-added reproductions (with complementary analysis or context), or organically produced (independent of any press release). These were examined through the lenses of framing theory and journalistic role performance approach. Results show that 70% of the news articles were influenced by press releases, with a significant presence of the Loyal-Facilitator dimension, particularly in government-issued releases. National outlets were more likely to produce organic content, while local media—despite showing higher demand for statistical information—relied more heavily on press releases to produce their coverage. Thematic focus also varied: national journalists prioritized economic indicators, while local outlets focused more on labor statistics. The study also found that articles based on SEADE press releases more frequently incorporated added value, while those based on government releases were more likely to be reproduced verbatim. These patterns may indicate structural constraints, particularly in local newsrooms, and varying levels of data literacy among journalists. By mapping how official statistics circulate in the media ecosystem, the research highlights the importance of hybrid, user-centered dissemination strategies that combine traditional tools like press releases with open government data practices. Such approaches can broaden the reach and enhance the relevance of official statistics in journalism and public discourse. By demonstrating how a better understanding of data circulation helps statistical agencies tailor their dissemination practices, this study contributes to the Open Government Data literature and highlights how user-centered strategies can foster more meaningful and critical engagement with official data.

Keywords. Data circulation, official statistics, journalism, data dissemination, Open Government Data, OGD, data literacy, journalistic role performance, framing.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1042

1. Introduction

The rapid evolution of data production technologies, particularly within Big Data, has transformed how governments generate and disseminate official statistics (Signorelli et al., 2023). Open Government Data (OGD) initiatives have enhanced transparency and broadened data access (Attard et al., 2015). However, despite the tendency to adopt OGD in pursuit of seamless data dissemination, structural and institutional barriers often hinder the frictionless data circulation (Piattoeva et al., 2018). While research has extensively covered data production

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

and use, the process of data circulation—how data moves between stakeholders—remains underexplored (Porto de Albuquerque et al., 2021).

This study examines the circulation of data between statistical agencies and journalists. The research question asks: How does data circulation occur between official statistics agencies and journalists? To answer this, the study employs a case study methodology, analyzing interactions between the São Paulo State Statistics Agency (SEADE) and journalists in Brazil during 2024.

The research investigates journalists' engagement with official data, particularly the role of press releases in shaping news production. The analysis is informed by Framing theory (Entman, 1993) and the Dimensions of Journalistic Role Performance (Mellado, 2015), providing insights into how journalists frame and disseminate statistical information. The study examines news articles published in 2024 that utilized SEADE data, comparing local and national media in terms of reliance on press releases, reporting depth, data literacy, and thematic focus. It also applies the Dimensions of Journalistic Role Performance framework to assess whether journalists critically engage with government-produced data or simply reproduce it. Additionally, news articles are categorized into themes such as Economy, Labor, and Demography to understand how different types of statistics are prioritized.

By analyzing press releases, journalistic practices, and media characteristics, the study highlights challenges and opportunities in improving the dissemination and use of official statistics. This research contributes to the discussion of data circulation in the OGD context, emphasizing the importance of user-centered approaches in data dissemination to bridge the gap between producers and users.

The paper is structured as follows: Chapter 2 reviews key literature on data, data users, data circulation, and journalism's role in data dissemination. Chapter 3 details the research methodology, including the case study approach and methods for analyzing news articles and press releases. Chapter 4 presents the results, while Chapter 5 discusses their implications. Finally, Chapter 6 concludes with recommendations for improving data circulation and suggestions for future research.

2. Literature review

2.1 Data and official statistics

Data play a fundamental role in shaping social and economic systems, influencing everything from daily decision-making to large-scale policy development (Kitchin, 2014). However, as data are never neutral, their meaning and use depend on how they are collected, analyzed, and interpreted (Kitchin, 2014). The rise of "datafication"—the process by which various aspects of life are transformed into data (Mayer-Schonberger & Cukier, 2014)— has resulted in an unparalleled growth of digital records, produced as unintended outcomes of routine activities (Torres-Freire, 2021). This transformation has been driven by the rapid development of new technologies, increased computational power, and enhanced data storage capabilities, all of which have enabled the large-scale collection, processing, and dissemination of data. With the advent of this phenomenon, commonly referred to as Big Data (Signorelli et al., 2023), governments have increasingly adopted new methods for collecting, processing, and storing vast amounts of information, integrating these resources into policymaking (Kitchin, 2014) and into the production of official statistics (Signorelli et al., 2023).

Official statistics, produced and disseminated by government agencies, serve as essential tools for informing public policies and promoting transparency (Signorelli et al., 2023; United Nations Statistics Division, 2013). Covering areas such as economics, demography, labor markets, and environment (United Nations Statistics Division, 2013), these data provide a foundation for decision-making across multiple sectors (Attard et al., 2015; Misra, Ranjan, et al., 2021). As the demand for timely and accessible statistics grows, statistical agencies are under increasing pressure to modernize their approaches, ensuring that official statistics remain relevant in an ever-evolving data landscape (Citro, 2014). This transformation reflects a shift in how data users interact with official statistics. Audiences seek not only access to data but means for their interpretation and application. Ensuring the use of official statistics is just as important as making it available (Laaboudi et al., 2024).

In response, Open Government Data initiatives have sought to make government data—including official statistics—freely available in machine-readable formats (Attard et al., 2015; Gascó-Hernández et al., 2018). These policies aim to increase transparency, improve public policymaking, and encourage civic participation (Attard et al., 2015). To be effective, OGD frameworks emphasize the need for standardized data structures, improved search mechanisms, and enhanced interoperability, making it easier for users to find and work with official data (Attard et al., 2015; Lourenço, 2015). An example is the implementation of Linked Open Data (LOD) by Eurostat, the European statistics agency, which not only provides raw datasets but also integrates metadata and employs diverse communication strategies to expand the reach and usability of official statistics (Laaboudi et al., 2024). While open data initiatives have significantly expanded access, researchers argue that availability alone does not guarantee

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

effective use. Meaningful engagement with data requires well-structured dissemination strategies that account for the diverse needs of users (Attard et al., 2015; Craveiro et al., 2023; Gascó-Hernández et al., 2018; Lourenço, 2015).

However, the role of statistical agencies in the dissemination process remains a subject of debate. Should their responsibility extend beyond publishing high-quality datasets to actively guiding users in their interpretation? Eurostat raised this very question: "Is it the role of the official statistics community to guide key users [...] in their use [...], or does our responsibility stop with putting the LOD 'out there'?" (Laaboudi et al., 2024, p. 88). Scholars argue that understanding user demand is crucial to enhancing the impact of open data initiatives (Attard et al., 2015; Begany et al., 2021; Craveiro et al., 2023), as it provides insight into how data circulation fosters informed decision-making and drives social transformation (Porto de Albuquerque et al., 2021).

2.2 Data circulation

Most research on data focuses on its acquisition and use processes (Porto de Albuquerque et al., 2021). While this perspective highlights the role of data in informing policies and institutional actions, it overlooks the potential for broader transformations that emerge when data flows across different stakeholders and governance levels. Some studies suggest that structural changes in public policy and governance are more effectively realized through dynamic data circulation, where data moves between actors, fostering recognition, coordination, and the opening of new channels for communication (Porto de Albuquerque et al., 2021). In this context, data circulation refers to the movement of data across different actors, enabling interactions that reshape governance arrangements and influence decision-making processes (Porto de Albuquerque et al., 2021). The way data travels within and between institutions, communities, and other stakeholders determines its accessibility, usability, and impact. Official statistical agencies often rely on seamless data flows to effectively disseminate information (Misra, Ranjan, et al., 2021). However, the ideal of frictionless data circulation is rarely achieved in practice due to contextual barriers, institutional limitations, and other structural constraints (Piattoeva et al., 2018). Ultimately, the influence of data is determined not just by its content but also by how it is applied, who uses it, and the purpose it serves (Beer, 2016).

The data circulation approach proposes mapping the circulation of stories and narratives created by users from data (Porto de Albuquerque et al., 2021). This mapping involves identifying key actors, the channels through which data is disseminated, the motivations behind its use, and its tangible impact on public policies and social dynamics. By analyzing these factors, researchers and practitioners can identify ways to enhance data circulation, ensuring broader access and more meaningful engagement with the information being shared. Strengthening these interactions can lead to more inclusive decision-making processes and a more democratized use of data for social transformation (Porto de Albuquerque et al., 2021). Beyond improving accessibility, mapping data circulation also provides valuable insights into the broader data ecosystem. It helps identify bottlenecks that restrict data flow, allowing for targeted interventions to address these issues (Porto de Albuquerque et al., 2021). Furthermore, it supports efforts to tailor data dissemination to different levels of data literacy, ensuring that diverse users—from policymakers to local communities—can effectively interpret and apply the information (Porto de Albuquerque et al., 2021). Strengthening these relationships fosters deeper engagement among stakeholders and enhances the overall impact of data on governance and civic participation. By understanding these dynamics, researchers and institutions can refine strategies for improving data circulation, maximizing its reach, and ensuring that data serves as a tool for meaningful and equitable change (Cinnamon, 2020; Pappas et al., 2018; Porto de Albuquerque et al., 2021).

2.3 Dimensions of journalistic role performance

Journalism shapes power dynamics in modern societies by influencing public and private debates through the way news is framed and delivered (Cushion et al., 2017; Mellado, 2015). Understanding how journalists operate within these dynamics requires examining their relationship with power, their presence in news narratives, and the strategies they use to engage audiences. In Dimensions of Journalistic Role Performance, Mellado (2015) explores these dynamics by mapping the features of news content that connect journalism's normative ideals with how these roles manifest in practice. The author's analysis identifies key journalistic roles. The Intervention role highlights the journalist's voice and interpretation in news content. The Watchdog role emphasizes holding public and private institutions accountable, while the Loyal-Facilitator role aligns with elite power structures or comparison with other regions. The Service role focuses on addressing audience interests through practical and utilitarian reporting. Civic Journalism fosters public engagement by adopting a citizen-centric perspective, while Infotainment prioritizes entertainment and emotional appeal, treating audiences as spectators (Mellado, 2015).

2.4 Journalism and data

Data is a powerful tool for democratic inquiry, enhancing information flows and enriching public debate. However, because most people do not engage directly with raw datasets, journalists play a crucial role in discovering, translating, and interpreting data (Cushion et al., 2017; Rogers, 2013).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The fast-paced nature of modern news production places significant pressure on journalists to process and communicate complex statistical information with clarity and accuracy. Data journalism encompasses a wide range of practices, from traditional infographics to in-depth investigative reporting based on raw data analysis (Knight, 2015). Its rise has been seen as a means of democratizing information through innovative reporting techniques (Bradshaw, 2011; Cushion et al., 2017; Rogers, 2013). While often associated with investigative projects, Cushion (2017) expands the definition to include the routine use of secondary data in reporting, emphasizing that data analysis and interpretation are increasingly part of journalists' daily work.

Data literacy is fundamental to how journalists engage with and use data. This skill set goes beyond technical proficiency, encompassing the ability to critically analyze data, understand its context, and interpret the realities it represents (Carmi & Yates, 2020; Helsper, 2021; OECD, 2019; Scheerder et al., 2017; Senra, 1994; Tygel & Kirsch, 2016). Despite its growing importance, significant gaps in data literacy persist. Media organizations with strong public broadcasting systems or larger budgets tend to invest more in data journalism, providing greater statistical expertise and shaping how data is incorporated into reporting (Appelgren et al., 2019; Cushion et al., 2017). These structural conditions influence journalistic role performance, reflecting newsroom decisions shaped by internal and external pressures (Shoemaker & Vos, 2009). For example, a study on the Arab Region found that journalists lacking numerical proficiency and technical skills for data acquisition and analysis tended to adopt a passive approach to data, rather than the active engagement necessary for effective data journalism (Lewis & Nashmi, 2019).

2.5 Framing

Framing shapes how journalists construct news stories, influencing public perceptions of issues (Lee & Basnyat, 2013; Scheufele & Tewksbury, 2007). At its core, framing involves selecting and emphasizing specific aspects of reality within a text to promote a particular interpretation (Entman, 1993). As one of the dominant theories in media studies (Lee & Basnyat, 2013), framing acts as a cognitive filter that simplifies complex issues into digestible narratives. This process helps audiences make sense of intricate events while also shaping their emotional and intellectual responses (Scheufele & Lewenstein, 2005).

2.6 The statistics agency of the state of São Paulo

The State of São Paulo, with a large territorial area comparable to countries like the United Kingdom, is composed of 645 municipalities and has Brazil's most significant economy. The case studied is that of the State of São Paulo Statistics Agency (SEADE). It is a public institution linked to the Government of the State of São Paulo, responsible for producing and disseminating socioeconomic and demographic data that support public policies in the state. Data dissemination occurs through the publication of its outputs on its website (www.seade.gov.br), sending press releases to the media and sharing audiovisual content on social media. The published data are made available in various formats, including an open data repository, text-based analyses, and dashboards featuring dynamic infographics for data visualization.

3. Methodology

This study conducted a case study of the State of São Paulo Statistics Agency (SEADE) in Brazil, analyzing data circulation between the agency and journalists, a key user group of official statistics (Attard et al., 2015; Misra, Ranjan, et al., 2021). It examined all news articles published in the Brazilian press in 2024 that referenced SEADE's data, comparing organically produced news to articles based on press releases issued by SEADE or the State Government. The analysis took place in January 2025.

São Paulo's economic significance and diverse media landscape provided a strong basis for the study. Newspapers in the region range from local to national coverage, and media classification was based on each outlet's self-declared reach on their websites. The year 2024 was selected to ensure accessibility to news articles and press releases, maintaining reliability and completeness of sources. To identify relevant articles, the author consulted SEADE's "Imprensa" (Press) section (https://www.seade.gov.br/imprensa/page/2/), used SEADE's internal news monitoring service (clipping), and conducted Google News searches with the keyword "SEADE," filtering results for Portuguese-language content from Brazil in 2024. Only written articles available online were analyzed, excluding video, audio, and print-only publications.

Press releases containing statistical data and citing SEADE were retrieved from SEADE's official website (https://www.seade.gov.br/press-release/) and the State Government's communication portal (https://www.agenciasp.sp.gov.br/?s=seade). In some cases, press releases from both sources were identical. To link news articles with specific press releases, the study assessed whether they covered the same topics and statistics within a 20-day window of publication.

News articles were categorized based on the level of influence from press releases. "Full Reproduction" included

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

articles that replicated the press release content verbatim. “Value-added Reproduction” referred to articles that incorporated press release content but added contextual elements, such as additional data or analysis. “Organic” articles were produced independently, without any influence from press releases. Each article was fully reviewed, including its title and body. Based on Framing theory (Entman, 1993), articles were classified by main theme. Themes aligned with commonly analyzed statistical areas: “Economy”, including GDP, economic projections, and investments; “Labor”, covering employment rates, informal work, and salaries; “Demography”, addressing population size, life expectancy, and fertility rates; and “Other”, for topics outside these categories (United Nations Statistics Division, 2013).

The study further applied Mellado’s (2015) Dimensions of Journalistic Role Performance, classifying articles into “Intervention”, “Watchdog”, “Loyal-Facilitator”, “Service”, “Infotainment”, and “Civic” roles, with some articles fitting multiple dimensions. Additionally, word count was measured to assess the depth of reporting. Media outlets were classified as “Local” if they primarily served a limited regional audience and “National” if they reached broader country-wide readerships.

4. Results

The research identified that throughout 2024, 81 Brazilian media outlets published 237 news articles that utilized official statistical data citing SEADE, the statistics agency of the State of São Paulo. During this period, the press received 112 press releases containing statistical data produced by the agency, of which 71 (63%) were sent directly by SEADE, and 41 (37%) were issued by the Secretariat of Communication of the State Government of São Paulo.

The analysis revealed significant differences in the use of press releases as sources for news. Of the 38 news articles based on Government press releases, 26 (68%) were fully reproduced without changes. In contrast, of the 125 news articles based on SEADE press releases, 81 (65%) were reproduced with value added, incorporating additional elements such as interviews, context, or data from other sources.

The average word count of news articles from local media outlets (476.1 words) was similar to that of national media outlets (473.7 words), with a difference of only 2 words. At the local level, the average word count difference between news articles induced by press releases (533.9 words) and organic news articles (531.0 words) was marginal, at only about 3 words. However, at the national level, organic news articles were significantly longer (644.9 words) compared to those based on press releases (299.5 words), showing a substantial difference of approximately 345 words.

The demand for news articles was higher among local media outlets than among national outlets. Of the 166 analyzed news articles (excluding the 71 articles that were full reproductions of press releases), 125 (75%) were published by local media outlets, while 41 (25%) were published by national outlets. Among local media outlets, most articles used press releases with added value (79 of the 125 or 63%). On the other hand, among national media outlets, 25 (61%) of the 41 news articles were produced organically, without any influence from press releases. Table 1 presents a summary of these findings, highlighting the differences in press release usage, word count averages, and the distribution of news articles between local and national/state-level outlets.

Based on the Framing approach (Entman, 1993), the 237 news articles were classified into three main themes: Economy, with 81 articles (34%); Labor, with 73 articles (31%); and Demography, with 40 articles (17%). Additionally, there was an “Other” category, which included 43 articles (18%). All themes exhibited a higher occurrence of articles induced with added value, except for the “Other” category. The Labor theme presented a significantly higher proportion of value-added articles (55%) compared to the other themes, which averaged 32%.

Among the 54 national news articles, most (25 articles, or 46%) focused on the Economy theme. In contrast, among the 183 local news articles, the majority (63 articles, or 34%) were related to the Labor theme. Regarding article length, value-added articles averaged 494 words, with Demography, Economy, and Labor frames averaging 519, 443, and 496 words, respectively. A notable difference was observed in the average length of organic articles, which were significantly longer: 939 words for Demography, 498 words for Economy, and 301 words for Labor. Table 2 provides data about distribution of types of use of press releases, article lengths, and coverage according to the frames.

The 166 news articles—excluding those classified as full reproduction—were classified according to the Dimensions of Journalistic Role Performance, with a single article potentially receiving more than one classification (Mellado, 2014). The Service dimension was predominant, encompassing nearly 100% of the analyzed articles. Within the Loyal-facilitator dimension, 70 out of the 95 value-added articles (74%) were categorized under this dimension. In comparison, among the 71 organic articles, 36 (51%) received the same classification.

In terms of thematic frames, the Economy and Labor themes showed high levels of Loyal-facilitator classification, with 84% and 90% of articles, respectively, categorized under this dimension. In contrast, the Demography and Other themes had significantly lower levels of Loyal-facilitator classification, at 25% and 19%, respectively. Regarding the Civic dimension, the Demography (32%) and Other (35%) themes had higher occurrences, while Labor showed very low values, and Economy had no occurrences classified under this dimension.

When analyzing the overlap between the Loyal-facilitator dimension and the origin of the press releases, the study found that 57 (70%) of the 81 articles influenced by SEADE press releases and all 12 (100%) articles influenced by Government press releases were classified under this dimension. In terms of the scope of the media outlet, of the 106 articles classified under the Loyal-facilitator dimension, 83 (78%) were published in local outlets, while 23 (22%) appeared in national outlets. Table 3 provides data about the Dimensions of Journalistic Role Performance dimensions across themes, press release origins, and media outlet scopes.

5. Discussion

5.1 Media dependency on government inputs

Among the news articles published in 2024 that utilized government statistical data, 30% were produced organically, 30% directly reproduced press releases issued by the agency or the government, and 40% were influenced by press releases but incorporated value-added elements (Figure 1). These figures highlight two key aspects: the influence of press releases on news production and the varying ways in which data is utilized.

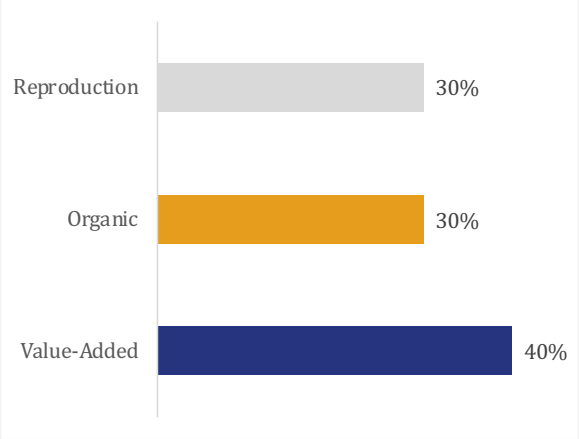

Fig. 1 - Press release use in statistical data-based news production.

Regarding the influence of press releases, 70% of the analyzed articles were impacted by these documents. This finding demonstrates that, despite advancements in the Big Data era within public statistics—such as new technologies for data collection and analysis (Citro, 2014; Signorelli et al., 2023)—there have been slow changes in the dissemination stage. The research suggests that data dissemination remains dependent on traditional practices, such as press office and public relations. Despite a tendency to rely on seamless data flows to disseminate information (Misra, Ranjan, et al., 2021), the frictionless circulation of data between statistical producers and journalists faces barriers, possibly related to resource limitations, time constraints, or editorial pressures (Cushion et al., 2017; Piattoeva et al., 2018).

On the other hand, the study indicates that frictionless data circulation is partially achieved. The analysis of data usage revealed that in 70% of the articles, journalists actively sought statistical data—30% independently and 40% by adding value to press release content. This value addition involved incorporating complementary information from other sources or directly from the statistical agency, adapting the data to better serve their audiences. These findings highlight the need to integrate both traditional and modern approaches to statistical data dissemination.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The literature emphasizes that Open Government Data producers must go beyond merely making data available (Attard et al., 2015; Craveiro et al., 2023; Gascó-Hernández et al., 2018; Lourenço, 2015). Studies suggest that statistical agencies, such as Eurostat, should not only provide data but also offer well-structured metadata to support data redistributors (Laaboudi et al., 2024). Well-designed metadata facilitates the integration of new data by redistributors, ultimately increasing the value of official statistics (Laaboudi et al., 2024).

However, in contexts such as the Brazilian, traditional dissemination methods—particularly press releases—continue to play a key role, especially in promoting the circulation of locally relevant statistics. In the studied case, journalists accessed official data through a hybrid model, combining traditional tools like press releases with modern approaches aligned with OGD principles (Attard et al., 2015; Gascó-Hernández et al., 2018; Lourenço, 2015; Misra, Ranjan, et al., 2021). This combination underscores the need for complementary strategies that enhance the accessibility and usability of official statistics for different audiences.

5.2 Capacity of local and national media

To understand local realities, the study analyzed the characteristics of news articles published by local media compared to those from national outlets, excluding articles that fully reproduced press releases. Among national outlets, organic articles were, on average, 345 words longer than those based on press releases, indicating a significant difference in terms of depth. Conversely, in the local context, the difference in length between organic articles and those influenced by press releases was minimal, with only a three-word variation. Previous studies have highlighted that well-structured media organizations with greater resources are better equipped to utilize data in their reporting (Appelgren et al., 2019; Cushion et al., 2017; Shoemaker & Vos, 2009). This disparity between the capacities of local and national media was also observed in the present study. Local outlets often face structural and financial limitations, while national outlets typically have greater resources, better-trained journalists, and access to advanced tools for investigation, enabling the production of more in-depth reporting with data (Lewis & Nashmi, 2019).

Despite these limitations, this study adds a new dimension to the discussion by identifying that the local demand for data is significantly greater than at the national level. In 2024, 75% of news articles utilizing São Paulo's state-level official statistics were published by local outlets, with most of these articles (63%) influenced by value-added press releases. In contrast, only 25% of such articles were published by national media, and among them, the majority (61%) utilized SEADE data obtained organically (Figure 2). Even with more limited resources, local media play a crucial role in covering the territory of São Paulo, surpassing national outlets in terms of the volume of published news. Although they may exhibit lower technical proficiency, local outlets demand more data, particularly those that address specific local realities across various themes. This underscores the importance of adopting different strategies to promote data access for local and national media.

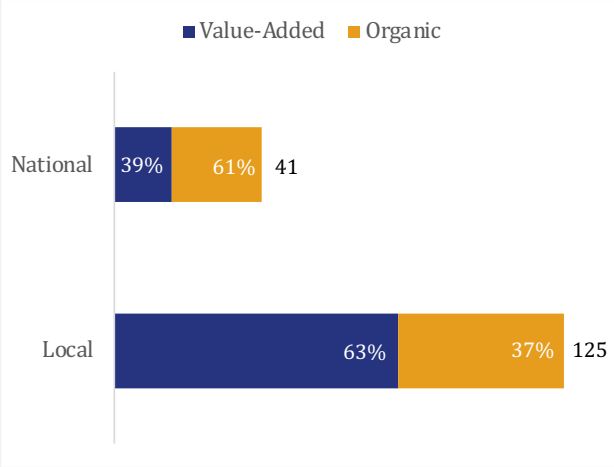

Fig. 2 - Media scope and press release use in statistical data-based news production.

5.3 Relationship between the press and the government

When producing news articles based on press releases, journalists added value to most of the releases originating from SEADE by including analyses and additional information. In contrast, most press releases issued by the State Government were reproduced verbatim, without significant modifications or additions. This practice of full reproduction can be attributed to structural limitations in newsrooms, such as lack of time, resources, or editorial capacity (Cushion et al., 2017). However, the data suggest that this tendency is more prevalent when press releases are directly linked to the government.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The more analytical use of press releases from the statistical agency may partially reflect the technical nature and credibility attributed to the agency, encouraging journalists to produce more customized articles. By complementing the data provided with additional information, journalists enhanced the value and relevance of these articles for their audiences. On the other hand, as data are not inherently neutral (Kitchin, 2014), press releases issued by the government containing statistical data may exhibit a bias toward highlighting positive results of government actions. The full reproduction of these releases might indicate a relationship of alignment between newsrooms and government power structures.

5.4 Journalists role performance

The analysis of the Dimensions of the Journalistic Role Performance, as proposed by Mellado (2015), enabled the exploration of the relationship between news articles and the roles performed by journalists. According to this approach, the study classified the news articles into different dimensions, allowing a single article to fit into more than one category (Mellado, 2015). To ensure greater analytical precision, the classification process excluded press releases that were fully reproduced.

The results showed that news influenced by value-added press releases had a higher incidence of the Loyal-Facilitator dimension, accounting for 64% of occurrences (Figure 3). This dimension was identified in 70% of news articles based on SEADE press releases and in 100% of those associated with press releases issued by the Government. In the case of news articles based on Government press releases, even when published with added value, they often exalted the region or supported power groups. On the other hand, news articles based on SEADE press releases also displayed these characteristics but to a lesser extent. Among the other dimensions, Service appeared in nearly all news articles (99%), reflecting the technical approach inherent in official statistics. The dimensions Civic, Infotainment, and Watchdog showed low incidence, with 13%, 7%, and 4%, respectively. Furthermore, no article was classified under the Intervention dimension.

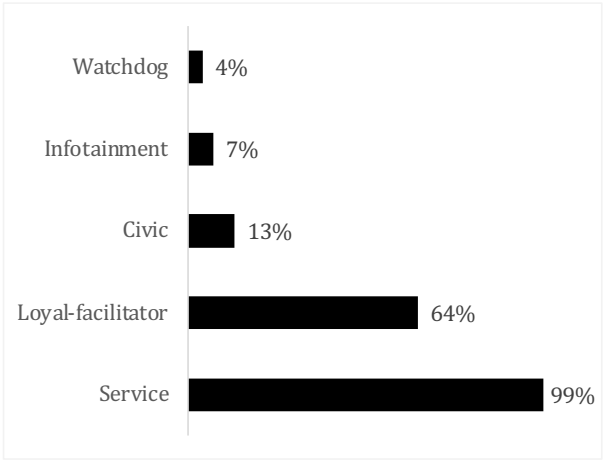

Fig. 3 - Role performance dimensions in statistical data-based news production.

The high number of news articles classified under the Loyal-Facilitator category, particularly those based on Government press releases, may suggest political alignment with power groups. Another explanation for the high prevalence of Loyal-Facilitator articles, alongside the low incidence of Civic, Infotainment, Watchdog, and Intervention dimensions, could be the low level of data literacy among journalists. These limitations may include difficulties navigating data repositories, using specialized software, mastering mathematical and statistical skills, and critically analyzing data (Carmi & Yates, 2020; Helsper, 2021; Misra, Jütting, et al., 2021; OECD, 2019; Porto de Albuquerque et al., 2023; Scheerder et al., 2017; Senra, 1994; Tygel & Kirsch, 2016). Although many journalists strive to complement press releases with information, they may face barriers to conducting more in-depth analyses, as the lack of technical skills may contribute to a more passive professional approach (Lewis & Nashmi, 2019). Journalists seeking statistical data independently may have chosen to conduct more accessible and easier-to-communicate analyses, such as comparisons between local and regional indicators, characteristic of the Loyal-Facilitator dimension. While practical, these choices can limit the complexity and depth of their analyses.

The dimensions of journalistic roles may reflect cultural aspects that vary by context (Mellado, 2015). In this sense, another possible explanation for the high incidence of the Loyal-Facilitator dimension is that Brazilian journalists may culturally lean toward comparing local indicators with other regions—a characteristic that, according to the author, defines the Loyal-Facilitator dimension. This hypothesis allows for a distinction between journalistic practices aimed at highlighting local progress and potential alignments with elites or power structures.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

5.5 Frames

The relationship between public statistics agencies and journalists becomes clearer through the lens of framing theory. By framing statistical data in news coverage, journalists influence how the public interprets and engages with official statistics. The way they present, contextualize, and emphasize certain aspects of data can shape societal debates and public understanding of policy issues. To understand the themes analyzed through the perspective of framing (Entman, 1993), the news articles were classified into the frames of Economy, Demography, and Labor, as well as an "Other" dimension that was excluded from the analysis due to its broad scope of unrelated topics. Based on this classification, it was observed that journalists from national media outlets showed greater interest in Economy-related news (46%), while local media focused more on the Labor theme (34%). Demography had a lower incidence in both local and national media, accounting for 16% and 19% of articles, respectively.

The analysis of dimensions based on the total occurrences within each frame revealed significant differences. The frames of Labor and Economy showed the highest incidence of articles classified as Loyal-Facilitator, whereas Demography had a considerably lower occurrence. The observed percentages for Labor, Economy and Demography were 90%, 84%, and 25%, respectively. The average word count for articles using data obtained organically also differed significantly across the frames, with averages of 301, 498 words and 939 words, respectively.

Economic indicators, such as GDP and investments, and labor indicators, such as employment and wages, are directly related to government actions with immediate impacts on society. The relevance of São Paulo to Brazil's economy may explain the national media's heightened interest in economic indicators, as economic events in São Paulo often have nationwide repercussions. In contrast, local media's emphasis on Labor may reflect the perception that news about employment opportunities and wages has a more immediate impact on readers' daily lives, meeting the urgent needs of their communities.

News related to demographic indicators, such as life expectancy and population size, were less common, likely due to journalists perceiving them as having a more indirect impact on daily life, despite their societal and public policy relevance. These articles had the lowest incidence of the Loyal-Facilitator classification. In local media, demographic indicators were less frequently used for regional or state comparisons, which often characterize the Loyal-Facilitator frame. By contrast, the Economy and Labor frames frequently related local data to broader contexts. While demographic outcomes are also influenced by government actions, they often stem from long-term investments, such as in public health, and are less associated with specific power groups.

5.6 Data circulation

The study revealed a range of variables that help characterize journalists, one of the user groups of public statistics. Factors such as the scope of the media outlet, the type of relationship with power groups, the level of data literacy, the journalist's role, and the chosen frame theme influence how statistical data is used.

Once the impact of data depends not only on what it represents but also on how it is utilized and by whom (Beer, 2016), from the perspective of user characteristics and needs, as highlighted by Porto de Albuquerque (2021), the study identified significant differences in the circulation of statistical data. Considering specific characteristics of users allows data-producing institutions, such as statistics agencies, to properly segment user groups and meet their needs. In the studied case, it was observed that cohesive groups, such as journalists from national outlets with higher data literacy covering themes like Demography, have different demands compared to, for example, journalists from local outlets with lower data literacy, who often focus on topics related to the labor market. For each group, data producers can adopt tailored dissemination strategies that maximize the impact and accessibility of statistics.

As suggested by Porto de Albuquerque (2023), mapping data circulation helps identify bottlenecks and propose improvements. For example, given that local media tend to cover labor-related topics and often demonstrate low data literacy, the statistical agency could adopt targeted strategies, such as sending press releases with data on local labor markets. This approach facilitates access to relevant information and helps contextualize the data to meet local audiences' needs. Segmenting user groups and adapting dissemination strategies based on data circulation enables data to reach users more effectively

5.7 Limitations and opportunities

This study has limitations that should be considered. The exclusive focus on São Paulo and its state statistical agency means that the findings reflect a specific regional context and may not be directly applicable to other settings. The study did not include direct engagement with journalists or their audiences, which could have provided additional insights into their motivations, challenges, and perceptions regarding data usage. Future research on detailing journalists' data literacy could complement the analysis of data circulation, contributing to a

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

more comprehensive understanding of their role as data users. Similarly, examining how data circulate between newspapers and their audiences could offer valuable perspectives on the broader impact of statistical information in journalism. The paper did not assess specific aspects of reporting quality, such as accuracy, contextualization, and source diversity. Including these elements in future research could provide a deeper understanding of how statistical data are integrated into journalistic narratives and how they contribute to public discourse.

6. Conclusion

This study examined data circulation between official statistics agencies and journalists, focusing on the role of press releases and news production in shaping how journalists use official statistics. By analyzing journalistic coverage of the data of the statistical agency of the state of São Paulo in 2024, the research identified key factors influencing the dissemination and use of official statistics.

The findings indicate that press releases play a significant role in shaping journalistic narratives, with a substantial portion of news articles either reproducing or adding value to the data provided by the agency. While this suggests that official statistics reach the media though Open Government Data practices, it also underscores the reliance on traditional dissemination strategies. Despite advancements in OGD initiatives, press releases remain an essential tool for facilitating data circulation. The study highlights the need for a hybrid dissemination strategy that combines traditional approaches, such as press releases and direct media engagement, with open data practices. By integrating OGD practices alongside conventional press materials, statistical agencies can enhance the reach and usability of their data, ensuring broader and more effective engagement with journalists and other stakeholders.

The study also found notable differences between local and national media outlets. Local journalists relied more heavily on press releases, while national media demonstrated greater independence in sourcing and analyzing data. These disparities might reflect variations in newsroom resources and data literacy, emphasizing the need for tailored strategies to enhance data accessibility across different media environments. The analysis of journalistic role performance revealed a predominance of the Loyal-Facilitator and Service roles, suggesting that most reporting on official statistics focuses on providing information rather than engaging in critical oversight. While this approach helps disseminate statistical data effectively, it raises questions about the extent to which journalists critically engage with government-produced statistics.

From a broader perspective, this study contributes to the research on Open Government Data by demonstrating how official statistical data move through different stages of the media ecosystem. It reinforces the idea that making data available is not enough—in the Brazilian context, a of user-centered hybrid approach of proactive dissemination practices combined with OGD practices, like an open data repository portal are crucial for ensuring that official statistics serve their intended purpose within the journalists.

By understanding the nuances of data circulation, statistics agencies can refine their dissemination practices, fostering an environment where official statistics are not only accessible but also critically examined and used by the public. Future research could build on these findings by exploring the motivations and constraints faced by journalists when using statistical data, as well as examining how audiences engage with news articles that incorporate official statistics. Additionally, further investigation into the impact of data literacy initiatives for journalists could provide valuable insights into improving data-driven journalism.

Abstract. This study investigates the role of data orchestration in enhancing data value generation within the judicial data ecosystem, grounded in Resource-Orchestration Theory (ROT). Data orchestration is defined as a multidimensional construct comprising data strategy, data governance, synergy, and technological infrastructure. These dimensions collectively facilitate the integration and coordination of data resources, processes, and stakeholders to maximize data value. Guided by the principles of ROT, which conceptualizes data as strategic resources to be structured, bundled, and leveraged, this study emphasizes the importance of orchestrating data resources to enhance their value within the judicial data ecosystem, where diverse actors and complex systems interact, ensuring data is effectively utilized as a strategic asset. A quantitative methodology was employed, with a survey conducted among experts from Brazilian courts and councils. Regression analysis was used to evaluate the relationship between data orchestration and data value, revealing a significant positive effect (0.687, $p < 0.001$), with data orchestration explaining 45.6% of the variance in data value. These findings demonstrate that coordinated efforts to align data-related resources and practices significantly enhance the value generated from data within the judicial ecosystem. By operationalizing ROT in this context, the study provides empirical evidence of how data orchestration contributes to improving the strategic potential of data in data ecosystems. The research advances theoretical understanding of ROT in the field of data ecosystems and offers practical insights for improving data management and governance in judicial settings. Although limited by sample size, the study opens pathways for future research to explore additional dimensions influencing data value generation and to validate these findings in other institutional contexts, acknowledging that generalizability is constrained by the specific characteristics of the Brazilian judicial data ecosystem.

Keywords. Data orchestration, data value, resource orchestration theory, data ecosystems.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.993

1. Introduction

Data orchestration is a broad concept that encompasses the integration of data strategy, data governance, synergy among stakeholders, and technological infrastructure (Schreieck *et al.*, 2022; Queiroz *et al.*, 2020). Data strategy involves planning how information is collected, analyzed, and shared to achieve organizational objectives (Gür *et al.*, 2021). Data governance establishes norms and responsibilities to ensure quality, security, and ethical use of information (Abraham *et al.*, 2019). Synergy fosters effective collaboration among various stakeholders (Cui & Han, 2022), while technological infrastructure supports interoperability and scalability of implemented digital solutions (Teece, 2020; Gupta *et al.*, 2020).

Through the lens of Resource-Orchestration Theory (ROT) (Zhang *et al.*, 2022), orchestration highlights the importance of strategically coordinating human, financial, technological, and informational resources to create value. ROT posits that organizations embedded in ecosystems can structure and bundle resources optimally,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

enabling them to respond to changes and generate value through efficiency and cost reduction, among other benefits. Within data environments, the strategic coordination of informational resources modernizes management practices and strengthens evidence-based decision-making (Queiroz *et al.*, 2020).

In the context of the Brazilian Judiciary, the efficient coordination of resources is particularly relevant. The Judiciary is organized into multiple instances and bodies—such as superior, federal, state, and district courts—reflecting the complexity of the judicial ecosystem established by the 1988 Federal Constitution (Brazil, 1988). While this institutional diversity is important for ensuring autonomy and independence among courts, it also creates challenges that require coordinated actions to meet growing demands for transparency and effectiveness. The National Council of Justice (CNJ) functions as the orchestrator of this ecosystem, promoting programs that integrate technology and innovation to modernize the Judiciary and improve access to justice (CNJ, 2023). For such initiatives to succeed, reliable and integrated data are indispensable, allowing the CNJ to align administrative practices, monitor court performance, and implement evidence-based public policies.

Building on this institutional arrangement, this paper conceptualizes the judicial data ecosystem as a domain-specific, orchestrated environment regulated by the CNJ (Oliveira & Lóscio, 2018; Gelhaar *et al.*, 2021). Within this framework, structured and centralized data management enables evidence-informed decision-making across judicial institutions. Data orchestration emerges as a strategic approach, with the potential to enhance analytical capabilities through big data applications (Mikalef *et al.*, 2023). The integrated analysis of large datasets generates insights that inform policy design, resource allocation, and operational efficiency. Moreover, the standardization and centralization of data contribute to greater transparency and help build public trust in judicial services, reinforcing the Judiciary's role in promoting citizenship (Salerno & Maçada, 2024a; Nikiforova *et al.*, 2024).

These dynamics are reflected in specific CNJ-led initiatives that exemplify the orchestration of data resources in practice. One such initiative is DataJud, which centralizes procedural data from all Brazilian courts (CNJ, 2022). By offering thematic dashboards, DataJud makes a wide range of information available to support institutional decision-making and the formulation of evidence-based public policies. This initiative is embedded within the broader Justice 4.0 Program, which promotes the adoption of technologies such as artificial intelligence and big data to enhance judicial efficiency and the quality of services provided by the courts (Barreto & da Costa, 2020; Vivian, 2020).

Despite its advantages, implementing data orchestration in the Judiciary faces significant challenges, including cultural resistance, limited technical training, and insufficient interoperability among systems of different courts (Castro, 2022; Vivian, 2020). Moreover, ensuring data security and privacy, especially regarding sensitive information, requires ongoing investments in technology and governance (Mikalef *et al.*, 2023).

These limitations highlight the complexity of advancing data orchestration and reinforce the need to better understand its actual contribution to data value generation within judicial ecosystems. Against this backdrop, the present study investigates the following question: *What is the impact of data orchestration on data value generation in the judicial data ecosystem*? To address this question, an exploratory quantitative methodology was adopted, employing a survey among experts from Brazilian courts and councils. The goal is to provide empirical evidence on the relationship between data orchestration and data value, contributing to the refinement of Resource-Orchestration Theory and to improved judicial data management.

2. Theoretical Framework

This section presents the theoretical framework underpinning the research, beginning with the foundations of Resource-Orchestration Theory, the core theory informing the phenomenon under study. Subsequently, the concept of data orchestration is developed as a construct comprising four interrelated dimensions: data strategy, data governance, synergy, and technological infrastructure, each detailed in subsequent sections.

2.1 Resource-Orchestration Theory

Resource-Orchestration Theory (ROT) is a theoretical approach widely used to analyze how organizations structure and manage resources to achieve strategic objectives in dynamic environments, such as ecosystems. Although originally developed in private sector contexts (Sirmon *et al.*, 2007; 2011), ROT has been increasingly applied in public administration, where resource alignment and coordination are also important (Gao *et al.*, 2022). ROT asserts that the value of a resource lies not only in its possession but also in an organization's ability to orchestrate it effectively through three key processes: structuring, bundling, and leveraging. These processes enable organizations to identify strategic resources, combine them efficiently, and use them to create value through mechanisms such as efficiency and cost reduction (Queiroz *et al.*, 2020).

Structuring involves identifying and mobilizing available resources to ensure their accessibility and alignment with

organizational objectives. Bundling entails combining resources in a complementary manner, creating synergies that enhance their utility. Finally, leveraging refers to the strategic use of resources to maximize their impact, capitalizing on opportunities and effectively responding to external threats. This approach is particularly relevant in data ecosystems, where multiple actors interact and share information to pursue common goals (Lin *et al.*, 2023; Zhang *et al.*, 2022; Sirmon, 2007).

Queiroz *et al.* (2020) argue that orchestration positively impacts ecosystems, with the phenomenon surpassing the sum of individual effects. In the data context, orchestration enables value generation that exceeds individual contributions. Autio (2022) highlights the utility of ROT in digital ecosystems, where coordinating intangible assets such as data enhances management practices. Additionally, Salerno and Maçada (2024a) emphasize that in ecosystems like the Brazilian Judiciary, data orchestration fosters the alignment of strategic initiatives and improves data quality.

By centralizing and integrating information through technologies such as DataJud, ROT principles can be applied to the judicial data ecosystem. ROT thus provides a theoretical foundation for analyzing how data, treated as strategic resources, can be structured and bundled to generate value (leveraging). After exploring these theoretical foundations, the next section elaborates on the concept of data ecosystems.

2.3 Data Ecosystems

Data ecosystems integrate organizations, technologies, processes, and stakeholders in a collaborative environment where data is collected, shared, and utilized as a strategic resource (Guggenberger *et al.*, 2020). This concept is especially pertinent in a context of intense flow of information. According to Oliveira and Lóscio (2018), a data ecosystem can be defined as a complex and interconnected network of organizations, technologies, and individuals utilizing data as a fundamental asset for their activities. This definition reveals the dynamic nature of ecosystems, where interactions among participants are pivotal for maximizing data value. Nikiforova *et al.* (2024) add that data ecosystems evolve over time, influenced by technological advancements, regulatory changes, and societal demands. Gelhaar *et al.* (2021) highlight that data ecosystems differ from other informational systems due to their capacity to foster collaboration among multiple actors, often from distinct sectors. These ecosystems are characterized by adaptability, resilience, and the ability to evolve based on new data and technologies. Furthermore, transparency and interoperability among systems and actors are critical elements for a data ecosystem's success.

Guggenberger *et al.* (2020) note that data ecosystems comprise several interdependent components, including data as a central resource, where its quality and accessibility are fundamental for effective functioning. The literature also emphasizes the use of data for analyses, modelling, and decision-making by ecosystem participants (Xu & Pero, 2023). Another essential aspect involves technological infrastructure, which provides the foundation for data collection, storage, processing, and dissemination. Platforms and solutions based on artificial intelligence often leverage data ecosystems (Nikiforova *et al.*, 2024; Gupta *et al.*, 2020). Weber *et al.* (2024) demonstrate that well-structured ecosystems transform data into strategic insights, fostering value generation.

Nikiforova *et al.* (2024) propose an evolutionary model of data ecosystems identifying six distinct generations, ranging from systems focused on raw data to intelligent ecosystems leveraging emerging technologies like artificial intelligence and machine learning. Oliveira and Lóscio (2018) distinguish between open ecosystems, emphasizing unrestricted data sharing among participants, and orchestrated ecosystems, characterized by a central actor regulating interactions and establishing norms. This typology is particularly useful for understanding complex ecosystems like the Brazilian Judiciary, where the CNJ acts as an orchestrator by promoting data integration through DataJud (CNJ, 2022).

The creation of DataJud, as part of the Justice 4.0 Program, demonstrates the potential of data ecosystems to centralize information, promote integrated analyses, and enhance administrative efficiency. This initiative reveals the significance of inter-institutional collaboration and technological interoperability in modernizing judicial services (CNJ, 2023; Barreto & da Costa, 2020). The concept of a judicial data ecosystem, as employed in this study, is a domain-specific, orchestrated data ecosystem (Oliveira & Lóscio, 2018; Gelhaar *et al.*, 2021), characterized by regulated interactions among institutions under a central orchestrator—the CNJ. This setting aligns more closely with the structured ecosystem model discussed by Nikiforova *et al.* (2024), in contrast to fully open data ecosystems (Weber *et al.*, 2024).

Having established the foundations of data ecosystems, particularly the typology emphasizing orchestrated data ecosystems, the discussion follows to the concept of data orchestration.

2.3 Data Orchestration

Data orchestration, as defined in this study, is based on Resource-Orchestration Theory (ROT) and refers to the strategic coordination of data-related resources, actors, and processes to generate value within a data ecosystem (Salerno & Maçada, 2024b; Zhang *et al.*, 2022). Rather than focusing on the technical automation of data flows, as seen in IT-based data orchestration, this perspective emphasizes how organizations structure, bundle, and leverage data resources to improve decision-making and policy implementation (Schreieck *et al.*, 2022; Queiroz *et al.*, 2020). This approach is particularly relevant in data ecosystems, where multiple stakeholders interact through shared data infrastructures. In such environments, orchestration helps to align goals, foster collaboration, and address common challenges—such as data fragmentation and lack of interoperability (Guggenberger *et al.*, 2020).

Within the framework of ROT, the processes of structuring, bundling, and leveraging are interdependent elements that enable value creation from data (Schreieck *et al.*, 2022). Structuring in data orchestration involves identifying, organizing, and allocating resources to ensure that data is accessible, relevant, and aligned with objectives (Queiroz *et al.*, 2020). Bundling refers to integrating and combining complementary data sources, enabling interactions among different information sources and systems. Leveraging denotes the strategic use of these resources to achieve organizational or collective goals within the data ecosystem (Salerno & Maçada, 2024a; Lin *et al.*, 2023).

These three processes, when coordinated effectively by an orchestrator, foster the ecosystem's dynamism, enhancing the strategic potential of data while strengthening value creation capabilities (Cui & Han, 2022; Schreieck *et al.*, 2022). Based on these assumptions, data orchestration comprises four primary dimensions: data strategy, data governance, synergy, and technological infrastructure. The selection of these dimensions of data orchestration was grounded in the core processes of ROT (structuring, bundling, and leveraging) and informed by empirical studies on data orchestration in digital and public ecosystems (Schreieck *et al.*, 2022; Cui & Han, 2022; Queiroz *et al.*, 2020). These dimensions are explored in detail in subsequent sections.

2.3.1 Data Strategy

Data strategy refers to a plan that guides how data will be used to achieve organizational objectives, setting priorities, guidelines, and promoting alignment between organizational goals and data, thereby integrating data into decision-making processes (Gür *et al.*, 2021; Marr, 2021). According to Vayyavur (2024), an effective data strategy requires not only planning for data use and related objectives but also alignment among stakeholders. In the context of orchestration, focusing on specific informational resources is important to explore the effects of integration and strategic coordination (Zhang *et al.*, 2022). This alignment is particularly relevant in public institutions where the common goal is to deliver services to the population.

In this context, data strategy becomes particularly important due to the complexity of interactions among different actors, aiming to guide how goals and objectives can be achieved through data (Schreieck *et al.*, 2022; Curry *et al.*, 2021). From this perspective, data orchestration is relevant for spreading and amplifying the benefits of a data strategy, enabling ecosystem participants to act collectively towards achieving objectives (Queiroz *et al.*, 2020). Orchestration facilitates the integration of efforts, enhancing the generation of value through data exchanges within the ecosystem.

As Gür *et al.* (2021) indicate, data strategy encompasses dimensions such as strategic declarations, internal and external data sources, ecosystem alignment, and strategy implementation. Through this lens, data orchestration leverages data strategy to promote alignment on how data contributes to achieving goals and objectives, establishing it as a central element of data orchestration by directing actors to work cohesively. Therefore, data strategy is adopted as one of the dimensions of data orchestration.

2.3.2 Data Governance

Data governance serves as a foundation for data orchestration by establishing norms, policies, and practices governing ecosystem data, widely recognized as a key element for maximizing the value of data within ecosystems (Lis *et al.*, 2023). Abraham *et al.* (2019) define data governance as a set of processes necessary to ensure that data is handled reliably and complies with legal and institutional requirements. According to Otto *et al.* (2011), data governance not only regulates the use of information but also maximizes its value by defining roles, authorities, and decision-making structures.

In this sense, Kim and Cho (2019) highlight that data governance enhances data strategy by setting the conditions needed to achieve proposed objectives. Thus, data governance integrates ecosystem actors by defining guidelines that promote collaboration among stakeholders and alignment regarding data-related practices. This interaction is particularly relevant in collaborative environments, such as the Judiciary, where clear role definitions and data quality assurance are fundamental to collective success (Salerno & Maçada, 2024b).

The literature explores the role of data governance as a facilitator for orchestration in ecosystems. Lin *et al.* (2023) argue that governance is fundamental for ensuring the proper flow of data within ecosystems, while Schreieck *et al.* (2022) add that orchestrators can leverage governance at three mechanisms—structural, procedural, and relational—to optimize this flow. The orchestrator adapts governance rules to accompany ecosystem transformations. This implies not only proposing new guidelines but also continuously reevaluating existing mechanisms to ensure that the ecosystem remains efficient, collaborative, and capable of generating value in a dynamic environment.

From the perspective of Resource-Orchestration Theory, governance establishes conditions for ecosystem actors to utilize their partners' data integrally, defining clear boundaries about what can or cannot be shared. Therefore, data governance emerges as a dimension of data orchestration by enabling ecosystem actors to understand their responsibilities and desired standards, establishing norms, policies, and practices for ecosystem data.

2.3.3 Synergy

Synergy is one of the core dimensions of data orchestration, reflecting the ability to align and integrate various actors within a data ecosystem to achieve outcomes that exceed the sum of individual contributions (Fredriksson & Hagberg, 2023). Guggenberger *et al.* (2020) argue that synergy is a fundamental element in complex ecosystems, enabling strategic collaboration and effective sharing of informational and technological resources. In data orchestration, synergy promotes the integration and alignment among actors, information flows, and technologies comprising the ecosystem. Thus, data orchestration relies on synergy to foster a cohesive environment and alignment in data-related initiatives.

The literature emphasizes that synergy does not occur spontaneously, requiring deliberate efforts for its development. Lin *et al.* (2023) stress that elements such as trust and effective communication are important for maximizing collaboration among actors. Zhang *et al.* (2022) argue that synergy involves aligning contributions and efficiently integrating resources, enhancing collaboration among stakeholders. This perspective links synergy with other dimensions of data orchestration, such as data governance, data strategy, and technological infrastructure, creating a complementarity that optimizes value generation. By encouraging data sharing and integration among actors, synergy enables the use of advanced data analysis tools, such as big data and artificial intelligence, thereby generating value through data (Vafaei-Zadeh *et al.*, 2020).

In summary, synergy as a dimension of data orchestration is instrumental in fostering collaboration among actors, technologies, and data flows within the ecosystem. Its integration with other dimensions (data governance, data strategy, and technological infrastructure) reveals its importance in creating a cohesive and aligned environment necessary for effective orchestration. By facilitating the complementarity of informational resources, synergy enhances the value of ecosystem data.

2.3.4 Technological Infrastructure

Technological infrastructure can be defined as the set of systems, platforms, devices, and networks that support data collection, storage, processing, and sharing within ecosystems (Otto *et al.*, 2019). According to Chiang *et al.* (2023) and Sirmon *et al.* (2011), technological infrastructure supports and enables orchestration processes by connecting resources, systems, and actors, facilitating integration. From the perspective of data orchestration, technological infrastructure acts as an enabler that integrates different data sources and systems.

Otto *et al.* (2019) emphasize that the interoperability provided by technological infrastructure is vital for data to flow seamlessly within ecosystems. Furthermore, technological infrastructure supports the implementation of standards defined by data governance, ensuring, for instance, consistent data storage and quality standards (Solomonides, 2023). It also offers the flexibility necessary to adapt to changes in data ecosystems, accommodating increases in data volume and complexity. Garg *et al.* (2018) and Ranjan *et al.* (2017) highlight that scalability is a fundamental attribute of technological infrastructure, allowing ecosystems to expand their capacities as new technologies and demands emerge.

Finally, Vafaei-Zadeh *et al.* (2020) stress that technological infrastructure supports data integration, enabling diverse applications and creating conditions to maximize the value of data. Thus, technological infrastructure becomes a core dimension of data orchestration by facilitating the wide use and sharing of data among ecosystem actors (Zhang *et al.*, 2022; Otto *et al.*, 2019).

3. Contextualization to the Brazilian Judiciary

The Brazilian Judiciary comprises a diverse structure, including superior, federal, state, and district courts, designed to ensure the independence and autonomy as outlined in the 1988 Federal Constitution (Brazil, 1988).

While this multiplicity is necessary to address the specificities of various jurisdictions, it also poses challenges related to data integration, process standardization, and administrative efficiency (Barreto & da Costa, 2020).

In this context, the National Council of Justice (CNJ) acts as the orchestrator of the judicial ecosystem, fostering administrative uniformity, establishing guidelines, and monitoring court performance (CNJ, 2023). Reliable and high-quality data are necessary for the CNJ to perform its functions effectively, motivating its role as the data orchestrator of this ecosystem (CNJ, 2009). Key CNJ initiatives involving orchestrated data include DataJud, the Judiciary Digital Platform (PDPJ), and the Justice 4.0 Program, which illustrate the application of data orchestration principles in the judicial ecosystem.

For instance, DataJud centralizes data from all Brazilian courts, creating an integrated database for analyses supporting administrative decisions and public policies. Meanwhile, the PDPJ promotes collaborative development among courts to offer multiservice solutions utilizing shared resources and collaborative tools within the judiciary. Finally, the Justice 4.0 Program incorporates emerging technologies like artificial intelligence and big data into judicial management, aiming to optimize procedural workflows and modernize service delivery (CNJ, 2022, 2023; Vivian, 2020).

By linking these CNJ-led initiatives with the theoretical concepts, important intersections with Resource-Orchestration Theory emerge, motivating further exploration of data orchestration in the judicial ecosystem, particularly through the four dimensions representing data orchestration (data strategy, data governance, synergy, and technological infrastructure). Regarding data strategy, CNJ initiatives outline objectives to be achieved through data, such as creating dashboards with quality information on court activities (CNJ, 2020). For data governance, it is observed that it manifests primarily through CNJ resolutions, such as Resolution No. 331/2020, which provides norms and guidelines for using ecosystem data (CNJ, 2020). Synergy, in turn, can be exemplified by the creation of the Judicial Research Network through Resolution No. 462/2022 (CNJ, 2022), promoting collaboration and alignment among ecosystem actors in data-related initiatives. Finally, technological infrastructure fosters interoperability and data flow among actors, exemplified by the Codex platform, developed to consolidate procedural databases and facilitate data input for technological applications used in the judiciary (CNJ, n.d.).

Therefore, data orchestration within the judicial ecosystem can be observed through the four theoretical dimensions developed under Resource-Orchestration Theory, wherein data strategy, data governance, synergy, and technological infrastructure promote data orchestration to maximize data value. This perspective positions the CNJ as the primary orchestrator of the judicial ecosystem's data, leveraging data resources to meet the ecosystem's and society's demands, as an example of the typology of orchestrated ecosystems (Gelhaar *et al.*, 2021; Oliveira & Lóscio, 2018).

With the contextualization of the judicial data ecosystem understood, the next section presents the methodology used to address the research question: What is the impact of data orchestration on data value generation in the Judicial Data Ecosystem?

4. Research Methods

This section outlines the methodology employed to investigate the proposed research question, focusing on measuring the impact of data orchestration on data value generation. A quantitative approach was adopted, detailed in the subsequent sections, encompassing the development of a questionnaire, its validation, and the statistical techniques applied.

4.1 Development of the Research Instrument

To measure the impact of data orchestration on value generation in the Judicial Data Ecosystem, a survey was conducted with specialists in the judicial ecosystem using a questionnaire. The choice of a questionnaire as a data collection instrument is justified by its ability to systematically and uniformly capture perceptions from the target population (Pinsonneault & Kraemer, 1993). The questionnaire was developed by a multidisciplinary team of researchers and judicial experts with proven experience in managing and analyzing data in the Brazilian Judiciary. The item construction was informed by prior theoretical frameworks, particularly Resource-Orchestration Theory (Zhang *et al.*, 2022), and operationalized through constructs derived from literature on data ecosystems and orchestration (Guggenberger *et al.*, 2020; Schreieck *et al.*, 2022). The final instrument contained 33 items to represent each orchestration dimension (data strategy, data governance, synergy, and technological infrastructure) and data value. Items were designed using a Likert scale of agreement ranging from 1 (strongly disagree) to 7 (strongly agree) to capture the intensity of perceptions regarding the proposed statements. The full questionnaire is available upon request from the authors.

4.2 Face and Content Validity

After the initial draft, a card sorting exercise was conducted with 10 data orchestration specialists to validate the structure and organization of the questionnaire's constructs (Spencer, 2009). The results indicated that the items were consistently organized and aligned with the proposed theoretical dimensions, with minor adjustments made to improve question phrasing. Subsequently, the Content Validity Index (CVI) was calculated based on evaluations from eight experts who assessed the clarity, relevance, and representativeness of the items concerning the constructs, ensuring the instrument's content validity. One item scored below the CVI threshold of 0.8 and was revised for clarity. The remaining items scored above 0.80, indicating an acceptable level of content validity (Alexandre & Coluci, 2011).

4.3 Data Collection

The questionnaire was available from October 15 to December 20, 2024, and distributed to all Brazilian courts and councils via the Judicial Research Network. It was also shared with Judicial Schools, Innovation Laboratories, and IT Departments within courts. A total of 35 responses were received from experts with in-depth knowledge of the judicial data ecosystem, representing segments such as state, federal, labour, and electoral justice, as well as superior courts and councils. Among respondents, 34.2% worked in strategic management, 45.8% in technology, and the remaining 20% in other technical data fields, ensuring broad representation of the Brazilian judicial data ecosystem.

4.4 Instrument Validation

The instrument's validity was assessed using principal component analysis (PCA) to verify the unidimensionality of the dimensions comprising data orchestration (data strategy, data governance, synergy, and technological infrastructure) and data value as constructs. Each dimension was analyzed individually, ensuring significant item contributions. One item (DGP1) scored below 0.7 and was excluded from the analysis (Hair *et al.*, 2019). Internal consistency for the four dimensions of data orchestration and data value was evaluated using Cronbach's alpha, confirming the instrument's reliability. Results are presented in Tab. 1, showing values exceeding literature standards (>0.7), supporting internal consistency (Cronbach & Meehl, 1955).

Tab. 1 - Cronbach's Alpha Result

Dimension	Cronbach's Alpha	
Data Strategy	0.942	
Data Governance	0.952	
Structural		0.943
Procedural		0.924
Relational		0.930
Synergy	0.925	
Technological Infrastructure	0.900	
Data Value	0.966	

4.5 Calculation of Latent Scores

To create a single score per respondent representing data orchestration across its four theoretical dimensions, principal component analysis (PCA) was again applied, extracting scores related to the first component. PCA is a statistical technique for dimensionality reduction that synthesizes shared variance among analyzed items into a reduced set of principal components (Jolliffe, 2002). In this case, the first component, which explained 58.43% of the variance, was selected as the single score to represent data orchestration, summarizing the four theoretically developed dimensions. A similar procedure was applied to the items representing data value, where the first component explained 88.62% of the variance.

4.6 Linear Regression

Using the standardized scores obtained from PCA, a linear regression analysis was conducted to examine the relationship between data orchestration (independent variable) and data value (dependent variable), assessing the significance of the beta coefficient (β) and the percentage of variance explained by the model (R^2). Linear regression is a statistical technique used to identify and quantify relationships between a dependent variable and one or more independent variables, widely used to understand associations between variables (Darlington &

Hayes, 2017). Assumptions of regression analysis (linearity, homoscedasticity, normality of residuals, and overall model fit) were graphically evaluated using R software.

5. Results

This section presents the findings from the methodological procedures performed to assess the impact of data orchestration on data value generation within the judicial data ecosystem.

5.1 Linear Regression Results

Based on the standardized scores obtained through PCA, the regression model results are presented in Tab. 2 and Tab. 3. Assumption diagnostics were graphically assessed in Fig. 1, suggesting that all assumptions were met (Darlington & Hayes, 2017).

The results indicate that data orchestration has a positive and statistically significant impact ($p < 0.05$) on data value ($\beta = 0.687$, $p < 0.001$). Interpreting the coefficient obtained, each additional unit of data orchestration corresponds to an average increase of 0.687 units in data value, based on the standardized scale (mean = 0, standard deviation = 1) derived from PCA (Darlington & Hayes, 2017; Jolliffe, 2002). Tab. 3 reveals that the overall model was significant ($p < 0.05$), explaining a substantial proportion of total variance. The adjusted R^2 value was 0.456, meaning that 45.6% of the variance in data value can be explained by data orchestration. This result indicates that data orchestration has a moderately significant impact on data value (Darlington & Hayes, 2017), aligning with theoretical perspectives presented in Resource-Orchestration Theory (Cui & Han, 2022).

Tab. 2 - Regression Results

Variable	Coefficient (β)	Standard Error	t-Statistic	p-Value
Data Orchestration	0.687	0.127	5.429	< 0.001

Tab. 3 - Analysis of Variance

Source of Variation	Sum of Squares	Degrees of Freedom	Mean Square	F-Statistic	p-Value
Regression	16.04	1	16.04	29.473	< 0.001
Residual	17.96	33	0.544	-	-
Total	34.00	34	-	-	-

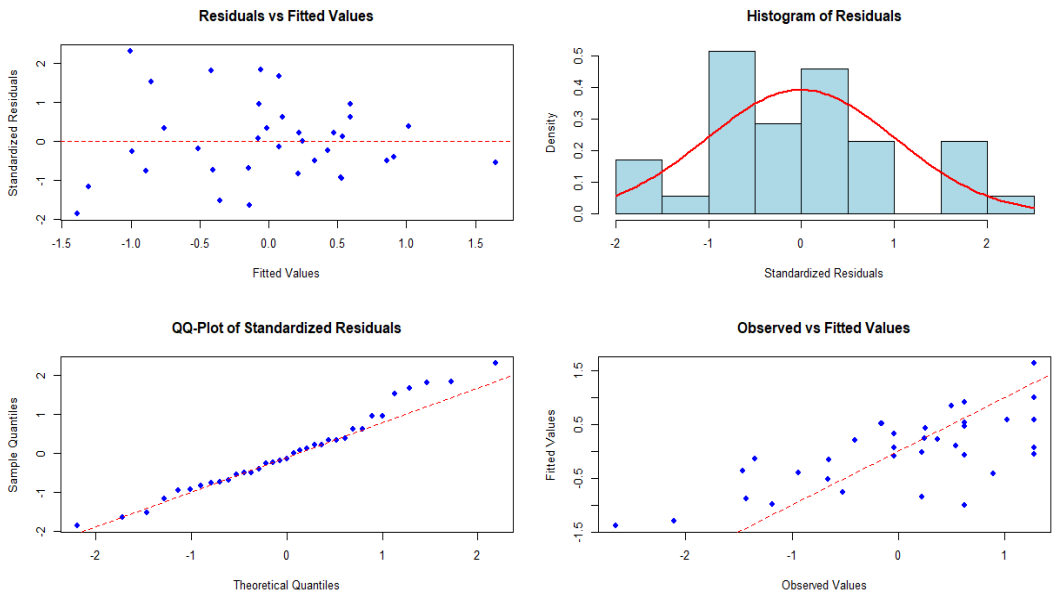

Fig. 1 – Graphical Analysis of Regression Model Assumptions.

5.2 Theoretical Implications

In the theoretical context of data orchestration, the results suggest that the processes of structuring, bundling, and leveraging proposed by Resource-Orchestration Theory can be operationalized through four dimensions: data strategy, data governance, synergy, and technological infrastructure. The leveraging process is represented by the observed increase in data value. These findings corroborate the theoretical framework presented in Section 2, confirming that data orchestration has a significant impact on data value within the judicial ecosystem. This relationship emphasizes the CNJ's role as the ecosystem's orchestrator, coordinating resources, actors, and processes, reflecting orchestrated ecosystems identified in the literature (Gelhaar *et al.*, 2021; Oliveira & Lóscio, 2018).

The results also provide empirical evidence that complements existing literature, contributing to a better understanding of how data orchestration influences data value generation in ecosystems. Addressing the research question directly, the impact of data orchestration on data value generation in the judicial data ecosystem was 0.687, meaning that each additional unit of data orchestration corresponds to an average increase of 0.687 units in data value (standardized scale). Resource-Orchestration Theory suggests that value creation results from the interdependent processes of structuring, bundling, and leveraging resources (Sirmon *et al.*, 2011; Zhang *et al.*, 2022), which, in the context of orchestrated data ecosystems, could be operationalized through data orchestration and its dimensions (Schreieck *et al.*, 2022; Queiroz *et al.*, 2020).

For instance, the impact of data strategy may be increased by strengthening alignment between organizational goals and data practices (Gür *et al.*, 2021), while data governance can evolve through the refinement of procedural and relational mechanisms to better accommodate dynamic ecosystem needs (Schreieck *et al.*, 2022; Lin *et al.*, 2023). Enhancing synergy depends on fostering trust and inter-organizational collaboration (Zhang *et al.*, 2022; Guggenberger *et al.*, 2020). Improvements in technological infrastructure may result from expanding interoperability and scalability to mitigate data fragmentation (Vafaei-Zadeh *et al.*, 2020; Otto *et al.*, 2019). Thus, while the regression model demonstrates the aggregate effect of data orchestration, a conceptual analysis indicates that each dimension has a distinct capacity to influence data value and may require targeted strategies for enhancement.

However, this study was not designed to isolate and test the individual effects of each dimension. While the findings offer initial empirical support for the Brazilian judicial data ecosystem, caution is warranted when generalizing to other institutional or national contexts. Governance structures, data policies, and the degree of central coordination in Brazil may differ significantly from those in other judicial or public data ecosystems. Moreover, the limited sample size constrained the analytical depth, particularly in assessing dimension-specific impacts. Future research with larger and more diverse samples could address these limitations by disaggregating the data orchestration construct and offering a more granular understanding of how each dimension contributes to data value across different settings.

6. Conclusion

Recent technological advancements in the Brazilian Judiciary, particularly the creation of DataJud, have fostered the development of a judicial data ecosystem, presenting opportunities to enhance court management and decision-making processes (CNJ, 2023). In this context, data orchestration has emerged as a strategic approach to optimize data value generation and improve judicial services (Salerno & Maçada, 2024a; Cui & Han, 2022; Schreieck *et al.*, 2022). Through a survey with experts from Brazilian courts and councils, linear regression results revealed that data orchestration positively and significantly impacts data value ($\beta = 0.687$, $p < 0.001$) on the judicial data ecosystem, with the model explaining 45.6% of the variance in data value.

The findings support Resource-Orchestration Theory's emphasis on the role of orchestration in value generation, highlighting the importance of data orchestration in effectively structuring, bundling and leveraging data resources (Lin *et al.*, 2023; Zhang *et al.*, 2022). The dimensions of data strategy, data governance, synergy, and technological infrastructure effectively represent data orchestration, which positively impacts data value generation in the judicial ecosystem, complementing prior studies (Salerno & Maçada, 2024a). These results also reinforce the significance of integration and collaboration among multiple actors to maximize the benefits of shared information in data ecosystems (Fredriksson & Hagberg, 2023; Guggenberger *et al.*, 2020). In addition, the finding aligns with previous studies highlighting the importance of strategic coordination of informational resources in value generation within ecosystems (Autio, 2022; Queiroz *et al.*, 2020).

The significant relationship between data orchestration and data value demonstrates the potential for judicial data ecosystems to adopt orchestration practices as a strategic approach to enhance their operations. By emphasizing coordinated data practices within ecosystems, this study establishes data orchestration as a structured approach to addressing challenges such as fragmented data and inefficiencies in information flow (Guggenberger *et al.*, 2020). This perspective reinforces the growing recognition that ecosystems benefit from orchestration practices

that balance resource alignment with collaborative engagement (Cui & Han, 2022). Furthermore, the judicial context call attention to the unique contribution of these practices in supporting public policies aimed at enhancing service delivery and accountability (Vivian, 2020). These insights provide a foundation for further exploration of how data orchestration can address challenges beyond the judiciary, particularly in data ecosystems where coordination among stakeholders is critical.

In summary, this research demonstrated the significant impact of data orchestration on data value generation, contributing to the academic understanding of how coordinated data practices enhance value creation within data ecosystems. While the research achieved its objective, it faced certain limitations. The primary limitation was the restricted number of respondents, which constrained the application of more advanced statistical techniques and limited the generability of the findings. Subsequent studies could address these limitations by incorporating larger sample sizes, exploring the applicability of data orchestration in diverse ecosystems, or employing advanced quantitative methodologies, such as PLS-SEM, to further validate and refine the construct. These efforts would offer deeper insights into the role of data orchestration in enhancing data value within ecosystems.

Abstract. Digital Public Infrastructures (DPIs) are an emerging concept for building foundational digital capabilities—such as digital identity, data sharing, and payments—designed and governed in the public interest to foster generative value creation. Although DPIs are increasingly promoted as instruments for enabling collaboration among governments, citizens, and organizations, the concept remains underdefined in both academic and policy discourse. This study addresses that gap by applying the Technology-Organization-Environment (TOE) framework and a grounded theory approach to analyze 143 academic and non-academic sources published between 2011 and 2024, including work from international organizations, think tanks, and philanthropic entities. We offer three primary contributions: First, we define DPIs as socio-technical systems with modular and layered architectures, governed through public-private collective action to support value creation and multi-actor interaction at scale. Second, we develop a conceptual framework structured around technological, organizational, and environmental dimensions. This framework identifies governance architecture and functional modularity, stakeholder orchestration, and public-private governance, as well as policy context and public rationale, as critical characteristics of emerging DPIs. Third, we position DPIs as an evolution of digital infrastructure and platform models, reoriented toward public interest objectives. We conclude with a call for interdisciplinary research to examine the design, implementation, and governance of DPIs across diverse regional contexts. Emphasizing their potential to deliver inclusive, interoperable, and scalable infrastructure capabilities, we argue that DPIs offer a promising foundation for addressing complex societal challenges.

Keywords. digital infrastructure, digital platforms, digital public infrastructure, digital public good, data ecosystems, public data spaces, government as a platform, platform regulation

1. Introduction

The swift digital transformation of governments, economies, and societies has underscored digital public infrastructure (DPI) as essential for value creation and social advancement (Mergel et al., 2019; Yoo et al., 2024). In September 2024, the UN's Global Digital Compact committed to strengthening DPI to close digital divides and accelerate progress on the Sustainable Development Goals (United Nations, 2024), a pledge echoed under India's G20 Presidency (UN Development Programme, 2023a). The G20 agree that DPIs facilitate seamless ecosystem interactions among governments, citizens, and private organizations, addressing societal challenges while promoting inclusivity (UN Development Programme, 2023b). In doing so, they play a foundational role in shaping the ongoing digital transformation in line with a public interest paradigm, aiming to promote efficient value creation, improve citizen satisfaction, and promote decentralization (Henfridsson and Bygstad, 2024; Mergel et al., 2019).

Existing research on digital infrastructures highlights their dynamic, open, and heterogeneous nature, which has increasingly intertwined with digital platforms, enabling interactions that extend beyond organizational boundaries (Constantinides et al., 2018; Tilson et al., 2010). Digital infrastructures are evolving into platforms, while large digital platforms simultaneously function as infrastructures, increasing their foundational role in driving innovation and facilitating collaboration (Bygstad and Hanseth, 2018; Plantin et al., 2018). However, much of this research focuses on private digital platforms, which, in cases like hybrid conglomerate platforms such as Apple, Amazon, or Microsoft, have increasingly transitioned into quasi-public infrastructures due to their societal relevance (Degen and Gleiss, 2025; Gleiss et al., 2023). This shift has sparked debate around emerging regulatory issues leading to calls for digital sovereignty, inclusivity, and accountability of these private actors (Heimburg and Wiesche, 2023; von Scherenberg et al., 2024; Yoo et al., 2024). The emerging discourse on DPIs redefines these foundational digital infrastructures in the context of data sharing, digital identity, and payment by embedding public values such as transparency, interoperability, and accountability in their design and governance (Möller et al., 2024; UN Development Programme, 2023b).DPIs also leverage government-built digital assets and public data ecosystems, now open to third-party collaboration to deepen public-private impact and foundational relevance(Degen and Teubner, 2024; Degen et al., 2025).

Against this background, we conduct a literature review in Information Systems and Public Management, complemented by a grounded theory analysis, to develop a more systematic understanding of the emerging DPI concept. In doing so, we collected and analyzed through inductive coding more than 143 publications from scholars, think tanks, international organizations, and philanthropic entities addressing DPIs within the timeframe 2011 to 2024. We conceptualize DPIs as a socio-technical system with a modular and layered architecture, initiated and governed by public and private stakeholders through collective action. They serve as a shared foundation for value creation with large-scale societal impact, enabling interactions of multiple actors in the digital realm while advancing the public interest. Our research aims to contribute to the emerging field of DPIs by addressing the research gap in its conceptualization. Using the TOE framework as a theoretical lens, we explore the challenges DPIs face in generating impact (Tidd, 2001). Specifically, we examine the technological, organizational, and environmental dimensions that shape the "*DPI black-box*" and influence the design, governance and adoption. The central research question guiding our study is twofold:

How can digital public infrastructures (DPIs) be conceptualized and what technological, organizational, and environmental challenges shape their implementation and governance?

The remainder of the paper is organized as follows: Section 2 outlines the conceptual and theoretical background. Section 3 details research design, data collection and methodology. Section 4 presents the results and introduces the DPI framework. Section 5 offers a discussion and reflection on the findings. Finally, Section 6 concludes and provides an outlook for future research along the limitations of this study.

2. Conceptual and Theoretical Background

2.1. Digital Infrastructures and Platforms

IS research has conceptualized digital infrastructures as "*shared, unbounded, heterogeneous, open, and evolving socio-technical systems comprising an installed base of diverse information technology capabilities and their user, operations, and design communities*" (Hanseth and Lyytinen, 2004, p.4). These infrastructures are inherently

layered and complex, evolving through generative mechanisms such as adoption (through actor engagement), innovation (through new functionalities), and scaling (through stakeholder integration) (Hanseth and Monteiro, 1997; Henfridsson and Bygstad, 2013). Digital infrastructures can be broadly categorized into "heavyweight" systems, such as the internet or cloud computing, and "lightweight" systems, including smartphones and wearables (Bygstad, 2017). These infrastructures provide essential computing power and foundational services, thereby enabling digital innovation (Bygstad, 2017; Yoo et al., 2010). Their nature means they often become noticeable only during disruptions (Star and Ruhleder, 1996; Tilson et al., 2010).

In recent years, digital infrastructures have increasingly opened to third parties beyond organizational boundaries, undergoing a process that can be termed "*platformization*" (Bygstad and Hanseth, 2018). Simultaneously, private digital platforms built on these infrastructures have transformed governments, economies, and societies (Constantinides et al., 2018). Platforms employ modular architectures, with owners establishing value-creation mechanisms that shape interactions among ecosystem actors(Baldwin and Woodard, 2009; de Reuver et al., 2018; Hein et al., 2020). Prominent platforms, such as Apple, Microsoft, Alphabet, Amazon, and Meta, have undergone a process of "*infrastructurization*" (Plantin et al., 2018), evolving into de facto digital infrastructures that support conglomerate ecosystems through centralized governance structures (Degen and Gleiss, 2025). These entities now offer foundational services, including cloud computing, interaction channels (e.g., smartphone and messaging platforms), and matchmaking capabilities (e.g., app stores and marketplaces), thus shaping societal norms, values, and value-creation mechanisms (Gleiss et al., 2023). Despite their value proposition, these platforms face increasing criticism due to growing dependence on their services and governance challenges (Heimburg and Wiesche, 2023; Henfridsson and Bygstad, 2024).

Public discourse highlights a demand for greater "*digital sovereignty*" among citizens, organizations, and policy makers, focusing on resource control, fairness in value creation and distribution, and addressing power asymmetries (Pohle and Thiel, 2020; von Scherenberg et al., 2024). Moreover, it underscores the growing desire for increased public oversight and government involvement in shaping digital infrastructure platforms to better align with public interests (Degen and Gleiss, 2025; Gleiss et al., 2023). Repeatedly, the importance of developing scalable public-sector-led alternatives to address the shortcomings of current digital realities are highlighted (Zuckerman, 2020). These efforts represent a form of public innovation, often initiated and guided by governments in collaboration with private and civic actors (Klievink et al., 2016). The goal is to tackle complex societal challenges, such as digital inclusion and equitable access, while providing foundational infrastructural capabilities that enable value creation and drive societal progress (Zuckerman, 2020).

2.2. Public Innovation and Public Interest

Public sector-driven innovation has become a focus of academic and policy debates (Mazzucato, 2011; Panagiotopoulos et al., 2019). This interest is particularly notable in the context of public-private cooperation and partnerships, which are recognized as key drivers of innovation aimed at creating public value (Shiva et al., 2024). Building on foundational frameworks such as Moore's Public Value Theory (Moore, 1997), the concept of public value encompasses three main dimensions: accountability, service quality, and citizen engagement (Hartley et al., 2017). While these principles are widely endorsed, their application within highly collaborative and regulated environments, such as platforms and digital infrastructures, remains limited (Gleiß et al., 2023; Hermes et al., 2022). Despite challenges, DPI policy discourse strongly emphasizes three core promises of public innovation: solving complex societal challenges, enhancing service delivery through digital transformation, and increasing transparency and inclusivity Mergel et al., 2019; Panagiotopoulos et al., 2019. Public innovation is an undirected form of innovation that seeks to address systemic issues, such as climate change and digital exclusion, through collaborative efforts and technological advancements (Kankanhalli et al., 2017).

Public innovation is built upon three core components: technology, organizational processes, and citizen cocreation (Hartley et al., 2017; Moore, 1997). Together, these elements form the foundation for generating public value across economic, social, and political measures. Economic value includes cost savings, efficiency gains, and economic growth driven by public-private collaboration. Social value emphasizes enhanced equity, inclusivity, and access to essential services. Political value strengthens trust, transparency, and democratic participation. As such public technology innovation has to face harsh public evaluation. A critical aspect for selling public innovation investments to stakeholders is the feedback loop between innovation and value creation (Scott et al., 2016). Innovations drive public value, which, in turn, fosters support for further innovation. However, there are relatively few successful examples of public innovation that have not been at least partially privately sponsored. A trade-off becomes visible: while private actors are often necessary for achieving

economies of scale and delivering high-quality services, they require adequate returns on investment, creating potential tensions in balancing public and private interests.

Public innovation policy faces additional challenges, including balancing citizen demands to ensure that innovations meet the needs of diverse populations while maintaining political neutrality (Edler et al., 2023). It must also navigate preexisting legal complexities, addressing national and international regulatory frameworks, including data protection, trade agreements, and intellectual property regimes. Furthermore, creating incentives for public-private partnerships is essential to encourage private sector participation without compromising public accountability and equity. To overcome these challenges, public innovation must adopt a collaborative and multi-stakeholder approach (Hodge and Greve, 2007). Governments must create enabling environments that balance the at times competing demands of citizens, private partners, and regulatory frameworks. By fostering public-private partnerships and leveraging co-creation processes, public innovation can fulfill its potential to deliver meaningful and sustainable public value (Zuiderwijk and Janssen, 2014). In this a cornerstone are shared visions and transparency often only delivered by neutral third parties.

2.3. Digital Public Infrastructure and Digital Public Goods

DPI is a highly recent phenomenon emerging in policy and public discourse only over the last five years (Hadavand et al., 2021; Zuckerman, 2020). Its development is closely linked to the concept of digital public goods, a relationship that has been explored in the historical emergence of these systems. However, the academic community often experiences a lag in addressing newly emerging topics (Rosa and Scheuermann, 2008). Consequently, literature on DPI remains sparse and both theoretical frameworks and empirical studies are highly diverse and unstructured. In general, DPI refers to foundational digital systems that enable governments, businesses, and individuals to interact within a digital ecosystem (UN Development Programme, 2023b). Examples include digital identity systems, interoperable payment platforms, and open data initiatives. These systems are designed to facilitate access to services, enhance economic participation, and improve governance. Digital public goods (DPGs) are characterized as digital assets and resources such as data that are universally accessible and serve the public good (UN Development Programme, 2023a). These include open-source software, open data, and algorithms that promote equitable access to digital services (Kankanhalli et al., 2017). The United Nations (UN) defines DPGs as systems that adhere to open standards and principles, ensuring inclusivity and transparency (UN Development Programme, 2023a). Throughout a pre-clustering of available sources, a degree of interchangeable use of the two terms in discourse has been identified, not represented in empiric research. Because of this, we approach the relationship between DPI and DPGs as symbiotic in accessible publications. DPI is portrayed as relying on DPGs to ensure scalability, interoperability, and openness. For instance, a digital identity system may leverage open-source technologies (DPGs) to ensure cost-effectiveness and adaptability (Degen and Teubner, 2024).

Tab. 1 – Literature Representation of Digital Public Infrastructure

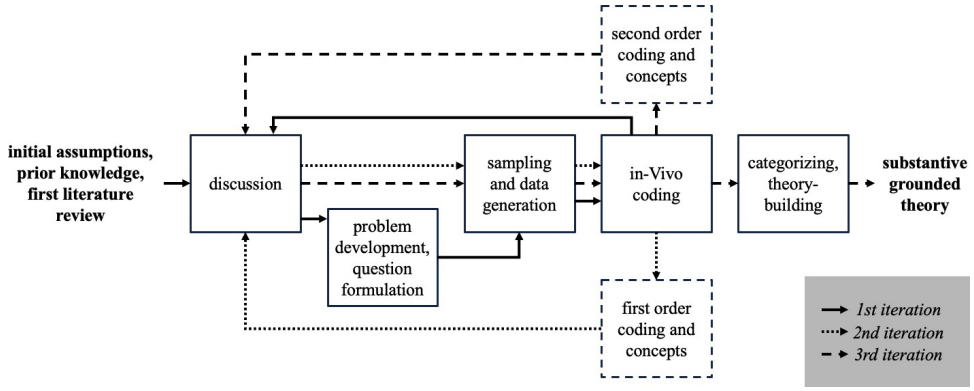
Research Stream	Brief Summary	Example Case	Example References
data exchange	Data exchange layers (or platforms) enable the transfer of information between stakeholders, e.g. companies, citizens, government.	India Stack x-Road Euro Stack	Aca-IS-22 Aca-S-40
identity	Digital identity systems provide individuals and organizations with verifiable means of identification without the need for further third-parties.	Aadhaar Diia PhylSis	Aca-S-31 Aca-S-22
payment	Payment systems facilitate digital transactions between citizens, businesses, and governments.	Pix UPI m-Pesa	Aca-S-18 Aca-S-42
public goods	Digital public goods encompass open-source software, data sets, algorithms, and platforms that are universally accessible and meant to benefit society as a whole.	eSanjeevani D-CENT	Aca-S-8 Aca-S-36

To achieve an initial overview of how the academic community has approached the topic, this study conducted a systematic literature review oriented at vom Brocke et al., 2009. Using the search operators "*digital public infrastructure*" OR "*digital public good*", we queried all fields in Scopus, AISeL, and AoM, resulting in a total of 82 publications (45 from Scopus, 35 from AISeL, and 2 from AoM). The findings from this review provide a

foundational understanding of how DPIs and DPGs have been academically treated and clustered, see Table 1. Information is accessible under: https://tinyurl.com/bdf8wet6. Although policy interest is rising, academic literature still lacks theoretically grounded definitions, empirical studies, and theory-driven research on DPIs. Insights stem mainly from lighthouse projects in India, Brazil, Estonia, and Singapore (UN Development Programme, 2023b), offering practical lessons but limited theory and often conflating DPI with DPG. While digital infrastructures and public–private partnerships have been studied (Ceccagnoli et al., 2012), no research has explicitly conceptualized DPI as a distinct phenomenon.

2.4. Theoretical Lens: Technology Organization Environment Theory

The Technology-Organization-Environment (TOE) theory provides a theoretical framework to understand how organizations, especially under high degrees of uncertainty (Tidd, 2001), adopt and implement new technologies (Awa et al., 2017; Baker, 2012). The TOE framework examines the interplay of three key contexts — *technology*, *organization*, and *environment* — and can be applied to explicate decision-making processes, particularly in the context of digital (public) infrastructure and data exchange (de Reuver et al., 2024). Originally introduced by Tornatzky and Fleischer in 1990 Baker, 2012, the TOE framework has gained widespread application in analyzing technology adoption and innovation Awa et al., 2017. TOE is foremost used to analyze the interplay between technological advancements, organizational dynamics, and environmental factors (Tsou and Hsu, 2015). This is particularly relevant in highly cooperative and regulated contexts (Yang et al., 2021), making it an appropriate theoretical lens to explore the complexities of public-private partnership dynamics in DPIs (Naithani and Agrahari, 2023). DPI serves as a prominent example of a highly complex system involving multi-actor stakeholders. These stakeholders include traditional public-private partnerships and extend to public-private-civic collaborations (Amard et al., 2024). For instance, the role of nongovernmental contributors, such as open source software (OSS) communities, is increasingly visible in the debate (Malgonde et al., 2023), alongside ongoing coordination challenges between BigTech entities and governmental institutions.



Within the TOE framework, DPI can be analyzed through three distinct lenses (Awa et al., 2017; Baker, 2012):

1. *Technological Foundations*: The technological characteristics of DPI, such as interoperability, scalability, openness, and cost-effectiveness, significantly influence its adoption and implementation. Examples include general digital platform foundations, digital identity systems, and payment gateways.
2. *Organizational Implementation and Management*: Governments, BigTech companies, non-profits, interest groups, and citizens all act as organizational actors with their own agendas, with distinct roles and interests.
3. *Environmental Influence in Cooperation, Legislation, and Regulation*: The broader environment, which includes collaboration, regulation, and competition, exerts a significant influence on DPI. Regulatory factors such as standards, modularity, law, and transnational regulation play a role in the formation of DPIs.

3. Data and Methods

3.1. Grounded Theory

Fig. 1 – Grounded Theory Research Process

DPI has gained significant attention, especially since India's G20 presidency (G20 India, 2023). Despite increased interest, definitions and theoretical work remain limited. To enable deeper analysis (Gregor, 2006), we used a grounded theory research design (Grover and Lyytinen, 2015; Wiesche et al., 2017), suitable for developing insights where theoretical foundations are weak (Corbin and Strauss, 1990). DPI's governance, mission, and scope implications make it ideal for grounded theory analysis (Birks et al., 2013; Urquhart et al., 2010). To reduce bias and reflect structural discourse, we examined academic work from management, law, and information systems, along with think tank reports and international organization publications. Our method involved iterative coding and constant comparison to identify key themes. By analyzing diverse materials, we aim to clarify DPI's conceptual and practical implications. This helps explain its multi-actor character and supports a structured understanding of DPI's role in governance and society. Figure 1 illustrates our process: team discussions, sampling, and data generation through in-Vivo coding repeated over three cycles.

3.2. Data Collection

Using the terms "digital public infrastructure" OR "digital public good", we retrieved 82 academic publications (2011–2024). Additionally, 61 non-academic sources—briefs, papers, blogs, reports, and practice research—were identified, with the earliest from 2020 (see Table 2). Non-academic searches focused on "digital public infrastructure" across the top 15 think tanks from the 2020 Global Go-To Think Tank Index (McGann, 2020) and top 10 from the 2024 Academic Influence rankings. Given DPI's emerging and policy-focused nature, including leading think tanks ensured timely, practice-driven insights that often precede academic theorization. A forward and backward citation analysis added relevant sources. All materials were open-access, English, and treated without quality differentiation. Data analysis involved in-Vivo coding to extract first-order concepts, which were iteratively grouped into broader categories. Second-order coding refined these categories into a grounded theory, supported by repeated review and abstraction cycles to ensure empirical depth and explanatory value. The TOE framework was applied following Gregory et al., 2018. Three researchers systematically reviewed all sources and conducted in-Vivo coding, see Figure 1.

Tab. 2 – Sources Used for Theory Development

Type	Outlets	n
academic article	SCOPUS, AoM, AISeL	82
blog	New America Foundation, Gates Foundation, Atlantic Council, Carnegie Endowment on International Peace, AI Now Institute, World Economic Forum, Council on Foreign Relations (CFR),	
brief	Atlantic Council, Open Knowledge Foundation, Konrad Adenauer Foundation, Fundação Getúlio Vargas (FGV)	7
paper	Brookings Institution, Carnegie Endowment on International Peace, Open Future, Chatham House (Royal Institute of International Affairs), Brookings Institution	7
report	Konrad Adenauer Foundation, Milken Institute, Center for Strategic and International Studies (CSIS), Project Liberty	6
commentary	Carnegie Endowment on International Peace, Chatham House (Royal Institute of International Affairs), Institut Montaigne	3
other	European Partnership for Democracy, Gates Foundation, Center for International Governance Innovation	6
Total		**143**

Data analysis involved in-Vivo coding to derive first-order concepts directly from the data, which were then iteratively categorized and abstracted into broader patterns and relationships. Through second-order coding, the team refined these relationships to develop a substantive grounded theory. The iterative nature of the process, highlighted by repeated cycles of data re-engagement, coding refinement, and theory abstraction, ensure that the resulting theory is both explanatory and empirically rooted.

4. Results

Employing the TOE framework (Baker, 2012), this research structures inductive findings around the technical, organizational and environmental context, proposing a comprehensive DPI framework. Additionally, to advance the conceptualization of DPIs, our study examines the challenges facing them in generating impact.

4.1. Technological Context: Governance Architecture and Functional Modularity

Tab. 3 – Example Sources DPI Technology Context

Context	Dimension	Practice Reference	Academic Reference
Technology	Governance Architecture	Pra-B-15, Pra-BA-4	Aca-S-1, Aca-S-5
	Functional Modularity	Pra-A-2, Pra-B-12	Aca-S-14, Aca-S-42

DPIs technological context can be understood through two key dimensions: the design of the governance architecture and the functional modularity of the DPI (Henfridsson and Bygstad, 2013). The design of the governance architecture describes the chosen technological innovation approach and the configuration of the infrastructure, which determines how centralized or distributed the DPI components and interfaces are. Functional Modularity refers to the feature set of the DPI system, which can be categorized into two key components: core infrastructure and enabling applications. Table 3 provides an overview of the technological context of DPIs, distinguishing the key aspects of governance architecture and functional modularity.

The technological innovation approach focuses on the trade-off between building upon legacy infrastructures and platforms, which often have established user bases, or developing entirely new infrastructure systems from scratch (Ozalp et al., 2018). Leveraging legacy systems enables the incremental enhancement of existing infrastructures by building upon established operational knowledge and the current user base. This approach facilitates the integration of new innovations, seamlessly embedding them into the core of the digital infrastructure to modernize it, a process that can be defined as DPI evolution. Conversely, developing an entirely new approach may replace existing offerings and components, potentially generating additional value, increasing efficiency, and reducing complexity through replacements. However, this approach necessitates building and operating the infrastructure from the ground up, a process referred to as DPI invention. For instance, the EUDI Wallet exemplifies a DPI that builds upon existing national EU electronic identification (eID) schemes (Degen and Teubner, 2024). It enhances functionality by introducing a new interface that broadens access for citizens and integrates multiple public and private identity data providers. This approach creates a robust identity data ecosystem through collaboration between public and private organizations, extending the scope and reach of existing digital identity infrastructures. In contrast, India's Aadhaar system represents a DPI developed entirely from scratch. It was designed to address the unique challenges of providing foundational digital identity verification to a diverse and large population (Desai and Manoharan, 2024).

The infrastructure configuration of DPIs impacts its technical architecture and governance. Centralized DPIs consolidate control under a single authority, enabling streamlined decision-making, standardization, and technical and organizational enforcement. This model is ideal for scenarios requiring regulatory oversight or uniformity. However, it introduces risks such as single points of failure, limited adaptability to diverse contexts, and heightened concerns around data privacy, surveillance, and abuse. Decentralized DPIs distribute control across multiple systems and organizations, promoting resilience, inclusivity, and local autonomy(Henfridsson and Bygstad, 2024). This approach distributes control through modularity, reducing risks such as single points of failure and limited adaptability through more flexibility. However, it requires robust frameworks for interoperability, resource allocation, and conflict resolution, which add to system complexity and can increase operational costs. DLT or Blockchain-based digital infrastructures, like Bitcoin, highlight the struggle to develop and govern decentralized infrastructures (De Filippi and Loveluck, 2016). Therefore, the choice between centralized and decentralized configurations is context-dependent, with hybrid models frequently combining both approaches to address diverse needs to achieve scalability, reliability, and inclusivity.

The functional modularity of DPIs can be differentiated into core infrastructure components and enabling application components, emphasizing the modular and layered characteristics of DPIs. This structure facilitates the recombination of capabilities and the seamless integration of functional layers, collectively forming the DPI foundations that enable generative interactions.DPI core infrastructure components include data storage systems designed to store and reuse data resources from diverse sources, enabling seamless data exchange across interconnected systems and organizations. These components extend beyond traditional sectoral boundaries, encompassing domains such as healthcare, financial services, and education. The European Gaia-X initiative in the cloud segment and the Estonian X-Road data exchange infrastructure exemplify these characteristics (Lips et al., 2023). As the foundational layer of DPIs, data exchange infrastructures deliver essential capabilities for large-scale data processing, connectivity, and interoperability (Pra-A-1). Cloud computing is a pivotal element of this foundational layer, providing the computational resources required to facilitate scalable and efficient

data exchange via data exchange standards and infrastructures. This foundation supports the deployment of enabling applications, which build on the core infrastructure to extend its functionality and tailor the DPI to specific usage contexts.

Enabling applications to provide advanced functionalities by bridging foundational infrastructure capabilities with the specific needs of diverse actors. These applications include components such as digital identity components (e.g., Singpass in Singapore), digital payment systems (e.g., Pix in Brazil), and increasingly, AI infrastructure capabilities (e.g. AI Commons) that align with the evolving technological advancements prevalent in the private sector (Pra-A-1). Enabling applications to operate across both heavyweight and lightweight infrastructures, leveraging their computational capabilities to deliver dynamic value tailored to user interactions (Bygstad, 2017). From an infrastructure configuration perspective, enabling applications are typically more distributed and decentralized compared to core infrastructure components. While core infrastructures are optimized for scalability, efficiency, and uniformity, enabling applications to prioritize flexibility and adaptability, making them more suited to address diverse and context-specific requirements. This more decentralized nature of enabling applications reflects their role in fostering generative innovation and enhancing the utility of DPIs within a variety of operational contexts.

4.2. Organizational Context: Public-Private Partnerships and Stakeholder Orchestration

Tab. 4 – Example Sources DPI Organizational Context

Context	Dimension	Practice Reference	Academic Reference
Organization	Public-Private Partnership	Pra-B-22, Pra-BA-4	Aca-IS-22, Aca-S-40
	Stakeholder Orchestration	Pra-B-11, Pra-B-4	Aca-S-14, Aca-IS-3

The organizational context of DPIs plays an important role in their initiation, governance, and operational effectiveness. Two key dimensions within this context are the structure of public-private partnerships and the orchestration of diverse stakeholders. Table 4 provides an overview of the organizational context in the two dimensions of public-private partnership and stakeholder orchestration.Public-Private Partnerships (PPPs) are fundamental to the organizational contexts of DPIs, necessitating strong collaboration among governments, private sector organizations, and civic actors (Stiglitz and Wallsten, 1999). The successful initiation, scaling, and development of a DPI requires not only technical capabilities and organizational resources but also the widespread adoption of DPI offerings by various stakeholders. Engaging the actors who will utilize the DPI is essential for fostering adoption, as it enhances the generation of tangible impact and demonstrates the societal relevance of the DPI to all stakeholders involved. For analytical clarity, two primary PPP models can be identified, though in practice, various hybrid combinations often exist and evolve over time to meet the demands of different contexts and life-cycle phases of a DPI.

In the first model, publicly owned – privately utilized, the DPI is owned by public entities but utilized by private organizations to leverage essential services that address existing organizational needs and build a foundation for value creation. Examples include government-owned digital identity infrastructures or health data-sharing platforms. This approach aims to ensure public oversight and is typically government-initiated, with digital infrastructures opened to private and other actors for broader collaboration and societal benefit. In the second model, privately owned – publicly regulated, the DPI is developed and owned by private entities but operates under public regulation to ensure alignment with societal and governmental objectives. Examples include privately developed digital payment systems (VISA, Mastercard) mandated to comply with public interest regulations. This scenario balances private investment and operational efficiency with public accountability, and typically, these privately owned DPIs emerge and are later regulated to ensure that public interests are strengthened.

Effective orchestration of stakeholders is essential for ensuring that DPI initiatives are inclusive, transparent, and aligned with shared goals to achieve collective action (Addo, 2022). Stakeholder orchestration can be conceptualized through two primary approaches: In the first scenario, the government leads the development and governance of DPIs, setting strategic objectives, regulatory frameworks, and operational guidelines. This approach is particularly effective in scenarios requiring strong public oversight, such as the case of government-provided digital IDs. However, it may face challenges in fostering innovation and adaptability due to constraints to control and avoid risks. In the second scenario, private sector stakeholders initiate and drive the development of DPIs, often in response to market demands or technological advancements. Governments

typically engage in a regulatory capacity, ensuring that the DPI aligns with public interest goals. Bottom-up models are highly adaptable and innovation-driven, exemplified by the emergence of private digital platforms such as Apple or Amazon that provide essential services for digital interactions. However, they require robust regulatory mechanisms to address risks such as monopolization or exclusion (Degen and Gleiss, 2025).

4.3. Environmental Context: Policy Environment and Public Rationales

Tab. 5 – Example Sources DPI Environmental Context

Context	Dimension	Practice Reference	Academic Reference
Environment	Policy Context	Pra-A-3, Pra-B-10	Aca-S-22, Aca-IS-3
	Public Rationale	Pra-O-1, Pra-O-3	Aca-S-6, Aca-S-10

Two key dimensions influence DPI beyond their technical and organizational context. First, DPI is promoted and shaped by emerging national and international initiatives and policies. Beyond this, public and policy discourse, especially about characteristics and objectives, influence perception and expectations towards DPI. Table 5 provides an overview of these two key environmental dimensions.

Recent national and international DPI initiatives have emerged, often focusing on their role in digital development. Prominently, India's G20 presidency in 2023 elevated DPI to the global stage by advocating for the concept, and citing domestic examples like Aadhaar and the UPI as models (Desai and Manoharan, 2024). International organizations like World Bank and the UN also recently embrace DPI to address challenges in different domains. Furthermore, the Global Digital Compact - adopted by the UN General Assembly in 2024 - emphasizes the need for collaboration to establish standards and systems for DPI (UN Development Programme, 2023b). These efforts demonstrate how DPI emerges as a recognized concept on national and international policy stages, understood as a tool aligning with different national and international objectives. Policy objectives range from equitable access to digital offerings, empowerment of citizens and organizations to participate in the digital economy and society, to ensuring privacy and security for various stakeholders in the interaction with core digital services. For example, digital identity components within a DPI stack can facilitate secure processes like e-voting, enabling widespread digital participation while maintaining trust and security (Egodawele et al., 2024). In addition, open data and data exchange capabilities (e.g. European Data Space Initiative) within DPIs ensure that public data is accessible and usable by multiple actors. Additionally, DPI is leveraged by early-adopter countries to showcase their national digital competence and success. Nations such as Estonia (e.g. X-Road), India (e.g. IndiaStack), and Ukraine (e.g. Diaa app), are frequently cited as examples for DPI benefits that leverage their achievements not only to strengthen their global position but also as an integral part of their national identity (Aurazo and Gasmi, 2024). For instance, Estonia proudly identifies itself as a "digital state," highlighting its pioneering role in the digital transformation arena (Lips et al., 2023). DPI solutions and components developed by national private sector players are actively promoted for export, showcasing a country's digital capabilities and fostering business opportunities abroad.

Objectives and rationales in policy and public discourse circle around themes of digital transformation, while also addressing concerns such as digital inclusion, privacy, security, and digital sovereignty (Zuckerman, 2020). DPIs are expected to provide a foundational framework that enables innovation, transformation, and value-creation across sectors. From a governmental perspective, DPIs contribute to modernizing public administrations not only internally but also in critical public service domains such as healthcare, education, and agriculture (Sandhu et al., 2023). By doing so, they can redefine and enhance digital interactions with citizens and organizations, creating more accessible, efficient, and user-friendly transactions. For instance, the Indian Unified Payment Interface (UPI) reshapes digital payments by creating a real-time, interoperable, and cost-effective infrastructure (Desai and Manoharan, 2024). Moreover, DPIs provide digital infrastructures to tackle issues that the private sector either cannot address (e.g., a foundational digital identity) or does not sufficiently prioritize (e.g., financial inclusion). This underscores the importance of offering public alternatives to enhance choice and sovereignty, reduce dependency on private-sector solutions, or motivate private actors to align more closely with public interests, such as fostering transparency and accountability.

Moreover, DPIs play an important role in empowering actors and strengthening digital sovereignty by ensuring equitable access, safeguarding rights, and promoting openness and alternatives. First, DPIs can enable access to essential services and foster civic participation by removing barriers to engagement through their legal and governance frameworks that support foundational offerings (Pra-B-15). By offering foundational

capabilities such as digital identity and secure data exchange, DPIs can enable access for all individuals, regardless of socioeconomic status, to vital services such as healthcare, education, and financial systems (e.g. Huduma Namba digital identity infrastructure in Kenya). Second, DPIs can contribute to the protection of digital rights and security. By embedding principles such as data privacy, transparency, and accountability into their design, DPIs can provide a secure ecosystem for digital interactions of multiple actors. Third, DPIs - depending on their design - offer open, publicly governed alternatives to privately initiated digital infrastructures and platforms. These alternatives reduce dependency on private platform infrastructure offerings, enabling nations to retain control and power over critical digital infrastructure capabilities (Pohle and Thiel, 2020). Finally, it may be argued that by promoting openness and interoperability, DPIs create an ecosystem that encourages competition and innovation. For example, India's Aadhaar system, integrated with other DPI layers like UPI, exemplifies how public digital infrastructure can foster self-reliance and sovereignty while simultaneously enabling private sector innovation (Desai and Manoharan, 2024). This innovation delivers value to citizens and drives a more inclusive economic growth, benefiting society as a whole.

Fig. 2 – Digital Public Infrastructure Framework

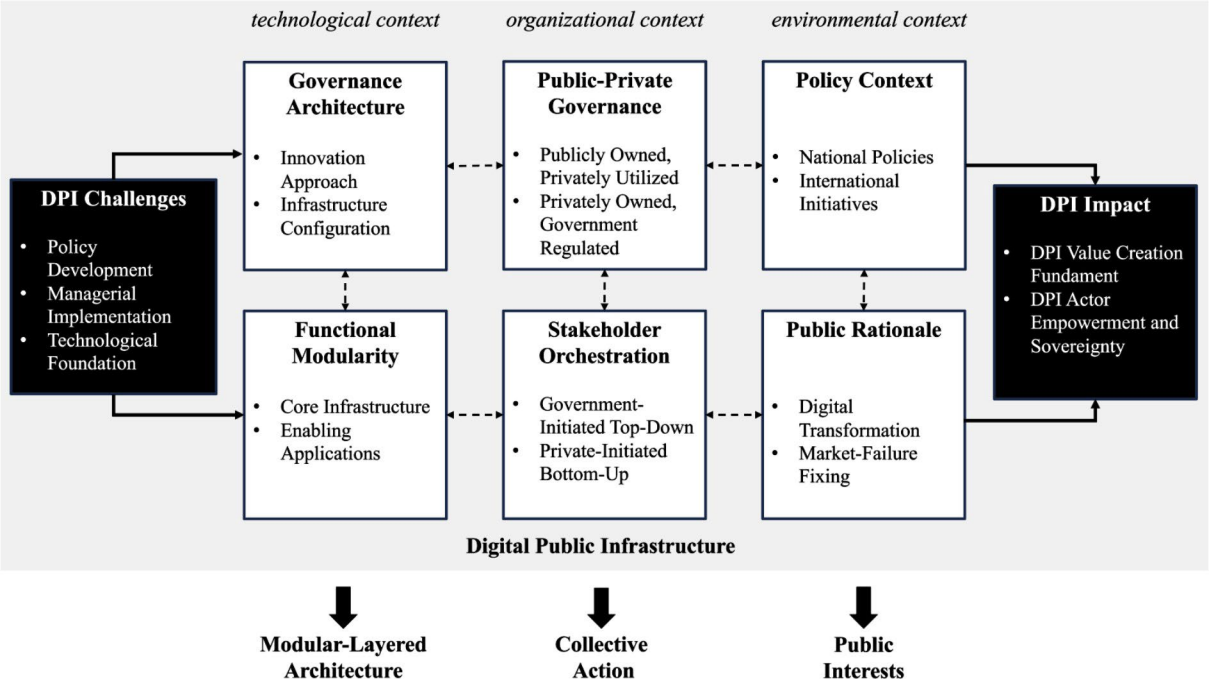


Figure 2 presents our DPI framework, highlighting the key characteristics of DPIs from technological, organizational, and environmental perspectives, and summarizes challenges faced in generating meaningful impact.

5. Discussion

DPI represents an emerging concept advocated especially by governments, international organizations, and philanthropic entities to reimagine the foundational digital frameworks that underpin public and private value creation (Panagiotopoulos et al., 2019; Zuckerman, 2020). DPI aims to facilitate seamless interactions among governments, citizens, and organizations, driving the evolution of digital infrastructures (UN Development Programme, 2023b). To function effectively as a socio-technical system with modular, layered architecture, DPIs must be governed through public–private collective action that embeds public-interest principles into their design and operation. Key imperatives include openness, interoperability, accountability, and inclusive access to ensure value creation and scalable multi-actor engagement in the public interest (Mensah, 2024).

From a technical perspective, standardization and interoperability represent challenges in establishing the foundational infrastructure required for the public-private, modular, and layered nature of DPIs. Given global discourse and necessity for interoperability across countries, achieving global standardization becomes a prerequisite for DPIs. While research on standardization, collaboration, and adoption of infrastructure standards is well-established in fields like information systems (Hanseth and Monteiro, 1997; Tilson et al., 2010), the

scale and global context of DPIs demand an extension of this knowledge. For example, there is a need to investigate processes and challenges associated with DPI standardization, as well as collaboration dynamics among diverse stakeholders.DPIs may necessitate the development of entirely new standards, which highlights the importance of research focused on the barriers to adopting such standards, strategies for overcoming these obstacles, and the role of international organizations and institutions in promoting standardization initiatives (such as the DPI Safeguards working group). Third, the politicization of standards—shaped by national interests, geopolitical tensions, and power dynamics—requires critical study to understand its impact on standard creation and diffusion(Blind, 2025). Technical standards and interoperability are essential in upholding the open and inclusive nature of DPIs, ensuring they remain accessible, adaptable, and capable of fostering value creation.

From a managerial perspective, aligning and orchestrating multiple actors and stakeholders present hurdles to developing, launching, and operating DPIs. Orchestration requires alignment of efforts among governments, private sector, and civil society to establish shared objectives and pool resources efficiently (Hermes et al., 2022) Furthermore, DPIs are not static; they evolve through dynamic processes and generative, reinforcing mechanisms driven by interaction with the using actors (Constantinides et al., 2018; Henfridsson and Bygstad, 2013). Consequently, orchestration emerges as a central managerial capability for DPIs. A critical area for further exploration is how to balance inherent tensions in DPI governance and management. These include reconciling control with fostering innovation, ensuring security while promoting actor acceptance, and aligning public interests with private value creation (Degen and Teubner, 2024; Panagiotopoulos et al., 2019). Furthermore, developing DPIs demands significant upfront investment, but their adoption and generative evolution can create opportunities for reinvestment as utilization increases (Constantinides et al., 2018; Scott et al., 2016). However, identifying sustainable financing models remains a challenge. Hybrid investment strategies that leverage existing components, promote reuse, and foster shared open-source development offer a promising pathway to reduce the financial burden on individual actors through collaborative efforts. Research should focus on identifying frameworks and strategies to effectively navigate these tensions and challenges.

From a policy perspective, our results highlight the need to consider the evolving context surrounding the technical and organizational embedding of DPIs, whose development, implementation, and governance are co-shaped by expectations and discourse around them. Consequently, multilateral cooperation is indispensable for aligning initiatives across regions and sectors. International organizations, e.g. the UN Development Programme (UN Development Programme, 2025), and agreements, e.g. UN Global Digital Compact (United Nations, 2025), play a key role in facilitating dialogue, establishing shared norms, and fostering collaboration among governments, public, private and civic stakeholders, and academia. Achieving harmonization requires striking a balance between concerns over privacy, security, and sovereignty with needs for collective action. However, a "one-size-fits-all" approach to DPIs is likely impractical due to the diverse contexts of their origins, designs, and applications. Given that DPIs transcend national boundaries, harmonizing policies and standards is crucial for ensuring interoperability and equitable access (UN Development Programme, 2023b). Divergent regulatory frameworks often lead to fragmented policy objectives and implementations, undermining the foundational character of these digital infrastructures. While high-level policy goals such as inclusiveness, openness, privacy, and security are widely endorsed, their practical operationalization and prioritization within specific contexts pose significant challenges. The policy context and public rationale for DPIs highlight their dual role: DPIs are envisioned to provide foundational infrastructure capabilities, such as identity, data exchange, and payments, to accelerate the digital transformation of governments, the private sector, and society. At the same time, they have to address diverse objectives, including value creation and digital inclusivity.

Furthermore, ongoing debates about DPIs reveal a shift from a passive regulatory role of governments in the digital realm and their increasingly active provision of digital infrastructures and services designed to reshape markets and actor interactions. The example of traditional infrastructures and networked industries demonstrates that, similar to emerging DPIs, governments have historically played a critical role in ensuring that essential infrastructure services are available to society (Finger and Montero, 2023; Hermes et al., 2022) Additional research should explore which emergent patterns might be identifiable to further conceptualize DPIs and help practitioners grasp this emerging concept. DPIs overlap with various emerging concepts in practice, such as GovTech (Bharosa, 2022), Government-/Countrystack (e.g. EuroStack), Government as a Platform (Cordella and Paletti, 2019), and calls for greater digital sovereignty (Couture and Toupin, 2019) through data spaces and data ecosystems (Möller et al., 2024) as well as the need to address existing digital divides (Vassilakopoulou and Hustad, 2023). This research set out to unpack the conceptual ambiguity surrounding DPIs by grounding the analysis in a structured socio-technical empirical perspective. Through the application of the

TOE framework, the study moves beyond the existing policy discourse to offer a deeper understanding of how technological design, organizational orchestration, and policy environments interact in shaping DPIs. In doing so, it offers a holistic view of DPIs as evolving digital infrastructures that deliver foundational capabilities through public-private collaboration aligned with the public interest.

6. Conclusion and Outlook

Digital public infrastructure (DPI) aims to reimagine foundational digital infrastructures with large-scale societal impact through public-private collaboration, guided by governance that integrates public interest principles—such as openness, interoperability, accountability, and inclusivity—while addressing technological, organizational, and environmental dimensions to ensure societal impact (UN Development Programme, 2023b). By systematically applying the TOE framework to examine the technological, organizational, and environmental dimensions of DPIs, we develop a DPI framework that offers conceptual clarity and a structured approach to understanding and advancing this emerging phenomenon (Awa et al., 2017; Baker, 2012). Positioned as socio-technical systems governed through collective action, DPIs hold the potential to deliver scalable, modular, and public interest-driven digital infrastructure capabilities. With foundational infrastructure components such as digital identity, data exchange, and digital payment systems, DPIs enable value creation and collaboration among diverse actors that aim to serve society.

Our findings show that DPIs encompass governance architecture and modular functionalities within the technological dimension, supported by public-private governance and effective stakeholder orchestration within the organizational dimension. In the environmental dimension, we sketched the motivations driving government engagement and the regulatory context surrounding DPIs. Key objectives include advancing the digital transformation of governments, economies, and societies, alongside addressing market failures that result in under-served groups (e.g., lack of digital inclusion) or power imbalances (e.g. between users and private digital infrastructure providers) caused by privately governed digital offerings. DPIs aim to empower interacting actors by enhancing access rights, safeguarding privacy, and strengthening sovereignty to serve more common public interests. To achieve this, standardization and interoperability are important factors in the technological dimension, while orchestration becomes the critical capability to initiate, adopt, and scale DPIs. In the environmental dimension, which encompasses regulations and policy goals, it is crucial to clearly define the boundaries of policy initiatives and regulatory scopes to avoid fragmentation and conceptual overlap with related terms like DPGs, GovTech, or data spaces and ecosystems. A well-defined DPI concept enhances the alignment and orchestration of relevant stakeholders, enabling the establishment of the capabilities required for DPIs to provide essential infrastructure capabilities to public, private, and civic actors.

Our study comes with limitations. First, the development of our DPI framework is based on the authors' analytical and coding capabilities, providing an initial conceptualization of DPIs within academic research. While this contribution advances both scholarly and practice-oriented discourse, it is subject to potential biases in the analysis. For instance, all authors reside and engage with DPI-related initiatives primarily in the Global North. This perspective enables deep insights but may inadvertently overlook environmental and contextual differences, as DPIs are particularly prominent in the Global South, where they operate under distinct socio-economic and political conditions. Second, while our grounded theory research design draws extensively from academic literature and publications by international organizations, think tanks, and philanthropic entities, it relies on secondary data often optimized to promote the concept of DPIs to a broad, international audience. To address this limitation, we plan a follow-up research project involving qualitative interviews with diverse experts recruited to represent public, private and civic stakeholders. This approach will enable us to extend upon our insights into DPIs, uncovering differences and commonalities across geographical, socio-economic, and political contexts, while addressing the limitations of our study.

DPIs are a timely and emerging concept that seeks to address multiple societal transformations and current challenges. Our study underscores that DPIs are highly context-specific, and a "*one-size-fits-all*" approach is not possible. These large-scale digital infrastructures not only shape societies but are also deeply influenced by them. We call for interdisciplinary research to examine DPIs across varied contexts and across implementation phases. Based on our academic literature review, we urge researchers and practitioners to view DPIs not as entirely novel phenomena but as an evolution of existing digital infrastructures and platforms. DPIs should be characterized as a progression toward more open, interoperable, and accountable foundational capabilities for public-interest value creation.

Track 20: Digital Government: Bachelor's and Master's Student Track

Track Description

This track aimed to provide Bachelor's and Master's students with a first-hand experience of how research works and to deepen their interest in academia. The idea was to attract original work and facilitate a constructive, developmental, double-blind peer-review process.

Track Chairs

H. Scholta, German University of Administrative Sciences, Germany
C.-P. Lee, National Taipei University, Taiwan
G. C. Wiedenhöft, Federal University of Rio Grande, Brazil

Abstract. As digital transformation progresses, platforms such as LinkedIn present unique opportunities for professional engagement in public governance and sustaining public values, yet their potential remains underexplored. This study analyses the communication practices of the EU Digital & Tech LinkedIn account – a channel for promoting Europe's digital transformation initiatives led by the European Commission. By analyzing 159 posts with their engagement metrics and user comments over a six-month period in 2024, we identified key patterns in content type, sentiment, and thematic focus. Informational posts dominate the account's feed, with an emphasis on topics such as artificial intelligence, cybersecurity, and data governance. These posts generate the highest interaction scores, reflecting LinkedIn's suitability for professional and policy-driven discussions and reinforcing the platform's value in generating thoughtful, substantive exchanges. LinkedIn is likely to promote public values such as transparency, inclusivity, and collaboration effectively when communication strategies prioritize detailed content and meaningful stakeholder interaction. However, the analysis also reveals missed opportunities for direct engagement, such as responding to user comments, posing open-ended questions, or leveraging other interactive features like polls or events, possibly allowing users to take on more active roles as prosumers. By embracing more participatory formats, public sector accounts could foster richer interaction and co-ownership of policy narratives. Ultimately, we underscore LinkedIn's underused potential as a dynamic platform for collaborative innovation in digital public governance, offering actionable insights into how communication strategies can strengthen trust, responsiveness, and legitimacy in the public sector.

1 Introduction

Although the latest innovations like artificial intelligence (AI), blockchain, and big data become more advanced each day, their successful implementation depends on technological infrastructure, regulatory frameworks, and organizational readiness (F. Davis, 1989; Rogers, 1983; Tornatzky & Fleischer, 1990). Integrating and managing these novel tools into governmental processes and services has become an indispensable part of advancing digital public governance (DPG). Public sector's key stakeholders, i.e., citizens and businesses, may have various perceptions of digital transformation. While the private sector is often seen as more tech-savvy and fast-adopting modern tools, individual users sometimes require more intensive mentoring to ensure everyone participates. An important aspect of DPG's external perception is its communication with these stakeholders.

The tools and platforms used to explain or simply make these innovations public often determine whether they are adopted or rejected in everyday life. In recent years, much of the focus has been on the technologies themselves, but an increasingly overlooked factor is the medium through which their purpose and impact are expressed (Milakovich, 2021). This is where communication plays a vital role. While its core principles – such as e.g., information transmission and audience engagement – remain intact, the rise of Facebook and other social media platforms since the mid-2000s has altered the traditional gatekeeping role of journalists (Gilardi et al., 2022; Valenzuela et al., 2019). Communication has evolved into a complex web of digital interactions that span borders, disciplines, and sectors, mediated increasingly by platforms and algorithms rather than professional editors (Grewal et al., 2022).

Therefore, as AI systems become more integrated into DPG, as questions of digital sovereignty gain attention, and as citizens demand more transparency in government operations, how these messages are communicated determines their societal values (Chen et al., 2023; Mergel, 2012). Public trust in these processes is not only about the content of policies but also about how governments articulate their intentions, engage stakeholders, and invite dialogue through, e.g., events (Boulianne, 2019) or social media interaction (Wukich, 2021). This makes it a fundamental and well-suited solution for building trust and collaboration and driving informed decision-making.

Social media has played a key role in digital transformation. Platforms like Twitter and Facebook have long been recognized for their ability to connect governments with citizens in real-time by spreading information widely and quickly (Haro-de-Rosario et al., 2018). Numerous examples of how public organizations use social media to create public value include, e.g., early disaster warnings through Indonesia's Twitter Tsunami Early Warning Network (est. in 2012), citizen engagement via participatory budgeting in American city councils (2013), and coordinating emergency relief during Hurricane Sandy through real-time social media mapping (Criado et al., 2013; Muniz-Rodriguez et al., 2020). However, private platforms are often criticized for increasing interactions and reactive behaviors resulting in extended time spent on the platform (Haro-de-Rosario et al., 2018).

Moreover, the lack of algorithmic transparency – particularly regarding the use of personal data – raises concerns. In the context of political discourse, these issues have been linked to increased exposure to radicalized content, targeted political advertising, and the spread of misinformation and fake news (Lewandowsky & Siri, 2023; Zerres, 2024). Conversely, LinkedIn has a slightly different emphasis on a professional and focused alternative uniquely suited for deeper, more thoughtful engagements.

With its audience of professionals, academics, and decision-makers, LinkedIn claims to be less about viral trends and more about substantive discussions on policy, strategy, and innovation (Graziano et al., 2023; Mergel, 2012). While this does not entirely reflect present conditions, as LinkedIn, too, follows a basic social media strategy, stakeholders are interested in a more professional environment (Graziano et al., 2023; Mergel, 2012). For example, public organizations worldwide have already actively engaged on LinkedIn, including major bodies such as the United Nations (5.8 million followers), the U.S. Department of State (1.4 million), and the European Commission (2.2 million) (European Commission, 2025b; United Nations, 2025; U.S. DOS, 2025). The content shared by these organizations is generally strategic, emphasizing professional engagement, policy advocacy, and targeted stakeholder interactions within a network which has been built on trust (Macnamara & Zerfass, 2012; Rus et al., 2021). Moreover, user interactions on LinkedIn tend to reflect more targeted inquiries and specific attitudes towards these public institutions (J. Davis et al., 2020).

However, despite its potential, the use of LinkedIn as a communication tool for leveraging public values has received limited academic attention yet to be explored. Therefore, this paper adopts a case study approach and focuses on a particular LinkedIn account, examining its potential to contribute to advancing public values using quantitative and qualitative research methods. Specifically, it investigates the communication strategies of the EU Digital & Tech account (EUDT), a key channel for promoting Europe's digital transformation initiatives. Though substantially smaller in following (51,000) than the parent account, the EUDT is used to share critical updates on topics such as AI governance, data privacy, and cybersecurity, engaging professionals in shaping the future of European digital governance (European Commission, 2025a). Examining the EUDT account, rather than the

broader EC account, allows for a more focused and detailed analysis of strategic communication tailored specifically to digital governance stakeholders.

The EUDT can only be considered an indicative case study, given that engagement patterns and user demographics may vary for different institutional contexts. However, the EUDT still offers a compelling illustration of the EC's primary digital governance messages, making it a valuable case for exploring LinkedIn's broader potential in public sector communication. Hence, the research is guided by the following question: *How can LinkedIn be effectively leveraged to promote audience engagement, support professional communication and uphold public values in digital governance?*

We also pose three sub-questions to guide our research processes:

1. *SQ1. What types of activity generate the highest engagement on the EU Digital & Tech LinkedIn account?*
2. *SQ2. What themes and sentiments emerge in audience comments on these posts?*
3. *SQ3. How can the EU Digital & Tech LinkedIn account enhance engagement with professional stakeholders such as policymakers, digital industry actors, and academic experts in the context of digital governance?*

By addressing these questions, this paper aims to contribute to the broader understanding of the role of communication in navigating the developing complexities of the digital age. It then explores how LinkedIn can serve as a professional engagement tool and build trust, inclusivity, and innovation in digital public governance.

The relevance of this research is multifold. First, LinkedIn's ability to facilitate discussions on AI governance reflects its alignment with the focus on promoting technology responsibly. Similarly, by analyzing interactions with the public, this research contributes to understanding how communication strategies promote public governance values like transparency, inclusivity, and responsiveness. LinkedIn's professional audience makes it a substantial platform for taking discussions on digital sovereignty and cybersecurity, ensuring that technical policies are effectively communicated to industry experts and, finally, decision-makers.

The following chapter offers insights into related works bridging stakeholder engagement and public values at the intersection of social media and explores frameworks for unlocking the full strategic potential. Then, the data source and preprocessing pipeline, as well as the topic modeling methodologies used, are assessed. This study combines a social science approach with a methodology from information sciences. Afterwards, all finalized results for this paper are discussed. Lastly, all findings are summarized, and further research is suggested.

2 Related Work

When digital transformation shapes governance, the role of social media platforms in addressing the gap between policymakers and stakeholders has become increasingly significant. While traditional forms of communication remain vital, the immediacy, accessibility, and interactivity of social media offer reliable opportunities for promoting dialogue, transparency, and collaboration. Among these platforms, LinkedIn has emerged as a space aimed at professionals from different fields to discuss governance, policy innovation, and digital transformation and drive interaction.

2.1 Public Engagement in Digital Public Governance

Social media platforms, which have been integrated into governmental communication strategies over the last decade, remain key tools for informing citizens and encouraging dialogue between diverse stakeholders. DPG increasingly relies on these effects on effective communication, primarily to promote transparency, participation, and collaboration among users. Mergel and colleagues (2012) highlight that digital tools have transformed communication from a unidirectional process to *"bidirectional exchanges"*, enabling governments to build trust and accountability in ways previously unavailable, similar to turning *consumers* into so-called *prosumers* (Bartosik-Purgat & Filimon, 2022).

Despite their transformative potential, not all platforms are equally effective for engaging professional stakeholders. Studies from different fields within public sector communication identify significant limitations in widely used platforms such as Twitter and Facebook, which – though effective for real-time updates and mass dissemination – often only drive superficial interactions (Lai & Fu, 2020; Rauchfleisch et al., 2023). Additionally, their reliance on broad audiences limits meaningful discussions on complex topics, such as digital governance policies, which require depth and nuance (Rauchfleisch et al., 2023).

LinkedIn, however, serves as a professional (and policy-driven) engagement platform. Unlike competitors with larger user numbers, LinkedIn specifically targets *"the world's professionals to make them more productive and successful"*, home to an environment with discussions on society, strategy, and innovation (LinkedIn Ireland Unlimited Company, 2016). Gestel and Grotenbreg (2021) argue that LinkedIn's features, such as longer-form content and a professional tone, make it particularly suited for driving sustained interactions and collaborative dialogue, which is essential in the context of public governance.

2.2 Governance and Policy (Non-Profit) Communication

Policy communication, especially in areas that require particular or expertise understanding, depends on the ability to express complex ideas clearly and effectively to the relevant audiences. Social media platforms are useful tools in this process, providing the reach and prompt action necessary to inform and get feedback. Studies on risk and crisis communication underscore the utility of platforms like Twitter and Facebook in disseminating policy updates, such as during the COVID-19 pandemic (Wang et al., 2021). However, their focus on mass communication limits their ability to engage technical and professional audiences on specific policy matters (Wang et al., 2021; Wukich, 2020).

In this narrower context, LinkedIn has also been recognized as a platform uniquely positioned to address these limitations. Its professional user base and tools like targeted advertising, event promotion, and long-form posts enable governments to communicate more effectively with industry experts, policymakers, and researchers. Faber (2022) emphasizes that LinkedIn's professional structure opens the door for thoughtful exchanges and professional engagement. It serves as a key channel for policy dissemination and collaboration in the public sector, particularly focusing on governance-related topics. This aligns with municipalities' strategies, as their LinkedIn content predominantly focuses on *"governance and general support*" (Faber, 2022).

Analyzing how different types of posts perform on social media platforms has been a recurring focus in the literature. Lovejoy & Saxton (2012) categorize social media posts from governments and non-profit organizations into three broad types: informational, interactive (communal), and action-oriented. Informational posts, i.e. those sharing detailed reports or policy updates, often generate high engagement due to LinkedIn's emphasis on large-format content. Interactive posts, including those encouraging comments or discussions, also perform well, as LinkedIn users are often motivated by the opportunity to share expertise and network with peers. Action-oriented posts, such as promoting events, can also succeed on LinkedIn when they align with the platform's professional tone and audience (Lovejoy & Saxton, 2012). Understanding the impact of these post types on engagement levels helps refine communication strategies, the authors specify.

2.3 Optimizing LinkedIn for Digital Governance Purposes

LinkedIn's features offer well-thought-out opportunities for enhancing stakeholder engagement, yet they remain underutilized in many governance contexts. Mergel (2012) notes that public agencies often underutilize professional tools like analytics and audience targeting, which are critical for maximizing the potential of platforms like LinkedIn to enhance governance-related communication. Studies examining LinkedIn's use in governance highlight several best practices. Faber (2022) found that posts combining detailed, relevant content with clear calls to action generate the highest levels of engagement. Similarly, targeted hashtags and audience segmentation significantly enhance post visibility and relevance. Along with other platforms, video content, as well as on LinkedIn, performs better than text content (Du et al., 2020). These findings suggest that advanced digital platforms, such as LinkedIn, can likely be strategically employed to engage professional audiences and drive interactions that align with public governance values like transparency and inclusiveness (Chen et al., 2023).

While LinkedIn remains underexplored in the literature, insights from studies of other platforms help contextualize its potential. Özdemir et al. (2025), in their analysis of EU executive communication on Twitter, identify a shift from neutral output reporting toward more participatory and engagement-oriented practices, which they term *opinionated communication*. This strategy combines reporting on institutional actions with individual framing, responsiveness, and inclusivity cues. These elements are increasingly important in public sector communication and point to untapped potential in LinkedIn's own interactive features, such as polls, comment replies, or stakeholder mentions. Studies also show that polls generate higher engagement rates than standard posts, as they invite direct participation and provide immediate feedback (Edney et al., 2018; Mergel, 2012).

Moreover, Özdemir et al. (2025) offer a useful distinction between four forms of legitimacy – input, throughput, output, and identity – which can help conceptualize communication strategies. Transparency and responsiveness support throughput legitimacy, while inclusive and participatory tools strengthen input legitimacy. Within this framework, LinkedIn's professional user base, structured format, and engagement tools could be leveraged to support trust and legitimacy in DPG. Despite emerging best practices, academic evidence on LinkedIn's role in this area remains limited, highlighting the need for further empirical research into how public organizations

communicate professionally and meaningfully on the platform.

3 Data and Methodology

This study adopts a mixed-method data approach to analyze LinkedIn's role as an effective communication tool in adhering to public values. Using the primary data collected directly from the EU Digital & Tech account on LinkedIn, this study investigates engagement patterns, thematic trends, and sentiment in professional interactions (Batrinca & Treleaven, 2015). The aim of the analysis is also to explore ways in which the platform could be optimized for public-sector communication. The selected research method provides a comprehensive and nuanced evaluation for more accurate results, and it was chosen due to its flexibility and potential for reliable results, which will be further explained in the following subchapters (Olteanu et al., 2018).

3.1 Data Collection

The dataset for this study has been drawn from LinkedIn posts, including all interactions with various users on the **EU Digital & Tech** account and the associated posts. Data collection focuses on activities shared between July 1 and December 31, 2024, capturing current trends and discussions relevant to digital transformation, AI integration, and cybersecurity. This 6-month period ensures the analysis reflects up-to-date practices and audience interactions in a dynamic landscape.

Accessing social media data is commonly facilitated through public APIs and open-source programmable frameworks (Batrinca & Treleaven, 2015). However, due to increasingly restricted API accessibility by private corporations, **PhantomBuster** – a tool which uses LinkedIn's API to extract contents automatically – was used (Perriam et al., 2020). Hence, the data extracted contains:

(1) post content (text used as content, multimedia and links shared within posts),

(2) engagement metrics (quantitative measures including likes, comments and shares)

(3) audience interactions (text data from user comments and potential replies)

(4) metadata (date- and timestamps).

PhantomBuster is primarily utilized to generate leads in a marketing environment and might include biases of commercial data extraction tools that are not specifically optimized for research purposes. Moreover, as PhantomBuster does not capture content updates or deletions, the dataset cannot reflect real-time changes, potentially affecting the accuracy of insights. Another concern is the authenticity of engagement: user interactions may include inputs from bots or inactive accounts, which can distort patterns of actual stakeholder involvement. However, a manual spot-check procedure was adopted to mitigate the risk of incomplete or erroneous data and improve the robustness of the findings. Specifically, 5% of the extracted posts and comments were randomly selected to verify their accuracy against the live LinkedIn interface. This approach provides a level of quality control that strengthens the reliability of the dataset, though it does not guarantee the total elimination of automated extraction anomalies (Olteanu et al., 2018).

3.2 Data Preprocessing

To ensure the data is suitable for analysis, preprocessing is conducted via Natural Language Processing (NLP) in several structured steps (Egger & Gokce, 2022; Pradha et al., 2019). This is standard practice in information science to ensure that textual data is cleaned, standardized, and ready for further, primarily qualitative, examination (Batrinca & Treleaven, 2015). To automate this process efficiently, Python-based software and databases *NLTK* and *spaCy* were used, both of which are widely recognized for their NLP capabilities and open source (ExplosionAI GmbH, 2024; NLTK Project, 2024). NLTK was applied for tokenization, stop word removal, and stemming, while spaCy supported part-of-speech tagging (assigning a grammatical category like noun, verb, adjective, etc.) and named entity recognition to assist in filtering personal names and non-English content. The combined use of both tools ensured the employment of complementary strengths in this structured approach.

The preprocessing steps, including their description, are as follows:

1. **Data Cleaning**: Non-text elements such as emojis, special characters, and URLs are removed to eliminate noise from the dataset – only textual content remains.

2. **Tokenization**: Text is split into individual units (tokens), such as words or phrases. Sentences like "AI governance is essential!" are tokenized into "AI", "governance", "is", and *"essential"* – removing periods and exclamation marks.

3. **Stop Word Removal**: Commonly used words (e.g., "and," "the," "is") that do not contribute to the thematic or sentiment analysis are filtered out using pre-defined lists. For this research, a specific list of words suiting LinkedIn's professional language has been chosen, including terms like "via", "regarding," and conjunctions like "therefore," which appear frequently in formal or policy-related posts but contribute little to semantic depth.

4. **Stemming**: Words are reduced to their word stem to ensure consistency and suitability for comparison. For example, variations such as *"governing"* and *"governed"* are standardized to *"govern*".

5. **Normalization**: All text is converted to lowercase to unify the dataset and avoid treating variations like "AI" and "ai" as different words.

6. **Data Structuring**: Preprocessed text is finally structured into a relational database, ensuring each post or comment is linked to its associated metadata (e.g., engagement metrics, hashtags, and timestamps). Non-English language and individual names are then excluded from further analysis due to the often unreliable automatic distinction between individual names (persons) and the correct identification of other languages (Keraghel et al., 2024).

This organization facilitates efficient retrieval and analysis (Egger & Gokce, 2022). The resulting clean and standardized text fits advanced analyses such as topic modeling, sentiment scoring, and engagement evaluation. If not mentioned otherwise, all general data is evaluated using Microsoft Excel.

3.3 Integrated analysis

Content analysis is conducted to categorize LinkedIn posts and assess their engagement performance (Batrinca & Treleaven, 2015). Posts are divided into three main types: informational, interactive, and action-oriented posts (Lovejoy & Saxton, 2012). For example, a post to invite stakeholders to contribute to a "*Call for Evidence on the Protection of Minors Online*" would be categorized as an action-oriented post, as it encourages direct participation from the audience in the policymaking process. By contrast, a post announcing the launch of the Digital Maturity Assessment tool ("*A new tool [...] is now available*!")(European Commission, 2024b), developed by the European Digital Innovation Hubs Network, would be classified as an informational post. Then, all engagement metrics (likes, comments, shares) are analyzed for each category to determine those types of posts generating the highest interaction scores.

Additionally, the use of features, such as visuals and multimedia, is assessed to understand their impact on engagement. For example, an informational post detailing an AI ethics report might include a visual infographic and relevant images. Its engagement metrics are then compared with those of an interactive post of another category that, e.g., aims at starting a discussion about AI governance. Patterns recognized can be used to identify effective communication strategies for LinkedIn's professional user base. To be able to compare the three categories of posts in terms of engagement, the **interaction score** *(I)* was calculated as follows:

$$I = L + C + R$$

There, L stands for the number of likes on the post, C for the number of comments and R for the number of times the post was shared. *Thematic analysis* identifies key topics and recurring themes in LinkedIn posts and audience comments, shedding light on stakeholder priorities (Batrinca & Treleaven, 2015). After preprocessing the text, Latent Dirichlet Allocation (LDA) is used to uncover clusters of related topics. This is done via Python-based software and associated libraries and is an established method for social media analysis (Ostrowski, 2015). For example, comments on AI governance posts may reveal themes like *"ethics," "accountability,"* and *"transparency,"* while cybersecurity discussions may center around *"data breaches"* and *"privacy concerns."* In addition to topic modeling, keyword analysis validates LDA results by highlighting frequently used terms reflecting users' interests (Ostrowski, 2015). Themes in these comments can be used in the recommendations to align post's contents better with users' interests, showing how effectively LinkedIn posts address professional concerns.

The *analysis* of audience/con-/prosumer *sentiment* is another critical aspect of evaluating social media communication strategies. This method provides insights into the emotional tone of audience responses, enabling organizations to understand public perception of their messages (Thelwall, 2018). Studies highlight that sentiment analysis might help governments identify areas of public support or discontent, providing a foundation for refining communication strategies (Zavattaro et al., 2015). Therefore, **TextBlob** (https://github.com/sloria/textblob), a

tool within a Python framework, was used to classify comments as positive, neutral, or negative. For instance, "*Love this! Video games are […] a great way for parents to learn with their kids!*" would be positive, while "*The problem is that the EU doesn't understand the problem...*" would be referred to as negative.

4 Results

This study offers actionable insights for improving the EC's LinkedIn communication strategy. In this section, we highlight how stakeholders engage and how their emotional responses may align with governance objectives, ensuring communication strategies remain foundational on trust and inclusivity, which is a common practice in successful long-term communication.

4.1 Content Analysis

Over the chosen six-month period between July 1 and December 31, 2024, the EU Digital & Tech account on LinkedIn made 159 postings, accounting for almost daily activity. The posts can be divided into three categories: informational (109 posts), interactive (10 posts), and action-oriented (40 posts). The posts collectively summed up 30,662 likes, 596 comments, and 3,887 shares (reposts), resulting in a total of 35,145 interactions.

The weighted average interaction score (I) across all post categories equals 221.1. Informational posts demonstrated the highest average interaction score, followed by interactive and action-oriented posts. Table 1 below presents the interaction scores:

Tab. 1. Interaction Scores per Category

Post category	No.	Share (%)	Average Interaction Score (I)
Informational	109	68.55	243.4
Interactive	10	6.29	198.6
Action-oriented	40	25.16	165.7

Furthermore, no postings assessed were published as text-only, as they all included either an image, document or video. Image-based posts demonstrated the best performance, 3.28% above the average. Document-based posts had a lower interaction score of 182, representing a 17.69% decrease compared to the average. Video posts performed the worst, falling 55.76% below the average. Table 2 below presents the distribution and engagement of posts per attachment type.

Tab. 2 - Interaction Scores per Feature Type

Post type	No.	Share (%)	Interaction Score (I)
Image	143	89.94	228.35
Document	11	6.92	182
Video	5	3.14	97.8

4.2 Thematic Posting Analysis

The standalone keyword distribution among postings directly by the EUDT account (conducted with stemmed terms), without addressing comments, highlights a strong emphasis on digital and European themes used by the LinkedIn account. The term "*ai*" appears most frequently, underscoring a central focus on artificial intelligence. There is a noticeable distinction between "*EU*" and "*European*" in the account's postings as well. Although often used interchangeably in the daily language, the term "*EU*" likely emphasizes the European Union's role as a regulatory and legislative authority as the account focuses on policies, laws, and frameworks that specifically target

different stakeholders from the tech sector. In contrast, "European" may highlight a sense of community and shared identity, rather focused on collaboration, inclusivity, and collective progress.

The table below illustrates the frequency of the terms mentioned.

Tab. 3 - Account posting frequency

Stemmed term	Mentions
ai	260
digit	256
eu	224
european	128

A more holistic insight comes from the LDA analysis conducted on the stemmed text data from LinkedIn posts. It identifies key topics, each characterized by the five most significant words.

Tab. 4 - Integrated LDA Results of Topic Modeling from Original Posts

Topic	Word 1	Word 2	Word 3	Word 4	Word 5
Topic 1P	infrastructur	european	eu	support	connect
Topic 2P	eu	ukrain	digit	cybersecur	digitaleu
Topic 3P	ai	eu	act	european	euro
Topic 4P	digit	eu	onlin	digitaleu	data
Topic 5P	data	eu	regist	event	simpl

These topics provide an overview of the dominant themes that the account uses and can thus be compared to the themes that users mention the most. Topic 1P emphasizes terms like "*infrastructure,*" "*European*," and "*support,*" indicating a focus on connectivity, European initiatives, and collaborative efforts. Topic 2P highlights words such as "*cybersecurity*," "*Ukraine*," and "*digital*," pointing to discussions surrounding digital security, geopolitical concerns, and professional technology-related themes. Furthermore, Topic 3P centers around terms reflecting a focus on artificial intelligence and highlights this together with regulatory frameworks and the broader European digital strategy. Topic 4P emphasizes discussions on digital transformation, online platforms, and data-driven initiatives, while Topic 5P includes terms such as "*data*," "*register*," and "*event*," pointing to themes of data governance, event participation, and possibly simplified processes for digital engagement.

4.3 Thematic Comments Analysis

The dataset consists of 596 comments containing 12,728 stemmed terms, of which 92.6% were identified as written in English. The remaining 7.4% were categorized as individual names (approximately 75%) and other languages (approximately 25%). The latter two have not been considered within the analysis (see chapter 3.2). Only five comments were written by EUDT moderators.

The keyword distribution highlights the dataset's focus on European themes (*"eu")* and artificial intelligence (*"ai"*). Other often-mentioned terms emphasize digital transformation and reflect the also technological orientation of the account. Additionally, terms like *"innov", "data", "ethic",* and *"discuss"* suggest nuanced discussions around innovation, ethics, and policymaking in digital and AI contexts. This distribution underscores the centrality of technology and governance themes in the dataset.

Tab. 5 - User comments frequency

Stemmed term	Mentions
eu	80
ai	76
digit	41
tech	35
onli	32

The following table highlights the results of the LDA analysis conducted on the stemmed text data from user comments.

Tab. 6 - Integrated LDA Results of Topic Modeling from User Comments

Topic	Word 1	Word 2	Word 3	Word 4	Word 5
Topic 1U	good	tech	eu	time	new
Topic 2U	ai	great	data	eu	digit
Topic 3U	ai	eu	european	europ	digit
Topic 4U	ai	data	protect	eu	innov
Topic 5U	europ	ai	cybersecur	digit	act

Topic 1U emphasizes terms like "*good*," "*tech*," and "*time*," likely indicating a focus on technological advancements and positive developments. Topic 2U highlights words such as "*ai*," "*great*," and "*data*," pointing to discussions on artificial intelligence, its potential, and data-driven innovations. Topic 3U focuses on AI in the European context, possibly focused on its alignment with regional priorities and broader EU initiatives. Moreover, Topic 4U highlights data protection and innovation themes, underscoring the importance of implementing digital advancements. Lastly, Topic 5U mentions cybersecurity and AI, particularly emphasizing Europe's efforts to act decisively concerning digital security and resilience.

4.4 Sentiment analysis

The sentiment analysis of the LinkedIn comments provides insights into the discussion's tone and nature. The breakdown of comments based on their tone is presented in the figure below.

Tab. 7 - Sentiment analysis of users' comments

Sentiment	Count	Share
Positive	287	48%
Neutral	270	45%
Negative	39	7%

Most comments (287) were categorized as positive, reflecting optimism or enthusiasm. For instance, this comment expresses positivity by highlighting progress and ethical considerations in AI: *"Thinking about AI, which is not only tech and engineering but also requires ethics and responsibility. It's inspiring to see progress in this area."*

Meanwhile, neutral sentiments indicate that much of the discourse was factual or was missing a strong emotional undertone. This comment, for example, poses a question without an explicit emotional tone: *"Is it possible to see who submitted these proposals and what are they about?"*

Negative sentiments were the least frequent. In a negative comment, e.g., the user expresses a strong emotional reaction to perceived setbacks in equity: *"It gives me chills down my spine that we're regressing when it comes to basic equity."*

All in all, we observe that the LinkedIn discussion, based on the data of the EUDT account, is predominantly neutral to positive, suggesting a constructive and balanced engagement. Only a tiny fraction of the comments reflects dissatisfaction or criticism. It is important to mention that comments or contents that may have been deleted before extracting data have not been included in the analysis.

5 Discussion

Overall, elevated levels of engagement across various types of posts, along with the mostly positive or neutral sentiment observed throughout the comments, suggest that LinkedIn can likely help facilitate a balanced exchange on topics such as AI governance, cybersecurity, and digital transformation, which the account aims at. To fully appreciate these insights, however, several important considerations and limitations should be explored in more detail, which will be closely linked to the respective sub-questions.

5.1 Informative Content: High Interaction or Just High Frequency?

There are distinct engagement patterns among different post categories. Informational posts consistently generated higher interaction scores than action-oriented or interactive content, revealing the importance of sharing detailed, in-depth information with LinkedIn's professional user base. This can be interpreted as a success for the account's strategy. Additionally, this finding can be confirmed with existing literature suggesting that posts with substantive content are more likely to result in thoughtful commentary on LinkedIn than more superficial calls to action like on other platforms (Lai & Fu, 2020; Rauchfleisch et al., 2023).

One possible explanation is that informative content meets LinkedIn's audience's expectations of acquiring knowledge and staying current on emerging digital governance trends. In contrast, action-oriented posts do tend to focus on promoting events or driving immediate participation on other platforms, which may not always result in sustained discourse on LinkedIn itself. Nonetheless, on the same point, an important factor to note is the imbalance within the collected dataset: informational posts far outnumbered action-oriented (greater factor 10), and interactive ones (greater factor 2). As a result, it remains difficult to conclusively state whether their content type alone drove higher engagement.

5.2 Keeping it positive while catching up with expectations

Comparing the LDA results for official posts and user comments further underscores some of the core themes driving professional engagement. On the official side, topics such as "*infrastructure*," "*cybersecurity*," and "*data*" – all closely associated with the European Commission's forward-looking digital strategies – appear strong. The repeated references to "*EU*," "*European*," and "*digitaleu*" confirm that the Commission's communication aligns well with policy goals: the content is directly tied to European digital initiatives and events, highlighting large-scale connectivity, cybersecurity collaboration, and data privacy.

User comments, on the other hand, reveal a slightly broader set of interests, often clustered around "*tech,*" "*AI*" and "*ethics*". While the first two terms align closely with the account's focus, the latter should be considered more often in future posts and could result in more active engagement, representing user interests. The presence of terms in multiple languages, e.g., Polish and Italian, would highlight the account's broad reach and remind users of regional differences across policies.

Sentiment analysis showed that most user responses remained positive or neutral, with relatively few explicitly negative comments. While these findings suggest an overall favorable reception, the neutral sentiments often took the form of information requests, indicating that users were keen to gather more facts before forming strong opinions, which should be considered for future posts. On this note, it stood out that in the results, only five comments out of 596 had been posted by the EUDT account itself over the selected six-month period. This aligns with the overall account focus, which appears to aim at providing news only. However, it shows unused potential for user engagement.

Negative comments mostly referenced matters like equitable access and perceived failings in addressing social or ethical dimensions of digital governance, offering an opportunity for policymakers to address these concerns in more detail. Notably, the standard sentiment analysis tool used here cannot reliably detect sarcasm or irony, which may hold back subtler criticisms or discontent. Therefore, the largely optimistic tone in the data must be interpreted cautiously – although checked manually – acknowledging potential shortcomings that simple polarity classification might not capture.

5.3 Optimizing LinkedIn Use for Governance

LinkedIn's professional user base appears drawn to thorough, information-focused content, but there remains unexplored room for experimenting with features that can further stimulate engagement. Although, as stated on the account itself, *"[w]e bring you the latest news"* (European Commission, 2024b), it seems the EUDT strategy focuses on conveying information only; elements within their posts actively channel discussions with open-ended questions. It can be inferred that the overall strategic approach should be streamlined. Once that has been completed, encouraging more interactive elements, such as polls or structured Q&A sessions, could offer valuable insights into stakeholder concerns and attract more sustained discussions. Similarly, leveraging document-sharing options might help deliver detailed policy reports or guidelines while simultaneously inviting comments from academics, industry representatives, and policy experts.

Moderation guidelines encouraging the EU Digital & Tech team to respond directly to user queries or questions could help bridge the gap between policy announcements and community feedback. By explicitly inviting subject matter experts or other stakeholders to engage in LinkedIn Live events, for instance, the account could generate a more interactive culture reflecting DPG's emphasis on inclusivity and modern-times responsiveness.

The thematic consistency in user comments, centered on AI, ethics, data governance, and cybersecurity, suggests that messaging focused on these areas resonates strongly. By blending substantive updates with open-ended conversation prompts, the EU Digital & Tech account could refine its strategy for reaching a broader, diverse audience. Ultimately, optimizing LinkedIn as a platform for digital governance should extend beyond increasing engagement metrics. It must also reflect fundamental public values, including transparency, inclusivity, and accessibility. This applies not only to the substance of the content but also to the modes of communication. Ensuring that materials are accessible, inviting participation from diverse user groups, and encouraging open, dialogic interaction across sectors and regions are essential steps toward aligning communication practices with the broader objectives of DPG.

6 Conclusion

This study presents a compelling case that LinkedIn can act as a relevant – although in this case underutilized – tool for communication in digital public governance. It is important to note that focusing on the EU Digital & Tech account does provide an in-depth view of one influential channel but cannot fully capture the diversity of communication approaches across other public sector accounts or national government profiles. While different content strategies result in varying degrees of engagement, the main trends suggest that the user base is indeed willing to engage thoughtfully with policy-related content on this platform, which might be useful for all parties involved. These themes resonate with core values of transparency, accountability, and innovation, signaling that the account's existing content strategy already addresses some fundamental principles of modern digital governance.

Looking ahead, a more comprehensive and improved participatory governance approach on LinkedIn would involve experimenting with additional media formats, such as short videos, infographics, real-time webinars, etc. While the account shows promise in posting regular, informative updates, more interactive strategies could help activate participation and make communication more dialogic. Through such strategies, followers can evolve into active prosumers, directly contributing to content creation and policy dialogue. This includes actively responding to user comments, conducting regular LinkedIn polls on current regulatory questions, using pinned posts to invite stakeholder feedback, or organizing periodic LinkedIn Live sessions with European Commission representatives or digital experts. These approaches are relatively low-cost and can stimulate recurring engagement across a more dynamic communication environment.

To then assess the impact of such measures, LinkedIn's built-in analytics tools (e.g., comment sentiment, viewer retention, and demographic breakdowns) could be systematically used. Metrics like comment-to-like ratios, average poll participation, or reply to rates to open questions could serve as benchmarks for interaction quality over time. These evaluation practices would allow communication teams behind such accounts to adjust their strategies iteratively and tailor them to different stakeholder groups, aligning digital governance communication with ongoing expectations of transparency, responsiveness, and user engagement.

Such strategies align directly with core DPG values – transparency, accessibility, and collaborative decision-making – thus positioning LinkedIn not merely as a news distribution tool but as a dynamic platform enabling followers to become prosumers actively participating in policy co-creation and shared innovation across the EU.

Future research might explore whether a more balanced content strategy – combining informational depth with invitations for audience participation – would result in different engagement patterns or emotional responses, particularly among different demographic segments. Moreover, comparing the engagement dynamics of the EUDT account with those of the broader European Commission may clarify whether observed trends are specific to stakeholders actively seeking updates on digital policy or whether they reflect more general patterns across the institution's social media landscape. Additionally, future research might apply the legitimacy framework introduced by Özdemir et al. (2025) to evaluate which types of institutional communication contribute most effectively to different dimensions of public legitimacy in digital governance contexts.

6.1 Limitations

This study found that LinkedIn might be an effective communication channel for DPG, yet various limitations shape the extent to which the findings can be generalized. First, focusing on the EU Digital & Tech account as a single channel reduces representativeness, as different organizations or agencies might have contrasting objectives, audiences, and communication styles.

Selection bias is another concern, as this study analyzed only the posts and comments that remained publicly visible during data extraction. Certain user contributions might have been deleted, flagged, or set to restricted visibility, potentially distorting the larger conversation around the topics. The reliance on automated data extraction tools, too, introduces possible inaccuracies if LinkedIn's interface changes or if connectivity issues interrupt the data collection process, which cannot be fully declined. Moreover, repeated mentions (of other people's names or tags) and replies can lead to partially duplicated entries. Even though the account and its contents are publicly accessible to all users, individual names and other personal information have been removed to comply with the EU's GDPR, addressing ethical concerns about data handling and privacy.

Language diversity further complicates sentiment and topic analyses since the chosen methodologies rely heavily on English-centric tools that do not always account for slang or other languages, e.g., Polish and Italian, as seen in the data set. Reliably including this data in future studies will account for a more inclusive approach, as this limitation causes multilingual users' sentiments or nuanced criticisms to go undetected.

Finally, the automated sentiment detection (TextBlob) cannot easily interpret sarcasm or subtle humor, possibly categorizing a critical comment's tone as neutral or positive. This limitation was, to an extent, addressed through manual spot reviews of selected comments. Expanding the analysis to multiple LinkedIn accounts, refining sentiment-detection methods and tools, systematically incorporating manual reviews as well as integrating machine learning tools with contextual understanding could employ richer and more precise insights.

Abstract. Cybersecurity is an integral part of digital public governance and aims to ensure the confidentiality, integrity and availability of sensitive citizen-, business-, and government-related data. Given the increasing complexity of cyberthreats, driven by the digital transformation of the public sector and emerging technologies, local governments need robust and resilient cybersecurity strategies. This exploratory study examines the October 2023 cyberattack on Südwestfalen IT (SIT), an IT service provider for over 70 municipalities, cities and districts in Germany. As a result of this ransomware attack, for several months, public services were severely disrupted for over 1.6 million citizens. Against the backdrop of the particular challenges that local governments face in managing their cybersecurity, this study identifies lessons that small and medium-sized municipalities and cities derive from this cyberattack. The paper adopts a multi-method qualitative exploratory research approach, combining key informant interviews and document analysis through reflexive thematic analysis. Key findings highlight the importance of thorough implementation of cybersecurity standards such as network segmentation, tighter monitoring practices and two-factor authentication. To mitigate cluster risks, other key lessons include increased focus on top-down decision-making to enforce non-negotiable cybersecurity standards, given the need for IT service collaboration and the use of economies of scale resulting from the resource constraints of smaller local administrations. Further practical implications include an increased focus on staff training and implementing change management strategies to reduce resistance to reform at various stakeholder levels. This exploratory study of the SIT's recent cyber incident also serves as an example for small and medium-sized municipalities that are not part of cooperation networks, encouraging them to reconsider their cost-benefit analysis of independent cybersecurity strategies versus collaborative frameworks. Overall, the study offers valuable insights into the implications of cyberattacks for local administrations of small- and medium-sized municipalities. As such, it aims to contribute to developing more equitable and resilient cybersecurity strategies.

Keywords. Cybersecurity, local cybersecurity strategy, local digital governance, public sector cyberattack.

1 Introduction

Cybersecurity is an essential aspect of digital public governance, encompassing the confidentiality, integrity and availability of data and information (Möller, 2023). Its societal relevance can be illustrated by the direct impact cybersecurity incidents might have on the daily operations of public administration and citizens respectively, including the disruption of critical public services, the loss of sensitive data of citizens, governments and businesses, as well as financial damage and the erosion of public confidence in government (Roumani & Alraee, 2025; Shandler & Gomez, 2022). The landscape of cyber incidents is broad, including data breaches, ransomware attacks, phishing, and denial-of-service (DoS) attacks. It extends further with the advancements of emerging technologies, such as artificial intelligence, which pose unique and novel risks to data and information security (Ndumbe & Velikov, 2024; Savaş & Karataş, 2022). Therefore, considering various types of cyberthreats is crucial to ensure a comprehensive – adaptive and resilient – cybersecurity strategy for any organisation, and thus, adequate incident response and risk mitigation activities.

Local governments are people's first point of contact: the services they provide can have a significant impact on citizens' satisfaction with, for example, democracy, thereby influencing social cohesion and reducing inequalities (Hunter et al., 2016; Masuku et al., 2022; Meza, 2015; Sabbi et al., 2024). For small and medium-sized municipalities (SMMs) and districts, cybersecurity resilience is particularly important. However, while local governments have formal cybersecurity policies, they fail to integrate cybersecurity practices into their day-to-day operations (Hatcher et al., 2020). Researchers have also found that SMMs lack cybersecurity awareness among staff and officials at all levels (Norris et al., 2019; Norris & Mateczun, 2022).The issue is exacerbated further because SMMs, in particular, struggle to maintain human and financial resources to provide quality services (OECD, 2023). While lack of funding and inadequate training have been identified as key challenges, local governments also face a unique set of institutional, political, historical and cultural barriers that influence their ability to prevent and respond to cyberthreats (Hossain et al., 2025; Preis & Susskind, 2022).

At the same time, according to the European Agency for Cybersecurity (ENISA), the majority of cyberattacks in the EU target public administration organisations (European Agency for Cybersecurity, 2024). In addition, ENISA is seeing an increase in the number and advancement of cyberattacks. These developments could become increasingly relevant for SMMs, given their structural vulnerability in this respect. Still, local governments' cybersecurity strategies and incident responses have not been extensively researched (Hossain et al., 2025; Preis & Susskind, 2022). Therefore, this exploratory research aims to answer the following question: *What lessons may small and medium-sized municipalities derive from cyberattacks?*

This paper focuses on a single case study to explore the experiences of SMMs in Germany, where their municipal IT service provider Südwestfalen IT (SIT), a network cooperation owned by 72 municipalities, cities and districts, recently suffered a massive cyberattack (Südwestfalen IT, 2024a). The SIT's owners are also its customers; thus its strategic development is driven by representatives of the SIT's members (Südwestfalen IT, 2024c). Accordingly, SIT is governed by its association assembly, which is made up of elected officials representing the local governments of its member entities.

Based on key informant interviews (KIIs) and document analysis, this paper aims (1) to identify key lessons learned from the SIT cyberattack, (2) evaluate how they impact cybersecurity strategies, and (3) draw practical implications for cybersecurity strategies of small and medium-sized administrative entities.

This study's relevance is twofold: as the SIT cybersecurity incident is relatively recent, mostly journalistic and forensic assessments have been conducted to date (Brockhues & Boeselager, 2024; r-tec, 2024). Drawing on this recent data, this paper examines the real-world strategies of SMMs to address the evolving cyberthreat landscape. As the cyberattack on SIT can be seen as a high-profile incident, examining its strategic implications is directly relevant for other small and medium-sized administrations and can help improve the robustness and resilience of their cybersecurity strategies.

The remainder of the paper is structured as follows: Section 2 presents an overview of related research, followed by Section 3, which introduces the conceptual framework of this study. The methodology is outlined in Section 4 and the key results are presented in Section 5. Section 6 provides a discussion of the main findings, followed by the conclusion in section 7.

2 Literature review

2.1 Key cybersecurity concepts

The term *'cybersecurity'* generally refers to the protection of internet-connected systems, including both hardware and software, as well as data and information, from threats, i.e. cyberattacks (Srinivas et al., 2019). Cyberattacks can have different intentions, such as compromising the confidentiality, integrity and availability of data and

information of public and private organisations (Möller, 2023). Various types of cyberattacks are commonly identified, including spyware that tracks information or a replicating virus that attaches itself to other software. Other examples include ransomware attacks, which encrypt data on devices and offer decryption upon payment of a ransom, and a zero-day attack, which exploits a vulnerability in software before a security patch can be applied. Data can also be threatened by a brute-force attack, which is a trial-and-error method of gaining access to information such as passwords. According to ENISA ransomware attacks rank among the primary cyberthreats (European Agency for Cybersecurity, 2024). The agency also states that cyberweapons targeting zero-day vulnerabilities are a growing concern.

2.2 Cybersecurity in the public sector

While certain aspects to cybersecurity are common across sectors, peculiarities of the public domain make the issue even more acute. The importance of public cybersecurity has increased significantly over the last decades, mainly due to the increasing interconnection between IT and critical public infrastructure (Wirtz & Weyerer, 2017). While this development leads to many positive effects, the public sector represents an attractive target for cyberattacks: public organisations deal with a wide range of sensitive data of citizens, private sector organisations and public infrastructure (Trautman et al., 2024; Wirtz & Weyerer, 2017). Given this field of tension, public governments and administrations are urged by practitioners and researchers to address the evolving cyberthreats through strategic management of cybersecurity (Wirtz & Weyerer, 2017).

Some authors find that municipal governments need to invest in resources and technical capacity building to prevent cyber incidents; others identify leadership in public administration as critical to implementing up-to-date cyber protection measures (Frandell & Feeney, 2022; Wirtz & Weyerer, 2017). In addition, researchers find that local governments of all sizes have significant gaps in their cybersecurity policies (Hossain et al., 2024b). Other research is mainly concerned with structuring the complex landscape of (public) cybersecurity frameworks, with the aim of helping policymakers and practitioners identify gaps and challenges in framework implementation (Hossain et al., 2024a; Srinivas et al., 2019).

While public sector cybersecurity challenges are generally faced by both smaller and larger administration entities, local governments, as the primary bodies politically and administratively in charge of SMM cybersecurity, may face unique obstacles (Hossain et al., 2025; Preis & Susskind, 2022). Based on a study of US local governments, researchers attest that local governments have significant shortcomings in managing their cybersecurity, such as unawareness of security best practices as well as lacking individual risk audits and implementation of existing measures and policies (Norris et al., 2019). These shortcomings are generally linked to limited financial resources and underinvestment, leading to a self-reinforcing cycle of technological vulnerability that ultimately discourages the innovative efforts needed to keep pace with evolving cyberthreats (Fusi et al., 2023).

In addition, researchers have found that rural municipalities with lower citizen demand for digital services also provide a smaller surface area for cyberattacks, although they note that these findings apply primarily to IT departments that manage their cybersecurity independently (Harry et al., 2025). However, other researchers recommend that local governments consolidate IT networks and form municipal collaborative partnerships to mitigate the cascading effects of budget constraints and reduce the fragmentation and complexity of cybersecurity measures (Hossain et al., 2025). On the other hand, research has shown that cybersecurity incidents can have a significant impact on the relationship between IT providers and local authorities, and that repairing trust is a complex process (Nowak & Distel, 2024). Given this complex and sometimes paradoxical landscape of considerations facing SMMs, it is highly relevant to explore the impact of an actual cybersecurity incident on local cybersecurity strategies.

3 Cybersecurity frameworks

In this section, we introduce and discuss how various available frameworks are operationalised and applied as heuristic lenses within the scope of this study (Abbott, 2004).

3.1 Cybersecurity frameworks overview

Various theoretical frameworks exist to cover and structure relevant aspects of this research topic, including the IT security compendium of the German Federal Office for Information Security (BSI), the international information security standard ISO 27001:2022, the US National Institute of Standards and Technology's Cybersecurity Framework 2.0 (NIST CSF 2.0) and the EU's NIS2 Directive.

NIST CSF 2.0 provides flexible, risk-based guidance for private and public cybersecurity management. Taking an outcome- and practice-oriented approach, NIST CSF 2.0 identifies six core functions of a cybersecurity framework: Govern, Identify, Protect, Detect, Respond and Recover. When compared with other frameworks, NIST CSF offers significant advantages for self-assessment, while at the same time, the framework would benefit from simplified

practical implementation (Ibrahim et al., 2018). Moreover, an earlier version of the NIST CSF has already been applied in a study of cybersecurity levels of local government organisations. Examining the cybersecurity levels of a local government organisation in Western Australia, several recommendations were formulated under the core functions of the NIST CSF, such as increasing cybersecurity awareness across the workforce and establishing a central inventory of assets, which serves as a basis for prioritising security measures based on their classification, criticality and business value (Ibrahim et al., 2018).

Ibrahim et al. (2018) also provide valuable insights into the application of the NIST CSF to a local government case, although this exploratory study can build on this by using a more recent version of the framework, i.e. NIST CSF 2.0, which additionally includes Governance as a core function of cybersecurity frameworks. As this study explicitly aims to identify the broader implications of the SIT cyber incident, it is essential to explore the development of governance approaches in this case of municipal collaboration.

In turn, the EU's NIS2 Directive complements this framework by adding a regulatory perspective, which is essential for analysing a municipal case in the EU. As an alternative, the IT security compendium of the BSI could be used (BSI, 2023). However, it may be considered too technical and detailed for the scope of this study.

3.2 Aggregated conceptual framework

In this study, a chosen heuristic lens comprises NIST CSF 2.0 and NIS2, as they are well-known and established cybersecurity frameworks with several strengths and include a wide range of aspects in a flexible way, which is particularly important for this exploratory study. They are also highly compatible and provide an international standard. Our conceptual framework is presented in the table below:

Tab. 1 – Conceptual framework

NIST CSF 2.0 core functions	NIST CSF 2.0 outcomes associated with core functions	NIS2 Directive focus measures
Govern (GV)	Establishing, communicating and monitoring the organisation's cybersecurity risk management strategy, expectations and policy	Appropriate management policies and clear accountability
Identify (ID)	Understanding the organisation's current cybersecurity risks	Regular and coordinated risk assessments
Protect (PR)	Safeguarding to manage the organisation's cybersecurity risks	Implementation of cyber hygiene baselines, practices and controls
Detect (DE)	Finding and analysing possible cybersecurity attacks and compromises	Early warning systems through appropriate technical measures
Respond (RS)	Taking action regarding a detected cybersecurity incident	Response obligations and reporting protocols
Recover (RC)	Restoring assets and operations affected by a cybersecurity incident	Ensuring process continuity and routine operations, as well as recovery measures

4 Methodology

4.1 Case description

SIT was founded in 2018, when two municipal IT service providers merged into the joint association SIT under the Municipal Cooperation Act of North Rhine-Westphalia, with the aim of consolidating their services for the benefit of their member municipalities, cities and districts. Due to SIT members' diverse size and structure, the cyberattack recovery process has been described as a balancing act (Brockhues & Boeselager, 2024). Within the scope of this paper, only SMMs that are members of the cooperation network SIT are addressed (Südwestfalen IT, 2024a).

During the night of October 29 to October 30 2023, the municipal IT service provider SIT detected a cyberattack on its systems, later described as the largest and most complex attack on the German public sector to date, with

over 1.6 million citizens affected (Südwestfalen IT, 2024d). In the following months, the digital public service landscape in this region in North Rhine-Westphalia was described as being thrown back into the Stone Age (Krischer, 2023). The most basic administrative operations, such as communication by telephone and mail, as well as the payment of social benefits, youth welfare services, the legal marriage of citizens and the issuing of driving licences, were unavailable (Brockhues & Boeselager, 2024). While some municipalities were more affected than others, all were severely hampered in their day-to-day administrative work by the SIT's remit: SIT provides comprehensive IT services such as e-government solutions, software development for administrative applications and network infrastructure (Südwestfalen IT, 2024b).

The cyberattack on the SIT in October 2023 exploited a zero-day vulnerability via a brute-force attack and is furthermore classified as a ransomware attack (r-tec, 2024). While the ransomware group that attacked SIT – a Russian collective called Akira – offered to coordinate modalities for recovering the data in exchange for a ransom, SIT chose not to do so due to valid backup copies of the data and the lack of evidence of data leakage (r-tec, 2024).

4.2 Data collection

This exploratory study adopts a multi-method qualitative research approach by relying on KIIs, complemented by archival and desk research (Bryman, 2012). Data gathered through desk and archival research include primary sources such as official records, reports and legislation, as well as secondary data such as academic journals, online databases and press outputs, providing a detailed description of the context of the study (Bryman, 2012). Two key complementary resources are the evaluation report conducted by the external company r-tec on behalf of SIT and a journalistic podcast series published by publicly-funded news broadcasts (Brockhues & Boeselager, 2024; r-tec, 2024).

By drawing on different data sources, theories and research methods, this study aims to fulfil the data, theory and method triangulation principle originally developed by Denzin (Bryman, 2012; Denzin, 2017). This approach not only allows for cross-comparability of findings but is particularly appropriate for this research topic as it involves different stakeholders with different perspectives and priorities (Bryman, 2012). By combining data from different key informants and sources with two different lenses, i.e. NIST CSF 2.0 and NIS2, triangulation provides a more comprehensive view of the research topic and increases the validity and credibility of the findings (Bryman, 2012).

In order to be able to ask open-ended and follow-up questions, the KIIs adopt a semi-structured approach (Magnusson & Marecek, 2015). As the single case study has not yet been widely researched, while preparing the interview questions guided by our conceptual framework, we remained open to new data and aspects that were not anticipated (Bryman, 2012). Potential interviewees were identified through desk research and network referrals, leading to two interviews in December 2024. The overview of informants is presented below:

Tab. 2 – Key Informant Interviews.

Interview	Role	Relevance	Format	Duration
1	Official of one of the districts affected by the cyberattack	Responsible for managing the district's administrative operations Involved in the SIT's strategic development	Online	45 minutes
	Leading member of the SIT's association assembly	The district consists of several SMMs and holds a total population of approx. 260.000		
2	Member of a city council	Represents the city's interests in the SIT's association assembly	Online	30 minutes
	Member of the SIT's association assembly	The city holds a total population of approx. 31.000, of which 15.000 live in the town centre and the rest in the surrounding villages		

The preliminary questions, which were sent to the interviewees in advance for the purpose of preparation, were developed and worded to cover the themes conceptualised by the aggregated framework consisting of the NIST

CSF 2.0 and the EU's NIS2 Directive. Hence, they were structured into the following blocks: implications for cybersecurity strategies and governance; current cyberthreats and protective measures; and threat detection, response and recovery. For instance, the questions asked what specific cybersecurity risks the attack revealed for SMMs, what specific challenges SMMs face in this regard, what impact the cyberattack had on cooperation between the SIT and its owners, and questions about strategies and actions beyond the SIT.

4.3 Data analysis

The data gathered from the interviews and archival and desk research was examined using Reflexive Thematic Analysis (RTA) (Braun & Clarke, 2006). While thematic analysis (TA) generally entails identifying, analysing and reporting on patterns, called '*themes*', within the data at hand, RTA takes a more interactive research approach. In RTA, themes are (re)developed based on analytical and interpretative reflection on the collected data (Braun & Clarke, 2006). Hence, themes emerge from an organic and reiterating coding process that includes review and reflection cycles during the whole data analysis process (Braun & Clarke, 2021a, 2021b). This iterative reflection on the data collected is particularly suited to the exploratory nature of this research, as the interviews, for instance, led to the identification of further resources.

Although RTA does not usually follow a strictly theory-driven approach or involve a priori coding, both cybersecurity frameworks form the initial basis for the data analysis process (Abbott, 2004). Braun and Clarke argue that research cannot be conducted in an atheoretical environment, so RTA aligns with this approach (Braun & Clarke, 2022). In addition, due to the flexible development of themes, (R)TA can be seen as more interpretive, whereas Qualitative Content Analysis is generally more descriptive (Braun & Clarke, 2021a). According to Braun and Clarke, this distinction arises since most TA methods explicitly rely on a discussion of the research's theoretical background. Given the heuristic lenses used, RTA is a better fit for this research.

The interviews were conducted in German, recorded in an audio format and transcribed with Microsoft Edge software (Bryman, 2012). The transcripts were manually cleaned by correcting transcription errors, but no content was edited (Bryman, 2012). Afterwards, the interviews were translated into English, and the correct information conversion was manually reviewed. The data analysis process was supported by the software NVivo 15 (Bryman, 2012).

5 Results

The following results section is structured according to the aggregated conceptual framework introduced in Section 3, which combines the core functions of NIST CSF 2.0 and focus measures of the NIS2 Directive. Due to the exploratory nature of this research, the developed framework served as a heuristic lens and provided a starting point for the data analysis, in order to systematically organise the findings from both the KIIs and the archival and desk research. The first part of this section presents insights related to the functions Govern and Identify, while the second part covers the functions Protect, Detect, Respond and Recover.

5.1 Key lessons learned on Governance and Identification

When it comes to cybersecurity governance, a key takeaway is the introduction of more top-down decision-making: "*And that was one of the lessons we learned: certain things cannot be discussed democratically within such an organisation. Once the necessity of a measure has been recognised, it must be decided top-down*" (Interview 1). This change in the SIT's approach to governance also includes the following measures identified through the themes of this analysis. The governance structure of the SIT does not provide for the network's leadership to be full-time, which is seen as a weakness, especially in times of crisis. In addition, political oversight of the SIT's strategy development through the association assembly is still quite strong due to its make-up, potentially hindering a quick implementation of reforms. However, the interviewees observe a growing understanding of top-down measures.

Cost considerations have also been identified as an obstacle to governance and decision-making: The SIT is supported by levies, meaning the members bear additional costs, e.g. for the implementation of new measures aimed at achieving minimum security standards. Regarding membership policy, the SIT leadership intends to demand minimum security standards: *"[…] SIT's primary focus is, of course, on securing its services and network. To ensure this, minimum standards will be imposed on members in the future. Only those who implement certain measures will even be allowed access to the network*" (Interview 1). Cost considerations and organisational structures, such as resistance of employees, were named as potential barriers to this membership requirement.

The analysis revealed several different risks identified by the interviewees. In terms of understanding the cybersecurity risks of SMMs within the SIT, the cyberattack has particularly highlighted a cluster risk arising from the nature of a cooperative association, where entities pool resources and data. However, this risk was exacerbated by the lack of network segmentation. In addition, the lack of basic security practices, such as two-factor

authentication and password requirements, was also uncovered. Furthermore, the cyberattack underlined the lack of human and financial resources as a particular risk for SMMs. According to the interviewees, this risk can only be mitigated by taking advantage of economies of scale, i.e. by cooperating in networks such as SIT. Additionally, the support of external parties in identifying individual cybersecurity risks is seen as positive, such as a situation analysis provided by the federal state or the involvement of r-tec in identifying immediate, medium-term and long-term measures.

5.2 Key lessons learned on Protection, Detection, Response and Recovery

To protect organisations from cybersecurity risks, the cyberattack has reinforced and revealed the need for several further measures. Regarding cyberthreat monitoring, network segmentation should be increased, especially against the background of the intention to widen cooperation between SMMs. Furthermore, SIT aims to de-complicate the applications it offers to simplify monitoring and updating security standards. Related to this, when evaluating the recovery, the respondents stated that processes varied from city to city and were complicated by the complexity and customisation of applications. During this phase, most cities learned that consolidating IT services can likely reduce the long-term complexity of daily monitoring and future recovery processes, while some cities also restored functionality on their own.

Two key lessons have been learned about future cybersecurity threat detection: (i) Installing tighter cyberthreat monitoring solutions to prevent attackers from moving freely within the network, regardless of significant ongoing costs. Furthermore, (ii) analysing and prioritising security alerts appropriately, i.e. against the background of the individual security architecture.

Regarding the detection and analysis of security alerts, interview 1 revealed that security alerts received from official authorities should be thoroughly read and analysed to assess their risk to SIT's individual infrastructure. Furthermore, the representative of one administration entity names measures apart from SIT, namely educating employees in cyber hygiene, such as password requirements and auto-locking screens. However, the interviewee notes that administrative staff have a limited understanding of such additional protective measures. In addition, the interviewed member of the city council states that the city aims to build offline redundancies for their most crucial processes, particularly ensuring business continuity. For future responses to cybersecurity incidents, the immediate involvement of external experts such as r-tec would be helpful, as would a rapid system shutdown to prevent the worst-case scenario of data theft.

In addition to confirming the previously developed overarching conceptual themes of lessons learned, increasing centralisation and collaboration were identified as themes strongly connected to cybersecurity governance. Even though these measures are not predominantly driven by small and medium-sized administrative entities, they strongly impact their cybersecurity strategies. Furthermore, strategies leading to this goal are supported by the interviewees, such as a state programme to examine the state of cybersecurity in each municipality, city, and district and increasing top-down dictation of minimum requirements.

6 Discussion

6.1 Top-down approach to cybersecurity standards

Two key lessons from the SIT cyberattack include (1) an increased focus on top-down decision-making to ensure effective development and implementation of cybersecurity measures and (2) significant investment in robust and proactive monitoring and segmentation measures. This adjusted governance strategy appears especially relevant against the background of increased costs of additional measures, such as close meshed monitoring.

In addition, although cluster risks are inherent in the structures of cooperative networks such as the SIT, the financial and human resource limitations of SMMs require the use of synergies and economies of scale. Identifying resource constraints as a key factor driving local cybersecurity constraints is additionally underlined by further research (Hossain et al., 2025; Preis & Susskind, 2022). The cluster risks will be mitigated by increasing the segmentation of IT networks according to national and international standards.

Moreover, the cyberattack highlighted the severe deficits in basic cybersecurity practices at an operational level, such as the lack of password requirements or two-factor authentication and has therefore been identified as a focus area both at the individual and at the SIT management levels and will be addressed for example through employee training. This recognition of shortcomings in basic security practices correlates with previous research that identified these as key risks for local cybersecurity (Norris et al., 2019).

Evaluating key lessons derived from the cyberattack, SMMs are incorporating them into their cybersecurity strategies. While respondents support stronger governance frameworks and the enforcement of minimum security

standards – i.e. members will be excluded if they do not comply – other stakeholders not interviewed in this study may be more critical of this change in strategy. The same may be true for increased costs, which in the past have significantly impacted the strategic prioritisation of cybersecurity measures. Striking a balance between affordability and compliance with minimum standards could be crucial for implementing new measures and updated strategies, which correlates with other research that identifies public administration leadership and financial investment as critical factors in managing cybersecurity (Frandell & Feeney, 2022; Fusi et al., 2023; Preis & Susskind, 2022; Wirtz & Weyerer, 2017).

We found increased segmentation, monitoring, and simplification of services as likely cornerstones of an updated SIT cybersecurity measures. These aspects were already evident but became further exacerbated by the cyberattack. However, the withdrawal of individualised IT solutions could trigger further resistance among SIT members, confirming the need for change and expectation management as an additional strategic priority not mentioned in the interviews.

6.2 Greater centralisation and improved local implementation

Regarding practical implications for the cybersecurity strategies of SMMs, centralisation efforts appear to be the most prominent. This overarching strategic trend, such as centralising IT services and deepening collaboration between administrative units, is particularly supported by SMMs due to their limited financial and human resources to maintain an adequate level of cybersecurity. In this process, SMMs can likely be identified as potentially benefiting the most. As these entities depend on pooling resources, they should also strengthen protective measures, such as making certain standards non-negotiable within the network cooperation. They could also advocate for further centralisation at the federal and state levels, which could further increase benefits from economies of scale, such as redundancy and expertise.

This trend towards increased collaboration and consolidation of IT networks is consistent with the findings and recommendations of other research, which identifies cost savings and less complex cybersecurity measures as key benefits (Hossain et al., 2025). However, these findings are not aligned with the implications of other research, which suggests that IT service providers serving more citizens also provide a larger surface area for cyberattacks and a more attractive target (Harry et al., 2025). On the other hand, the respondents are aware of this increase in cluster risk and, therefore, support the introduction of the necessary cybersecurity standards to mitigate these risks and to be able to take advantage of the economies of scale on which they depend. Moreover, something that could be emphasised more by the SIT but is already being addressed at an individual level is cyber hygiene training for employees, which aims to reduce human-related cybersecurity risks. The need to improve and advocate for the implementation of cyber hygiene practices at a local level is also highlighted by previous research (Hatcher et al., 2020; Norris & Mateczun, 2022; Preis & Susskind, 2022).

6.3 Concluding reflections

While most of the key findings can be grouped according to the conceptual framework developed earlier, it becomes clear that they are highly interrelated. For example, reducing the complexity and customisation of IT services aims to significantly simplify Identification, Detection and Recovery, while it is also a key issue for the Governance of cybersecurity strategies. Therefore, effective change and expectation management measures and the involvement of all relevant stakeholders – such as political leaders, mayors and administrative staff – can be seen as crucial to achieving this strategic goal. A strategic change management approach was not identified during the data analysis but could significantly improve and speed up reform processes. As the specific implications of a complex service and governance landscape, such as the case of the SIT, have not been explicitly discussed in prior research, these findings provide new insights into developing cybersecurity strategies of collaborating local governments. However, researchers have previously found that local governments face a unique set of obstacles depending on their institutional, political and cultural context, which this case also confirms (Preis & Susskind, 2022).

Overall, the data analysis confirms the core functions and focal points of a cybersecurity strategy developed based on NIST CSF 2.0 and the EU's NIS2 Directive. In particular, proactive measures focused on preventing future cyberattacks are emphasised due to the accumulation of lessons learned within the themes of identifying, protecting and detecting cyberthreats. Furthermore, many of the consequences drawn were already observed before the cyberattack, but their urgency increased considerably. This increased sense of urgency against the background of evolving technology and public digital transformation is illustrated not only by the interview respondents but also by existing research (Ndumbe & Velikov, 2024; Roumani & Alraee, 2025; Savaş & Karataş, 2022; Wirtz & Weyerer, 2017).

7 Conclusion

This exploratory qualitative research study finds that SMMs affected by the cyberattack on SIT have learned several

key lessons that ultimately affect the realignment of cybersecurity strategies. Overall, the urgency of implementing a proactive, centralised and standardised approach to IT services and cybersecurity strategies and measures was reinforced. In particular, as small and medium-sized administrations face budgetary and human resource constraints, they rely on a collaborative network, such as the SIT, with robust and up-to-date cybersecurity measures mitigating cluster risks. The SIT's cyberattack highlighted critical gaps in basic requirements, such as lack of monitoring, network segmentation, two-factor authentication and password requirements. Given the lengthy decision-making processes on such measures in the past, the interviewees concluded that there should be more top-down decision-making on implementing non-negotiable cybersecurity standards. Based on the analysis, practical implications include greater emphasis on employee training and developing change and expectation management strategies to mitigate resistance to reform. Other municipalities and local administrations not yet attacked might use these practical implications to evaluate their own state of cybersecurity, carefully ensuring the implementation of their national and international standards, such as segmentation and monitoring.

This case also illustrates the need to involve all relevant stakeholders, such as administrative staff through appropriate training, or political and administrative leadership in raising awareness of the need for action. In addition, this case could prompt other municipalities not involved in a cooperation network to reevaluate their cost-benefit calculation for maintaining cybersecurity standards on their own, and hence, likely improving redundancy, effectiveness, and cost-efficiency.

This study relies on two key informants, which may limit the breadth of perspectives. Nevertheless, for an exploratory analysis, the combination of interviews and document review offers a solid foundation. The interviewees can be considered representative of their own district and municipality, though further interviews and comparisons with other small and medium-sized administrative entities would improve the generalisability and validity of the findings.

Despite the limitations of representativeness, this research can be seen as revealing crucial implications for local cybersecurity governance of SMMs and thus providing a starting point for future research. Further research could explore and compare cybersecurity strategy and preparedness in rural and urban, or smaller and larger communities. For example, it would be interesting to further analyse the role of budgetary and human resource factors, as well as interoperability, in order to inform federal-state efforts to centralise IT services. Further research could also explore the role of change and expectation management measures, for example, by assessing the further implications of top-down governance models.

Abstract. This paper focuses on the application of Human-Centered Design (HCD) techniques to enhance the agile requirements engineering process within the context of Brazilian Digital Government. Providing a public experience that prioritizes digital platforms represents a significant opportunity to improve citizens' quality of life by facilitating access to information and services. Our analysis is based on a case study conducted in a large Brazilian public company, where a survey was applied to assess the use of HCD techniques such as prototyping, usability testing, Design Thinking, personas, user journey mapping, UX Writing, and Plain Language. The survey results highlighted prototyping as the most widely used technique. There was a high perceived value for usability testing; however, barriers to its broader implementation may exist. Techniques such as persona creation, user journey mapping, and Design Thinking showed moderate usage, while UX Writing and Plain Language had low adoption rates. The adoption of these techniques may vary depending on team roles. Factors such as age group, role accumulation, and time within the company influence their application. The findings reinforce the need to expand HCD training, especially for underutilized techniques, to maximize their benefits within the agile requirements engineering process. This effort can contribute to improving project efficiency and enhancing the quality of digital services in the governmental context.

1. Introduction

The digital revolution is profoundly transforming public administration, gradually redefining the services offered by the State. This process brings challenges and demands that evolve as technologies become more advanced. At the core of this transformation is a citizen-oriented and citizen-driven model, in which users are no longer mere passive recipients of services but become co-creators of these solutions. This is a comprehensive digitalization effort that goes beyond seeking operational efficiency to promote the collaborative development of public services (Viana, 2021).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

This movement requires the alignment of institutions, organizations, people, technologies, data, and resources to achieve significant change in both the public sector and society. More than just technological innovation, it represents a true shift in mindset aimed at generating public value and building a more inclusive, participatory, and effective government (Viana, 2021).

The Organization for Economic Co-operation and Development (OECD) defines digital government as the use of digital technologies to modernize government operations, aiming to generate public value. Unlike e-government, which focuses on the use of Information and Communication Technologies (ICT) to enhance operational efficiency and governance methods, digital government proposes a broader evolution. It promotes a paradigm shift by transforming service delivery and governmental processes into "digital by design" practices (Gardenghi et al., 2020).

According to the Brazilian Government GOV.br (2023), user-centered services are those that: i) are easy to find and understand; ii) require the least number of steps possible; iii) are accessible to everyone who needs to use them; iv) function in a way that feels familiar to the user; v) are consistent throughout the entire digital journey (not just parts of it). Understanding users' needs and promoting service quality assessments are essential for public acceptance (GOV.br, 2023).

In this context, Requirements Engineering becomes crucial for the production of quality software, with Human-Centered Design (HCD) practices supporting the process by helping to understand users' needs (Carreira et al., 2022; Neto et al., 2020; Pedrosa et al., 2022; Pereira & Marczak, 2020; Santos et al., 2022). ISO 9241-210:2019 (International Organization for Standardization, 2019) defines HCD as an approach to system design and development that aims to make interactive systems more usable by focusing on system usage and applying knowledge and techniques from human factors, ergonomics, and usability. Although the term "human-centered design" emphasizes the impact on a wide range of stakeholders—not just direct users—the terms "user-centered" and "human-centered" are often used interchangeably.

Additionally, there is a growing emphasis on the use of agile methodologies, as established by Ordinance SGD/MGI 750 of the Secretariat of Digital Government of the Ministry of Management and Innovation in Public Services (PortariaSGD750, 2023). This ordinance recommends adopting a software development process segmented into short iterations, frequent deliveries, and well-defined scopes. In this agile context, Requirements Engineering can integrate HCD to address challenges such as the lack of formal documentation and ensure a proper understanding of customer needs (Keshk et al., 2022).

Although there is extensive research correlating Requirements Engineering with HCD techniques such as prototyping (Bjarnason et al., 2021), usability testing (Keshk et al., 2022), personas (Pinheiro et al., 2019), user journey mapping (Carlos Filho et al., 2021), and Design Thinking (Pereira & Marczak, 2020), there is a noticeable lack of studies focusing on government projects. This work aims to advance the understanding of the integration of Agile Requirements Engineering and HCD techniques through a case study in a Brazilian public company that develops systems used by citizens. The purpose of this case study is to encourage system development teams to adopt HCD techniques, promoting the improvement of the quality of digital services widely used by society.

The remainder of the paper is organized as follows: Section 2 presents the theoretical foundation; Section 3 discusses related work; Section 4 describes the methodology used; Section 5 presents the results obtained; and finally, Section 6 provides final considerations and suggestions for future work.

2. Theoretical Framework

This section provides an overview of Human-Centered Design (HCD) and Agile Requirements Engineering.

2.1. Human-Centered Design

According to Grilo (2019), HCD emerges as an approach in which product decisions are guided by the diverse characteristics of the target audience. Human-centered design involves understanding experiences and narratives related to the circumstances users face (Grilo, 2019).

User-centered thinking is a powerful tool for creating innovative products. To ensure that systems provide meaningful experiences, it is crucial to understand what people seek and what motivates them. A product should be a direct solution to users' problems.

According to International Organization for Standardization (2019), User Experience (UX) encompasses users' perceptions and responses resulting from the actual and/or anticipated use of a system, product, or service. These perceptions and responses include users' emotions, beliefs, preferences, perceptions, comfort, behaviors, and accomplishments before, during, and after use.

HCD shifts the focus to human aspects. Ignoring these principles may lead to consequences such as: (i) lack of product or service adoption; (ii) switching to competitors; (iii) increased training and support costs; (iv) inefficiency in usage; and (v) user dissatisfaction and operational errors (Venson et al., 2022). The following sections describe some techniques associated with HCD.

2.1.1. Prototyping

A prototype is a sample, model, or initial release that simulates one or more aspects of the final product (Olsen, 2015). Prototyping is a requirements engineering practice that allows obtaining feedback on requirements directly from the client. According to Warfel (2011), the requirements process with prototyping significantly contributes to reducing inefficiencies and waste, standing out for the following benefits: (i) reduction of misinterpretation; (ii) tangible experience; (iii) resource savings; (iv) interdisciplinary engagement; (v) exploration of alternatives; (vi) product focus; and (vii) early identification of errors.

Applying prototyping in the early stages of product development offers several benefits, such as testing ideas, avoiding misunderstandings, encouraging constructive criticism, and involving professionals from all sectors related to the product's lifecycle. It is essential to conduct early testing, without waiting for the software to be fully completed. On the contrary, the earlier these tests are conducted, the greater the chances of identifying and correcting issues before investing unnecessary time and resources. Including wireframes alongside a requirements document can increase the accuracy of a written requirement by up to 80% (Warfel, 2011).

However, there is a misconception that using prototypes delays the process by consuming time with simulations. In practice, prototyping accelerates results by enabling learning through trial and error, while facilitating decision-making about which direction to follow (Olsen, 2015).

2.1.2. Usability Testing

Usability testing is one of the most widely used and well-known research techniques in the context of Human-Centered Design (HCD) (Nielsen, 2012). According to ISO9241-11 (2018), usability is defined as the extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency, and satisfaction.

Usability testing is a valuable tool for evaluating products by involving real users interacting with the designed solution. It analyzes user behavior, actions, and movements, linking their verbal expressions to their reactions regarding the product (Grilo, 2019). The use of prototypes and usability testing is recommended in the literature as an effective strategy to mitigate failures in software projects (Lauesen, 2020).

2.1.3. Design Thinking

Design Thinking (DT) has stood out as an effective approach to help developers better understand users' real needs by leveraging empathy, creativity, and rationality. DT is user-centered and aims to solve complex problems through innovation and iteration (Parizi et al., 2022).

Research conducted by Pereira et al. (2021) indicates that DT improves requirements gathering and specifi-

cation, promoting greater collaboration, communication, and understanding of user needs. Rapid prototyping and a human-centered focus present a promising approach to dealing with ambiguous and volatile requirements from various project stakeholders (Hehn et al., 2019).

However, challenges persist, including a lack of appreciation for the approach, insufficient time to explore user needs, a shortage of experienced professionals in DT, and low stakeholder engagement. Research by Canedo et al. (2022) has shown that developers' lack of knowledge limits the adoption of DT in industrial practice.

2.1.4. Personas

The personas technique is a user-centered approach used to explore and organize data about end-users (Pinheiro et al., 2019). Personas are fictional, specific, and detailed representations of target users. They provide a clear identity for the user, creating a memorable, engaging, and actionable image that serves as a focal point for the design process (Pruitt & Adlin, 2010). Furthermore, personas communicate information more effectively than other artifacts, helping the product team and organization stay focused on users' needs and expectations.

According to Pruitt and Adlin (2010), the application of personas provides the following benefits: (i) exploration of assumptions and knowledge; (ii) user focus; and (iii) generation of empathy.

Although personas offer a wealth of qualitative data, their traditional creation requires significant time and effort in data collection, making it a costly technique. As an alternative, (Pinheiro et al., 2019) propose the use of proto-personas. This agile approach allows designers and developers to quickly create personas based on prior knowledge of the target audience.

2.1.5. User Journey Mapping

According to Melo and Abelheira (2015), User Journey Mapping is used to deepen the understanding of an experience by analyzing its positive and negative aspects along a timeline. A user journey map should illustrate a specific journey for a persona, incorporating elements such as feelings or emotions, needs, barriers, and other relevant metrics aligned with the organization's goals (Carlos Filho et al., 2021).

This technique enables the identification of requirements from the user's perspective, which differentiates it from other approaches. Insights derived from user observations or statements can reveal valuable opportunities (Carlos Filho et al., 2021).

2.1.6. UX Writing

UX Writing is the process of creating text that shapes user interactions with an interface. This includes elements such as titles, buttons, labels, instructions, descriptions, notifications, alerts, and controls visible to the user. The process begins by identifying the project's purposes, opportunities, and constraints. Before writing, the professional must understand both the users' and the organization's goals (Podmajersky, 2019).

To define these goals, the writer collaborates with experts who understand them and with the users themselves, always in a co-creation process. From the early stages of ideation and development, the writer should actively participate in team meetings, contributing to the discovery, design, and refinement of the experience. UX Writing is thus an iterative process involving creation, evaluation, and continuous improvements.

Besides being a key component in product design and development, UX Writing aims to create content that guides users throughout their interactions, providing a more fluid and satisfying experience. According to Lentez and Mager (2023), this work not only improves navigation but also increases user engagement and satisfaction, enhancing the product's success. However, it requires a deep understanding of the target audience, the product or service, and the context in which they will be used (Lentez & Mager, 2023). UX Writers must balance clarity, conciseness, and personality to meet user expectations and organizational goals.

2.1.7. Plain Language

The Plain Language technique aims to make information more understandable to everyone, reducing barriers to inclusion (Oliveira et al., 2023). Clear comprehension is essential, especially when presenting information intended for citizens. Complex texts can pose a significant barrier to interacting with e-government systems, particularly in contexts with low literacy levels and limited access to support resources. The writing style commonly associated with the public sector often uses dense and complex linguistic constructions, making reading and comprehension difficult (Fischer et al., 2019).

Plain Language seeks to promote universal accessibility by creating clear texts that can be easily understood by people with different literacy levels (Fischer et al., 2019). When applied to Requirements Engineering, it can improve communication among developers, stakeholders, and end-users. Its application spans various areas, including technical documentation, user interfaces, and user stories.

2.2. Agile Requirements Engineering

The study by Lauesen (2020) revealed that the main cause of failures in projects is related to requirements. Missing, ambiguous, or incomplete requirements can result in errors in the final system, rework, customer dissatisfaction, and schedule delays. Gralha et al. (2018) highlighted that the requirements process has significant impacts on the product, the team, and the organization. Agile requirements engineering faces challenges such as: Insufficient user stories to adequately communicate the requirements, Interpretation errors and lack of understanding of the requirements and Requirement changes during development.

2.3. Related Work

This section provides a review of previous research related to the theme of this work. Various approaches integrating agile requirements engineering and Human-Centered Design (HCD) have been discussed in the literature, describing their relationships, challenges, and difficulties.

The study by Kusuma et al. (2024) proposes the Emotion Map to capture emotions during requirements elicitation, contributing to more adequate specifications. Another study by the same authors highlights methods such as interviews and usability testing to integrate UX into requirements engineering, emphasizing the benefits of reducing errors and improving software quality (Kusuma et al., 2023).

Techniques like lean persona, addressed by Teixeira and Zaina (2022), help document requirements in both startups and established companies. (Martinelli et al., 2022) show the importance of clear and measurable acceptance criteria to ensure user satisfaction. A. B. Marques et al. (2022) analyze the incorporation of usability into user stories in remote agile environments, highlighting communication and collaboration challenges.

Approaches such as those by Keshk et al. (2022) integrate prototypes and user stories into the agile flow to improve the clarity of requirements. Parizi et al. (2022) explore the application of Design Thinking (DT) in defining requirements, facing challenges in integrating with agile methods. Studies by Zorzetti et al. (2022), Zorzetti et al. (2020), and Machado et al. (2020) discuss the combination of HCD and Lean Startup with agile methodologies, promoting rapid adaptation and continuous feedback.

Other works, such as those by Bjarnason et al. (2021) and Pereira et al. (2021), propose frameworks and standards to guide teams in incorporating UX into agile requirements. Souza et al. (2020) present a recommendation tool to support the teaching of DT in requirements elicitation. Almeyda et al. (2021) analyze the integration of UX with agile methods, highlighting benefits such as more intuitive products and challenges such as resistance to change.

Parizi et al. (2021) and Carlos Filho et al. (2021) propose tools to recommend DT techniques and improve the specification of requirement scenarios. L. Marques et al. (2020) explores the post-interaction journey to map the user experience and identify improvements. Cleto Filho and Zaina (2020) discuss the integration of UX into user stories in remote agile environments. Studies also address how clients can contribute to defining requirements through proto-personas, enriching communication between stakeholders (Pinheiro et al., 2019). The studies presented explore how Human-Centered Design (HCD) practices can mitigate challenges

found in agile requirements engineering. This work distinguishes itself by analyzing the context of government projects, which bring specific challenges and scenarios.

The previously mentioned works do not consider the environment of a large public enterprise. In the case of agile process models, organizational culture influences the effectiveness of applying agile practices (Looks et al., 2024). Moreover, in the public sector, software development often occurs through external contracts (Looks et al., 2024).

3. Methodology

This work was conducted in 2024 at an information technology company within the Brazilian Federal Public Administration. The company has national presence, a robust technological infrastructure, and extensive experience with large systems. For over 50 years, it has developed solutions that enable control, transparency, and simplify the relationship between society and the government. Information was collected to assess the company's current scenario regarding the use of HCD techniques in the requirements engineering (RE) process, through the application of a questionnaire.

The questionnaire was developed based on the perceptions collected by the author in the daily work environment. The main objective was to assess the application of the studied techniques and the value perceived by participants in relation to them. To achieve this, questions were formulated to capture both the frequency of use of the techniques and the perception of their usefulness and impact. The questions are driven by the goal of understanding the adoption of the investigated practices within the participants' context.

To ensure that the questionnaire items adequately cover the construct we aim to measure, it was reviewed by two expert professors who are co-authors of this study. Additionally, it underwent a preliminary validation with a colleague from the company, who assessed the clarity and comprehensibility of the questions. The questionnaire was approved by the Research Ethics Committee with Human Beings. The academic research was authorized by the company.

3.1. Questionnaire design

The instrument used for data collection was a structured questionnaire with both closed and open-ended questions, divided into two sections: demographic information and participants' perception of the use of Human-Centered Design techniques. Below are the main questions:

- Demographics (Years in the company, Gender, Age)
- What role do you perform in your team?
- How much experience do you have with Requirements Engineering activities?
- How much experience do you have with User Experience activities?
- Have you applied or used the results of any of the following techniques: Persona Creation, User Journey, Design Thinking, Prototyping, User Testing, UX Writing, or Plain Language?
- Which of these techniques have you applied or used the results of?
- To what extent do you find these techniques valuable when used in the requirements engineering process?
- What benefits did you observe from applying these approaches?
- What limitations/drawbacks did you observe in these approaches?

The data analysis scope for this article focuses exclusively on the closed-ended questions. We invited software engineering practitioners to participate. The target population comprised 200 employees, with invitations sent via email. The research received 166 responses.

3.2. Data analysis

The data description utilized frequency tables displaying absolute values, percentages, and response rates by category for variables allowing multiple selections. To verify the relationship between team roles and the use or non-use of the studied techniques, a logistic model was constructed due to the possibility of multiple roles

within the team. The goodness of fit was checked using the Hosmer and Lemeshow Test, and the explanatory power was assessed using the Nagelkerke coefficient.

To check the association between categorical variables, the Chi-square Test was used, followed by a post hoc multiple comparisons test with Bonferroni adjustment to identify differences in variables with more than two levels. To verify the relationship between the values assigned to the techniques and other variables, the Cochran-Armitage Test (linear trend test) was used, as both the response and explanatory variables are ordinal. In cases of statistically significant differences, the Kendall Tau Correlation Coefficient was also calculated to identify possible monotonic trends in the levels of the explanatory variable. IBM SPSS Statistics 20 was used for the analysis. Due to the exploratory nature of the study in the field, where the effects may be subtler, the significance level adopted throughout the analysis was 10%.

3.3. Participants and sampling

In order to characterize the sample and examine the behavior of categorical variables, Table 1 presents the absolute and relative frequencies. Table 1 describes the participants' profile, highlighting that the majority have been with the company for more than 10 years (61.45%). The predominance of men (75.90%) is evident. Regarding age, the most represented range is between 36 and 45 years (34.34%). Nearly half of the respondents (47.59%) hold more than one role in the team. The "Implementer" role is the most common, practiced by 61.45% of individuals, followed by "Requirements Analyst" with 40.96%.

Tab. 1 – Data description.

Variables	Freq. Absolute	Freq. Percentage	Respondents (%)
How many years have you been with the company?			
Less than 1 year	63	37.95	-
From 1 to 2 years	1	0.60	-
More than 10 years	102	61.45	-
Gender			
Man	126	75.90	-
Woman	38	22.89	-
I prefer not to say	2	1.20	-
Age			
18-25	12	7.23	-
26-35	30	18.07	-
36-45	57	34.34	-
46-55	39	23.49	-
Over 55	28	16.87	-
Do you take on more than one role on the team?			
Yes	79	47.59	
No	87	52.41	
Role in the team			
Requirements Analyst	68	21.05	40.96
Function Point Estimator	38	11.76	22.89
Manager	27	8.36	16.27
Implementer	102	31.58	61.45
UX Designer	25	7.74	15.06
Tester	52	16.10	31.33
Other	11	3.41	6.63

4. Results

Table 2 presents the description of the variables related to the design capabilities studied. Based on the analysis of Table 2, it is highlighted that 63.25% of participants have applied or used the results of design techniques, with "Prototyping" (59.64%) being the most used, followed by "User Testing" (34.34%). Regarding experience, 43.37% have no experience in UX activities. For Requirements Engineering, 30.72% have more than 10 years of experience.

Tab. 2 – Description of data related to the design capabilities studied.

Variables	Freq. Absolute	Freq. Percentage	Respondents (%)
Time of experience with Requirements Engineering activities			
None	54	32.53	-
Up to 2 years	32	19.28	-
3 to 5 years	16	9.64	-
6 a 10 years	13	7.83	-
More than 10 years	51	30.72	-
Time of experience with User Experience (UX) activities			
None	72	43.37	-
Up to 2 years	55	33.13	-
3 a 5 years	32	19.28	-
6 a 10 years	5	03.01	-
More than 10 years	2	1.20	-
Which techniques below have you already applied or used the results?			
Personas	54	17.03	32.53
User Journey	48	15.14	28.92
Design Thinking	27	8.52	16.27
Prototyping	99	31.23	59.64

High	36	48.65	-
Very high	22	29.73	-

To identify which roles within the company might be linked to a higher use of the discussed methods, Table 3 was developed. The logistic model displayed below models the variable "Uses any of the mentioned techniques?" based on variables related to the roles held within the company. Table 3 shows that the majority of individuals, regardless of the role assumed, have used or applied the results of some HCD technique. It can also be observed that some roles significantly alter the likelihood of being classified as a user of the mentioned techniques. Individuals who are Requirements Analysts are twice as likely to be users of these techniques (compared to those who do not hold this role). Similarly, Function Point Estimators are 3.239 times more likely, and Managers are 2.987 times more likely to be users of some of the techniques. On the other hand, Implementers are 61.4% less likely to use the aforementioned techniques. The model shows a good fit (p-value = 0.922) and explains 38.7% of the variability in the response variable.

Tab. 3 – Logistic Model with explanatory dummies defined based on the variable "Role in the team".

Role in the team	Use techniques		( )	DP	P-value	Exp( )
	Yes	No				
Requirements Analyst	54	14	0.693	0.411	0.092	2.000
Function Point Estimator	34	4	1.175	0.633	0.064	3.239
Manager	22	5	1.094	0.519	0.035	2.987
Implementer	54	48	-0.488	0.246	0.047	614
UX Designer	25	0	20.326	7327.391	998	> 100
Tester	39	13	0.206	0.440	0.640	1.228
Percentage of correct predictions	76.2	62.3	Média = 71.1			
Nagelkerke = 0.387						
P-value = 0.922 (Hosmer test and Lemeshow)						

To verify the relationship between the use or non-use of the studied techniques and other categorical variables, Table 4 was developed. It is important to note that one individual was excluded from the analysis when crossing "How many years have you been with the company?" with "Uses any of the mentioned techniques?", as they were the only representative of their level in the table, which did not provide useful information, violated the test assumptions, and inflated the p-value.

We observed that individuals with more than 10 years in the company are more likely not to use the techniques (71 out of 102). Individuals in the age range of 26 to 35 years are more likely to adopt the techniques. Those who perform more than one role in the team significantly use the techniques more ($p < 0.0001$). In this context, potential relationships between the assigned values and other variables of interest were analyzed. No relevant associations were identified between team roles and the value assigned to the techniques of Design Thinking, User Journey, User Testing, UX Writing, Plain Language, and Persona Creation.

However, Table 4 reveals a significant association for the Implementer role with the Prototyping value ($p = 0.026$; Tau = -0.216). This suggests that implementers are less likely to value this technique. On the other hand, Requirements Analysts show a positive trend, although marginally significant ($p = 0.084$; Tau = 0.237), indicating a higher valuation of this technique.

5. Discussion

5.1. Demographic Data

The respondent profile is predominantly male, in the age range of 36 to 45 years. The male predominance may reflect a historical pattern in the Information Technology field, where men have traditionally occupied most positions. Despite efforts to increase diversity, female representation is still lower in many parts of the world. The age range of 36 to 45 years may indicate a significant presence of professionals with established experience. This result could lead to discussions about workplace diversity, as well as gender and age.

The high frequency of the "Implementer" role may indicate that the organization is focused on technical execution and software development. This suggests that the organization places emphasis on the technical delivery

Tab. 4 – Relationship between use of techniques and other variables of interest.

Variable	Use techniques Yes	No	P-value	Groups**
How many years have you been with the company?				
Less than 1 year	30	33	0.0393*	-
More than 10 years	31	71		-
Age range				
18-25	5	7	0.0132*	ab
26-35	18	12		b
36-45	18	39		ab
46-55	8	31		a
Over 55	12	16		ab
Has more than one role in the company?				
Yes	63	16	<0.0001*	-
No	42	45		-

of solutions, with a workforce concentrated on "making things happen."

The high incidence of Requirements Analysts may point to a concern with the elicitation and definition of requirements. This is a positive sign of maturity in software development processes, as it indicates attention to the early stages of the system life cycle, when requirements are gathered, analyzed, and validated. The relevance of requirements analysts may signify that the organization recognizes the importance of understanding the client's problem.

5.2. Use of HCD Techniques

Table 2 shows the design techniques adopted by the participants. The analysis of some aspects is as follows:

High adoption of design techniques (63.25%). An adoption rate above 60% indicates that the techniques are relevant and applicable to the participants' work.

Prototyping as a highlight (59.64%). The use of prototyping as the most applied technique is a positive indicator, as it allows for the quick visualization and testing of solutions, reducing risks in development and improving the quality of deliveries as pointed out by Bjarnason et al. (2021).

User Testing (34.34%). Although less used by participants than other techniques, user testing is a relevant technique for validating designed solutions based on real feedback. Its adoption demonstrates that participants are also concerned with the end-user experience. These findings are consistent with the studies by Kusuma et al. (2023). However, the significant difference between the use of prototyping (59.64%) and user testing (34.34%) may indicate barriers to implementing user testing. Possible reasons could include: (i) difficulty in accessing representative users; (ii) additional costs and resources required to organize tests; (iii) lack of familiarity or confidence in the technique as listed in the challenges of the work by Kusuma et al. (2023).

Moderately used techniques. Results placing Persona Creation (32.53%), User Journey (28.92%), and Design Thinking (16.27%) at a moderate level suggest some reflections on their application. Some participants are applying the Persona Creation and User Journey techniques, indicating recognition of their value, but the percentages suggest that not all projects or teams see them as essential. Their application might be viewed as relevant only in specific contexts. The even lower adoption of Design Thinking suggests difficulties in its incorporation into daily work. These techniques may be seen as time-consuming or complex, especially in contexts with tight deadlines and lean teams. There may be a misalignment with the reality of the projects, which requires adaptations to make them more relevant, as proposed by Pereira and Marczak (2020).

Less used techniques. The fact that the least used techniques are UX Writing (6.63%) and Plain Language (12.65%) may indicate challenges in their application. These techniques have a qualitative impact (improved communication, greater clarity for users), which may make it harder to prioritize them compared to techniques with a more direct impact, such as prototyping. Below is the analysis of some of these challenges:

- **Limited familiarity with the techniques.** These techniques may be less known to the participants, making their application in daily work more difficult.
- **Perception of relevance.** Participants may not perceive the relevance of these techniques for their activities and may be unaware of the results they can yield.
- **Lack of resources.** Implementing these practices may require cultural or organizational changes, such as greater collaboration between teams or process adaptations.

5.3. Perception of Value of HCD Techniques

The percentages presented for the value attributed to the techniques reflect the different impressions participants have about their importance. The main points are as follows:

High Perception of Value for Prototyping and User Testing. Prototyping (76.70%) is the technique with the highest perceived value, indicating that participants recognize the effectiveness of visualizing and testing solutions before implementation as addressed by Keshk et al. (2022). This result aligns with its high adoption rate (59.64%), reinforcing the connection between perceived value and actual use. The perception of value is also high for User Testing (68.13%), suggesting that participants recognize its impact. Despite this, its practical adoption (34.34%) is lower, implying that there may be barriers to its implementation.

Intermediate Perception of Value for Persona Creation and User Journey. The perception of value for Persona Creation (26.32%) may indicate that participants struggle to directly link personas to project outcomes. Some may view it as a theoretical exercise. The User Journey (49.46%) is rated higher than Persona Creation. This could be because mapping the journey provides more visible insights into touchpoints and opportunities for improvement.

Low Perception of Value for UX Writing and Plain Language. The values attributed to UX Writing (21.43%) and Plain Language (29.73%) suggest that participants may not fully understand the importance of these techniques in creating clear and effective communication.

5.4. Use of HCD Techniques According to the Role in the Team

Regarding the use of HCD techniques based on the role within the team, there is high adoption among Requirements Analysts, Function Point Estimators, and Managers. However, there is low adoption among Implementers. Below is an analysis of the results:

High Adoption Among Requirements Analysts, Function Point Estimators, and Managers

- Requirements Analysts (2x more likely). Since these professionals are directly involved in the elicitation, definition, and documentation of requirements, it is natural for them to see more value and applicability in design techniques, especially those focused on the user, such as prototyping, persona creation, and user journey. This suggests that the techniques align well with the responsibilities of those in this role.
- Function Point Estimators (3.239x more likely). This group is often involved in measurements that assess complexity and development effort. Design techniques can be seen as useful tools for refining requirements, making estimates more accurate. The high adoption rate may indicate that these professionals recognize the impact of these techniques on scope definition and reducing ambiguity.
- Managers (2.987x more likely). Managers tend to value tools that help align expectations with stakeholders, reduce risks, and improve value delivery.

Low Adoption Among Implementers (61.4% less likely)

- Distance from the design process. Implementers may feel less connected to the design process or view these techniques as outside their main responsibilities. This could reflect a traditional division between design and implementation, where implementers are more focused on technical execution.
- Lack of visibility of the impact. These professionals may not perceive how design techniques can directly benefit their work.
- The data highlights that design techniques are more widely used by those directly involved in defining requirements or managing projects, while those focused on implementation tend to underuse them.

5.5. Factors Influencing the Application or Use of Technique Results

Table 4 provides insights into the factors influencing the adoption of design techniques. The analysis is divided into three main perspectives: age group, role accumulation, and years with the company.

1. Greater Adoption in the 26 to 35 Age Group

- Possible correlation with experience and flexibility. Individuals in this age group may be at the beginning or peak of their careers, where: (i) they are more exposed to new trends, practices, and work methodologies, and (ii) they demonstrate a greater willingness to experiment and apply innovative techniques.
- Recent academic training. This generation may have had more exposure to design techniques during their education, making them more familiar with them.

2. Greater Use of Techniques by Those Playing Multiple Roles

- Holistic view of the project. Individuals with multiple roles have a broader understanding of the processes and needs of the project, which facilitates the adoption of techniques that connect different areas.
- Need for adaptation. The multiplicity of functions requires these professionals to seek more efficient solutions.
- Autonomy and decision-making. These professionals likely have more responsibilities within the project, motivating them to adopt tools that can generate better results.

3. Lower Use of Techniques Among Individuals with More Than 10 Years in the Company This presents an interesting contrast with the previous results. We suggest some possibilities for this difference:

- Resistance to change. Professionals with more years in the company may be more accustomed to established practices, showing resistance to adopting new approaches. This may include the perception that the proposed changes are unnecessary in relation to what already works well.
- Less exposure to recent training. Individuals with more time in the organization may have had less access to recent training that emphasizes these techniques.

5.6. Factors Influencing the Perception of Value of the Techniques

The result that implementers are less likely to value the technique and that requirements analysts show a positive trend may indicate:

Differences in Responsibilities and Focus of Roles. Implementers are more focused on the technical execution of solutions and code implementation rather than delving into user-centered design practices or early planning stages. Since these techniques are applied during the initial phases of the development cycle, implementers may view them as less relevant to their work.

Role of Requirements Analysts. Requirements analysts play a key role in translating user needs into technical requirements. This makes design techniques directly applicable to their work. Design techniques help better understand user requirements, aligning well with their responsibilities. This alignment tends to promote the appreciation of these techniques. The "marginally significant" trend may suggest that, while they recognize the benefits, the adoption of these techniques might not be as robust. Other more traditional approaches may still be perceived as sufficient or more practical.

These results indicate that, while requirements analysts recognize the utility of design techniques, implementers may need more convincing regarding the importance of these techniques in the development cycle. Thus, the findings of this research are consistent with the related works previously discussed, reaffirming the relevance of HCD techniques in supporting Agile Requirements Engineering. However, this study advances the field by deepening the analysis of how these techniques are used and perceived, specifically considering the role taken by each team member within the projects. Furthermore, it contributes by discussing the factors that influence this usage and the perceived value attributed to the techniques, framing these analyses within the specific context of governmental projects. It is therefore expected that the results presented here can support both theoretical reflection and practical application in similar environments, broadening the understanding of HCD implementation in complex and challenging organizational contexts.

6. Conclusion

The research revealed significant adoption of Human-Centered Design (HCD) techniques in the organization analyzed, demonstrating that these methods are considered relevant and applicable to the participants' work and can bring substantial improvements to digital government initiatives. Among the techniques, prototyping emerged as the most widely used, reinforcing its effectiveness. User testing also shows good usage, although there may be barriers to its broader implementation.

Techniques such as Persona Creation, User Journey Mapping, and Design Thinking showed moderate usage, while techniques like UX Writing and Plain Language had low application, indicating opportunities for greater dissemination and training in these areas. The perception of the techniques' value was aligned with their frequency of use, highlighting a direct relationship between practical application and recognition of benefits.

The analysis also revealed that the adoption of techniques varies depending on the roles played within the team. Requirements Analysts, Function Point Estimators, and Managers demonstrated high adoption, while Implementers showed lower application, likely due to differences in responsibilities and focus. In addition, factors such as age, role accumulation, and time in the company influence the application of the techniques.

In summary, the results reinforce the importance of expanding HCD training, particularly for groups with lower adoption and promoting underutilized techniques to maximize benefits in the Agile Requirements Engineering process. Aligning responsibilities, demonstrating how each role within the team can benefit from HCD techniques, fostering a collaborative environment, and reinforcing how these practices contribute to the entire development cycle can encourage broader adoption.

In future work, we propose to conduct focus groups to deepen the discussions based on the responses obtained from the questionnaire, allowing for a more comprehensive understanding of the investigated aspects. The composition of these groups should consider the diversity of participants—in terms of roles, experiences, and organizational contexts—to ensure multiple perspectives on the topics addressed. Additionally, we intend to further explore the specificities of agile methodology adoption, emphasizing the analysis of the integration between HCD practices and agile principles in governmental projects.

Abstract. Metaverse technologies are rapidly emerging and providing innovative opportunities to both the public and private sectors. Despite technological progress, governments worldwide face challenges in keeping pace, resulting in a misalignment of technological capability and governance mechanisms. This research aims to assess the differences in European Union and United States metaverse governance approaches, focusing on how broader digital governance models are being extended into immersive technology domains. This assessment utilizes a qualitative exploratory document analysis and two expert interviews to identify the key governance mechanisms and thematic orientations shaping early policy responses. Despite actions that both the EU and the US are taking to establish metaverse governance models, explicit regulation of immersive technologies remains limited. However, both have existing strategies, regulations, and legislation on related technology topics, such as AI and data privacy, which are expected to directly and indirectly impact the development and management of the metaverse. Drawing on an existing geopolitical technology governance assessment model as a framework, this research upholds existing assertions that the European Union values risk management and user protections in its digital governance and regulation. In contrast, the United States takes two other approaches: the Silicon Valley techno-solutionist approach and the Washington D.C. business-focused laissez-faire approach. These broader digital governance cultures are reflected in how each actor is beginning to position itself with regard to immersive technologies.

Keywords. Metaverse, virtual worlds, tech governance, digital governance, regulation

1 Introduction

The development of metaverse technology by the private sector for entertainment purposes is featured frequently in the news. As Uzun (2023, p. 231) asserts, the metaverse is "*the next step in the evolution of the Internet,*" transitioning the Internet into a robust, three-dimensional immersive experience. Nonetheless, through public-private partnerships, the public sector is increasingly using metaverse and hybrid technologies for the public good in new ways that experts could not have fathomed.

However, technological solutions are not a silver bullet to public issues. Also described as "*the next internet battleground*" (Anderson & Rainie, 2022, p. 5), the metaverse offers an unprecedented opportunity for both the public and private sectors, but major risks threaten to introduce or perpetuate a whole host of ethical concerns if not governed appropriately. Threats found in both the physical and digital realms also extend to the metaverse (Qamar et al., 2023), and users have reported experiencing hate crimes, sexual assault, cyber and financial crime, and privacy abuse (Gómez-Quintero et al., 2024). Because of often ambiguous and insubstantial governance measures on both micro (platform) and macro (government) scales, offending users may perceive a positive cost-benefit, with risk and effort needed relatively low and potential rewards high (Gómez-Quintero et al., 2024). INTERPOL (2024) has also highlighted that the agile and digital nature of the metaverse provides perpetrators with the ability to leave the crime scene seamlessly and without leaving evidence behind, as they would in the analog world. The metaverse also raises questions and concerns around the collection and use of personal identifiable information and data privacy issues (Congressional Research Service, 2022), increased surveillance under the guise of accountability (Di Porto & Foà, 2023), ambiguity around data ownership and intellectual property, disparities in implementation across regions and demographics (Congressional Research Service, 2022), and rising levels of crime in general.

Thus, the rise of the metaverse as a converged digital-physical environment invites new questions about governance across virtual spaces that are technically interconnected, but socially and legally diverse. While the developments are often driven by the private sector, governments (even as potential eventual users) experience difficulty in acting promptly enough to address evolving opportunities and threats. For example, with jurisdictions across the world diverging in their treatment of data protection, platform accountability, and virtual assets, the metaverse may risk becoming a fragmented legal landscape unless universal principles or interoperable standards are established. As is true with other emerging innovations, the technology behind the metaverse is developing more rapidly than governments can regulate (Uzun, 2023).

Overall, understanding how different governments approach metaverse governance is crucial, as legal and regulatory frameworks will shape the rights, risks, and responsibilities of users, developers, and platforms in these virtual spaces. Admittedly, the present-day global metaverse governance landscape varies. For example, South Korea has enacted the world's first metaverse-specific law while simultaneously introducing non-binding ethical guidelines to guide industry development (Ministry of Science and ICT, 2024). The United Arab Emirates promotes a principle-based, innovation-friendly approach through its Dubai Metaverse Strategy and Responsible Metaverse Self-Governance Framework (United Arab Emirates, 2023), while China integrates metaverse identity into its broader surveillance and digital governance infrastructure (Hung, 2022).

Furthermore, regulation may often overcorrect in other regards, as seen in the European Union's (EU) risk aversion and the United States' (US) overemphasis on techno-solutionism and private sector prioritization. Despite the EU and US' shared democratic values and structure, and close historic and strategic partnership, the two governments take opposite-side-of-the-spectrum approaches, which makes them prime for comparative analysis.

Given the relatively nascent state of research on the metaverse and its usage in the public sector, this paper explores emerging metaverse technologies and potential use cases and opportunities for the public sector, thus establishing incentives for government regulation. Exploring these governance models not only reveals regulatory gaps, but also deeper tensions in the interplay between innovation, control, and fundamental rights in a rapidly evolving digital world.

The study will then build on these assessments to answer the following research question:

How do the EU's risk-averse regulatory orientation and the US's techno-solutionist and industry-friendly stance shape their respective approaches to metaverse governance?

In the research that follows, we present overviews of the related research, introducing metaverse technologies and their associated characteristics. The article then outlines areas of opportunity for public sector use of the metaverse and identifies the values present in EU and US digital governance models. Following this, we explain our research design by providing a description of our qualitative analysis approach and then offer a landscape of metaverse and related governance mechanisms. Finally, we present the findings of our comparative analysis, rooted in the predetermined values and geopolitical governance framework.

2 An Overview of Metaverse Governance

2.1 Interpreting the metaverse and virtual worlds

The metaverse is a multifaceted and evolving socio-technical system (Dwivedi et al., 2022). There are no uniform definitions of the terms *metaverse* and *virtual world,* and while some experts use them interchangeably, others argue for a differentiation between the terms. Generally, *virtual worlds* are nascent and developing, while the *metaverse* is used to describe virtual worlds that have fully matured (Di Porto & Foà, 2023). The European Union also favors the term *virtual world* in its strategy documents (European Parliamentary Research Service, 2023), although language on the topic is subject to change by source.

Broadly, the metaverse can be examined through a lens of four dimensions: as an environment, an interface, an interaction space, and as a social value holder (Dwivedi et al., 2022). These dimensions might range from highly immersive, realistic simulations to abstract, rule-defying virtual worlds, and from more basic sensory interfaces to identity-rich spaces for collaboration (Dwivedi et al., 2022). Overall, despite the varying terminology used, the technical characteristics that define metaverses and virtual worlds tend to stay consistent among experts. Research conducted by Gómez-Quintero et al. (2024) consulted 27 specialists with knowledge in metaverse and other digital crime. Consistent attributes proposed by the stakeholders included *"multiuser, multipurpose, user-generated, spatial, immersive, persistent, multiplatform, interoperable, and involve ownership and avatars"* (Gómez-Quintero et al., 2024, p. 3). Other experts from this group consulted have put forward the following attributes—scalable, synchronicity, open, decentralized, heterogenous, virtual-physical hybridity live, and hyper spatiotemporal—although these are more subject to vary. In 2023, the World Economic Forum built onto pre-established definitions by introducing the concept of interoperability as a requisite for the metaverse. However, this idea is not supported without exception, as the United States government views interoperability as an eventual characteristic of more mature, future metaverse technologies (Di Porto & Foà, 2023). For clarity's sake, this research will exclusively use the term *metaverse* to refer to metaverse and virtual world technologies, as appropriate.

The metaverse is further supported by a combination of extended reality (ER), augmented reality (AR), and virtual reality (VR) technologies (Uzun, 2023), and an amalgamation of other technologies such as artificial intelligence (AI), Internet of Things (IoT), 5G, and distributed ledger (e.g., blockchain, non-fungible tokens (NFT), and decentralized autonomous organizations (DAOs)) to facilitate actions such as commerce and interpersonal communication within the metaverse (European Parliamentary Research Service, 2023). As technology capabilities advance, experts anticipate that the use of the metaverse will become more ubiquitous in the coming years, shifting from users primarily accessing the metaverse using specialty virtual reality and augmented reality devices to using daily personal devices like laptops and smartphones (Gómez-Quintero et al., 2024).

2.2 Opportunities for the public sector

Digital transformation is an ongoing process for many public sector organizations across the world, with common objectives such as increasing public value through improved efficiency, transparency, and security of public services and internal administration.

Public sector interest in the metaverse accelerated during the COVID-19 pandemic and has sustained since (Mailangkay, 2024). For example, some early speculations of VR-based public services have been captured in the United Nation's 2022 biannual e-government survey (Lnenicka, 2024).

Furthermore, public organizations are discussing leveraging the metaverse technologies to enrich digital service delivery in areas where immersive, interactive, or spatial experiences can add value (Lnenicka, 2024), such as the fields of healthcare, education, manufacturing, and defense (European Parliamentary Research Service, 2023). For example, in a healthcare-oriented metaverse, doctors can virtually train for medical procedures and patients can obtain care from medical professionals remotely. Students can learn virtually and engage in a more "traditional" academic setting, such as a virtual classroom, rather than over a video call platform as popularized during the COVID-19 pandemic. In addition, businesses and militaries can create tools like digital twins within the metaverse to enhance and streamline design and manufacturing practices (European Commission, 2023a).

Additionally, governments worldwide have a vested interest in leveraging these opportunities to deliver services more efficiently and equally to residents and citizens who may not have had access to or interest in traditional, analog methods. For instance, Tuvalu—a small island nation facing significant threats from climate change and rising sea levels—uses the metaverse to address real-world challenges to serve its people. Experts predict that Tuvalu could be submerged by 2050, leaving the country uninhabitable (Yeo, 2024). To respond to this threat, the Tuvaluan government announced the Future Now Project, which aims to create the world's first digital completely digital nation. The project will feature digital twins of the islands that citizens can navigate, digitized administrative

documents and data, and virtual archives where citizens can interact with culturally meaningful traditions such as family stories and traditional dances (Yeo, 2024). Tuvalu's government is also seeking digital statehood recognition from other governments, which would establish a path to sovereignty (Accenture, n.d.). Current international law requires a clearly defined territory and permanent population for state sovereignty, but Tuvalu may lose both in the coming decades. Due to the slow-moving and reactionary nature of international law, Tuvalu is not able to rely on existing legal standards alone and instead is using metaverse technology to imagine a new version of statehood, when traditional options fall short (Yeo, 2024).

In addition, the Maldives, Sweden, Estonia, and other countries have embraced metaverse technologies, at one point maintaining embassies with limited functions in Second Life, a popular online virtual world platform from the mid-2000s. Moreover, the micronations of Principality of Sealand and the Dominion of Melchizedek have both been built on blockchain technology (Rothe et al., 2024). Furthermore, in 2021, the city of Seoul pledged to invest 3.9 billion won (approximately 2.5 million euros) to develop a new metaverse platform called "Metaverse Seoul." This platform would allow citizens to file civil complaints, receive consultation from civil servants, and take part in Korean cultural experiences such as festivals and memorials (Seoul Metropolitan Government, 2021), all innovative channels for increased citizen engagement and civic participation.

On the one hand, the metaverse can support new forms of interaction between citizens and public authorities, offering opportunities for more engaging, human-centered interfaces within digital government systems (Lnenicka 2024). On the other, to ensure that metaverse technologies are being governed appropriately to serve the public, a number of factors must be deliberated. These include the role and responsibility of platform moderators and managers (Gómez-Quintero et al., 2024); the future of digital identity and personhood, especially in the context of online accountability (Gómez-Quintero et al., 2024); ethical considerations (Lnenicka, 2024); user privacy, choice, and autonomy (Arbanas et al., 2023); and "protection by default" and "trust by design" principles (Arbanas et al., 2023).

2.3 Governance value interplay

Governance in the metaverse unfolds across multiple, layered dimensions that reflect both its technological architecture and social complexity (Dwivedi et al., 2022). As such, any successful metaverse governance will need to strike an appropriate balance between protecting user rights and encouraging innovation. The metaverse brings together diverse virtual spaces with varying rules, users, and values. As such, issues of interoperability, privacy, accountability, and cross-border regulation emerge with urgency (Dwivedi et al., 2022).

Furthermore, early research suggests that governance in the metaverse is not only about regulating a new technology (governance-of-metaverse) but also about reimagining how societies might operate when rules are embedded in code, space is borderless, and identities are fluid (governance-by-metaverse) (Dwivedi et al., 2022).

The governance landscape is further complicated by the presence of decentralized technologies such as non-fungible tokens (NFTs) and decentralized autonomous organizations (DAOs), which offer new models of ownership and collective rulemaking, yet also challenge traditional legal and institutional frameworks (Dwivedi et al., 2022).

One theory that defines the interplay between values, priorities, geopolitics, and state autonomy is the Four Internets model by researchers O'Hara and Hall (2018). This model uses the lenses of digital sovereignty and fragmentation to identify and assess rationales behind the digital governance models of the European Union and the United States. O'Hara and Hall's Four Internets include Brussels' Bourgeois Internet, Silicon Valley's Open Internet, DC's Commercial Internet, and Beijing's Authoritarian Internet, each with their own set of defining goals and approaches. Brussels' internet is characterized by its user-centric focus aimed at defending *"civilized bourgeois public space[s] against incivility, taking action, for example, against disruptors"* (O'Hara and Hall, 2018, p. 6). Silicon Valley's internet, in contrast, is innovation-focused, identifying technology as a potential (and often likely) solution to any problem users may face. Washington, DC follows a model that prioritizes the financial and commercial benefits of technological development, rewarding close relationships between Big Tech and politics. Finally, the Chinese model prioritizes state ownership and assertive growth into international digital spaces.

The EU and US models will be further expanded on in the discussion section, but in the meantime, they provide helpful framing on the interconnected relationship between a model's history (such as the creation of the EU or the birth of the Internet), government values (including risk mitigation, innovation, commercialization, and state autonomy), and regulatory mechanisms (a centralized versus fragmented approach).

3 Research Methods

3.1 Data collection

To conduct this research on metaverse governance, we used a combination of primary and secondary data content analysis.

Primary data came from the industry stakeholders with extensive experience in digital policy—particularly through Transatlantic and larger geopolitical lenses—and proven expertise on metaverse emerging technologies. A purposive sampling technique was applied to identify relevant interview partners. Potential participants were selected through web searches and personal networks, based on their engagement with metaverse-related topics and governance issues. Where contact information was available, individuals were invited to participate via email, with an explanation of the research objectives and interview purpose. Two positive responses were received, and interviews were conducted with participants actively involved in the field.

The overview of interview partners is presented below:

Tab. 1 – Experts overview

Expert	Role	Industry	Expertise	Application to metaverse
A	Data and privacy policy manager	Tech	AI policy and regulation European politics and technology	Data privacy, content moderation, and platform accountability
B	Senior policy analyst	Research	Geopolitics and governance of emerging technologies, e g. digital public infrastructure	AI governance, international digital policy, strategic regulation

The semi-structured interviews followed an interview guide, focusing on the state of digital regulation in the EU and US, as well as the opportunities and threats of each government's approach. The aim was to elicit detailed, expert-level insights into the contextual factors influencing how metaverse governance develops in the two contexts. The interviews helped inform larger thinking about the characteristic differences between broad digital governance approaches of the European Union and the United States, using artificial intelligence and digital public infrastructure (DPI) as grounding points. Both AI and DPI are two key emerging technologies that are fundamentally integrated into the metaverse, so the speakers' insights were valuable in reinforcing broader learnings from the literature review. The purpose the interviews served was general framing of the geopolitical and political aspects of each government's approach.

Secondary sources—such as academic articles, government reports and policy papers, and consulting reports—were reviewed to establish a general idea of the current state of regulation and governance. The type of sources available did vary. They were identified through purposive browsing of relevant institutional websites (e.g., European Commission, US federal agencies), professional platforms, and keyword searches using terms such as metaverse regulation, immersive technology governance, and digital policy. This engagement with secondary materials helped identify dominant framings, gaps, and conceptual tensions in current public discourse.

Because the United States does not currently have federal regulation explicitly addressing the metaverse (nor a streamlined digital policy framework comparable to the European Union), academic literature on the US approach to metaverse governance remains limited. As a result, we leaned heavily on gray literature for this part of the research, using sources from well-established international consulting firms and articles and reports from the US and EU governments.

3.2 Data analysis

Relevant and related metaverse governance mechanisms (including strategies, regulations, legislation, consultations and convenings, and initiatives) were identified during interviews and documents analysis as part of a data collection mapping exercise and were then grouped by the type of governance lever. These mechanisms covered a wide range of policy areas, from data privacy and user protection to artificial intelligence funding and virtual reality development, all of which are likely to shape the inner workings of the metaverse.

Because of the complex nature of the metaverse, the regulatory ecosystem will likely consist of interconnecting mechanisms and tools to sufficiently address new challenges, necessitating a broad look at specific and related levers. This approach enabled a flexible analysis of how existing digital governance measures, often not explicitly labelled as "metaverse governance," may nonetheless inform the emerging policy landscape in this domain.

4 Findings

European and American concepts of the metaverse share similar qualities, such as those featured first in 2022 policy papers in the European Union and the United States. Collectively, these definitions focus less on the characteristics and qualities of digital worlds and more on the differentiation between digital and physical worlds (Di Porto & Foà, 2023). The European Parliamentary Research Service described them as "*an immersive and constant virtual 3D world where people interact by means of an avatar to carry out a wide range of activities. Such activities can range from leisure and gaming to professional and commercial interactions, financial transactions or even health interventions such as surgery"* (European Parliamentary Research Service, 2022, p. 1). The US Congressional Research Center introduced the metaverse as "*an immersive and persistent virtual world where users can communicate and interact with other users and the surrounding environment and engage in social activities, similar to interactions in the physical world"* (Congressional Research Service, 2022, p. 3). Despite the similarities in conceptualization, each government takes a distinctly unique approach to addressing the metaverse and related emerging technologies.

4.1 European Union landscape

The European Union is relatively advanced in its metaverse governance approach—as demonstrated by its Strategy on Web 4.0 and Virtual Worlds framework released in 2023—and invests significant funding into developing associated technologies. In fact, more than half of European organizations working on metaverse-related projects receive funding from the EU (Joint Research Centre, 2023). In addition to the framework and funding opportunities, the EU has enacted a number of well-established regulations—such as the General Data Protection Regulation, Digital Services Act, and Digital Markets Act—that guide the development and management of digital spaces in the European Union and beyond.

One significant challenge the EU is expected to face in its regulatory efforts is the complicated dynamic introduced by its multi-state government model. *"For European policymakers, one challenge is of jurisdiction – of how to regulate a new infrastructure of global computing. This reflects broader concerns with regulation, where many countries are now considering the efficacy of domestic regulations in dealing with multi-national firms"* (Egliston et al., 2024, p. 14).

An overview of the metaverse governance landscape in the European Union is presented below. Organized and grouped by type of mechanism, the list includes metaverse and related strategies, regulations, legislation, consultations and convenings, and initiatives. Despite the actions the European Union is taking (to be outlined momentarily) to establish a framework strategy of governance for metaverse technologies, neither the EU nor the US have fully developed and executed a governance plan. However, both governments have existing regulations and legislation on related topics, which are expected to have a significant impact on the development and management of the metaverse. The following section will outline US governance mechanisms in the same format.

Strategy

- **Strategy on Web 4.0 and Virtual worlds** addresses the rapid development of digital and hybrid technologies—including metaverse technologies—and ensures they promote real-world European values and principles (European Commission, 2023b).

- **2030 Digital Decade Plan** provides a comprehensive framework for EU digital action on the following: "*a digitally skilled population and highly skilled digital professionals, secure and sustainable digital infrastructures, digital transformation of businesses, digitalization of public services*" (European Commission, 2024b).

Regulation

- **General Data Protection Regulation** imposes data privacy and security requirements on digital entities and platforms that collect data from Europeans. This is considered the most robust and strict data protection law in the world (Wolford, n.d.), but may not cover invasive forms of future data collection in the metaverse (Garcia, 2023).

- **Digital Services Act** & **Digital Markets Act** establish a comprehensive accountability system for internet

providers that protects the fundamental rights of users and enforces accountability for online platforms in Europe and ultimately abroad (European Commission, 2023b). However, experts are currently unclear how the protections will transfer to the metaverse (Di Porto & Foà, 2023).

- **Digital Identity Framework** sets out to provide Europeans with a digital wallet feature that facilitates digital payments and identity verification (European Commission, 2024b), both of which are key functions in the metaverse.

Legislation

- **Artificial Intelligence Act** addresses the risk that AI poses, sets guidelines on specific use for developers and deployers, and reduces financial and management burdens for smaller businesses (European Commission, 2024a).

- **Data Act** delegates the Commission to encourage interoperability of data spaces and data processing services and supports horizontal interoperability between companies of all sizes (Di Porto & Foà, 2023).

Consultation and convening

- **Citizens' Panel on Virtual Months** discusses recommendations for the Commission on implementing virtual world work based on citizens' values and expectations on topics such as work and job markets, digital identity in virtual worlds, and connectivity and access (European Commission, n.d.).

- **European Virtual and Augmented Reality (VR/AR) Industrial Coalition** convenes policymakers and industry experts to identify opportunities and challenges, inform policymaking, and encourage investment (European Parliamentary Research Service, 2023).

Initiative

- **Digital twin programs,** including **CitiVerse, Destination Earth (DestinE), Local Digital Twins for Smart Communities,** and **European Digital Twin of the Ocean,** create immersive, accurate environments to facilitate scientific research and medicine, urban planning and management, and policymaking (European Commission, 2023c).

4.2 United States landscape

In comparison to the EU, the US takes a lax regulatory approach to digital policy (Expert A). In general, federal frameworks are industry-specific, regulating the finance and healthcare sectors, while state jurisdictions are responsible for upholding broader consumer protection rules (Arbanas et al., 2023). Because the United States lacks mechanisms such as a federal data protection agency or a federal metaverse privacy law (Deloitte, n.d.), states are left to fill in the regulatory gaps with jurisdictional action, as demonstrated with California's legislation below. This jurisdictional approach creates a piecemeal and fragmented data regulation and enforcement ecosystem (Deloitte, n.d.) and few governance levers to pull. Misaligned actions also exist at the federal level; it is possible (and common) for the administration, Senate, and House of Representatives to have differing and opposing goals. Given the deeply integrated nature of metaverse technologies, platforms, and issues, the US' traditional fragmented approach limits which, and how many, governance levers the country can pull. Policies that are in place encourage innovation, limit private sector liability, and allocate funding for metaverse-related technology projects.

Strategy

- **Executive Order on Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence** establishes standards for AI safety, security, and privacy—while outlining user civil rights and commercial protections—and promotes innovation and domestic and international competition (White House, 2023). This, however, may not create lasting change because it is not binding, and priorities will change with the Trump administration (Expert A).

Legislation

- **Section 230 of the Communications Decency Act** grants online platforms the ability to moderate user content without being held legally liable, which contributed to the growth of the internet during its infancy (Deloitte, n.d.), although Section 230 is currently contested in the US and platform immunity may change

(Arbanas et al., 2023).

- **California's AB 587** requires social networks to publish content moderation policies and provide descriptions of their processes for flagging and reporting problematic content like hate speech, racism, extremism, dis- and misinformation, harassment, and political interference (Arbanas et al., 2023).

- **CHIPS and Science Act** authorizes funding to support research and development of key advanced communications technology and immersive technology (Congressional Research Service, 2022).

Consultation and convening

- **Congressional Caucus on Virtual, Augmented, and Mixed Reality Technologies** leads Congress' action on metaverse-related technologies. Established in 2017, the Caucus appears to be currently inactive (Garcia, 2023).

Initiative

- **Declaration for the Future of the Internet** asserts and recommits to international goals for the future of the internet, including openness, digital freedom, interoperability, and decentralization (Congressional Research Service, 2022).

5 Discussion

This study examined how two influential actors—the European Union and the United States—are beginning to govern the metaverse through broader digital policy mechanisms. While explicit metaverse regulation remains scarce, early signals in both jurisdictions reveal key differences in institutional logic, regulatory style, and governance priorities. These differences stem not only from legal structures (e.g., centralized vs. decentralized governance) but also from contrasting views on risk, innovation, and the role of the state in shaping emerging digital environments.

To meaningfully compare the two approaches, we focus on two dimensions observed across interview and document data: (1) whose interests are prioritized, and (2) how risk and innovation are framed in relation to immersive technologies. While both regions acknowledge the metaverse as a potential growth area, their governance trajectories reflect deeper normative and structural differences. In what follows, we discuss how these orientations influence emerging governance mechanisms, such as strategic positioning, regulatory design, and stakeholder engagement, and consider what they might mean for future public sector involvement in immersive technology governance.

5.1 Risk aversion

By outlining the EU's focus on long-term risk management and mitigation—ultimately for better user outcomes—Expert A reinforced the arguments O'Hara and Hall (2018) made in their Four Internets model assessment of the European Union's digital regulation approach. Again, the Brussels Bourgeois Internet values virtue, prudence, and civility. Because these objectives are long-term and not dependent on the whims of whichever major company is developing metaverse technology, the EU benefits from stronger political stability than the United States does. As Expert A explained, "*the fundamentals of that are almost similar in every situation: you look at privacy, you look at platform accountability. The EU is ahead, not necessarily because they're better at it, it's just because their processes matter more. The politics of it can at most postpone things, but it's done within a process of 'this is the policy that matters and we're going to push it through.'*" As demonstrated in the findings above, the European Union has a relatively robust and stable metaverse governance approach, including metaverse- and virtual world-specific strategies and other adjacent strategies and regulations.

5.2 Techno-solutionism

In direct contrast to the EU's approach of prioritizing policy over politics, the US takes a politics-first approach to governance. Rather than placing users at the center of governance decisions, the dominance of technology firms (specifically Big Tech) is emphasized above all else (Expert B). This view of techno-solutionism aligns with O'Hara and Hall's (2018) vision of the Silicon Valley Open Internet governance model. This digital model encourages technology providers to innovate fervently in a move fast and break things style, with the end goal of achieving public good through technology. Such emphasis leaves risk management conversations to develop organically, often as a second thought and to the detriment of users' wellbeing. In comparison, the United States' governance landscape is more limited, with existing related legislation and levers focused on private sector innovation and financial success.

5.3 Private sector focus

Additionally, Expert B argued that business culture in the United States—coupled with the country's standard light touch and laissez-faire regulatory approach—has greatly influenced innovation, as seen during the inception and growth of the early internet. Big Tech wields immense influence in the US through its lobbying efforts and close political relationships in Washington, DC, and O'Hara and Hall (2018) further advance this idea in their DC Commercial Internet model, which discusses the mutually beneficial (financial and political) relationship between Big Tech and Republican politicians. This focus on private good—rather than public good as in the Silicon Valley model—is likely to intensify as Republicans take control of the Presidency, Senate, and House of Representatives in early 2025. However, as Expert A pointed out, discussions around values and goals may have a limited impact in reality. "*Fundamentally, that [values and goals] doesn't matter, because there are limited levers that can be pulled in the United States within a very fragmented and very unresponsive set of actions."*

6 Conclusions

This research focused on exploring the landscape of metaverse opportunity and regulation in the US and EU—two strong players in the global technology arena—to establish the necessity for robust governance. This research has found inherent and fundamental differences between each government's digital models and priorities, which impact their metaverse governance perspectives. The United States values innovation and business opportunity, often overlooking user rights and protections, while the European Union prioritizes the user, often at the expense of stifling innovation. In short, the distinction can be summed up as "freedom to" versus "freedom from" (O'Hara & Hall, 2018). The EU also takes a centralized approach to governance and regulation, as compared to the US' decentralized and fragmented regulatory approach, resulting from the country's focus on state autonomy and ultimately reducing the number of regulatory mechanisms the federal government can use.

Both the European Union and the United States have new administrations and key legislation that will shape priorities over the next several years, with the European Union welcoming a new Commission in 2024, and a new party in the White House in 2025. Moreover, the European Union's Artificial Intelligence Act came into effect in 2024, and its impact will be felt across the artificial intelligence and related technology sectors. Given this evolving landscape and the rapid pace of technological development and the potential for public sector use of the metaverse for the public good, further research into the topic of metaverse governance is welcomed. For example, future studies can extend the findings of this paper onto broader geopolitical contexts for a more holistic overview of various approaches to metaverse governance. It is also relevant for future research in exploring how national governance frameworks shape the experience and agency of users in the metaverse.

6.1 Limitations

It is worth noting some of the limitations of this research, particularly the uncertainty surrounding the risks and benefits of the metaverse and related technologies, such as artificial intelligence. Experts worldwide are divided on the future of the metaverse (Anderson & Rainie, 2022, p. 6). Two main predictions on potential popularity and maturity emerge: one faction foresees a rise in the use of augmented- and mixed-reality technologies, though not to the immersive extent of full-scale metaverse technologies. The other argues that *"these new worlds could dramatically magnify every human trait and tendency – both the bad and the good."* Because of this ambiguity, existing research is limited and the future is unclear.

Another limitation of this research is potential bias, as both experts interviewed have professional experience at liberal institutions. This may color their perspectives on the political and geopolitical aspects of this conversation, as liberals generally tend to favor regulation, while conservatives often favor a laissez-faire and business-driven approach.

Ultimately, our findings are intended to provide preliminary insights, rather than broad generalizations. They provide an insightful lens on how metaverse regulation is addressed differently across the world and would only benefit from additional research in other regulatory contexts, like China, India, or middle-power governments, in the future.

Track 21: Dialogues about Latin America (Portuguese, Spanish and English track)

Track Description

The track aimed to explore the rich and complex context of the Latin American Digital Government. Latin America has a significant cultural and linguistic diversity, ranging from densely populated urban centers to rural areas. Some of the region's characteristics include urban populations, developing economies, and deep inequalities in access to services, including digital technologies. Digital infrastructure is a challenge from big cities' peripheries to remote areas, which affects the region's digital economy and public service delivery. However, Latin America has experienced rapid growth in digital government, a promising market for tech and govtech startups, presenting opportunities for digitalization. Many Latin American countries have invested in digital government strategies and adopted emerging technologies like AI and 5G. These initiatives aim to increase transparency, facilitate citizen engagement, and drive economic development while facing diverse and complex challenges, such as addressing digital exclusion, ensuring personal data privacy, and improving government interoperability and cybersecurity.

Resumo. Cada vez mais as iniciativas de cidades e regiões inteligentes vem sendo pensadas a fim de conferir mais qualidade de vida para os cidadãos. A governança do espaço urbano é um elemento primordial ao desenvolvimento e gestão de cidades e regiões que almejam se tornarem inteligentes. Nas regiões de fronteira, que apresentam dinâmicas distintas das demais regiões dos países, desenvolver cidades e tornar regiões de fronteira inteligentes pode ser possível através da atuação conjunta dos governos subnacionais e da comunidade por meio da composição de uma governança binacional. Esse estudo de caso único teve por objetivo entender a motivação e o processo de criação de uma região de fronteira inteligente (RFI) no contexto latino-americano através da análise das iniciativas e resultados de uma rede formal de governança binacional localizada na fronteira Brasil-Argentina. Foram entrevistados 23 atores da governança e analisados diversos documentos. A motivação para criar uma governança binacional está relacionada a articulação e instrumentalização das ações de desenvolvimento planejadas em conjunto para a região de fronteira. As ações e iniciativas envolvem infraestrutura, inovação, segurança, tecnologia, educação, empreendedorismo e turismo. Com um considerável histórico de ações de desenvolvimento, a região estudada teve avanços em alguns projetos e ações, porém, foi só com a presença de uma governança binacional que muitas das ações planejadas puderam começar, de fato, a sair do papel. As ações de articulação se mostram indispensáveis para operacionalizar as iniciativas planejadas. O capital social e as redes que a governança movimenta são motrizes para a realização das ações e projetos inteligentes.

Palavras-chave. Região de fronteira inteligente, Governança, Desenvolvimento regional, América Latina, Iniciativas, Resultados

1. Introdução

As iniciativas de cidades inteligentes (CI) podem conter diferentes características e serem desenvolvidos por meio de diferentes dinâmicas quais sejam de colaboração, tecnologia e governança (Lousada & Valentim, 2011). As decisões sobre as iniciativas de CI, seja em cidades ou territórios, também estão sujeitas às questões legais, institucionais, político-geográficas e econômicas. Nos países da América Latina e em muitos dos países em desenvolvimento, as cidades localizadas em regiões de fronteira, por exemplo, são comumente desamparadas por políticas públicas concisas por parte de ambos os países (Oddone, Vázquez, & Oro, 2018). Não raro, os territórios de fronteira são planificados conforme as agendas e anseios do Estado central sem considerar as necessidades e especificidades de uma região de fronteira. Contudo, de alguns anos para cá, a fronteira passou a receber um olhar mais sensivel a ser também pensada e transformada pelos povos que a habitam (gestões subnacionais e ações de paradiplomacia) (Sant'Anna, 2013). Porém, ainda existem uma tendências à centralização; o diálogo sobre desenvolvimento regional e integração entre países limítrofes ainda acaba acontecendo, de maneira institucional, somente em capitais e em órgãos vinculados às relações internacionais como embaixadas e organizações intergovernamentais.

Mais recentemente, no campo da geopolítica e das fronteiras, surgiram linhas de pesquisa que investigam infraestruturas e projetos de integração entre os países (Rascovan, 2020). Estes estudos se baseiam em uma vasta história de integração regional, facilitação de fronteiras, comércio internacional e infraestruturas. Algumas iniciativas têm pensado as regiões de fronteira para além de campos referentes à segurança e à defesa. Na América Latina, geralmente os governos de localidades de faixa de fronteira vivenciam dificuldades com questões técnico-científicas e escassez de recursos porém, estes têm excelentes oportunidades de aprimorar várias questões em virtude de sua proximidade com os cidadãos e melhor conhecimento do território (Oddone *et al*., 2018). Mesmo na ausência de tratados, acordos e regramentos internacionais, a realidade das cidades fronteiriças, principalmente as conurbadas, é marcada pela integração econômica e cultural. As cidades conurbadas são aquelas cidades de fronteira cujo limite territorial geralmente é marcado somente por uma rua (Sandes, 2020). As regiões fronteiriças são espaços de propagação e de reunião de distintas identidades (Albuquerque, 2020). Nessas localidades, muitas vezes as pessoas residem em um país, mas trabalham em outro, por exemplo e, a população realiza compras conforme a cotação das moedas, optando por comprar em seu país ou no país vizinho. Existem relações sociais, afetivas e familiares, caracterizadas como binacionais e, se convive simultaneamente com duas moedas, dois idiomas e por vezes dois fusos horários (quando um país adota horário de verão e o outro não).

A governança é vista como uma das mais importantes dimensões das cidades inteligentes (Pereira, *et al*. 2017). A existência de governanças urbanas que estabeleçam objetivos comuns em favor da comunidade a partir das necessidades locais (Peters & Pierre, 2012) e governanças binacionais ou transfronteiriças (Oddone et al., 2018) onde instituições e governos subnacionais de dois ou mais países podem atuar de forma integrada pode ser a forma de fazer com que o desenvolvimento aconteça. Neste sentido, este estudo teve como objetivo entender a motivação e o processo de criação de uma região de fronteira inteligente (RFI) no contexto latino-americano através da análise das iniciativas e resultados de uma rede formal de governança binacional localizada na fronteira Brasil-Argentina.

Reconhecendo que o atual modelo de urbanização é insustentável (UN HABITAT, 2016), as principais respostas para esse problema estão na melhor gestão de recursos, na redução de resíduos e no melhor acesso às tecnologias digitais (ITU & UNECE, 2016). Nesta linha, o conceito de CIs desempenha um papel de destaque (Albino, Berardi, & Dangelico, 2015) por estar associado a inciativas mais enxutas em governos (Angelidou, 2014) porém, os arranjos de regiões inteligentes e regiões de fronteira inteligentes ainda não são muito explorados, por essa razão, é importante que sejam estudados. Observar as CI e as RFIs e seus processos é necessário pois, muitas das motivações para a adoção das iniciativas de CI objetivam a melhoria da qualidade de vida dos cidadãos e a redução das desigualdades(Caragliu & Del Bo, 2019).

Entre os países signatários do Mercado Comum do Sul (Mercosul), as fronteiras entre Argentina, Brasil e Uruguai são percebidas como as mais dinâmicas da América do Sul (Campos, 2017) o que traz oportunidades significativas de desenvolvimento de regiões de fronteira inteligentes. Os estudos que tratam sobre a governança em CI e que vão além do uso da tecnologia para soluções de governo, ainda são pouco expressivos uma vez que ainda são poucas as pesquisas que olham para o entendimento das relações políticas e estratégias desse novo modo de governar a cidade (Ruhlandt, 2018). Também, na América do Sul, ainda são poucas as iniciativas de governança transfronteiriça (Oddone & Vázquez, Oro, 2018).

2. Cidades e Regiões de Fronteira Inteligentes

As CI também são definidas como territórios com alta capacidade de aprendizagem e inovação, onde incorpora-se a criatividade de sua população, as instituições geradoras de conhecimento e infraestrutura digital de comunicação e gestão do conhecimento (Komninos, 2011). Algumas das publicações sobre o tema defendem fortemente o uso de tecnologias da informação e comunicação (TIC) no planejamento de CIs e definem o conceito de cidade inteligente com base nesse aspecto (Angelidou, 2014). O conceito de CI também é empregado abrangendo a gestão do conhecimento e as comunidades e regiões inteligentes (Batty *et al*., 2012; Deakin & Al Waer, 2011).

Conforme os estudos de Kourtit e Nijkamp (2012) as dimensões de CI estão vinculadas ao Capital humano (com a força de trabalho qualificada da cidade); ao Capital de infraestrutura (com as facilidades da alta tecnologia); ao Capital social (com intensas e abertas ligações de *network)* e, *ao* Capital empreendedor (envolvendo criatividade e atividades comerciais de alto risco). Ao estudar as conexões entre os *stakeholders* envolvidos nos projetos de CI, bem como suas orientações, objetivos e tendências, Giffinger *et al.* (2007) listaram e descreveram os elementos que compõem as dimensões.Cada uma das dimensões de CI são compostas por características e fatores que juntos norteiam as cidades sobre que temas e ações devem priorizar para as desenvolver. A Tabela 1 apresenta os principais elementos de cada dimensão de CI.

Tab. 1 – Características e Fatores de uma Cidade Inteligente

ECONOMIA INTELIGENTE (Competitividade)	**CIDADÃO INTELIGENTE (Capital Social e Humano)**
Espírito inovador	Nível de qualificação
Empreendedorismo	Afinidade com a aprendizagem ao longo da vida

As iniciativas de CI são consideradas um dos caminhos para dar melhores respostas às questões urbanas, ampliar a oferta de políticas públicas e fortalecer a democracia (Echebarria, Barrutia, & Aguado-Moralejo, 2020; Moolngearn & Kraiwanit, 2024; Vanolo, 2018). Neste sentido, as estratégias de CI geralmente focam em bairros e conglomerados geográficos escolhidos pelos decisores (Komninos, 2011). Entretanto, o campo das iniciativas de CI pode transpor os limites das cidades e da iniciativa pública. As iniciativas de CI podem envolver regiões e, contextos "multi-jurisdicionais" (Nam & Pardo, p.190, 2011). Muitos projetos de CI podem ser "intergovernamentais, interorganizacionais ou intraorganizacionais" onde as atividades de interação "podem ser de partilha, comunicação ou integração" (Nam & Pardo, p.190, 2011). Já existem territórios e ou regiões que adotam soluções de CI em várias de suas cidades de forma simultânea e estratégica.

A lógica das regiões inteligentes e das regiões de fronteira inteligentes (RFI) deve ser basicamente mesma das CI: promover desenvolvimento e gerar qualidade de vida para as pessoas que vivem no território indo além do conceito de limite geográfico do país. Cidades localizadas em regiões de fronteira que adotam soluções de CI o fazem de maneira a realizar cooperação internacional e gerar mais inteligência para ambos os países (Soe, 2018). A tecnologia vem sendo usada como ferramenta para oensar a inteligencia das regiões (Krimmer, et al., 2021). Já existem alguns exemplos de regiões de fronteira inteligentes como as cidades de Helsinki e Tallin que trabalham de forma conjunta são cidades do norte da Europa com alta frequência de deslocamento e que agora têm um novo modelo para serviços digitais conjuntos pensando-as como cidades transfronteiriças, o chamado Sistema Operacional Urbano (Soe, 2018).

Além de projetos individuais de CI e das regiões inteligentes, algumas cidades também participam de redes de CI onde, em diferentes aspectos, as melhores práticas são compartilhadas entre seus membros (Palomo-Navarro & Navío-Marco, 2018). Neste sentido, amplia-se o alcance dos objetivos das iniciativas de CI por meio do intercâmbio de experiências. Os governos locais podem obter diferentes benefícios pela participação na rede, adquirindo sinergia e eficiência nas operações além de poder replicar casos de sucesso, conseguir financiamento de projetos internacionais ou mesmo criar planos a nível nacional para as CIs (Palomo-Navarro & Navío-Marco, 2018).

Há, porém, que se levar com cautela algumas questões relacionadas às fronteiras inteligentes. Ao pensar somente em alta eficácia e eficiência usando TICs na forma de sistemas de monitoramento, por exemplo, sem pensar em questões culturais do território de fronteira, corre-se o risco de reforçar uma dinâmica de exclusão de algumas populações (Delgado, 2020). Pois, através de tecnologia se pode monitorar ilegalidades, o que é positivo, mas também diferenciar fluxos de pessoas e bens considerados inapropriados ou indesejados, interferindo nas dinâmicas das regiões de fronteira, ricas em intercâmbios, expressões culturais e sociais (Benedetti, 2014; Sandes, 2020). Gerir as fronteiras é fazer a gestão de locais, circulação de pessoas, mercadorias, transportes, fluxos migratórios e comércio e entre outros (Benedetti, 2011). Porém, embora permita maior volume de informações, capital, melhora de processos e gestão (Delgado, 2020) é preciso trabalhar a paradiplomacia com critério a fim de que a RFI possa ser inovadora mas também, socialmente justa e inclusiva.

3. Procedimentos metodológicos

Essa pesquisa adotou caráter qualitativo e exploratório-descritivo e foi desenvolvida por meio de um estudo de caso único (Yin, 2014). O caso estudado foi a governança binacional de uma região rural de fronteira localizada

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

entre o Brasil e a Argentina e que tem aplicado iniciativas de CI. O caso se intitula La Frontera (LF) e está composto em uma região que busca se tornar uma RFI. A escolha pelo caso deu-se porque a região é uma fronteira seca, característica geopolítica que potencializa implementar ações de integração. As cidades da região já vinham trabalhando em prol do desenvolvimento do território a partir de iniciativas isoladas e passou a atuar em conjunto. Essa região tem a particularidade de que no lado brasileiro há cidades de dois estados (Santa Catarina-SC e Paraná-PR) que fazem divisa com as cidades argentinas da província de Missiones (MS).

A fim de realizar triangulação de dados (Gibbs, 2009), foram coletados dados primários e secundários. As técnicas de coleta de dados empregadas na pesquisa foram entrevistas narrativas (em profundidade) e análise de documentos. Os dados da pesquisa foram coletados no mesmo período, compreendido entre agosto e dezembro de 2020, de forma a contemplar o recorte temporal da ocasião do processo de formação da governança binacional assim como a atuação da governança na criação de iniciativas inteligentes.

Na ocasião da realização da pesquisa o LF contava com 34 membros entre brasileiros e argentinos. Nessa pesquisa, foram realizadas 23 entrevistas com os atores da governança do LF sendo 5 no idioma espanhol e 18 no idioma português. Cabe ressaltar que os cinco entrevistados argentinos totalizam todos os atores argentinos atuantes na governança no momento da coleta de dados. Foi elaborado e entregue um Termo de Consentimento Livre Esclarecido (TCLE) para cada um dos entrevistados bem como, um Termo de Autorização de Uso de Nome para a direção do LF. Foram entrevistados todos os atores que coordenam os eixos temáticos do LF (7) e outros 16 membros da governança que desempenham diferentes papéis (Tabela 2). Para preservar o anonimato dos entrevistados os mesmos estão relacioandos de E1 a E23.

Tab. 2 – Relação dos entrevistados

Em seguida da execução das entrevistas, foi feita a transcrição das entrevistas e a tradução das entrevistas dos atores argentinos do LF que foram realizadas no idioma espanhol. A seleção dos atores entrevistados se deu à partir da análise de documentos do LF e por bola de neve (Patton, 1990) conforme as indicações dos entrevistados. A saturação foi observada a partir da 20ª entrevista. A Tabela 3 mostra a relação dos documentos analisados por essa pesquisa conforme data e motivação. Ao longo do texto os documentos são identificados de D1 a D8.

Fonte: dados da pesquisa

Os dados coletados foram analisados por meio da técnica de Análise do Conteúdo Categorial. A análise do conteúdo foi feita conforme orientações de Bardin (2016), onde, inicialmente as entrevistas foram transcritas para que todos os dados estivessem em modo de texto, após, as falas dos atores entrevistados e os textos dos documentos foram associadas à significados, ou seja; codificados de uma forma sistemática. As categorias analisadas foram: motivação, histórico, resultados e iniciativas. As entrevistas e documentos foram codificados com a utilização do programa Nvivo12© versão pra Windows. A partir da transcrição das entrevistas, e, análise dos documentos selecionados, foi possível relacionar sistematicamente as falas das entrevistas com os documentos; os classificando em itens e fazendo a associação dos achados com a fundamentação teórica relacionada às CI e RFI.

4. Análises e discussões

O caso estudado chamado projeto La Frontera (LF) se trata de uma Governança Binacional instituída no ano de 2019. O LF funciona através da atuação de atores dos setores público e privado de três cidades da Província de MS na Argentina e nove cidades brasileiras sendo uma localizada no estado de SC e oito cidades do PR. A governança busca operacionalizar a integração e desenvolvimento da região através de ações voltadas para as áreas de economia, migração, educação, inovação e turismo. Com a escolha desse caso, percebe-se que as dimensões de CI quais sejam governança, economia e viver inteligente são contempladas pela iniciativa. Existe certa trajetória de ações de desenvolvimento e iniciativas de CI em cidades da região. Os entrevistados relataram quais são essas iniciativas e a Tabela 4 mostra a quantidade de vezes em que o tema foi abordado nas entrevistas.

Fonte: Dados da pesquisa

Conforme os relatos dos entrevistados e os documentos analisados, os primeiros esforços para a integração binacional e desenvolvimento regional se deram através da realização de Fóruns Locais de Desenvolvimento e com trabalhos e projetos realizados em parceria com o Sebrae (agência brasileira de desenvolvimento econômico) (D3). Na década de 1990, um prefeito de um dos municípios criou a primeira incubadora empresarial da região (E23). Na mesma época, os atores locais fizeram contato com uma *trainee* do Sebrae (que atualmente está na gestão regional do Sebrae Paraná), que passou a acompanhar atividades voltadas para ao empreendedorismo e desenvolvimento regional (E23 e E10). Apesar de que, quando as ações de integração e desenvolvimento da região iniciaram, o Sebrae não tivesse escritórios na região (E10) foi feita uma parceria entre Sebrae , prefeituras e micro e pequenas empresas (MPE's) criando várias ações e programas ao longo dos anos. Com base nas análises dos documentos e das falas dos entrevistados foi possível mapear as as iniciativas de desenvolvimento que antecederam o LF (D3):

- **EMPREENDEDORISMO E GESTÃO**: iniciativa de 1997 e funciona na atualidade realizando atendimento nas cidades de Capanema-PR, Santo Antônio do Sudoeste-PR e Realeza-PR;
- **1º PROGRAMA LÍDER**: primeira edição do Programa Líder Sebrae na região, ocorrida no período compreendido entre 2008 e 2009 sendo um projeto de formação de líderes que objetivava mobilizar, integrar e capacitar lideranças para elaboração de planos conjuntos de desenvolvimento regional;
- **CONSÓRCIO INTERMUNICIPAL DA FRONTEIRA (CIF):** criado em 2009 e funcionando até os dias de hoje. Surge, entre outros esforços, da 1ª edição do Programa Líder. O Programa consiste em um consórcio criado no ano de 2009 e que atualmente funciona como associação pública, de direito público dos municípios de Barracão-PR, Bom Jesus do Sul-PR, Dionísio Cerqueira-SC e a cidade de Bernardo de Irigoyen-MS da Argentina como parceira informal pois a legislação brasileira não contempla a participação de cidades estrangeiras em consórcios intermunicipais. O CIF foi motivado pela revitalização da região cuja meta principal foi promover o desenvolvimento regional (D3);
- **PRÓ-FRONTEIRA**: projeto de mobilização desenvolvido de 2010 a 2012 para abertura das aduanas vocacionais entre o Brasil e a Argentina;
- **AMBIENTE DE NEGÓCIOS DO SEBRAE**: projeto cidade empreendedora criado em 2017 (e atual) que ocorre em oito dos quatorze municípios que compõem o território brasileiro (divisão do Sebrae) – foi implementando a partir de lei geral e com a criação de Salas do Empreendedor (D3);
- **FRONTEIRAS COOPERATIVAS**: projeto de desenvolvimento de ações conjuntas entre Brasil e Argentina que funcionou de 2013 a 2018. Intuía tornar a região de fronteira uma referência em desenvolvimento, através de ações de cooperação internacional, empreendedorismo, cidadania, integração produtiva e negócios. Focou o desenvolvimento de competências de relacionamento junto a lideranças que atuaram de forma integradas com iniciativas locais a fim de construir estratégias e planejar as cidades integradamente e sinergicamente. Seu objetivo principal era melhorar o ambiente transfronteiriço para as MPE's e o empreendedorismo, visando gerar e aproveitar oportunidades de cooperação para o desenvolvimento econômico integrado das cidades gêmeas;
- **COMITÊ DAS MICRO E PEQUENAS EMPRESAS:** criado em 2017 e ainda em funcionamento, implantando temas que contribuam para a melhoria do ambiente de negócios (compras, crédito, inovação, aduanas vocacionadas e educação) das MPE's;
- **ESCRITÓRIO DE ARTICULAÇÃO DO SEBRAE NA FRONTEIRA:** criado em 2019, um escritório que pretende concretizar a integração da fronteira, através de promoção, mobilização, qualificação, atendimento de lideranças e empresários, com ênfase no estabelecimento de ambiente favorável a atuação das MPE's;
- **PROGRAMA LÍDER FRONTEIRA:** realizado entre os anos de 2018/2019 foi a terceira edição de formação do Programa realizada pelo SEBRAE na região. Teve como objetivo a composição de uma governança para articular as ações de desenvolvimento do território. Nesta ocasião, o programa Fronteiras Cooperativas fez parceria com o SEBRAE para capacitação de lideranças locais, brasileiras e argentinas, que ao final do período do programa originou como entregável o LF e o Fronteiras Cooperativas foi descontinuado. A partir do final do ano de 2019 surge o LF.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Com esses processos de desenvolvimento regional em curso e com a questão geográfica a região tornou-se foco interessante para o desenvolvimento de uma agenda econômica e política. Neste sentido, o Programa Líder Sebrae voltado a reconhecer e desenvolver lideranças para o desenvolvimento regional foi realizado para identificar e treinar líderes locais para atuar com desenvolvimento regional. A nível nacional, nas palavras do Sebrae esse projeto foi criado para "responder a carência de uma atuação integrada entre as lideranças do poder público, entidades privadas e do terceiro setor para a promoção de desenvolvimento sustentável dos territórios brasileiros" (Sebrae, 2021). Através do programa, o Sebrae esperava sensibilizar lideranças e fomentar a organização e qualificação de atores para a construção e implementação de agendas de desenvolvimento econômico para todo o território. Neste sentido, a terceira edição do Programa Líder foi a primeira em que atores argentinos participaram. Destaca-se que para atuar no países vizinho, o Sebrae recebeu aval do Itamaraty e de embaixada argentina (E10). O Programa Líder vem sendo realizado em outras regiões brasileiras (Sebrae, 2021), mas até o momento o único projeto binacional foi o desenvolvido nessa região (E10, E15).

A articulação prévia da governança culminou em alguns ganhos políticos. E12 coloca: "nós conseguimos também transformar, ser reconhecido pelo Ministério da Fazenda, Dionísio Cerqueira, Barracão e Santo Antônio de Sudoeste, como cidades gêmeas" (E12). Este é visto como um passo importante no caminho rumo à constreução de uma RFI. As cidades apresentavam as características de cidades gêmeas (Benedetti, 2014) e o reconhecimento de Santo Antônio do Sudoeste-PR, Barracão-PR Dionísio Cerqueira-SC como cidades gêmeas com cidades argentinas se deu por meio da Portaria Nº 213, de 19 de Julho de 2016 do Ministério da Integração Nacional que estabeleceu no Brasil o conceito, os critérios e a listagem de todas as cidades brasileiras (Brasil, 2016).

Cada uma das edições do Programa Líder acabou originando uma iniciativa de desenvolvimento para a região e contribuindo para que o LF fosse criado. A E10 fala que já no ano de 2013 começava-se a ouvir falar do conceito de cidades inteligentes (Caragliu & Del Bo, 2019) e da integração em cidades gêmeas (Benedetti, 2014) porém ainda não se tinha uma visão da possibilidade de construir uma região de fronteira inteligente ainda mais em uma região rural. A visão de uma RFI foi sendo construída com o passar dos anos e com a constatação de que o desenvolvimento seria mais efetivo se ocorresse de forma binacional (Soe, 2018, Krimmer et al., 2021).

Em maio de 2019, antes da criação do LF ainda em formação do Líder, os atores elaboraram um documento intitulado Carta de Motivação Território de Fronteira. Abaixo, o trecho da Carta de Motivação apresenta informações sobre as expectativas da criação do LF:

> *"O Projeto Líder Fronteiras Cooperativas teve um papel fundamental na identificação dos atores desse processo, de forma a permitir ações, no sentido de suprir de informações referentes à transferência de tecnologias, investimentos financeiros e internacionalização dos negócios, permitindo fazer parte do processo de desenvolvimento da região na qual as organizações estão inseridas. Esse projeto de desenvolvimento estruturante está associado ao processo de acumulação da inovação e da formação do capital social. O território está cada vez mais sendo considerado como uma estrutura ativa (de desenvolvimento, de sustentabilidade e de capital social). Temos líderes que fazem acontecer o progresso através do pertencimento do território, protagonismo e orgulho de ser da Fronteira"* (D3).

Esse documento demonstra que elementos presentes no conceito de CI como inovação (Mills et al., 2024) e capital social (Fletcher, 2020) estão presentes na motivação para a criação do LF. Outro elemento percebido como motivador foi o de que não existia um sentimento de identidade fronteiriça. . Destaca-se o fato de que as cidades da faixa de fronteira são codependentes (Sandes, 2020) e portanto, precisam umas das outras para se desenvolverem, principalmente por questões de infraestrutura e de economia. Durante o programa Líder, os atores da atual governança perceberam que para viabilizar as iniciativas de CI e as ações planejadas a nível de território, precisavam constituir uma governança que fosse binacional. Constata-se que a composição da governança bonacional foi uma espécie de entregável da formação do Sebrae e que passou a atuar no ano de 2019. O LF então se associa às iniciativas anteriores e compõe a Governança Binacional com CIF e Fronteiras Corporativas.

Outra iniciativa que leva a região rumo a se desenvolver como RFI é o **Consórcio Intermunicipal da Fronteira** (CIF) que é uma associação de direito público, um consórcio formado por quatro cidades: Dionísio Cerqueira-SC, Barracão-PR, Bom Jesus do Sul-PR e Bernardo de Irigoyen-MS. Foi criado objetivando desenvolver propostas e projetos de desenvolvimento para a região de fronteira. Desenvolve parcerias principalmente nas áreas da saúde, economia, educação e assistência social. Essa iniciativa que trouxe várias outras iniciativas para os municípios integrantes como a reforma de um hospital que antes era particular e hoje atende os três municípios brasileiros do consórcio sendo atualmente 100% SUS (E3). Se caracteriza como uma iniciativa de governança inteligente e traz elementos de governança colaborativa (Giffinger et al., 2007; Pereira, Cunha, et al., 2017) altamente estratégicos para a consolidação de uma RFI.

À partir de ações de articulações, o LF conquistou a construção do **Parque Turístico Ambiental da Integração** (PTAI), conhecido popularmente por Lago Internacional da Tri Fronteira que tem uma extensão de 3 km. É um parque classificado como uma iniciativa de Viver intelogente (Giffinger et al., 2007), localizado na divisa entre Bernardo de Irigoyen-MS e Dionísio Cerqueira-SC cuja área que também compreende o rio Peperi-guaçú que antes era degradada, com pontos alagados, usada como depósito irregular de lixo e local de passagem ilegal e descaminho

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

foi recuperada de forma conjunta entre Brasil e Argentina e hoje é um espaço integração, prática de esportes, lazer, atividades recreativas, culturais, gastronômicas e comerciais para os cidadãos argentinos e brasileiros. O parque ambiental recebeu o investimento de mais de 10 milhões, recursos oriundos do Governo Federal do Brasil e da província de MS, do PR e de SC, além de recursos do município de Dionísio Cerqueira. A Figura 1 mostra o PTAI.

Fig. 1 – Parque Turístico Ambiental da Integração (PTAI)

Fonte: (D3) Dados da pesquisa (2021)

O **Gabinete de Gestão Integrada-Intermunicipal** – GGI-I é uma iniciativa que faz o monitoramento da fronteira e o tráfego de veículos por meio de câmeras de monitoramento na faixa de fronteira. Se caracteriza como outra iniciativa no escopo da Governança Inteligente e que contribui para a RFI (Pereira, et al., 2017; Pereira, Parycek, et al., 2018). Trabalha em parceria com as prefeituras e com o CIF e tem órgãos trabalhando de forma integrada na Argentina e no Brasil, como as polícias civil e militar, a Receita Federal e o exército dos dois países:

"O GGI, da segurança pública, trabalha a integração das forças policiais né, em um território, um local, um Estado e nós trabalhamos toda essa questão do GGI, da união, toda a força policial de Barracão, de Dionísio, de Bom Jesus e Bernardo de Irigoyen. Isso acaba envolvendo as polícias civis, militares, dos dois Estados, a polícia federal, de Dionísio, a Receita Federal e toda a força policial da Argentina, policial federal da Argentina, o exército. Então nós temos esse, esse gabinete, já há muito tempo que ele é fomentado pelo CIF, no consórcio, mas é a gente que organiza, dá toda estrutura, né, apoio inclusive a gente conseguiu muito acordo, a gente conseguiu equipamentos com a receita federal, com a polícia a gente conseguiu canil, para instalar na polícia de Dionísio pra atender toda nossa região, e conseguimos com a Itaipu, a Itaipu bancou, deu desde animais, foi adquirido ração, o equipamento tudo. Então tudo graças ao consorcio e ao GGI, então o consorcio ele é fundamental também, no fomento dessas, dessas outras ações" (E3)

Aspecto interesante é que a cidade de Realeza-PR detém o título de Cidade Amiga do Idoso conferido pela Organização Mundial da Saúde (OMS) a cidades que pensam o envelhecimento ativo a partir de infraestrutura e serviços públicos adaptados às necessidades dos idosos (Realeza, 2021). A fim de incluir essa população e promover qualidade de vida e o viver inteligente (Giffinger et al., 2007) o município tem iniciativas como o **Clube do Vovô**, o **Vôlei Adaptado** e o **Centro Dia** (Realeza, 2021) que promovem a saúde e a participação ao assumir que um envelhecimento ativo demanda que os idosos participem da vida da cidade, da política e que sejam ouvidos, tendo seus direitos assegurados. O **Fronteira Iguassu Circuito de Cicloturismo** é uma iniciativa de Viver Inteligente (Giffinger et al., 2007) realizada pelo Fronteiras Cooperativas nos municípios de Comandante Andesito-MS, Capanema-PR e Planalto-PR. Objetiva fortalecer a prática esportiva e turística e potencializar a economia e comércio dos mais diversos setores. Além da realização do circuito, o Fronteira Cooperativas fez o mapeamento de pontos turísticos localizados ao longo dos trajetos (Planalto, 2018) para desenvolver a região com turismo de aventura. A partir daí, algumas das iniciativas que aconteciam de forma isolada e estavam concentradas nas cidades de Barracão-PR, Dionísio Cerqueira-SC, Bom Jesus do Sul-PR e Bernardo de Irigoyen-MS começam a ser ampliadas. A partir da criação do LF como uma governança binacional com definição de planejamento estratégico em três eixos temáticos (educação, economia e integração e cutltura) do LF, foram estabelecidas ações a serem desenvolvidas em praticamente todo o território de fronteira da região a fim de torná-lo mais inteligente. Mapeou-se as iniciativas de CI e de RFI desenvolvidas e classificou-as conforme as dimensões de CI propostas no *framework* de (Giffinger et al., 2007) (Tabela 5).

Tab. 5 - Iniciativas da governança binacional quando às dimensões de cidade inteligente

Iniciativa	Descrição	Dimensão

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Formação de professores gestores nas escolas públicas	Cursos para formar professores da rede pública do BR e da ARG na área da gestão escolar	Cidadão Inteligente por Nível de qualificação dos gestores das escolas
Projeto Levantamento bibliográfico sobre a história da fronteira	Projeto para fazer Levantamento bibliográfico sobre a história da fronteira, organizar em material impresso	Dimensões Viver e Cidadão inteligente por facilidades culturais, desenvolvimento de uma educação pautada na história da região
JEPP (Jovens Empreendedores Primeiros Passos)	Disseminar a cultura empreendedora e orientar para o plano de negócios	Dimensões Economia e Cidadão Inteligente por espírito inovador, habilidade de transformar, empreendedorismo, nível de qualificação
Melhoria na eficiência do Polo Aduaneiro da fronteira	Tornar a região um Polo Aduaneiro - Trabalhar politicamente para acelerar a publicação da licitação junto a RFB para privatizar a ACI Cargas de Dionísio Cerqueira. Implantar lojas francas nos três municípios da fronteira, fortalecer os apoios políticos para a abertura do Porto Seco; criar uma revista: Polo Aduaneiro – La Fronteira	Dimensão Economia inteligente por integração internacional, fomento a turismo, e visão do território de forma abrangente
App La Frontera	Mapeamento e elaboração de App de pontos turísticos, informações sobre o território e comunicação com a governança	Dimensão Economia e viver inteligente por integração internacional, fomento a turismo e economia
La Frontera Inova	Trilha com metodologia criada e executada pelo SEBRAE com conteúdo de empreendedorismo e inovação para desenvolver Startups - Aplicação nos IFES da região e universidades	Dimensão Economia inteligente por empreendedorismo e inovação
Programa La Frontera Compra Aqui	Objetiva aumentar a participação de empresas do território nas compras públicas através de três iniciativas: Divulgação de editais, parceria com as associações comerciais e capacitação de empresários locais	Dimensão Economia Inteligente por inovação, estímulo da economia local
Projeto - Passeio Costaneiro da Integração	Parque binacional que irá revitalizar área pública respeitando rio que divide Santo Antônio do Sudoeste-PR e San Antônio e onde será construído um espaço verde e cultural com "anfiteatro natural"	Dimensões Viver, Mobilidade e Ambiente Inteligente: construção verde, proteção do meio ambiente, atratividade turística, mobilidade internacional e facilidades culturais
Projeto - Paisagem e espaços públicos para a integração transfronteiriça	Elaboração dos projetos de engenharia, levantamento topográfico planimétrico	Dimensões Ambiente Inteligente: acessibilidade, atratividade turística, mobilidade internacional
Escola de Robótica - Bernardo de Irigoyen-MS	Espaço projetado para o desenvolvimento, treinamento e expansão de vocações tecnológicas, através de modelo pedagógico inovador, projetada para crianças e jovens de 5 a 18 anos, onde são realizados treinamentos em robótica e/ou programação. É pautada na Lei de Educação Disruptiva da Província de Misiones-ARG.	Dimensões Viver e Economia Inteligente por Empreendedorismo, inovação e educação para o século XXI
POLOTIC – Misiones – Campus Bernardo de Irigoyen -MS	O ICT Misiones Polo é um projeto provincial de inovação industrial que desenvolve sua primeira experiência no Parque Industrial Posadas (SAPEM). Para mudar a matriz produtiva da província voltada para as novas tecnologias, foi planejado como um espaço-chave para pensar em Missões para o futuro. O polo é baseado em diferentes bases: como um local para treinamento em programação em diferentes idiomas e níveis, testes, modelagem 3D, impressão 3D, desenvolvimento de aplicativos móveis, linguagem audiovisual, gerenciamento e construção de drones e, em breve, robótica, eletrônica aplicada e automação industrial.	Dimensões Viver e Economia Inteligente por Empreendedorismo, inovação e educação para o século XXI
Internacionalização de Startups – SEBRAE/PR	A internacionalização das Startups, tem como objetivo a abertura de novos mercados e prospecção de negócios com outros países, para as iniciativas que participam do programa STARTUP-PR. Está prevista através da interação com a Rede Ibero Americana de Incubadoras (RETEI), que	Dimensão Economia inteligente por integração internacional, inovação e empreendedorismo

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

	conta com 20 incubadoras (México, Costa Rica, El Salvador, Peru, Colômbia, Chile, Paraguai e Argentina), além de Portugal, Bélgica e Israel.	
Centro de Empreendedorismo e Inovação Binacional	Será espaço compartilhado, localizado em Bernardo de Irigoyen-MIS, que utilizará o movimento de crianças, jovens, comunidade, empresas e startups, que buscam trabalhar e desenvolver projetos de forma colaborativa, para crescer e desenvolver-se de forma mais rápida e sustentável. Será formado por: Polotic, Escola de Robótica e Programa de Internacionalização de STARTUPS SEBRAE-PR. Será binacional, atendendo brasileiros e argentinos. Uma ferramenta de intercâmbio cultural, boas práticas de gestão e ampliação de mercado, promovendo o desenvolvimento local.	Dimensões Viver e Economia Inteligente por Empreendedorismo, inovação e educação para o século XXI

Conforme os entrevistados, um dos resultados esperados quando da criação de espaços públicos de lazer como o Parque Turístico Ambiental da Integração e o *Paseo Costanero* é que estes: "ajudam na coesão social [...] o parque é um lugar de dispersão para abrir as mentes e levar à integração da sociedade, não há diferença entre ricos e pobres, ajuda a economia porque tem sempre algum lugar perto do parque [...]" (E2). A proposta do *Paseo Costanero* é ser construído respeitando o curso do rio e a arborização composta por vegetação nativa. Além das questões ambientais, e de atratividade turística, os parques podem ser uma oportunidade de fazer integração (Benedetti, 2011), de se conviver com a diversidade e de que se construa uma consciência coletiva (Coesão Social) contemplada pela dimensão Viver Inteligente (Giffinger et al., 2007). A Figura 12 mostra projeto do Projeto Paseo Costanero da Integração.

Fonte: dados da pesquisa (2021)

Os recursos para essas iniciativas de CI foram, em sua maioria, recursos públicos oriundos dos governos municipais, da província de Misiones, do governo do estado do Paraná, do governo federal, do Sebrae e do FOCEM o que coincide com o proposto por Chourabi *et al.* (2012) que diz que a maioria dos projetos de CI é fomentado e financiado direta ou indiretamente pelos governos. O Sebrae é uma agência de desenvolvimento vinculada ao Estado e o FOCEM um fundo internacional financiado por governos de países do Mercosul. Muitas dessas iniciativas que estão em status de implementação ou de articulação já eram ideias de iniciativas e projetos anteriores, mas que sem uma governança binacional não achavam maneira de serrem realizadas.

Através dessas iniciativas se pode ver materializados os conceitos de CI e de RFI. A Governança Binacional tem o desafio de coordenar os esforços necessários para articular e integrar as iniciativas e de oportunizar o desenvolvimento. Percebe-se que as iniciativas planificadas ainda estão em sua maioria no escopo das ações do Sebrae. A médio prazo seria interessante que as ações do LF extrapolassem a dimensão econômica e se utilizassem de TICs, por exemplo, para trazer um olhar mais diverso e mais social a novas iniciativas de CI e RFI. Outro ponto que ainda não é muito explorado nas ações do LF é a livre circulação dos fronteiriços. Ao pensar novas estruturas aduaneiras, por exemplo, os atores precisam atuar a fim de que todos os cidadãos possam ter os mesmos direitos na RIF.

5. Considerações Finais

Objetivando entender a motivação e o processo de criação de uma região de fronteira inteligente (RFI) no contexto latino-americano através da análise das iniciativas e resultados de uma rede formal de governança binacional localizada na fronteira Brasil-Argentina foi possível perceber que regiões de fronteira inteligentes são passíveis de serem construídas a partir de uma abordagem colaborativa e *multistakeholder*. A governança colaborativa já é abordada em inúmeros estudos sobre CI mas os estudos sobre RFI focam mais em questões de migração e menos em governança e desenvolvimento regional, especialmente em espaços urbanos em regiões rurais. A partir do estudo deste caso percebe-se que na RFI a colaboração e a integração se fazem ainda mais importantes. Indo além do modelo de governança binacional, não basta que atores de ambos os países pensem o desenvolvimento e as ações para o território, é necessário que exista uma diversidade de atores participando das decisões e da implementação das iniciativas e atuando para articular ações com outros níveis como estados, governos federais e agências internacionais de desenvolvimento.

Gerir territórios de fronteira envolve certos níveis de complexidade pois engloba a circulação de pessoas, mercadorias, transportes, fluxos migratórios, comércio internacional e entre outros. Em localidades pequenas, é mais fácil promover o desenvolvimento quando os esforços são conjuntos. Mas comunidades rurais, via de regra, estão mais afastadas dos grandes centros e podem ter menos poder político. Os governos subnacionais, as instituições da região e os cidadãos encontram em uma governança bi ou trinacional, metodologia adequada para o desenvolvimento. Na governança binacional a formulação de políticas públicas e de promoção de desenvolvimento regional e iniciativas de desenvolvimento que carecem de articulação também podem ser praticadas por meio de capital social e redes de cooperação com outros países vizinhos uma vez que necessitam de planejamento, articulação e de captação de recursos.

A respeito da transformação da fronteira em uma RFI, assume-se que o conceito de RFI deva englobar questões de melhoria de condições de infraestrutura aduaneira, migratórias e de segurança, porém deve ir além. Considera-se que uma região de fronteira só se tornará inteligente quando, em nível institucional, puder trabalhar de forma conjunta para superar ou minimizar gargalos de questões relativas às diferenças culturais, legais e estruturais, através de participação ativa da sociedade e passar a proporcionar qualidade de vida aos cidadãos de ambos os países. Além da governança inteligente ser dimensão chave para o planejamento das ações executadas em outras áreas, no caso de uma RFI, uma governança participativa, colaborativa e plural apoiará as ações necessárias à região.

Acerca das limitações da pesuisa os resultados encontrados somente são analisados a partir da ótica dos atores da governança, que são gestores, empresários e atores de instituições, mas, a visão dos cidadãos fronteiriços não foi contemplada pela investigação. Como sugestão de pesquisas futuras aponta-se a realização de pesquisas analisando as nuances da presença de iniciativas de CI na efetiva mudança social para as pessoas que vivem no território de fronteira e sobre o direto à cidade em ambos os países. Investigar se altos níveis de centralização e hierarquização mais rígida das instituições dos países podem em certa medida interferir do desenvolvimento de CI e RFI. Verificar se existe relação entre a descontinuidade ou a sucessão de múltiplos projetos de CI em uma mesma cidade ou território e seus possíveis impactos para a comunidade. Estudos que investiguem processos de gentrificação ou globalismo fechado em regiões de fronteira na América Latina que utilizem soluções de TIC em questões migratórias e possível relação entre tais fatores.

Agradecimentos

O presente trabalho foi realizado com apoio da Coordenação de Aperfeiçoamento de Pessoal de Nível Superior – Brasil (CAPES) – Código de Financiamento 001.

Resumo. O artigo é um ensaio teórico que busca apresentar um framework de análise e um quadro analítico das dimensões de cidadania no contexto da transformação digital na América Latina a partir dos diferentes projetos políticos em disputa na região. Para a construção do framework e do quadro, são utilizadas as dimensões de cidadania de status legal/associação, direitos sociais e participação. O conceito de cidadania no contexto da transformação digital é apresentado em contraposição ao conceito de cidadania digital, a partir do entendimento de que a cidadania é um processo abrangente e em constante mudança através das práticas sociais dos agentes e das instituições. A transformação digital afeta este processo permanente da cidadania permitindo o uso das tecnologias da informação e comunicação (TIC) por parte das instituições e agentes na construção destas práticas sociais. No contexto latino-americano, os projetos políticos democrático-participativo e neoliberal estabelecem uma disputa de significados de dimensões chave como status legal/associação, direitos sociais e participação. Neste contexto, as práticas sociais são orientadas por estes projetos políticos em disputa. O framework e o quadro analítico propostos neste estudo buscam contribuir para a análise da complexidade do contexto latino-americano ao estabelecerem essa relação entre o impacto das práticas sociais com uso de TIC nas dimensões da cidadania e a orientação dessas práticas pelos projetos políticos em disputa.

1. Introdução

Com o avanço da transformação digital nas relações sociais e entre Estado e sociedade, a cidadania cada vez mais vem sendo relacionada com a utilização de tecnologias da comunicação e informação (TIC), gerando o conceito de cidadania digital (Mossberger et al., 2008; Mossberger & Tolbert, 2021; Schou & Hjelholt, 2018). A perspectiva hegemônica deste conceito está baseada na relação entre Estado e sociedade intermediada através do uso de TIC (Moosberger et al., 2008; Ribble & Bailey, 2007; Robles, 2009). Nesta perspectiva, a centralidade está direcionada a observar se o cidadão possui o acesso necessário às TIC para se relacionar de forma efetiva com o Estado e acessar políticas e serviços digitais.

Este conceito hegemônico é criticado por não observar o cidadão como um sujeito político que pode estabelecer práticas de mudança da cidadania (Chen et al., 2021) e entender a cidadania como algo estático e não como um processo de participação e transformação ativa da sociedade (Benhabib, 2004; Isin, 2008). Nesta perspectiva crítica, as práticas sociais de cidadania digital são estabelecidas por um cidadão que se constitui através do uso das TIC para a reivindicação de direitos (Isin & Ruppert, 2020).

Porém, tanto a perspectiva hegemônica quanto a crítica propõem um conceito de cidadania digital e de cidadão digital que desfocam a importância do contexto histórico local e das instituições na construção da cidadania. Mesmo com a inclusão das TIC, a cidadania segue relacionada ao pertencimento a uma determinada comunidade

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

política com seu conjunto de direitos e organização legal (Rydén et al., 2024).

Neste sentido, propomos o conceito de cidadania no contexto da transformação digital como uma forma de retomar a centralidade do contexto histórico e da relação entre instituições e cidadão. Através deste conceito, a construção da cidadania é entendida a partir da relação dialética estabelecida entre as práticas sociais regulamentadas historicamente pelas instituições e influenciadas pelas ações dos agentes em um determinado contexto (Fairclough 2016; Fairclough & Fairclough, 2012).

Na América Latina, a cidadania possui uma trajetória histórica própria vinculada a confluência de múltiplos projetos políticos de disputas de significados (Dagnino, 2006). Estes múltiplos projetos afetam o significado das práticas sociais, com vieses convergentes devido à proximidade discursiva.

O contexto de transformação digital afeta diretamente essa disputa entre projetos políticos de construção de significados da cidadania, com as TIC sendo utilizadas nas práticas sociais de diferentes formas conforme o projeto. As dimensões de cidadania presentes no contexto latino-americano apresentam variação de significados dependendo do projeto político dominante e da forma como as TIC são utilizadas para estabelecer essa preponderância de poder.

Neste sentido, o objetivo deste estudo é apresentar um framework de análise das dimensões de cidadania no contexto da transformação digital na América Latina a partir dos diferentes projetos políticos em disputa na região. Partindo das dimensões de cidadania propostas por Stokke (2017) – status legal/associação, direitos sociais e participação –, o estudo busca contribuir com a discussão sobre o significado destas dimensões pelos diferentes projetos políticos e como as práticas sociais de desenvolvimento e uso de TIC são estabelecidas pelas relações dialéticas entre as instituições da estrutura social e os agentes baseados nesta disputa discursiva. A questão central que orienta essa pesquisa é: *Como a cidadania no contexto da transformação digital se constitui no cenário latino-americano?*

O artigo está estruturado na seguinte forma, além dessa introdução: na seção 02 é apresentado o conceito de cidadania no contexto da transformação digital em contraposição ao conceito de cidadania digital; na seção 03 é apresentado a cidadania no contexto latino-americano e como as TIC são utilizadas para as práticas sociais dos agentes e instituições através dos diferentes projetos políticos; a seção 04 apresenta a discussão do uso de TIC pelos diferentes projetos políticos e como eles influenciam as dimensões de cidadania e traz a proposta de framework de análise e de quadro analítico.

2. Crítica ao conceito de cidadania digital: a cidadania no contexto da transformação digital

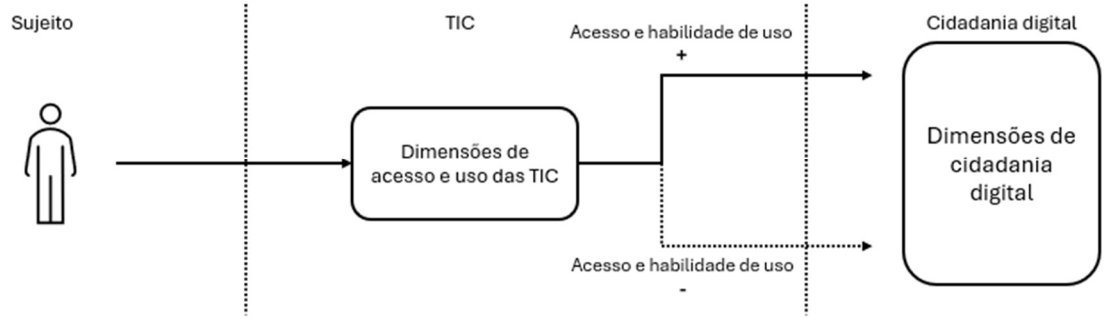
2.1 A relação entre cidadão e Estado através da lente da cidadania digital

Cidadania digital é um tema de pesquisa que vem avançando no campo acadêmico em diversas áreas do conhecimento (Chen et al., 2021; Fernández-Prados et al., 2021). Apesar deste avanço, ainda há uma amplitude conceitual e de formas de mensuração da cidadania digital a partir de diferentes campos de estudo (Chen et al., 2021).

Podemos observar, em diferentes revisões de literatura sobre o tema (Chen et al., 2021; Fernández-Prados et al., 2021), que duas visões hegemônicas de cidadania digital se aproximam conceitualmente. Na área da ciência política, Moosberger et al. (2008) conceituam a cidadania digital enquanto a capacidade do indivíduo em participar da sociedade e se relacionar com o Estado através do uso da internet. Na educação, Ribble e Bailey (2007) definem cidadania digital enquanto o uso apropriado e responsável da internet por parte do indivíduo em sua interação em sociedade e com o Estado.

Ambas as perspectivas partem de uma centralidade das TIC na construção conceitual de cidadania digital. O acesso e as condições de uso da internet são observados como determinantes de alcance das diferentes dimensões da cidadania.

Esta construção conceitual aproxima a cidadania digital de categorias próprias de mensuração da inclusão digital, como as utilizadas no conceito de digital divide (Andreasson, 2015; van Deursen & Helsper, 2015; van Deursen & van Dijk, 2014). As desigualdades digitais entre indivíduos e comunidades, seja na disponibilidade de acesso à internet ou no conhecimento necessário para utilizar as TIC, afetam o engajamento do cidadão e a capacidade de participação social online (Mossberger & Tolbert, 2021).



Partindo desta construção binária entre inclusão e exclusão digital, a proposta conceitual de cidadania digital de Mossberger et al. (2008) busca observar como o uso da internet afeta a capacidade do cidadão em acessar

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

diferentes dimensões de cidadania. Utilizando as dimensões de cidadania civil, política e social propostas por Marshall & Bottomore (2021), Mossberger et al. (2008) demonstram como a falta de utilização da internet afeta o cidadão em cada uma dessas dimensões no contexto estadunidense.

A proposta conceitual de Mossberger et. al (2008), relacionada com a de Ribble e Bailey (2007) e outras como a de Robles (2009), que entende o cidadão digital como o indivíduo que exercita seus direitos políticos e sociais através da internet, podem ser observadas a partir de um framework comum. Neste framework, a centralidade está nas TIC como forma de acesso à cidadania, como podemos observar na figura 01:

Fig. 1 - Framework comum do conceito de cidadania digital (elaborado pelos autores).

Porém, essa construção conceitual instrumental da cidadania digital não observa o cidadão como um sujeito político que age e pode estabelecer práticas sociais de mudança da realidade (Chen et al., 2021). Esta limitação acaba deixando o conceito aberto à crítica por não conseguir abarcar aspectos das modificações ocorridas através da transformação digital em dimensões da cidadania em determinado contexto histórico e geográfico.

Um destes aspectos passíveis de crítica no conceito de cidadania digital está na presunção da existência de um cidadão digital e de uma cidadania digital dada, o que levaria a existência de uma não cidadania formada por aqueles que estão excluídos da sociedade digital (Rydén et al., 2024). Apesar do impacto das TIC na cidadania devido à transformação digital, a cidadania ainda é fixada nas relações offline do cidadão (Rydén et al., 2024), que se relaciona com o ambiente online, mas não é definida por ele como pretende este conceito de cidadania digital.

Outro aspecto passível de crítica no conceito hegemônico de cidadania digital está no entendimento da cidadania como algo a ser alcançado através do uso das TIC. Este conceito se baseia na definição clássica da cidadania como um conjunto de direitos e deveres estáticos (Isin, 2008), e não como um processo de participação e transformação ativa da sociedade onde indivíduos e grupos lutam em busca de reconhecimento (Benhabib, 2004; Isin, 2008).

Neste conceito de cidadania digital, o cidadão se apresenta como um recipiente de direitos e obrigações a partir do uso da internet (Isin & Ruppert, 2020). O que falta nesta construção conceitual é a figura do cidadão enquanto um sujeito constituído historicamente que se utiliza da internet para reivindicar seus direitos (Isin & Ruppert, 2020).

Ao focalizar a capacidade de acesso do indivíduo à cidadania através da tecnologia, a perspectiva hegemônica de cidadania digital acaba por relegar a segundo plano a capacidade do indivíduo e de movimentos organizados em utilizar a tecnologia não para acessar uma determinada realidade, mas sim transformá-la. A cidadania é um processo em constante construção, sendo as TIC mais um fator que influencia esta construção em um contexto de transformação digital.

Uma perspectiva de contraposição a este conceito hegemônico de cidadania digital parte desta crítica para propor o foco no cidadão digital enquanto agente central no processo de construção da cidadania (Isin & Ruppert, 2020). As dimensões de cidadania deixam de ser algo estático a ser alcançado através das TIC para se tornarem processos dinâmicos influenciados pelo agir do cidadão.

2.2 O processo de construção da cidadania digital

Entender a cidadania e o cidadão digital não deve se resumir apenas à habilidade de se relacionar em sociedade ou com o Estado através da internet (Isin & Ruppert, 2020). A formação da cidadania e do cidadão é um processo histórico e geográfico complexo, em que as TIC se constituem em um novo elemento que possui o potencial de alterar esse processo, mas não de determiná-lo (Isin & Ruppert, 2020).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

A questão é que o acesso e participação em dimensões da cidadania baseada no uso de TIC não estabelece necessariamente uma nova forma de cidadania e um novo cidadão, mas afeta a já existente (Schou, 2018). As dimensões da cidadania são afetadas, mas não criadas, através da nova forma de participação política com o uso de TIC (Schou, 2018).

Se entendemos a construção da cidadania e do cidadão enquanto um processo político e social e não apenas como o uso da internet para acessar direitos já estabelecidos, a questão se torna qual perspectiva utilizar para observar este processo. Neste sentido, duas perspectivas podem ser utilizadas para esta análise: a primeira estabelece o foco na construção do cidadão enquanto sujeito que reivindica direitos através do uso de TIC (Asenbaum, 2019; Isin & Ruppert, 2020) e a segunda foca na relação de construção da cidadania enquanto um processo dialético estabelecidas entre agentes e instituições através de práticas sociais com o uso de TIC (Fairclough, 2016; Fairclough & Fairclough, 2012).

A perspectiva focada na construção do cidadão digital analisa como este se constitui em uma nova figura política (Isin & Ruppert, 2020; Schou, 2018). E esta constituição ocorre através das práticas adotadas pelo cidadão em uma interconexão entre o espaço offline e online (Isin & Ruppert, 2020).

As TIC influenciam na redefinição deste cidadão ao alterar suas interações políticas (Asenbaum, 2019). Nesta perspectiva, a cidadania digital é um processo que se conforma através da intersubjetividade do cidadão em espaços online e offline (Asenbaum, 2019).

No entanto, há aspectos que a perspectiva focada na construção do cidadão digital não contempla. O processo histórico de formação da cidadania conforma não apenas o cidadão, mas também instituições com capacidade de regulamentar práticas sociais e afetar a agência do cidadão. Estas instituições devem ser entendidas em seu contexto histórico e geográfico e as práticas sociais que elas regulam estão diretamente relacionadas a este contexto.

Neste sentido, adotamos uma perspectiva focada na relação entre o cidadão e as instituições e as práticas sociais que eles estabelecem entre si como o aspecto central na formação da cidadania (Fairclough, 2016; Fairclough & Fairclough, 2012). Tanto a formação do cidadão quanto da cidadania ocorre através deste processo em constante mudança entre instituições e agência. A transformação digital é um aspecto que se agrega a esta relação, em que as TIC podem ser utilizadas tanto pelo cidadão quanto pelas instituições em práticas sociais de modificação de diferentes dimensões da cidadania.

Para entender este impacto das TIC na construção da cidadania e do cidadão, propomos o conceito de cidadania no contexto da transformação digital em contraposição à cidadania digital e cidadão digital. Esse conceito é entendido como a construção de práticas sociais de cidadania através da regulação das instituições e da agência dos agentes com o uso de TIC em um determinado contexto histórico.

2.3 A cidadania contextualizada e o conceito de cidadania no contexto da transformação digital

Cidadania é um conceito multifacetado, onde diferentes dimensões e categorias se combinam em configurações múltiplas, dependendo do contexto histórico sob análise (Dagnino, 2006; Wappenstein, 2004). Neste sentido, não há um único conceito de cidadania, mas cidadanias que se conformam por parte de agentes sociais e estatais em práticas de demanda, reivindicações e lutas em determinados contextos locais ou nacionais (Wappenstein, 2010).

Apesar da complexificação conceitual devido a fenômenos como a globalização, migração populacional e a construção de espaços online de participação (Rydén et al., 2024; Stokke, 2017), a cidadania segue relacionada com o vínculo entre um território e os membros da comunidade (Rydén et al., 2024). Um dos principais aspectos de defesa do conceito de cidadania no contexto da transformação digital em contraposição à cidadania digital está no entendimento de que as práticas sociais seguem relacionadas a este contexto territorial offline, e não circunscritas a um universo digital (cyberespaço) construído através das TIC.

Isto significa afirmar que mesmo as práticas sociais realizadas pelos agentes através de TIC em ambientes online estão vinculadas a construção histórica da cidadania em um determinado território. A representação estabelecida no ambiente online é uma abstração do mundo físico com regras e regulação definidas pelos agentes e instituições responsáveis pela produção e implementação das TIC (Sørensen & Pica, 2005).

Os próprios desafios colocados pela transformação digital estão diretamente vinculados com o processo de construção da cidadania em determinado contexto. O movimento #BlackLivesMatter, que ganhou força nas redes sociais e plataformas digitais, está relacionado ao combate ao racismo estrutural existente na realidade estadunidense, ou seja, é uma luta histórica offline que foi redirecionada para as plataformas online (Francis & Wright-Rigueur, 2021).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

No âmbito dos estudos de cidadania digital e de cidadão digital, a questão do contexto histórico também é considerada, porém sem a centralidade que estamos propondo neste estudo. Mossberger et al. (2008) demonstra como as dimensões de cidadania digital no contexto estadunidense estão ligadas à princípios ideológicos como o liberalismo econômico, o republicanismo político e a hierarquia atributiva entre os cidadãos. No contexto dinamarquês, Schou e Hjelholt (2018) apresentam a digitalização vinculada ao processo de neoliberalismo afetando o Estado de bem-estar social no contexto dinamarquês.

É a partir deste processo contextualizado na transformação digital que podemos entender como a construção de práticas sociais pelos agentes políticos através do uso de TIC afeta a cidadania e o cidadão. Práticas sociais devem ser entendidas neste estudo enquanto entidades organizacionais estabelecidas entre instituições e agência, sendo moldadas pelas instituições, mas também influenciadas pelos indivíduos através de suas ações (Fairclough, 2003; Fairclough, 2005).

No conceito de cidadania no contexto da transformação digital, as instituições de cidadania são entendidas como estruturas sociais construídas historicamente em um determinado contexto que organizam e regulam as práticas sociais. As TIC podem ser utilizadas nas práticas sociais dos agentes para questionar estas estruturas históricas (Fairclough & Fairclough. 2012).

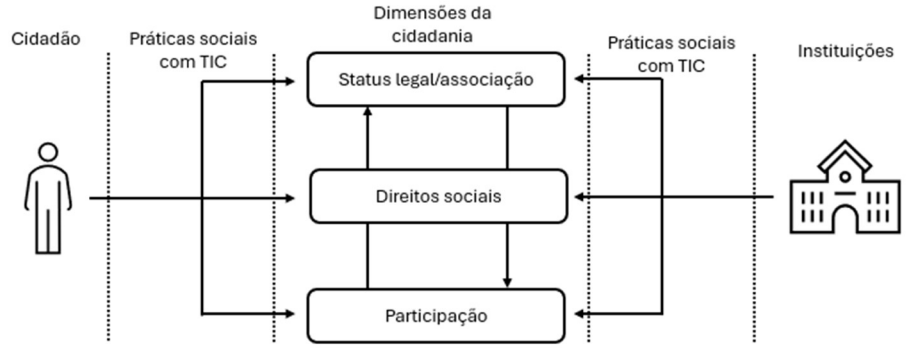
A mudança nas diferentes dimensões de cidadania e no cidadão ocorrem a partir desta relação entre instituições e agência interrelacionadas através das práticas sociais. No contexto da transformação digital, as TIC são utilizadas para fortalecer práticas sociais de transformação em determinado contexto.

Para entender como as práticas sociais estabelecidas através das TIC pelos agentes e instituições se interconectam, partimos do modelo baseado em dimensões da cidadania proposto por Stokke (2017). Neste estudo, as dimensões de status legal e associação são analisadas em conjunto. As dimensões de cidadania propostas podem ser resumidas da seguinte forma:

a) Status legal/associação: pertencimento a uma determinada comunidade política, sendo o conceito de comunidade política variável no tempo e espaço (Stokke, 2017). Relacionada também à condição contratual entre cidadão e Estado baseada em direitos e responsabilidades (Stokke, 2017).

b) Direitos sociais: relacionada a dimensão de cidadania social de Marshall e Bottomore (2021), se refere ao conjunto de direitos relacionados à associação e ao status formal de cidadão de uma determinada comunidade (Stokke, 2017).

c) Participação: a participação nos processos de decisão da comunidade é vista como uma dimensão central da cidadania ativa (Dagnino et al., 2006; Stokke, 2017). O direito à participação do cidadão é um aspecto central do aprofundamento democrático (Dagnino et al., 2006).



A partir deste modelo, pode-se entender a cidadania como uma construção onde a forma e a substância das diferentes dimensões são o resultado de disputas políticas (Clarke et al., 2014; Stokke, 2017). No contexto da transformação digital, estas disputas são influenciadas pelo uso de TIC por parte dos agentes e das instituições.

No conceito de cidadania no contexto da transformação digital proposto neste estudo, entendemos que o elo de conexão entre as diferentes dimensões está nas práticas sociais estabelecidas pelas instituições e pelos agentes. Neste sentido, práticas sociais de participação e luta podem ser voltadas para garantir direitos ou a associação do cidadão à determinada comunidade.

Esta relação entre as diferentes dimensões e as práticas sociais de instituições e agentes com o uso de TIC no contexto da transformação digital pode ser ilustrada da seguinte forma (figura 02):

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Fig. 2 - Framework de cidadania no contexto da transformação digital (elaborado pelos autores).

Ao analisar o contexto latino-americano, Dagnino et al. (2006) demonstram como a confluência entre projetos políticos antagônicos levam os agentes e as instituições a estabelecerem práticas sociais difusas. Este contexto difere do dinamarquês apresentado por Schou e Hjelholt (2018) onde a contraposição entre o projeto neoliberal e o Estado de bem-estar social está bem definida.

3. A cidadania no contexto da transformação digital na América Latina

3.1 Cidadania na América Latina e a disputa discursiva

No contexto latino-americano, o fenômeno da cidadania ganha força a partir dos anos 1970 e 1980 com a emergência de movimentos sociais de luta pela democratização e por avanços em direitos civis, em especial em países com regime autoritário (Dagnino, 2003). Com a redemocratização observada na América Latina a partir dos anos 1980, estes movimentos sociais adotaram o discurso da cidadania enquanto referência de luta por direitos sociais e como articulador comum entre as diferentes pautas de reivindicações (Alvarez et al., 1998; Dagnino, 2003).

O papel desempenhado pelos movimentos sociais questiona uma cidadania formada historicamente na administração das diferenças sociais a partir da reprodução legalizada das desigualdades (Holston, 2013). É construída uma cidadania insurgente no sentido da ruptura com essa legalização das desigualdades e alicerçada no "direito a ter direitos" (Dagnino, 2003; Holston, 2013).

Movimentos de diferentes matizes e demandas, como as associações comunitárias urbanas no Brasil (Holston, 2013), asambleas barriales na Argentina (Torres et al., 2021) e o Movimento Zapatista no México (Martínez Espinoza, 2024), se aglutinaram em um projeto político específico. Este projeto, multifacetado em suas diferenças nacionais, possui em comum o questionamento das definições políticas de poder na América Latina: seus participantes, instituições, processos, agenda e escopo (Alvarez et al., 1998). Este projeto comum é denominado por Dagnino (2006) como projeto democrático-participativo e tem como base o aprofundamento da democracia em contraposição aos limites de participação estabelecidos pela democracia liberal representativa.

Estabelecendo uma relação com as dimensões de cidadania propostas neste estudo, o projeto democrático-participativo propõe práticas voltadas ao reconhecimento das diferenças como status legal/associação à comunidade. Este entendimento reflete na dimensão de direitos sociais na lógica do "direito a ter direitos" proposta pelos movimentos sociais (Dagnino, 2003) e na de participação através da concepção de compartilhamento do poder do Estado pelo cidadão e por grupos sociais nas esferas decisórias.

No entanto, no mesmo período em que os movimentos sociais ascendiam na América Latina em questionamento aos regimes autoritários ou às limitações da democracia representativa, outro projeto político ganhava força devido à crise do estados de bem-estar social europeus e a necessidade de reorganização das relações de acumulação capitalista (Dagnino et al., 2006; Pollitt & Bouckaert, 2011): o projeto neoliberal. Ao contrário do foco estabelecido na ampliação da democracia do projeto democrático-participativo, o projeto neoliberal se estrutura na primazia do mercado e no enxugamento do Estado, com a transferência de responsabilidades para a sociedade civil e para o setor privado (Dagnino et al., 2006; Osborne & Gaebler, 1991).

Na América Latina o projeto neoliberal adquire características específicas devido ao contexto de avanço de conquistas democráticas encontrado na maioria dos países da região (Dagnino, 2004). Esta configuração leva o projeto neoliberal a estabelecer interlocução com a sociedade civil e com movimentos sociais em instâncias de participação estabelecidas pelo Estado. Esta relação estabelecida entre os diferentes projetos estabelece uma confluência onde as nuances de entendimentos sobre participação, representação e a própria cidadania se

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

confundem em discursos com retóricas próximas, mas com significados extremamente diferentes (Dagnino, 2004).

Isto não significa que este processo de confluência ocorra da mesma forma entre os diferentes Estados da América Latina. Enquanto no Chile o processo de democratização ocorreu de forma lenta após a queda de um regime autoritário que serviu de laboratório de experiências neoliberais (Budds, 2013), na Argentina as asembleas barriales ocuparam posição de poder durante a crise política de 2001com as quedas dos governos de la Rua e Saá (Torres et al., 2021). O que permanece enquanto característica comum entre os diferentes países é a confluência entre os dois projetos e a disputa de significados da cidadania.

Com relação às dimensões de cidadania, o discurso das políticas de status legal/associação do projeto neoliberal é voltado à inserção do indivíduo à comunidade e a manutenção do contrato social através de ações de entidades privadas e do terceiro setor, buscando reduzir a participação do Estado (Dagnino et al., 2006; Osborne & Gaebler, 1991). Além da redução das atribuições estatais, na visão conservadora do projeto, a expansão da cidadania reivindicada por grupos sociais é questionada.

Na dimensão de direitos sociais, o projeto neoliberal estabelece uma lógica de mercado, tendo o Estado enquanto provedor de serviços e o cidadão visto como um cliente (Dagnino, 2004; Dagnino et al., 2006). Na dimensão de participação, o projeto estabelece uma lógica política instrumental, voltada para o repasse de responsabilidades do Estado para outros setores, como organizações não governamentais (Dagnino, 2004; Dagnino et al., 2006).

Um dos aspectos centrais para o entendimento da confluência entre os dois projetos está em compreender que eles não ocorrem de forma homogênea. Ou seja, dependendo do contexto, as práticas sociais próprias de um determinado projeto podem estar combinadas com outro. Isto ocorre devido a heterogeneidade dos agentes estatais e da sociedade civil (Dagnino et al., 2006) e pelas relações de poder estabelecidas entre os agentes e as instituições, que não permite a hegemonia absoluta de um projeto político devido as variações contextuais de poder.

A transformação digital observada a partir dos anos 2000 afetou diretamente as relações dentro da sociedade e entre Estado e sociedade (Mossberger et al., 2008) devido ao uso das TIC. A utilização das TIC possui a capacidade de ressignificar as práticas sociais estabelecidas pelos diferentes projetos políticos na América Latina. A cidadania no contexto da transformação digital latino-americana é afetada diretamente por estas práticas sociais.

3.2 Transformação digital e a reconstrução das práticas sociais

Segundo dados do E-government Development Index 2024, a América Latina apresenta um índice relevante de governo digital (0.6553), acima da média mundial (0.6382) e que reflete a evolução das agendas digitais de governo eletrônico nos países latino-americanos (Nicolás et al., 2022). Em especial os países da América do Sul apresentam um índice bem acima da média mundial (0.7462).

No âmbito do acesso à internet, a região apresenta um crescimento exponencial a partir dos anos 2000. Apesar deste avanço, desafios de conectividade são observados principalmente em áreas rurais e entre a população de baixa renda (Galperin, 2017).

Este avanço da transformação digital na América Latina possui a capacidade de impactar em diferentes aspectos da cidadania na região. Na implantação de serviços públicos através das TIC (Filgueiras et al., 2019) e no uso de redes sociais e aplicativos para organização e divulgação de lutas por direitos (Blanco, 2019).

Com base no conceito de cidadania no contexto da transformação digital, podemos entender que as dimensões de cidadania são vinculadas ao contexto histórico nas quais são construídas. O uso de TIC na elaboração de práticas sociais de cidadania pelos diferentes agentes é diretamente influenciada por estas instituições construídas historicamente em um determinado contexto.

4. Dimensões de cidadania no contexto da transformação digital e proposta de framework analítico

Nesta seção, apresentaremos as dimensões de cidadania relacionando-as com o contexto latino-americano, as TIC e os projetos políticos. Através desta relação, propomos no final da seção um quadro analítico a ser utilizado em conjunto com o framework de análise de práticas sociais a partir do conceito de cidadania no contexto da transformação digital.

4.1 Status legal/associação à comunidade

Os Mapuches possuem um histórico de contestação territorial frente ao Estado chileno que remonta ao período da

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

colonização. Para auxiliar nesta luta histórica, comunicadores e ativistas mapuche tem utilizado as TIC para a construção de redes de comunicação e a mobilização entre as comunidades que quebram o bloqueio imposto pela mídia tradicional (Rivera & del Valle Rojas, 2021).

O uso das TIC por movimentos indígenas não se restringe apenas ao caso dos Mapuches. No sul global, as TIC vem sendo utilizadas por estes movimentos como forma de resistência e potencialização de lutas históricas por reconhecimento de reivindicações estabelecidas (Guntarik, 2022; McLean, 2020; Soriano, 2012).

Assim como ocorre com os movimentos indígenas, a apropriação de TIC por movimentos sociais na América Latina é uma constante nas lutas contra as desigualdades (Friedman, 2005; Treré & Magallanes-Blanco, 2015). O uso estratégico destas tecnologias, em especial para comunicação, contribuiu para o desenvolvimento de lutas por direitos de diversos movimentos, como o Zapatista no México (Treré & Magallanes-Blanco, 2015).

Nestes casos como dos Mapuches e do movimento Zapatista, as TIC são apropriadas para potencializar as reivindicações de "direito a ter direitos", construindo práticas sociais vinculadas ao projeto democrático-participativo. Esta forma de apropriação de tecnologias contrasta com as práticas sociais estabelecidas através do projeto neoliberal.

No discurso do projeto político neoliberal, a dimensão de statu legal/associação está vinculada à utilização das TIC por parte do cidadão para acessar o Estado e vantagens de mercado. "Ser digital" é um prerrequisito para o cidadão ser competitivo e estar incluso na vida em sociedade (Schou & Hjelholt, 2018).

Esta construção discursiva aproxima a visão do projeto neoliberal sobre o reconhecimento do cidadão da perspectiva hegemônica de cidadania digital, que observa como o cidadão possui a capacidade de se utilizar das TIC para acessar as diferentes dimensões de cidadania (Mossberger et al, 2008). As estratégias de governo digital na América Latina também refletem essa visão de inclusão a uma cidadania digital através do uso de TIC (OECD, 2023).

A principal diferença entre o projeto democrático-participativo e o projeto neoliberal na dimensão de status legal/associação não está vinculada a questão da importância das TIC para o cidadão. O diferencial está no uso das TIC para acessar a cidadania presente no discurso do projeto neoliberal contrastando com a apropriação das TIC como forma de reivindicação de direitos de acesso à comunidade e manutenção do contrato social.

No projeto democrático-participativo, a apropriação das TIC ocorre como forma de se contrapor as tecnologias da mídia tradicional e as implementadas por instituições estatais (Rivera & del Valle Rojas, 2021; Treré & Magallanes-Blanco, 2015). Enquanto no projeto neoliberal, o uso por parte do cidadão é uma necessidade, mas a ampliação de direitos é questionada através das mídias tradicionais.

4.2 Direitos sociais

A dimensão da cidadania enquanto direitos sociais é uma das mais afetadas por práticas sociais com o uso de TIC. Isto se deve ao avanço na implementação de serviços públicos digitais como uma das principais estratégias de governo digital (Distel & Lindgren, 2021; Filgueiras et al., 2019; Lindgren & Jansson, 2013).

Neste sentido, a implementação de serviços públicos digitais acaba afetando não apenas a discussão de quais direitos sociais o cidadão possui, mas também de como ele acessa estes direitos. Na lógica dos serviços públicos digitais, a interação entre cidadão e Estado é realizada diretamente através das TIC, com o próprio cidadão acessando as plataformas digitais sem a necessidade de mediação de um servidor público (Filgueiras et al., 2019).

Na América Latina, a implementação de serviços públicos digitais também é umas das estratégias centrais de governo digital da maior parte dos países (OECD, 2023). A necessidade do cidadão utilizar as TIC para acessar estes serviços e o papel das TIC nos direitos sociais estabelece uma disputa entre as práticas sociais do projeto neoliberal e do projeto democrático-participativo.

Para o projeto neoliberal, a digitalização de serviços públicos é uma estratégia que vai além da oferta de melhores serviços e a criação de valor para o cidadão. Ela está vinculada também com a redução de custos para a administração pública, sendo esta muitas vezes a prioridade institucional, como demonstra a fala do então ministro da economia do Brasil Paulo Guedes durante o Dia Nacional do Supermercado de 2020:

> A Reforma Administrativa tem um alcance estimado em R$ 300 milhões nos próximos anos. E acreditamos que o resultado será muito maior, pois assumimos que, para cada 100 brasileiros que se aposentem, 70 seriam contratados. O que acontece, na verdade, é que a cada 100 que aposentam, contratamos apenas 26, justamente por conta da digitalização que permite economizar alguns serviços. Então, é possível que a economia seja de até R$ 500 milhões nos próximos anos por conta do digital (Paulo Guedes, 2020).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Estas práticas de implementação de políticas públicas voltadas para a redução de custos na administração levam a um descompasso entre o avanço da digitalização e a situação fática de acesso às TIC por parte do cidadão. No caso de serviços públicos voltados às populações com menor acesso à internet por questões econômicas ou capacidade de uso, serviços implementados unicamente na modalidade digital podem restringir a capacidade de requerimento (Dos Santos Da Silva & Cruz Rodrigues, 2023).

Quando o projeto neoliberal busca estabelecer respostas para a inclusão digital, ele aposta em uma perspectiva de determinismo tecnológico, atribuindo às TIC a capacidade de resolver questões complexas de exclusão por si só (Rosa, 2013). O projeto democrático-participativo se contrapõe a esta visão instrumental estabelecendo o foco no papel que as TIC podem desempenhar na garantia e expansão de direitos (Rosa, 2013).

Na visão do projeto democrático-participativo, a questão deixa de ser o uso das TIC como instrumentos de acesso ao Estado para se tornar a possibilidade de autonomia para o cidadão. A apropriação tecnológica deve estar combinada com serviços públicos digitais para a garantia e avanço de direitos sociais (Silveira, 2008). A implementação de serviços públicos digitais não pode ser dissociada desta lógica de autonomia e avanço de direitos sociais.

4.3 Participação

A participação do cidadão e do outros agentes não governamentais na definição de políticas públicas digitais é entendida como um aspecto central para a construção de uma cidadania ativa (Bianchi, 2021). A construção de uma agenda de transformação digital no setor público mais inclusiva, sustentável e igualitária depende da participação destes agentes (OECD, 2023).

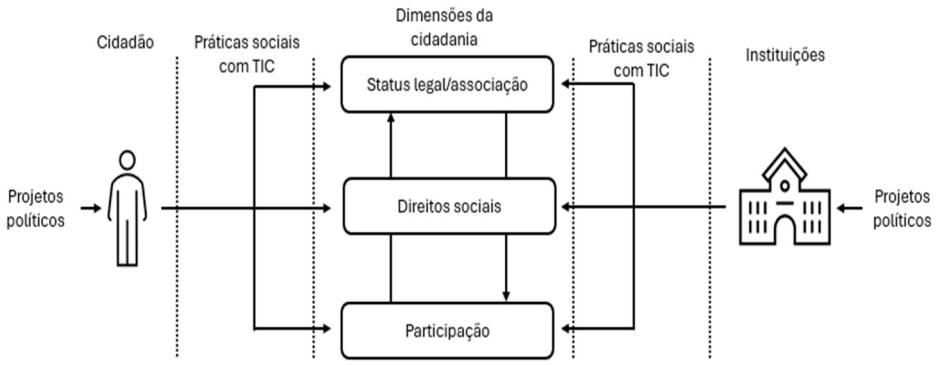
Apesar deste entendimento sobre a necessidade de participação do cidadão e de outros agentes, os órgãos de coordenação sobre governo digital nos países da América Latina ainda necessitam avançar nesta inclusão de agentes estratégicos não-governamentais. O Uruguai é um caso particular por possuir representação da academia e do setor privado no Consejo Asesor Honorario para la Sociedad de la Información (OECD, 2023).

No entanto, a pauta sobre participação e de agentes não-governamentais se torna uma discussão complexa quando questionamos sobre qual participação estamos falando. Participação é um dos principais conceitos no qual o significado está em disputa entre os diferentes projetos políticos.

Para o projeto neoliberal, o significado de participação está vinculado à transferência de responsabilidades do Estado para agentes não-governamentais e privados. Estes agentes ficam responsáveis pela execução de serviços públicos enquanto o poder decisório das políticas públicas segue nas mãos do Estado (Dagnino, 2004; Dagnino, 2006).

Parcerias-público privadas tem sido utilizadas por governos na América Latina como forma de vencer desafios relacionados ao governo digital (Palaco et al., 2019). Em países como o Brasil, estas parcerias são firmadas para repassar à agentes não-governamentais a operacionalização de plataformas de requerimentos de serviços digitais (Dos Santos Da Silva & Cruz Rodrigues, 2023).

A questão é que a participação no discurso do projeto neoliberal não avança para construção de espaços públicos de discussão e deliberação sobre a estratégia de transformação digital. No discurso do projeto democrático-participativo, este compartilhamento de poder decisório é central para uma participação efetiva do cidadão e de outros agentes não-governamentais (Dagnino et al., 2006).



O caso do Consejo Asesor Honorario para la Sociedad de la Información do Uruguai (OECD, 2023), a instituição do Comitê Consultivo da Estratégia Nacional de Governo Digital (MGI, 2024) e as diversas experiências de orçamento participativo digital na América Latina (Cunha et al., 2014; Pineda & Iasulaitis, 2016) são casos em que a participação pode deixar de ser instrumental. Este significado de participação pode resultar em um poder decisório efetivo do cidadão e dos agentes não-governamentais através do uso de TIC.

4.4 Framework analítico a partir das dimensões propostas

A análise do contexto latino-americano e da disputa existente entre o projeto democrático-participativo e neoliberal permite a expansão do framework de cidadania no contexto da transformação digital. O framework analítico passa a incorporar os projetos políticos, entendidos como construção discursivas que orientam as práticas sociais com o uso de TIC (figura 03):

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Fig. 3 - Framework de cidadania no contexto da transformação digital a partir dos projetos em disputa (elaborado pelos autores).

O cidadão e os agentes não-governamentais não estabelecem apenas práticas sociais vinculadas ao projeto democrático-participativo e as instituições práticas sociais orientadas pelo projeto neoliberal. A pluralidade política, social e cultural do contexto latino-americano reforça essa heterogeneidade e a capacidade de diferentes agentes e instituições em estabelecerem suas práticas a partir dos diferentes projetos políticos em disputa (Dagnino et al., 2006).

Neste sentido, a análise do impacto das práticas sociais com uso de TIC nas diferentes dimensões de cidadania não deve estar focado em qual agente está agindo ou qual instituição está afetando as práticas sociais. A análise deve estar focada em qual projeto político está orientando as ações dos agentes e influenciando as instituições.

No contexto latino-americano, os projetos democrático-participativo e neoliberal disputam o significado de conceitos vinculados as dimensões de cidadania como status legal/associação, participação e direitos sociais. Propomos um quadro analítico (tabela 01) para entendimento destes diferentes significados e como eles podem ser utilizados para a análise de práticas sociais com uso de TIC nas diferentes dimensões de cidadania.

Tab. 01 – Significado das dimensões de cidadania a partir dos projetos políticos

	Status legal/associação	Direitos sociais	Participação
Projeto democrático participativo	Apropriação das TIC como forma de reivindicação de direitos de acesso à comunidade. As TIC se tornam instrumentos de potencialização de lutas por direitos.	TIC como forma de expansão de direitos sociais. Serviços públicos digitais vinculados com a autonomia e avanço de direitos para o cidadão.	Participação enquanto compartilhamento de poder entre agentes estatais, cidadão e agentes não-governamentais. As TIC são utilizadas pata construção de espaços deliberativos.
Projeto neoliberal	Uso das TIC para acessar dimensões de uma cidadania já estabelecida. Busca reduzir a capacidade de reivindicação do cidadão.	Direitos sociais acessados através do uso de TIC. A redução de custos é um objetivo a ser alcançado através das TIC. Inclusão digital entendida a partir de uma lente instrumental.	Participação instrumental vinculada com o repasse de responsabilidades estatais para agentes não-governamentais e privados. Poder decisório permanece exclusivo dos agentes estatais.

O framework e o quadro analítico proposto formam um conjunto a ser instrumentalizado para pesquisas empíricas de cidadania no contexto da transformação digital na América Latina. As dimensões e a construção conceitual dos projetos políticos em disputa permitem uma amplitude para abarcar as diferenças regionais, além da inclusão de questões próprias de contextos nacionais.

5. Conclusão

Podemos observar como o contexto latino-americano apresenta questões próprias no processo de construção da cidadania e como os diferentes projetos políticos em disputa na região afetam esta construção. Neste contexto, as

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

TIC são utilizadas para a construção de práticas sociais orientadas pelos projetos em disputa.

O conceito de cidadania no contexto da transformação digital busca abarcar essa complexidade contextual ao entender as dimensões da cidadania enquanto processos em disputa de significados. As práticas sociais dos agentes e das instituições, orientadas pelos projetos políticos em disputa, se constituem no fator central deste processo.

Significados de conceitos como status legal/associação, direitos sociais e participação não são únicos no contexto latino-americano e se modificam dependendo da visão de cada projeto político em disputa. Ao analisar processos como a implementação de serviços públicos digitais ou a utilização de TIC na construção de espaços virtuais de participação, os analistas devem levar em consideração estes múltiplos significados.

O framework de análise e o quadro analítico apresentados a partir da discussão da cidadania no contexto da transformação digital na América Latina são a contribuição teórica presente neste estudo. Entendemos que este framework e a análise dos diferentes projetos políticos em disputa no contexto latino-americano podem contribuir para estudos empíricos futuros que busquem entender as dinâmicas das práticas sociais com uso de TIC na América Latina.

Estes estudos empíricos de entendimentos das dinâmicas de práticas sociais com uso de TIC na América Latina são a sugestão para estudos futuros. A aplicação do framework e do quadro analítico proposto podem auxiliar no avanço da proposta e na inclusão ou modificação de entendimentos a partir de casos concretos.

Futuros possíveis de processos de inovação para o Poder Judiciário a partir de experiências formativas

João Guilherme de Melo Peixoto [a*], *Alex Sandro* Gomes [b*]

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 19 May 2025

Abstract. This work aims to analyze senses and meanings related to the construction of continuing education processes designed with the objective of transversalizing the culture of innovation, creativity and public entrepreneurship in the Judiciary. For this, narrative interviews were carried out with actors from the Judiciary who participated in the lato sensu Postgraduate course "Innovative Jurisdiction beyond 2030". Within the results obtained from the collected data, we found the presence of three macro themes, namely: a) meanings of the notion of innovation; b) dialogue between the field of law and the culture of innovation in the Judiciary; and c) perceptions about the effectiveness of the strategy for implementing innovation processes via training actions. Such aspects point to the need to structure training processes which point to the development of skills (whether individual, collective and/or organizational) which enable the actors of the Judiciary to reflect, produce and share knowledge, methodologies, approaches and other processes specific to current societies.

Keywords. Innovation, continuing education, Public sector, Justice

Policy paper, DOI: https://doi.org/10.59490/dgo.2025.926

1. Introdução

O futuro das instituições governamentais e os processos de modernização da administração pública são temas recorrentes nas sociedades contemporâneas (MAZZUCATO, 2014 FURTADO, 2009; FREEMAN, 1995). Ademais, ainda sobre o tema, no que diz respeito à incorporação de tais questões às dinâmicas estratégica, tática e operacional voltadas ao setor público (KOURY, 2011), mais especificamente àquelas associadas ao Poder Judiciário, protocolos concernentes à tríade gestão de dados, inovação e avanço tecnológico configuram-se como macro-temáticas essenciais para pensar a prática da Justiça no futuro.

Sobre aspectos associados à gestão de dados no sistema jurídico nacional, aponta-se que, desde os anos 90 do século XX, avanços podem ser percebidos acerca da utilização de sistemas digitais de captura e processamento de dados produzidos pelos atores que compõem o Judiciário nacional. Iniciativas nacionais, a exemplo do Justiça em Números (publicado desde 2004) demonstram que a incorporação de dinâmicas próprias ao uso de big data (ORSINI, 2017), como a criação de algoritmos voltados à análise de um grande volume de dados os quais auxiliem na compreensão de problemáticas reais e contemporâneas da Justiça brasileira, podem configurar-se como uma eficiente opção estratégica.

Já em relação à inovação, definida aqui como fruto do processo de aprendizagem, procura e exploração, de onde brotam novos produtos, novas técnicas, novas formas organizacionais, alterações institucionais, de mercado e de

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

serviços, que podem ser tecnológicas ou sociais (CASTRO; GUIMARÃES, 2019, p. 175), a criação de laboratórios de inovação (WERNECK, 2020) e demais espaços dedicados ao estímulo da criatividade e ao intraempreendedorismo já fazem parte da realidade de diversos tribunais no país.

Visto isso, e a partir de Roger (1995), fica claro que o conceito de inovação nos anos 90 do século XX direcionou o debate para questões relacionadas ao desenvolvimento de novas ideias, práticas ou objetos, apontando para uma visão excessivamente abrangente e voltada à originalidade desses. Essa conceituação converge em certa medida com o que a Comissão Europeia (2013) afirma ao classificar a inovação como o processo de geração e implementação de novas ideias com foco na geração de valor para a sociedade. Ainda com esse viés, Van de Vem et al. (2000) traz uma abordagem do conceito de inovação que incorpora a implementação de novas ideias por meio de aspectos associados à motivação e ao engajamento. Por fim, destaca-se Schwella (2005), apontando a necessidade de desenvolver competências relevantes para a inovação a partir de um intenso trabalho de educação continuada dos atores envolvidos no processo.

Diante disso, e com foco nas especificidades relacionadas ao setor público, também é necessário entender a inovação como um importante motor de mudança diante dos desafios que envolvem a administração pública. Muitos autores identificam o papel ativo do setor público na sociedade e suas particularidades (KIM; SUNG, 2021; AGUNE; CARLOS, 2017; BELMONTE DA SILVA; FERNANDEZ JARDÓN, 2021; EL-HADDADEH; IRANI; MILLARD; SCHRÖDER, 2014), bem como a necessidade de aprofundar estudos sobre as transformações da cultura de inovação relacionadas ao setor (ANDHIKA; NURASA; KARLINA; CANDRADEWINI; 2018; WIPULANUSAT; PANUWATWANICH; STEWART; SUNKPHO, 2019; DE OLIVEIRA; DOS SANTOS; 2019).

Em pesquisa realizada no Reino Unido, Holanda e República Checa, Baxten, Schoeman e Goffin (2015) apontam para a necessidade de criação de uma cultura sistêmica de inovação a qual estimule a geração de novas ideias e cooperação entre os atores envolvidos (CASTRO; GUIMARÃES, 2019). De acordo com Werneck et al. (2020), "os laboratórios surgem como uma das tentativas de lidar com as incertezas e complexidade dos problemas públicos" (p. 13).

Outrossim, questões alusivas ao desenvolvimento tecnológico devem ser encaradas como salutares para a compreensão dos desafios voltados à construção dos futuros possíveis da inovação no Poder Judiciário. Incorporação de temáticas, como o uso e a aplicação de inteligência artificial (FELIPE; PERROTA, 2018) e sua compreensão por parte dos servidores, magistrados e demais integrantes do Judiciário estadual e nacional, apontam para a necessidade de construção de políticas de "popularização" deste e de outros conceitos (programação de computadores, metodologias ágeis de projetos, etc.); os quais se constituem como essenciais para uma política eficaz de formação continuada.

Visto isso, surge aqui uma questão-chave: como oferecer aos atores do Poder Judiciário nacional subsídios teórico-metodológicos e práticos para a incorporação de saberes relacionados à inovação?

Dessa forma, e tendo em vista a necessidade de expansão e atualização de pesquisa relacionadas aos processos de formação voltados ao Poder Judiciário, este trabalho orienta-se à necessidade de uma investigação exploratória acerca do que faria sentido em processos de formação continuada desenhados visando difundir a cultura da inovação, da criatividade e do empreendedorismo público no Poder Judiciário. Que elementos podem ser destacados destas formações e de que forma os participantes atribuem sentido aos conteúdos e as práticas realizadas nestas experiências formativas?

2. Método

O presente trabalho visou analisar, a partir da realização de entrevistas narrativas (JOVCHELOVICH; BAUER, 2002) com atores do Poder Judiciário matriculados no curso de Pós-graduação lato sensu "Jurisdição inovadora para além de 2030" (iniciativa inédita da Escola Nacional de Formação e Aperfeiçoamento de Magistrados Ministro Sálvio de Figueiredo Teixeira – ENFAM), a construção de processos de formação continuada desenhados visando difundir a cultura da inovação, da criatividade e do empreendedorismo público no Poder Judiciário. Buscamos que sentidos e significados podem ser extraídos dos discursos e narrativas destes participantes no que se refere às vivências em inovação dentro de seus respectivos órgãos e unidades judiciais.

Para a realização da coleta de dados, foram selecionados, a partir de uma amostra não-probabilística (por conveniência), 4 participantes do curso em questão, os quais foram divididos em "servidores" (dois participantes) e "magistrados" (dois participantes). As entrevistas foram realizadas virtualmente entre os meses de abril e maio de 2023. Importante destacar os participantes foram informados que a entrevista não teria nenhuma validade para o processo de avaliação do curso, como também foram informados que poderiam interromper a realização a qualquer momento.

Já no que se refere ao curso de Pós-graduação lato sensu "Jurisdição inovadora para além de 2030", destacamos, entre os objetivos de aprendizagem elencados na proposta (ANDERSON, 2001; WIGGINS; MCTIGHE, 2005): "capacitar os

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

cursistas à cultura da inovação, colaborando para que o Poder Judiciário nacional se fortaleça na consecução de sua atividade-fim (prestação jurisdicional) e meio (questões extrajudiciais e de governança do sistema de justiça)"

Por fim, ressaltamos que, a partir dos elementos obtidos durante a coleta, realizamos um processo de sistematização dos dados em macro temáticas visando buscar elementos de conexão entre práticas elencadas por servidores e magistrados entrevistados e características relacionadas ao desenvolvimento de uma cultura de inovação no setor público.

3. Resultados

Após a realização das entrevistas narrativas com participantes do curso pós-graduação lato sensu "Jurisdição Inovadora – para além de 2030", constatamos a presença de macro-temáticas as quais articulam processos relacionados aos sentidos da implantação da cultura da inovação no Poder Judiciário.

A partir de aspectos conectados à: a) acepções da noção de inovação; b) interlocução entre a prática do direito e a cultura da inovação no Poder Judiciário; e c) percepções sobre a efetividade de estratégia de implantação de processos de inovação via ações de formação; visamos sistematizar insights apontados durante as entrevistas em macro-temáticas no sentido de especular futuros possíveis para apontar cenários possíveis para a implantação de processos de inovação focados nas realidades plurais do Poder Judiciário brasileiro.

3.1 Macro-temática 01: acepções da noção de inovação

Para os servidores e magistrados entrevistados, a própria ideia de inovar no Poder Judiciário se apresenta como uma perspectiva muitas vezes evitada pelos representantes da alta administração dos tribunais. Tal posicionamento está associado, em alguns casos, a falta de protocolos e práticas de gestão difundidas de maneira clara e objetiva entre tais representantes. Para o "Servidor A": "Há um afastamento das necessidades, sendo completamente distintas e também dos processos, que deveriam ser descentralizados, o que não acontece, né? Quando acontece algo inovador, normalmente é algo imposto e vem de cima para baixo. E isso prejudica a análise concreta do que acaba sendo efetivamente implementado nas varas, entendeu? A gente vê muito isso. !

Também vale destacar que as transições entre equipes gestoras, que no judiciário brasileiro dura dois anos, figurou como um dos fatores que impactam a absorção da cultura da inovação pelos gestores, como também para os demais integrantes dos tribunais. Para o "Magistrado B": "Eu preciso registrar uma certa dificuldade, alguns empecilhos estruturais… por exemplo, poderia citar a mudança de gestão de presidência de tribunais, isso é um empecilho à inovação porque há uma mudança às vezes de política institucional por parte do gestor e acaba ou atrasando, ou mudando o foco. E nessas transições se perde muito tempo num momento que não tem como perder, né? Então esses ruídos eu percebo que acaba tendo um prejuízo muito grande"."

Visto isto, percebemos a necessidade de difundir da cultura da inovação no judiciário brasileiro, com vistas a potencializar não só os resultados dos projetos desenvolvidos a partir de abordagens mais criativas, integradoras e humanizadas, como também gerar nos servidores, magistrados e demais colaboradores uma relação de pertencimento e envolvimento que, atualmente, não é percebida como um valor necessário à alta administração.

3.2 Macro-temática 02: interlocução entre a prática do direito e a cultura da inovação no Poder Judiciário

Para os entrevistados, o desenvolvimento e a vivência da cultura da inovação nos respectivos tribunais dos quais fazem parte mostra-se como uma conduta necessária à atualização das práticas relacionadas à operacionalização do direito em uma sociedade em intensa transformação. É preciso entender que protocolos e metodologias tradicionais de planejamento, execução e gestão administrativa não suportam mais as demandas sociais advindas dos atores que recorrem ao sistema judicial nacional.

Segundo um dos entrevistados, "Magistrado A", para além de buscar operacionalizar como os órgãos do judiciário, deve-se incorporar cultura de inovação às suas práticas cotidianas. É preciso construir pontes com outros setores e atores, como, por exemplo, as universidades. Para o entrevistado, tal postura advoga positivamente para que o tema e as dinâmicas relacionadas à cultura da inovação no Poder Judiciário alcance as esferas táticas e estratégicas, o que pode garantir perenidade e institucionalização desta pauta. Ainda segundo o magistrado: "uso a experiência na magistratura para conectar melhor meus alunos com a realidade e uso certamente a academia para aprimoramento da [minha] atividade judicial".

Para o "Magistrado B", uma das maiores barreiras atitudinais relacionadas a implementação da cultura da inovação no judiciário está relacionada ao tradicionalismo e a intensa necessidade de formalização de protocolos de administração, representando uma visão de gestão pública nada conectada a realidade atual, a partir da necessidade de perpetuar artifícios estruturais de hierarquização e padronização de códigos voltados à manutenção do status quo. Para o entrevistado, "falar em inovação é algo novo e muito complexo na justiça. Porque o judiciário, em parte, tem que ser burocrático, já que busca a aplicação da lei e de regramentos. Então você conseguir trazer inovação nesses espaços em que foram criados na visão de palácios é algo novo e muito difícil".

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Já a partir de outro ponto de vista, destacamos aqui as ponderações do "Servidor B". O mesmo desenvolve a ideia de que a desconexão entre as atividades realizadas por quem "opera" as unidades administrativas e judiciais no dia-a-dia faz com que muito do que seja desenvolvido apenas reproduza práticas previamente avaliadas como "boas práticas". Tal decisão, conforme o entrevistado, afasta os atores da justiça brasileira da criação de uma cultura da inovação, a saber: co-criação, empatia, experiência do usuário. Segunda o servidor: "Como assessor, você chega até um pedaço do processo, você não consegue resolver, você entrega e diz: ó, chefe, não consegui. E aí segue a vida, né? Nada muda".

Complementando tal perspectiva, o "Servidor A" aponta que a desconexão entre o Poder Judiciário e sociedade pode ser apontada como uma das principais fontes de desafios para a implementação de processos de inovação nos órgãos. A partir de pequenas práticas cotidianas relacionadas à construção de uma comunicação repleta de ruídos, por exemplo, nota-se um afastamento e uma descrença por parte da população no trabalho desenvolvido pelos atores judiciais. Segundo o entrevistado: "Quando trabalhei em secretaria eu me deparei com várias situações. Uma delas que não sai da cabeça era que a mulher não conseguia entender o que era indeferido. Então, ela ficou com aquela cara meio abatida e eu pergunte: "a senhora entendeu? O juiz indeferiu o seu pedido". Aí ela falou: "tudo bem, meu filho". E ficou com aquela cara de que tudo bem, mas não estava entendendo nada. Perguntei: "A senhora entendeu o que eu falei?" Ela disse: "não". Mencionei que o juiz negou, que o pedido foi negado. Eu poderia ter dito negado antes, mas a gente está tão acostumado a falar "deferi", "pleiteou". São palavras que não interessam. São simples para gente, mas inacessível para a maioria da população."

Dito isso, podemos trazer a tona a necessidade urgente de uma difusão efetiva de valores associados à cultura da inovação no setor público, em particular, no Poder Judiciário, a saber: construção de práticas de administração pública as quais ampliem o papel do jurisdicionado na elaboração de políticas públicas voltadas a solução de demandas reais; espaço para a reflexão e autocrítica de gestores e demais colaboradores dos tribunais brasileiros acerca do trabalho realizado; desenvolvimento de estratégias de interlocução entre os diversos atores internos (servidores, magistrados, demais colaboradores) e externos (Ministério Público, Defensoria Pública, representantes da sociedade civil organizada, entre outros) que aproximem os projetos e ações classificadas como "inovadoras" dos impactos diretamente gerados no desenvolvimento de atividades cotidianas nas unidades de trabalho da justiça brasileira.

3.3 Macro-temática 02: interlocução entre a prática do direito e a cultura da inovação no Poder Judiciário

Por fim, também verificamos, após a sistematização das entrevistas, dois tópicos relacionados às experiências vivenciadas pelos participantes durante as atividades realizadas no curso de pós-graduação. O primeiro deles diz respeito à percepção dos estudantes acerca do processo de construção do curso e principais barreiras atitudinais relacionadas às práticas inovadoras no Poder Judiciário a partir da experiência coletiva proporcionada pela pós-graduação.

Visto isso, como destaca o "Magistrado A", para que uma especialização em inovação fizesse sentido, não poderia jamais ser ofertada apenas para juízes. Tal perspectiva iria ao encontro aos princípios da co-criação e da empatia, salutares para a construção de projetos com abordagens não tradicionais. Todavia, destacamos aqui a pontuação do "Servidor B", que, apesar de tal discurso proferido pelo "Magistrado A", alega não haver uma regular disponibilidade de juízes e juízas para atividades que exigem integração entre diferentes atores do judiciário: "Em determinado momento, principalmente na hora de prototipar, a gente vê uma retrancada, sabe? A gente vê principalmente os magistrados, a gente vê com essa sensação de puxar o freio mesmo, de "não isso daí não vai dar". "Ah, isso daí já foi tentado, né?" E o que eu gosto na inovação é exatamente o contrário, né? De você revisitar soluções que já foram pensadas em outra realidade, em outro contexto, com outras pessoas, com outras tecnologias e você voltar pra ela agora, né? E vamos tentar de novo diferente, né?"

Ainda sobre questões associadas a conexão entre juízes e servidores durante as atividades realizadas no curso, reforça o "Servidor A": "no momento eu vejo uma certa resistência, sabe? Eu vi tanta coisa bacana, tanta coisa interessante na pós-graduação, sobretudo essa questão de troca de experiências, processos, procedimentos que já funcionam em outras áreas, que podem se aplicar a cada adaptada pra outras situações, mas eu vejo uma certa resistência. Por exemplo, o que eu aprendi na pós eu não posso aplicar na prática sozinho aqui na vara que eu atuo, mas eu faço questão porque eu sei que esse movimento ganha força, eu sei que esse movimento é crescente e que ele é urgente, não há como fugir e eu continuo insistindo."

Já o segundo ponto a ser destacado dentro desta macro-temática descrita conecta-se às abordagens metodológicas utilizadas durante a pós-graduação acima referida. O uso de abordagens em salas de aula virtuais que ultrapassaram o uso de técnicas expositivas para apresentação de aspectos teóricos e práticos sobre inovação no Poder Judiciário mostrou-se uma modalidade percebida pelos estudantes como efetiva. Essa percepção parece apontar para a viabilidade de formações continuadas para difusão de uma cultura de inovação na modalidade a distância ou híbrida.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Para o "Servidor B": "A pós-graduação inteira vem me surpreendendo por ela mesmo, entendeu? Por si própria, assim, o jeitão como ela foi bolada. Então, por exemplo, em vez de TCC, são essas práticas. Essas práticas são soluções que vão ser apresentadas para o conselho, vão ser apresentadas para os ministros".

4. Discussão

No que diz respeito às características associadas à implantação da cultura da inovação nos órgãos que compõem o judiciário nacional, observamos inicialmente uma percepção negativa acerca dos modelos de gestão da inovação utilizados nos respectivos tribunais, a partir de características enraizadas no que Bresser-Pereira (1996) definiu como modelo Administração burocrática, a saber: "A administração pública burocrática foi adotada para substituir a administração patrimonialista, que definiu as monarquias absolutas, na qual o patrimônio público e o privado eram confundidos. O nepotismo e o empreguismo, senão a corrupção, eram a norma. Tornou-se assim necessário desenvolver um tipo de administração que partisse não apenas da clara distinção entre o público e o privado, mas também da separação entre o político e o administrador público. Surge assim a administração burocrática moderna, racional-legal. [...] Surge a burocracia estatal formada por administradores profissionais especialmente recrutados e treinados, que respondem de forma neutra aos políticos. Max Weber (1922) definiu e descreveu de forma genial esse tipo de administração no início deste século". (BRESSER PEREIRA 1996, p. 3)"

Em outros termos, e segundo os entrevistados, existe um posicionamento demasiadamente centrado na figura dos gestores. Estes ocupam cargos de destaque na hierarquia dos órgãos, e acabam por decidir monocraticamente o que deve ou não ser identificado como tema ou objeto de interesse para as estruturas administrativas responsáveis por gerenciar a inovação. Para o "Servidor B": "As mudanças de gestão se dão num prazo muito pequeno. Não é um privilégio nosso, mas o nosso tempo é muito curto e as pessoas agem muito por ego. É assim: eu quero ver a instituição? não, eu quero ver o meu nome na placa, né? Então rola ainda muito isso e daí de repente a inovação não é a prioridade daquela pessoa naquele momento ou então alguém decide desfazer o que foi feito, ignorar, não sei."

Tal ponto de vista é endossado pelo entrevistado "Magistrado B", que reforça o processo de substituição de lideranças associado ao curto tempo de gestão como uma problemática relevante para a implantação de uma efetiva política de inovação nos tribunais: "A mudança de gestão de presidência de tribunais, isso é um empecilho à inovação porque há uma mudança às vezes de política institucional por parte do gestor e acaba ou atrasando, ou mudando o foco. E nessas transições se perde muito tempo num momento que não tem como perder, né?"

Ademais, podemos destacar como outra problemática relevante para a difusão de uma cultura da inovação no judiciário o distanciamento entre os processos de planejamento e execução da prestação jurisdicional ofertada das reais necessidades do público. Para o "Servidor A", o conservadorismo e a necessidade de controle administrativo afasta a pauta da inovação do verdadeiro foco da atividade judicante que, segundo o entrevistado, é a boa prestação de serviço ao jurisdicionado.

Por fim, podemos observar que experiências ativas e inovadoras de ensino-aprendizagem que transcendam os atuais modelos de formação judicial antecipam futuro caminhos para a construção de processos de difusão da inovação para o Poder Judiciário nacional. Faz-se necessário compreender que, para que, abordagens tradicionais, com foco na exposição e na passividade do estudante, mostram-se em total desconexão com os valores e princípios a serem desenvolvidos a partir da implementação da cultura da inovação nos tribunais, a saber: empatia, desburocratização, usuário no centro do processo, humanização de serviços, entre outros.

5. Conclusões

O presente trabalho tem por objetivo analisar percepções relacionadas à construção de processos de formação continuada desenhados visando difundir a cultura da inovação, da criatividade e do empreendedorismo público junto a atores do Poder Judiciário. A partir das análises realizadas, constatamos que, para construção de futuros possíveis para a inovação no Poder Judiciário, evidencia-se, então, a necessidade de estruturar processos formativos os quais apontem para o desenvolvimento de competências individuais, coletivas e/ou organizacionais que possibilitem aos atores do Poder Judiciário refletir, produzir e compartilhar conhecimentos, metodologias, abordagens e demais processos próprios às sociedades atuais.

Ainda sobre questões atreladas às dinâmicas formativas, os protocolos específicos concernentes aos processos de ensino e aprendizagem voltados à educação contemporânea também atravessam reformatações (IMBERNÓN, 2009; FREIRE, 1997; LEAL; MIRANDA; CASA NOVA, 2018). De início, surgem os questionamentos: como estimular docentes e discentes em um contexto educacional no que se refere à formação direcionada aos novos desafios enfrentados pela sociedade? Como conectar características dos saberes formais e não-formais, muitas vezes dispersas na sociedade?

Constata-se que, o uso de Metodologias Ativas de Ensino/Aprendizagem (FUGGETTA, 2012; DIESEL,; BALDEZ,;

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

MARTINS, 2017; MATTAR, 2017), mesmo estruturas pouco inovadoras, foram percebidas como uma renovação andragógica. Esta apresenta como ponto de ancoragem o desenvolvimento de protocolos mais inclusivos, participativos e dinâmicos em ambientes de ensino e aprendizagem. Todavia, para que a pauta da inovação se perpetue e para que tais práticas formativas oferecerem resultados satisfatórios, é preciso repensar a autonomia de diferentes setores e atores do Poder Judiciário diante da prática da inovação no setor.

Atrelado a isto, formação continuada e gestão adaptada à inovação são processos necessários para a consolidação da cultura da inovação na justiça brasileira. A partir de tais características, acreditamos ser possível repensar as percepções atreladas às práticas cotidianas de servidores e magistrados do judiciário brasileiro, com evidências consistentes que podem sedimentar estratégias de promoção da inovação, criatividade e ao empreendedorismo no setor público.

Resumo. Este artigo busca analisar os impactos da digitalização dos serviços públicos em amostra de serviços digitais disponibilizados pelo governo federal brasileiro. Foi desenvolvido um instrumento metodológico de avaliação, que permite a mensuração de impactos econômicos, sociais e ambientais da iniciativa de soluções de governo digital. Para tanto, foram simulados dois estudos de caso, a saber: Solicitação de aposentadoria por idade (Instituto Nacional do Seguro Social) e Obtenção de passaporte (Polícia Federal). As simulações realizadas indicam que a implementação do governo digital no Brasil possui impactos expressivos em termos econômicos, sociais e ambientais. Observa-se que a redução do tempo dedicado ao deslocamento e aos atendimentos presenciais é um fator fundamental na composição dos impactos, especialmente os de natureza econômica. Em se tratando dos impactos ambientais, verifica-se que a digitalização contribui para a redução de desmatamento e emissões de CO_2, alinhando-se a políticas de transição verde. No entanto, cumpre destacar a necessidade de considerar contrapartidas ambientais, como o aumento de emissões relacionadas à maior demanda por armazenamento de dados e dispositivos mais avançados. Apesar das limitações, os resultados reforçam o papel do governo digital como uma ferramenta estratégica para a formulação de políticas públicas inclusivas, sustentáveis e baseadas em evidências, promovendo maior eficiência e impacto positivo na sociedade. Sugere-se aprimorar o modelo com variáveis adicionais, como idade, renda e modais de transporte, além de adaptar o cálculo do rendimento médio para diferentes perfis de usuários e serviços. A inclusão de custos relacionados ao consumo energético, segurança cibernética e gestão de lixo eletrônico também se mostra essencial para uma análise mais abrangente.
Palavras-chave. Governo digital, avaliação de impactos, simulação.

Abstract: This article aims to analyze the impact of the digitalization of public services in Brazil. A methodological evaluation tool was developed to measure the economic, social and environmental impacts of the Digital Government Solutions initiative. For this purpose, two case studies were simulated: Applying for a retirement pension (National Social Security Institute) and obtaining a passport (Federal Police). The simulations carried out indicate that the implementation of digital government in Brazil has significant economic, social and environmental impacts. The reduction of time spent on travel and face-to-face services is a fundamental factor in the composition of the impacts, especially those of an economic nature. In terms of environmental impacts, digitalization contributes to reducing deforestation and CO2 emissions, in line with green transition policies. However, environmental trade-offs need to be considered, such as the increase in emissions associated with greater demand for data storage and more advanced equipment. Despite the limitations, the results reinforce the role of digital government as a strategic tool for formulating inclusive, sustainable and evidence-based public policies, promoting greater efficiency and positive impacts on society. It is suggested that the model be improved with additional variables such as age, income and transport mode.
Keywords. Digital government; impact assessment, simulation.

* Este trabalho é parte do resultado de uma parceria desenvolvida entre o Ministério da Gestão e Inovação em Serviços Públicos e a Universidade Federal de Minas Gerais, por meio do Termo de Execução Descentralizada No. 31/2023.

1. Introdução

A transformação digital impactou organizações públicas e privadas nos últimos anos e a Pandemia da Covid-19 acelerou este movimento. A aplicação das Tecnologias da Informação e Comunicação (TICs) no Governo tem levado a avanços na prestação de serviços públicos, incentivado o engajamento dos cidadãos, além de possibilitar que governos se tornem mais responsáveis, transparentes e eficazes (Acharya et al., 2008; United Nations Educational Scientific and Cultural Organization, 2019).

A associação das TICs ao Governo, conhecida como Governo Digital, é uma iniciativa complexa. Promover serviços centrados nos cidadãos enquanto se fortalece a transparência, a efetividade, a inclusão e a confiança no Estado representa um desafio crescente (United Nations, 2018). Embora traga novas oportunidades, essa transformação exige a formulação e implementação de políticas públicas inovadoras, cuja execução ainda carece de clareza, especialmente na integração dos mundos físico e digital (Janowski, 2015). É importante destacar que, por seu caráter multidisciplinar, o Governo Digital é influenciado por diversas áreas do conhecimento, como ciência política, ciência da informação, administração pública, sistemas de informação, gestão de tecnologias da informação, economia, dentre outras. Esta compreensão é multifacetada e abrangente pois está relacionada ao suporte para a modelagem e automação de processos e procedimentos internos, a gestão de tais processos nas instituições públicas, bem como à melhoria da disponibilização de serviços públicos finalísticos e viabilização de ferramenas com vistas a ampliar a transparência e responsabilização dos agentes públicos no uso destas ferramentas e processos.

No entanto, o conceito de Governo Digital vai além da mera informatização de processos, exigindo uma reestruturação sistêmica das instituições públicas para garantir integração, interoperabilidade, segurança, mecanismos robustos de identificação e autenticação e inovação contínua respeitando a privacidade do cidadão.. No Brasil, essa transformação vem sendo construída desde a década de 1960, com iniciativas voltadas à modernização dos serviços governamentais. A criação do Programa de Governo Eletrônico (e-GOV) no início dos anos 2000 representou um marco nessa trajetória, estabelecendo diretrizes para a governo digital e promovendo a integração de tecnologias em diversas esferas da administração pública, algo que só se tornou efetivo em 2016 com a política de governança digital. Alguns exemplos de iniciativas desenvolvidas neste programa, foram as estratégias gerais de tecnologia do governo federal, a Infovia Brasília, os Padrões de Interoperabilidade (e-Ping) e o Modelo de Acessibilidade de Governo Eletrônico (e-MAG).

A preocupação com a avaliação e o monitoramento das iniciativas de Governo Digital tem sido constante. Já em 2002, a Secretaria de Logística e Tecnologia da Informação do Ministério do Planejamento (SLTI/MP) divulgou a primeira avaliação do e-GOV, identificando avanços e desafios. Posteriormente, em 2004, a criação do Departamento de Governo Eletrônico impulsionou o desenvolvimento de métricas para a avaliação da qualidade dos serviços digitais, considerando aspectos como usabilidade, transparência e acessibilidade. A implementação de indicadores específicos tem permitido um acompanhamento mais preciso dos impactos da digitalização sobre os cidadãos e a gestão pública.

Para a consolidação da transformação digital dos serviços públicos, os avanços devem ser constantes. Entre 2017 e 2018, recomendações da Organização para a Cooperação e o Desenvolvimento Econômico (OCDE), destacaram a necessidade de fortalecer as estratégias de governo digital no Brasil. Como resposta, foram adotados mecanismos para tornar a administração pública mais ágil e eficiente. Um exemplo é a adaptação do *Standard Cost Model*, metodologia originalmente desenvolvida na Holanda, que possibilitou a mensuração do impacto financeiro da digitalização dos serviços públicos. A Calculadora de Economia com Interoperabilidade representa outro avanço significativo no campo da transformação digital. Essa ferramenta quantifica os benefícios financeiros decorrentes da eliminação de processos burocráticos, estimando o tempo economizado por cidadãos e agentes públicos e convertendo esses dados em valores monetários.

No âmbito regulatório, a promulgação da Lei nº 14.129, em 2021, consolidou diretrizes fundamentais para a transformação digital no Brasil, estabelecendo princípios para a modernização dos serviços públicos e o fortalecimento da transparência e eficiência administrativa. Um dos destaques dessa legislação é a exigência de plataformas digitais que possibilitem a avaliação contínua dos serviços pelos usuários, garantindo maior controle sobre a qualidade do atendimento público. Além disso, a implementação do Autodiagnóstico em 2024 resultou na criação do Índice de Maturidade em Governança em Tecnologia da Informação do Sistema de Administração dos Recursos de Tecnologia da Informação - iGOVSISP, um conjunto de indicadores que avalia a maturidade das instituições federais em diversas dimensões, como governança de TIC, proteção de dados e infraestrutura digital.

Diante desse panorama, torna-se evidente que a avaliação e o monitoramento das políticas de transformação digital são componentes essenciais da modernização da administração pública. Contudo, permanecem os desafios de aprimorar as metodologias de mensuração e assegurar que a inovação digital esteja alinhada às necessidades dos cidadãos e dos governos. Assim, o presente estudo propõe-se a contribuir com essa temática por meio da construção de uma ferramenta de avaliação, que permite a mensuração de impactos econômicos, sociais e ambientais da iniciativa de soluções de governo digital. Para tanto, os impactos da digitalização foram simulados a partir de dois estudos de caso: Solicitação de aposentadoria por idade (Instituto Nacional do Seguro Social) e

Obtenção de passaporte (Polícia Federal).

Para tanto, este trabalho se organiza em cinco seções, além desta introdução. Na próxima seção é apresentado o arcabouço teórico que subsidia a construção deste estudo. A terceira seção se dedica ao desenho da pesquisa, detalhando a construção dos indicadores e o roteiro de execução das simulações. A quarta seção reporta os resultados obtidos para cada um dos estudos de caso, desagregando os impactos econômicos, sociais e ambientais. A quinta seção discute os principais resultados e implicações. Por fim, na sexta seção, dispõem-se as considerações finais.

2. Contexto e fundamentação teórica

A avaliação de políticas públicas se consolidou ao longo das duas últimas décadas como componente central do planejamento dos governos em função, principalmente, da necessidade de uma melhor alocação dos recursos e de se elaborar um instrumento de controle democrático dos governos (Arretche, 2013). Presente em diversos países e sob diferentes contextos, a situação do Brasil, no que diz respeito ao âmbito federal, não é diferente. Pode-se observar um esforço sistemático de se estruturar um sistema e instrumentos de governança e o desenvolvimento de um arcabouço teórico voltado para avaliação de políticas públicas.

Um aspecto importante na avaliação de políticas públicas consiste no objetivo e no foco definidos para a avaliação. Isso inclui uma análise abrangente da política, cobrindo sua apresentação, a teoria do programa, as atividades e produtos, os resultados e impactos, os custos e a gestão financeira, além dos indicadores de eficiência. Com base nessas evidências, pode ser desenvolvida uma análise geral da política, tendo como resultados as conclusões e recomendações para seu aprimoramento ou para o debate sobre a priorização dos recursos públicos em sua execução.

O foco principal dos estudos reside nos impactos sobre a administração pública (Gupta e Jana, 2003; Barbosa, Pozzebon e Diniz, 2013) ou sobre a sociedade (Dhaoui, 2022; Marinho, 2023; Gan, Zhang e Zhang, 2023). Dentre as pesquisas analisadas, a grande maioria trata de questões envolvendo a usabilidade e acessibilidade dos portais estatais e a provisão digital de serviços públicos (Gupta e Jana, 2003; Peters, Jassen e Engers, 2004; Barbosa, Pozzebon e Diniz, 2013; Heidlund e Sundberg, 2022; Metler et al., 2024). Nesse sentido, nota-se um foco predominante em entender se as práticas de Governo Digital são adequadas para o uso dos cidadãos, contudo nota-se uma lacuna que reside em compreender como essas práticas os impactam.

Essa característica pode ser observada nos estudos que avaliam o Governo Digital na administração pública. Nesse sentido, tanto Gupta e Jana (2003), quanto Barbosa, Pozzebon e Diniz (2013) realizaram estudos de caso para, respectivamente, Nova Délhi e São Paulo, em que os autores desenvolveram quadros multidimensionais para avaliação das políticas de Governo Eletrônico. Esses quadros partem de uma revisão de literatura e de entrevistas com agentes chave. Ambos os estudos possuem especificidades, visto que as medidas de avaliação são bastante específicas para cada administração. Nesse sentido, eles ressaltam a importância de considerar o contexto social e administrativo ao se criar os mecanismos de avaliação.

São escassos trabalhos que procuraram avaliar o impacto das políticas de governo digital e interoperabilidade em uma escala mais ampla, enquanto política pública, o que nos permite vislumbrar uma lacuna na literatura e na pesquisa. Um esforço recente foi feito por Misuraca, et al (2020) que apresenta uma proposta para avaliar o impacto da tecnologia da informação e da adoção de ferramentas de governo digital sobre diferentes aspectos e contextos variados.

2.1 Indicadores de impacto do governo digital

O objetivo desta seção é apresentar um modelo abrangente e robusto para a avaliação do impacto das políticas de governo digital. Com base no arcabouço teórico-metodológico, se buscou delinear os indicadores mais relevantes e analisar sua capacidade de resposta na construção de um modelo eficaz de avaliação do impacto da digitalização.

Partimos de arcabouço analítico mais geral voltado para avaliação de políticas públicas, proposto por Chen e Rossi (1983) que nos permitiu identificar variáveis de tratamento, intervenção e resultado. Esse framework auxilia na compreensão das variáveis exógenas que podem influenciar as variáveis de tratamento, intervenção e resultado, bem como as perturbações estocásticas que podem afetar a intervenção e os resultados. Um exemplo importante é o letramento digital, que pode influenciar tanto a intervenção quanto os resultados. Cabe destacar que a última Pesquisa de Governo Eletrônico das Nações Unidas (2024) demostrou a necessidade e a importância do letramento digital (United Nations, 2024). Outro exemplo relevante é a infraestrutura de acesso às redes, que varia significativamente em um país com as dimensões do Brasil, impactando diretamente a eficácia das intervenções e os resultados obtidos.

Se, por um lado, para avaliar a política de digitalização da oferta de serviços públicos, o sistema de intervenção e as variáveis de tratamento são bem delimitadas, a aplicação do modelo geral apresentado na Figura acima necessita de variáveis de resultados. Soma-se a isso o fato de que são poucos os estudos voltados para a avaliação de impacto

do governo digital em outros países, o que restringe os exemplos de uso de indicadores específicos. Ainda assim, há um esforço de mapeamento de indicadores de variáveis de resultados, possíveis de serem mensuradas e utilizadas no caso brasileiro em análise.

Na literatura, parte significativa dos trabalhos direcionam o foco para a análise dos impactos da implementação do governo digital sobre a criação de valor público, isto é, os benefícios que a implementação proporciona à sociedade como um todo. Luna et al. (2024), por exemplo, investigaram as percepções dos cidadãos mexicanos sobre a criação de valor público por meio de serviços digitais com dados coletados através de grupos focais. Na mesma direção, Fan et al. (2022), buscaram observar os efeitos do governo digital sobre o bem-estar subjetivo dos cidadãos, utilizando a confiança como um indicador.

No entanto, a avaliação de impacto proposta neste relatório demanda a captação de variáveis menos abstratas, com resultados mais concretos e mensuráveis nas áreas econômica, social e ambiental. Uma exigência que, por vezes, encontra obstáculos como a indisponibilidade de dados. Han et al. (2023), por exemplo, analisam o impacto do governo digital sobre a qualidade do ar na China, usando indicadores de concentração de poluentes. Avotra et al. (2021) têm como foco o impacto das políticas de governo digital sobre a "responsabilidade social corporativa", mensurada através de indicadores de qualidade institucional e corrupção, com dados coletados de um survey próprio. Por último, Gan, Zhang e Zhang (2023) utilizam dados em nível das cidades para medir o impacto do governo digital no empreendedorismo na China, usando como indicador o número de novas empresas registradas.

De forma mais ampla, o Marco Metodológico de Medição de Impacto, desenvolvido para apoiar a Rede de Governo Eletrônico da América Latina e o Caribe (Rede GEALC), consiste em uma estratégia de avaliação que delimita impactos da digitalização dos serviços públicos em diferentes dimensões. Para tanto, são construídos indicadores de impactos relacionados a tempo, dinheiro, inclusão, meio ambiente, transporte público, confiança nas instituições, dentre outros. Para além da multidimensionalidade dos impactos, outra especificidade desta metodologia é a subdivisão por segmentos da sociedade, de modo que são pensados em diferentes indicadores para cidadãos, empresas e o governo (Banco Interamericano de Desenvolvimento, 2017).

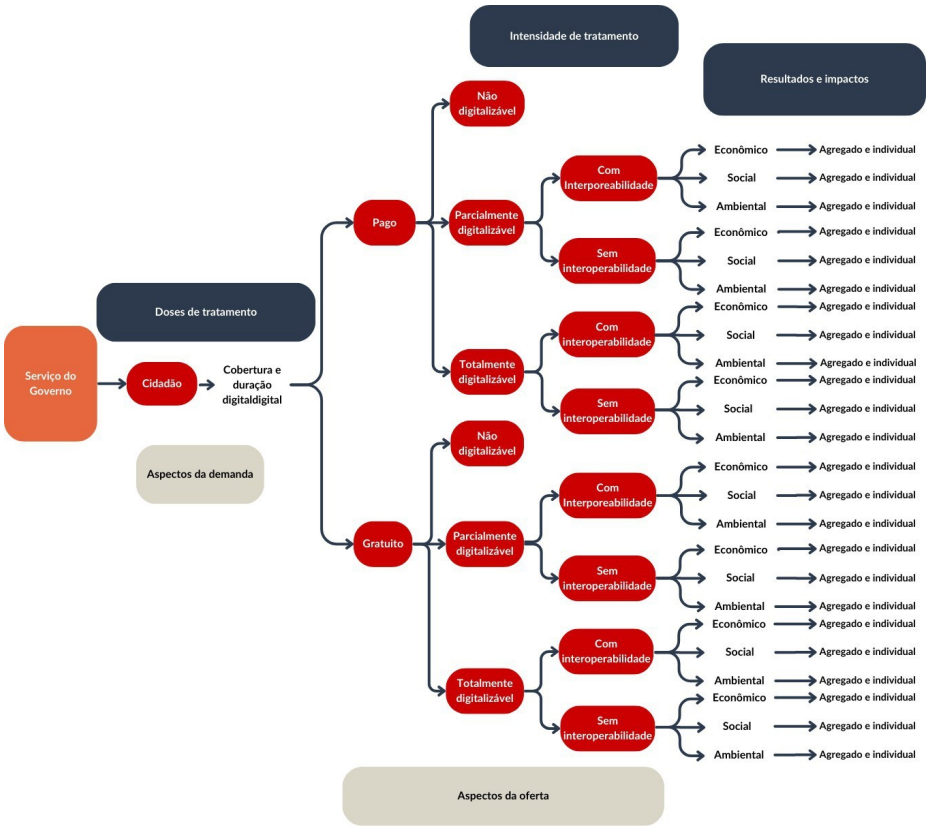
No caso proposto, indicadores de resultados nas dimensões econômica, social e ambiental precisam ser formulados para que seja possível uma avaliação abrangente da implementação de iniciativas de governo digital. Na dimensão econômica, os impactos podem ser observados por meio da redução de custos operacionais do governo, como gastos com transporte e logística, além do aumento do acesso a redes de informações que facilitam o emprego e oportunidades de negócios.

A digitalização também pode dinamizar microempresas, incentivando a abertura de novos empreendimentos, como demonstrado por Gan, Zhang e Zhang (2023). Além disso, a formalização dessas atividades econômicas no mercado de trabalho pode ter impactos significativos na arrecadação fiscal e na sustentabilidade financeira do setor público. Nesse sentido, pode ser relevante considerar indicadores específicos que capturem esses impactos, como o aumento na taxa de formalização de negócios, o crescimento da receita tributária devido à melhor fiscalização digital, e a taxa de adoção de tecnologias digitais por pequenas e médias empresas.

No que diz respeito à dimensão social, os indicadores podem abranger a inclusão social por meio da melhoria da cidadania digital e financeira, bem como da redução de assimetrias de informação entre diferentes grupos. Esses avanços ampliam o acesso equitativo a serviços digitais, fortalecendo, assim, a participação cidadã e a democracia participativa. Outra alternativa é analisar a redução de tempo proporcionada pela digitalização dos serviços, que elimina a necessidade de atendimento presencial. Essa mudança pode não apenas reduzir os custos de mobilidade e o custo de oportunidade para os cidadãos, mas também permitir que eles dediquem mais tempo a atividades produtivas ou de lazer. Outro indicador relevante é a taxa de adesão a programas governamentais por meio dos canais digitais, indo de encontro ao proposto por Marinho (2023).

Sobre a dimensão ambiental, é possível identificar efeitos positivos da digitalização, atrelados ao menor consumo de papel, redução nos custos de energia e transporte, além dos benefícios para a mobilidade urbana, decorrentes da redução da necessidade de deslocamentos físicos dos cidadãos para acessar os serviços públicos. Contudo, é importante destacar que também existem impactos negativos da digitalização para as mudanças climáticas. O aumento do consumo de energia e da produção de resíduos de Tecnologia da Informação e Comunicação (TIC), em função do ciclo de vida limitado e das constantes inovações que envolvem os produtos de TIC, são elementos que geram preocupações quanto aos efeitos de carbonização que podem resultar da transformação digital do governo (Banco Mundial, 2023).

No entanto, para além dos impactos diretos resultantes da implementação das políticas de governo digital, sejam eles sociais, econômicos ou ambientais, uma análise abrangente dos efeitos também inclui possíveis resultados indiretos. Esses resultados não são necessariamente previstos na etapa de planejamento da política, mas podem surgir como um efeito positivo delas. Nesse sentido, algumas possibilidades residem na mensuração de indicadores voltados para a transparência governamental e para a confiança que os cidadãos possuem nas instituições públicas. Esses aspectos são fundamentais para fortalecer o contrato social entre governos e cidadãos,



sustentando a legitimidade das políticas implementadas e incentivando uma maior participação democrática.

3. Desenho da pesquisa

A construção desta pesquisa parte de três elementos centrais: tipologia dos serviços; definições dos indicadores econômicos, sociais e ambientais; definição de dose e intensidade do tratamento; execução da simulação. É importante começar pela indicação da classificação dos serviços ofertados pelo GOV.BR. Além do segmento da sociedade, outra informação relevante para a avaliação de impacto refere-se ao órgão que oferta o serviço. A dosagem corresponde ao público-alvo do serviço, representando uma medida da parcela da população que aspectos da oferta que afetam a intensidade do tratamento, como o nível de digitalização do serviço, que indica quanto ele pode ser digitalizado. O outro elemento é a interoperabilidade, que sinaliza se o serviço está integrado à rede Conecta GOV.BR. A presença de interoperabilidade acarreta reduções nos tempos de espera e processamento das solicitações.

A Figura 1 reporta de forma esquemática a estratégia de avaliação acima descrita, para o segmento cidadão. Cumpre destacar que para os demais segmentos a figura é análoga, seguindo-se a mesma lógica.

Figura 1 – Tipologia dos Resultados e Impactos da digitalização dos serviços públicos brasileiros para o segmento Cidadão

Fonte: Elaboração própria.

Como observado, a definição de indicadores e o tratamento estatístico são elementos centrais para a avaliação de impactos almejada por este estudo. Nesse sentido, retoma-se a preocupação quanto à qualidade dos indicadores utilizados, tendo em vista a importância que eles apresentam para a medição de impacto, bem como o acompanhamento de políticas públicas. Os indicadores precisam apresentar algumas características que garantam sua relevância e utilidade prática. Assim, com base na literatura consultada, foi elaborada uma lista de indicadores relevantes, organizados segundo as dimensões econômica, social e ambiental. O Quadro 1 reporta uma breve descrição dos indicadores construídos

Quadro 1 – Indicadores de impacto econômico social e ambiental

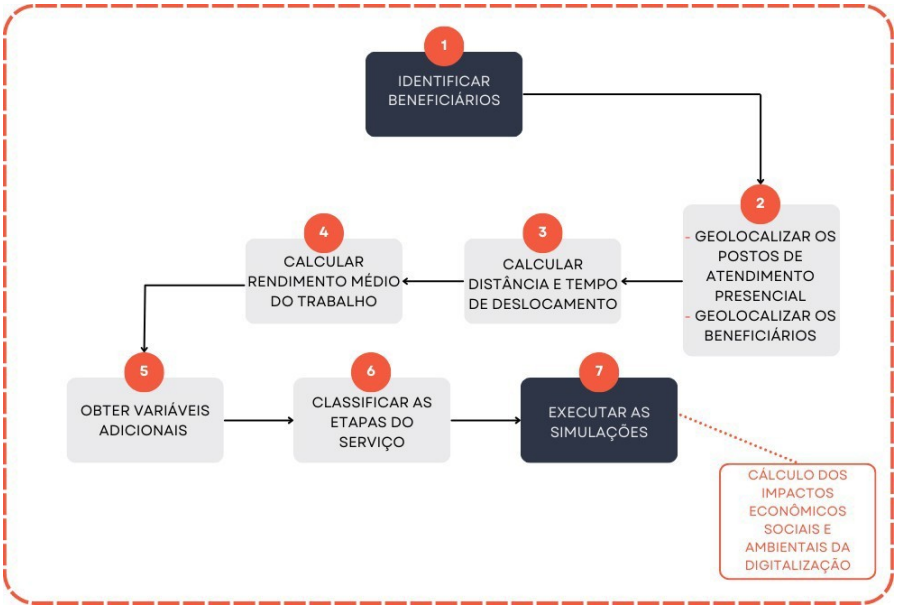
Dimensão	Indicador	Descrição
	Custo de Oportunidade do Tempo (Cidadãos)	Mede o benefício econômico para cidadãos, associado à redução do tempo gasto em serviços digitais comparado aos presenciais
	Produtividade (Empresas)	Mede o impacto da digitalização na produtividade empresarial, reduzindo o tempo para tramitação de processos

Econômico	Produtividade (Terceiro Setor)	Mede o impacto da digitalização na eficiência do terceiro setor, com base no tempo economizado
	Produtividade (Governo)	Avalia a produtividade governamental pela redução do tempo de tramitação, como provedor de serviços públicos
	Eficiência (Governo)	Mede os benefícios governamentais decorrentes da digitalização, aumentando a eficiência administrativa
	Gastos com Gasolina	Calcula a economia nos custos com combustível devido à redução dos deslocamentos para serviços presenciais
	Gastos com Passagens	Mede a redução nos custos com transporte público devido à eliminação de deslocamentos presenciais
	Gastos com Impressão	Avalia a redução nos custos de papel, tinta e toner com a substituição de documentos físicos por digitais
	Gastos com Armazenamento	Calcula a economia nos custos de estocagem de documentos físicos pela adoção de processos digitais
	Gastos com Energia	Mede o aumento nos custos de energia devido ao uso de dispositivos eletrônicos para acessar serviços digitais
	Gastos com Internet	Analisa o aumento dos custos com internet fixa e móvel associados ao uso de canais digitais
	Gastos com Aparelhos Eletrônicos	Calcula o custo adicional com a aquisição de aparelhos celulares para acessar serviços digitais
Social	Bem-Estar Social	Mede o tempo economizado pelos cidadãos com a digitalização, expressando ganhos de bem-estar em horas
	Exclusão por limitações de letramento digital	Refere-se à parcela da população que não acessa os serviços digitais por falta de habilidades
	Redução de assimetrias	Mede a qualidade das informações disponíveis no serviço digital, por meio da proporção de avaliações positivas
	Redução de congestão urbana	Mede a redução do volume de carros em circulação decorrente da digitalização
Ambiental	Redução de uso de papel (unidades de folhas de papéis)	Significa a redução do papel consumido em função da digitalização de processos e da substituição de documentos impressos por versões eletrônicas
	Redução de árvores cortadas para produção de papel	Refere-se à diminuição do impacto ambiental relacionado ao corte de árvores para produção de papel
	Redução do uso de tinta e toner (unidades de toners de 1000 impressões)	Mede a diminuição do consumo de tinta e toner, ao transitar para soluções digitais
	Redução do consumo de CO2 (kg de CO2)	É a redução das emissões de CO2 em função digitalização, por exemplo pela redução das idas presenciais
	Aumento do gasto energético (em kWh)	Refere-se ao aumento no consumo de energia elétrica devido ao uso de tecnologias digitais, como servidores, dispositivos móveis, centros de dados, entre outros

Fonte: Elaboração própria.

3.1 Dose e tratamento: cenários

Conforme discutido, a dose depende da cobertura do serviço digital, da duração (tempo) em que o serviço é ofertado por meio de canais digitais, e varia em intensidade de acordo com o grau de digitalização de suas etapas. Além disso, a dose também é influenciada pela intensidade de uso dos serviços digitais em relação a outros canais de prestação de serviços e pela interoperabilidade. Para fins de cálculo dos impactos, os resultados são agregados para cidadãos, empresas, governo e terceiro setor.



Considerando-se a ausência de informações sobre a parcela de usuários que demandam os serviços em canal digital, foram construídas duas simulações e dois cenários potenciais, que objetivam refletir o aumento da demanda por canais digitais e os benefícios da interoperabilidade.

Para efeitos das simulações foram construídas duas alternativas: A primeira simulação considera todas as etapas digitalizáveis como digitais, excluída a interoperabilidade; a segunda simulação também considera todas as etapas digitalizáveis como digitais, mas inclui a interoperabilidade, que se traduz em ganhos de tempo no preenchimento e na realização de serviços, além da otimização das etapas.

Para cada uma das simulações foram consideradas duas doses de tratamento, que refletem o percentual dos usuários do serviço por meio do canal digital, a saber: 25% e 90%. Em todos os cenários foram consideradas a intensidade máxima da digitalização e a duração, ambas para o período de um ano.

3.2 Roteiro para realização das simulações (Cookbook)

A partir de uma estrutura de etapas genéricas, o artefato possa ser aplicado a diversos serviços, com ajustes específicos conforme a disponibilidade de dados, o tipo de beneficiário e a infraestrutura de atendimento. A Figura 2 ilustra o processo que deve ser percorrido para realizar a simulação dos impactos resultantes da digitalização de um determinado serviço, em sequência são apresentados e brevemente discutidos cada um destes passos.**Figura 2 –** Roteiro para realização das simulações (Cookbook)

Fonte: Elaboração própria.

As etapas para a simulação seguem uma lógica estruturada, iniciando pela identificação dos beneficiários do serviço, que pode ser feita com base em dados cadastrais disponíveis ou, na ausência destes, a partir de listas públicas ou estimativas provenientes de fontes indiretas, como a RAIS ou cadastros administrativos. Em seguida, é necessário obter a localização dos pontos de atendimento e dos beneficiários, utilizando bases oficiais e ferramentas de geolocalização. Posteriormente, calcula-se o deslocamento necessário para o atendimento presencial, considerando distâncias e tempos estimados por ferramentas como APIs de mapas. Na sequência, utiliza-se o rendimento médio do trabalho, obtido em bases como a RAIS ou a Pesquisa Nacional por Amostra de Domicílios (PNAD-C), para calcular o salário-hora médio dos trabalhadores envolvidos no serviço.

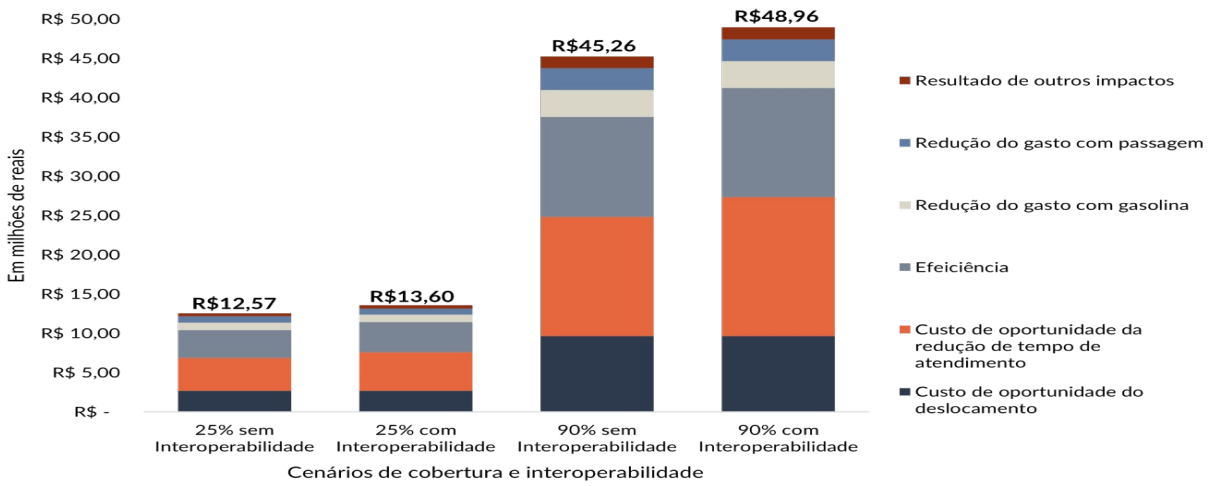
Outras variáveis relevantes, como custos e indicadores sociais e ambientais, devem ser coletadas de acordo com a especificidade do serviço analisado. As etapas do serviço, por sua vez, são classificadas em “digitalizáveis” ou “não digitalizáveis”, identificando ganhos potenciais relacionados à redução de deslocamentos e atividades presenciais. Por fim, com base nas variáveis obtidas, são calculados os indicadores de impacto econômico, social e ambiental, ajustando as fórmulas conforme a natureza do serviço, o perfil dos beneficiários e o tipo de atendimento envolvido.

3.3 Estudos de caso

Para este artigo, apresentamos as simulações de dois serviços ofertados por órgãos federais e publicados no Portal de Serviços Federais. Os serviços escolhidos foram: “Solicitar Aposentadoria por Idade, ofertado pelo Instituto Nacional do Seguro Social (INSS)” e” Obter Passaporte, ofertado pela Polícia Federal (PF)”.

Solicitar Aposentadoria por Idade subdivide-se em quatro serviços, sendo eles: Solicitar aposentadoria por Idade Urbana; Solicitar aposentadoria por idade Rural; Solicitar aposentadoria por Idade de Pessoa com Deficiência; e Solicitar aposentadoria por Idade - Acordo Internacional. Tais serviços são ofertados pelo INSS, que objetiva conceder o benefício social a cidadãos que possuem o tempo mínimo de contribuição de trabalho e/ou idade mínima estipulada por lei. O público-alvo é composto por idosos aptos à aposentadoria, não havendo recortes de renda ou grau de instrução. O serviço possui duas etapas, sendo ambas digitalizáveis e digitais. No ano de 2023, foram concedidos 914.528 benefícios e os dados foram obtidos em nível municipal.

Obter Passaporte é um serviço destinado aos cidadãos, que desejam emitir o passaporte para realizar viagens internacionais, sendo realizado pela Polícia Federal (PF). O passaporte é um documento de viagem internacional, que identifica o viajante e pode ser utilizado por brasileiros e não-brasileiros. São seis etapas para realização do serviço, sendo que cinco delas são digitalizáveis e quatro são digitais. Em 2023 foram 2.419.986 beneficiários, na qual os dados são desagregados por UF.



4. Resultados

4.1. Aposentadoria por idade

Os impactos econômicos foram reportados de forma agregada, a partir do somatório dos indicadores de: custo de oportunidade do deslocamento; custo de oportunidade do tempo de atendimento; eficiência; redução dos gastos com gasolina e passagem e outros impactos. A começar pelo serviço de Solicitar Aposentadoria por Idade (INSS), conforme ilustra o Gráfico 1, em um contexto com interoperabilidade, uma cobertura digital do serviço equivalente a 25%, pode gerar um impacto econômico positivo de cerca de R$13 milhões, já no cenário mais otimista, com 90% de cobertura digital, o ganho da digitalização seria superior a R$48 milhões. Na ausência de interoperabilidade os valores são próximos, porém, nos dois cenários, inferiores, indicando o benefício potencial dessa integração.

O ganho da digitalização, ao migrar de uma cobertura de 25% para uma de 90%, superou os R$ 30 milhões em ambos os cenários, com e sem interoperabilidade. Além disso, os benefícios da interoperabilidade mostram-se maiores no cenário de 90% de cobertura digital do serviço, superando 3 milhões de reais, em comparação ao cenário de cobertura digital inferior (25%), onde o ganho é de aproximadamente R$1 milhão. Adicionalmente, nota-se que os indicadores que se relacionam com ganhos de tempo, eficiência, custo de oportunidade do tempo de atendimento e custo de oportunidade do deslocamento, são os que possuem maior volume na composição do final do impacto.

Gráfico 1 – Impactos Econômicos simulados da digitalização, em diferentes cenários, do serviço Solicitar Aposentadoria por Idade, oferecido pelo INSS, em 2023

Fonte: Elaboração própria, com base nas simulações.

Os impactos sociais são compostos por indicadores que se traduzem em ganhos de bem-estar à sociedade, garantindo, por exemplo, maior equidade e inclusão no uso de plataformas digitais. É importante ressaltar que impactos sociais se diferem dos econômicos e, portanto, não se tem aqui o objetivo de quantificá-los em unidades monetárias. As horas poupadas com a digitalização dos serviços, seja por meio da redução da necessidade de deslocamento e/ou do tempo de atendimento, não necessariamente seriam despendidas em atividade laboral. O tempo ganho pode ser convertido em lazer, atividades de cuidado ou descanso, por exemplo, em todos esses casos, reduzi-lo ao ganho monetário, mostra-se limitante. Nesse sentido, os indicadores de impacto social apresentam unidades de medida diferentes, sendo eles: bem-estar social (em horas); exclusão digital, pela ausência ou insuficiência de habilidades digitais; redução de assimetrias; e redução da congestão urbana. É importante destacar que a exclusão digital possui três níveis que dependem da conjulgação de diversos fatores, como gênero, idade, perfil socio-econômico, interesse, habilidade, dentre outros Scheerder, van Deursen, van Dijk (2017),

A Tabela 1 mostra que, no cenário menos otimista, ou seja, com 25% de cobertura digital, a interoperabilidade produz um ganho para os usuários de aproximadamente 30 mil horas. Considerando-se os cenários com e sem interoperabilidade, o número de horas poupadas equivale a cerca de 370 mil horas e 400 mil horas, nesta ordem. Para o contexto mais otimista, 90% de cobertura, os ganhos com a interoperabilidade são ainda maiores, aproximando-se de 100 mil horas. Olhando-se para o montante de beneficiários excluídos digitalmente, nota-se que dos 914 mil beneficiários, quase 350 mil não possuem habilidades digitais básicas e, portanto, estão impossibilitados de utilizar o serviço em canal digital.

Sobre qualidade da informação e acessibilidade, 68% dos usuários que avaliaram o serviço, entendem que as informações disponíveis na página de acesso digital são úteis. Esse valor é acima da média dos serviços federais,

que é 46%, indicando que as informações estão bem colocadas, mas que há espaço para melhorias. Por apresentar apenas uma etapa digitalizável, em que há necessidade de deslocamento, no cenário mais otimista, quase 473 mil carros deixaram de estar na rua devido à digitalização do serviço, já no cenário de cobertura mais baixa (25%), observou-se uma redução da congestão urbana em cerca de 131 mil carros.

Tabela 1 – Impactos Sociais simulados da digitalização, em diferentes cenários, do serviço Solicitar Aposentadoria por Idade, oferecido pelo INSS, em 2023

Indicador de impacto social		**Cenário 1 – 25% de cobertura**	**Cenário 2 – 90% de cobertura**
Bem estar social - horas ganhas	Sem interoperabilidade	370 742	1.334 670
	Com interoperabilidade	399 386	1 437 789
Exclusão digital pelo Letramento Digital - Beneficiários potencialmente excluídos por falta de habilidades digitais		348 185	
Redução de assimetrias - nota de 0 a 1 da qualidade da informação do serviço		0,68	
Redução de congestão urbana - redução de carros na rua no ano pela digitalização do serviço		131 389	472 999

Fonte: Elaboração própria, com base nas simulações.

Também para os impactos ambientais, não se pretende monetizar os valores calculados. Para alguns impactos, como o aumento do gasto energético e as reduções no consumo de papel e tinta/toner, esse processo é trivial, bastando definir o preço dos produtos/serviços e, posteriormente, multiplicar pelo respectivo impacto, em unidades de kWh, folhas de papel ou toners de 1000 impressões. Para os demais indicadores, a precificação não pode ser feita de forma tão direta. Além disso, é relevante pensar no impacto dessas variáveis do ponto de vista da redução das emissões de CO2, em Kg, e do desmatamento, como o total de árvores poupadas.

Em se tratando do impacto de aumento do gasto energético, que é negativo na perspectiva ambiental, a Tabela 2 mostra que o serviço Solicitar Aposentadoria por Idade registrou um aumento de mais de 24 mil kWh, considerando-se o cenário sem interoperabilidade e com cobertura digital de 90%. Para o mesmo cenário, nota-se que a interoperabilidade promove ganhos, por meio de uma redução do gasto energético de cerca de 8 mil kWh. No cenário mais conservador, 20% de cobertura, os impactos são aproximadamente 25% dos valores em kWh, também neste caso, a interoperabilidade mostra-se benéfica.

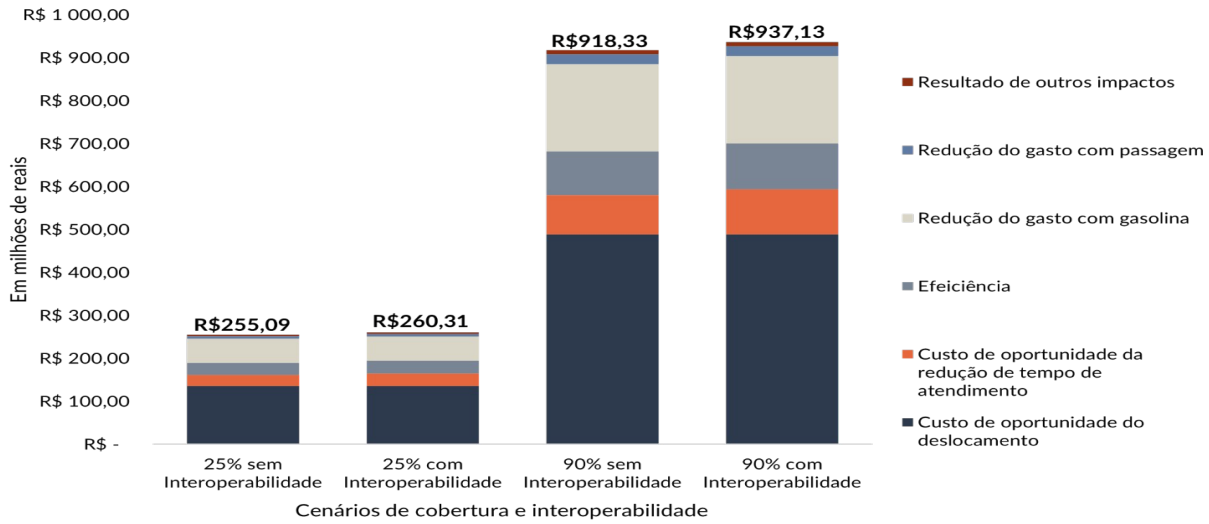
Considerando-se o cenário de maior cobertura digital, observam-se reduções interessantes no uso de papel, com quase 3,3 milhões a menos de unidades de folhas de papéis sendo utilizados, o que resulta em cerca de 4.280 árvores, que deixariam de ser cortadas. Também se verifica uma redução no consumo de tinta/toner. Ademais, tem-se uma redução do consumo de CO2 de cerca de 880 mil kg, muito justificada pela ausência da necessidade de deslocamento.

Tabela 2 – Impactos Ambientais simulados da digitalização, em diferentes cenários, do serviço Solicitar Aposentadoria por Idade, oferecido pelo INSS, em 2023

Indicador de impacto ambiental		**Cenário 1 – Cortura de 25%**	**Cenário 1 – Cortura de 90%**
Aumento do gasto energético (em kWh)	Sem interoperabilidade	6 716	24 178
	Com interoperabilidade	4 573	16 416
Redução de uso de papel (unidades de folhas de papéis)		914 525	3 292 290
Redução de árvores cortadas para produção de papel		1 189	4 280
Redução do uso de tinta e toner (unidades de toners de 1000 impressões)		791	2 846
Redução do consumo de CO2 (kg de CO2)		244 109	878 794

Fonte: Elaboração própria, com base nas simulações.

4.2. Obter passaporte



Sobre o serviço Obter Passaporte, ofertado pela PF, nota-se pelo Gráfico 2 dois aspectos fundamentais: o primeiro refere-se ao impacto econômico total ser substancialmente superior em todos os cenários simulados; o segundo é a composição deste impacto, que também diverge do serviço anterior. Nota-se que o custo de oportunidade do

deslocamento é o impacto de maior magnitude para este serviço, seguido pela redução do gasto com gasolina. Por se tratar de um serviço que apresenta um menor número de agências além de três vezes mais etapas, em comparação ao INSS, os custos associados ao deslocamento impulsionam de forma expressiva o impacto econômico total.

No contexto mais otimista, com 90% de cobertura digital, o impacto econômico é de R$918 milhões e R$937 milhões, considerando-se os cenários sem e com interoperabilidade, respectivamente. Nesse sentido, os ganhos econômicos da interoperabilidade são de cerca de R$19 milhões. Em relação ao cenário mais conservador, ou seja, com menor cobertura (25%), nota-se uma diferença que se aproxima dos R$700 milhões, havendo um ganho de interoperabilidade de aproximadamente R$5 milhões.

Um aspecto relevante é que se trata de um serviço pago. Caso for segmentado os impactos para os beneficiários e para a administração pública, a taxa de serviço deve ser levada em conta. Sendo assim, haveria uma redução do impacto econômico para os beneficiários e um aumento para a administração pública. Como exemplo, no cenário mais otimista, haveria um gasto de aproximadamente R$560 milhões com pagamento da taxa do serviço, contudo, o impacto aos beneficiários ainda assim seria positivo, aproximadamente R$260 milhões, sendo em média R$118,96 de benefício econômico. Já para a administração pública, haveria um ganho total de aproximadamente R$680 milhões.

Gráfico 2 – Impactos Econômicos simulados da digitalização, em diferentes cenários, do serviço Obter Passaporte, oferecido pela PF, em 2023

Fonte: Elaboração própria, com base nas simulações.

Além dos maiores ganhos econômicos, o serviço também apresentou maiores ganhos sociais, conforme se verifica na Tabela 3. Com a cobertura igual a 25% e sem interoperabilidade, há ganhos de mais de 8,6 milhões de horas, que podem ser convertidas em bem-estar social. Já no cenário de 90% de cobertura, os ganhos superam 31 milhões de horas. Mantendo-se a ordem dos cenários, a interoperabilidade gerou impactos positivos de cerca de 200 mil e 600 mil horas. Apesar de relevantes os ganhos com a interoperabilidade, cumpre destacar que o serviço Obter Passaporte, por ter muitas etapas e poucos postos de atendimento para realização do serviço, em termos relativos, apresenta o maior ganho de tempo associado à ausência de necessidade de deslocamento.

Adicionalmente, há uma redução da congestão urbana no cenário de 25% de cobertura que supera 1 milhão de carros, e que se aproxima dos 4 milhões de carros no cenário com 90% de cobertura digital do serviço. As informações mostram-se relativamente bem avaliadas, com 66% dos usuários avaliando que elas foram úteis. Por outro lado, cerca de 850 mil beneficiários estariam excluídos do uso digital desse serviço, em função da ausência ou de limitações no letramento digital.

Tabela 3 – Impactos Sociais simulados da digitalização, em diferentes cenários, do serviço Obter Passaporte, oferecido pela PF, em 2023

Indicador de impacto social		**Cenário 1 –**	**Cenário 2 –**
		Cobertura de 25%	**Cobertura de 90%**
Bem estar social - horas ganhas	Sem interoperabilidade	8 632 184	31 075 862
	Com interoperabilidade	8 808 641	31 711 108

Exclusão digital pelo Letramento Digital - Beneficiários potencialmente excluídos por falta de habilidades digitais	851 498	
Redução de assimetrias - nota de 0 a 1 da qualidade da informação do serviço	0,66	
Redução de congestão urbana - redução de carros na rua no ano pela digitalização do serviço	1 079 129	3 884 864

Fonte: Elaboração própria, com base nas simulações.

Por último, conforme reportado na Tabela 4, o serviço Obter Passaporte também apresentou os maiores impactos ambientais simulados, bem como econômicos e sociais. Isso ocorre por se tratar de um serviço que apresenta três vezes mais etapas que os demais e cuja distância que o beneficiário precisa percorrer para chegar a uma agência prestadora é, em média, maior.

Sobre o gasto energético, notam-se diferenças substanciais, advindas da interoperabilidade, considerando-se os cenários 1 e 2, os valores aproximam-se dos 11 mil kWh e 40 mil kWh, respectivamente. Mais uma vez a integração dos serviços apresenta um impacto ambiental relevante. Cerca de 22 milhões de folhas de papel deixariam de ser utilizadas e mais de 28 mil árvores seriam preservadas graças à digitalização dos processos. Ademais, também se observam reduções nos gastos com tinta/toner e nas emissões de CO2, que reduzem em mais de 14 milhões de Kg no cenário 1 e quase 53 milhões de Kg no cenário 2, em função da redução das necessidades de deslocamento.

Tabela 4 – Impactos Ambientais simulados da digitalização, em diferentes cenários, do serviço Obter Passaporte, oferecido pela PF, em 2023

Indicador de impacto ambiental		**Cenário 1 – Cobertura de 25%**	**Cenário 2 – Cobertura de 90%**
Aumento do gasto energético (em kWh)	Sem interoperabilidade	36 965	133 075
	Com interoperabilidade	25 168	90 604
Redução de uso de papel (unidades de folhas de papéis)		6 049 965	21 779 874
Redução de árvores cortadas para produção de papel		7 865	28 314
Redução do uso de tinta e toner (unidades de toners de 1000 impressões)		6 050	21 780
Redução do consumo de CO2 (kg de CO2)		14 676 551	52 835 582

Fonte: Elaboração própria, com base nas simulações.

5. Discussão

Os resultados apresentados mostram que a implementação do governo digital no Brasil possui impactos expressivos em termos econômicos, sociais e ambientais. As simulações indicam que avanços na digitalização dos serviços públicos podem gerar impactos ambientais relevantes, sobretudo a partir de reduções do desmatamento e das emissões de CO2. Destaca-se que existe uma contrapartida da emissão de gases de efeito estufa que, apesar de não ter sido considerada nas simulações, mostra-se importante. Trata-se de uma tendência de aumento das emissões em função da maior necessidade de armazenamento de dados e de uso de aparelhos tecnologicamente mais potentes. Nesse sentido, mesmo diante das limitações, destaca-se que a digitalização tem potencial para contribuir com políticas de transição verde.

O artefato apresentado oferece algumas possibilidades de aperfeiçoamento, que podem ser exploradas em desenvolvimentos futuros. A começar pelo rendimento médio cujo recorte dá-se apenas por Unidade Federativa (UF), sendo possível a inclusão de outras variáveis do público-alvo dos serviços, como idade, sexo e renda, especialmente para serviços voltados à população mais vulnerável. Outra possibilidade é o cálculo do rendimento médio para eficiência, levando em conta o salário médio-hora dos órgãos federais que oferecem o(s) serviço(s) em análise, que pode ser viabilizado a partir dos dados da RAIS. Pode-se calcular ainda o rendimento médio da produtividade para os serviços destinados a empresas, governos ou terceiro setor, também com base nos dados da RAIS. Em todos os casos, a obtenção de um impacto mais desagregado mostra-se interessante para se pensar o planejamento de políticas ou de avaliações direcionadas a públicos específicos.

O tempo de atendimento na realização dos serviços é outro aspecto que oferece oportunidades para melhorias. É possível, por exemplo, segmentar os serviços de acordo com o público-alvo, isso porque serviços voltados à população mais idosa e carente podem ter ganhos de tempo menores com a digitalização em comparação com serviços voltados à população de alta renda e em idade ativa. Além disso, a complexidade do serviço também pode influenciar no ganho de tempo, sendo necessário mapear as etapas do atendimento antes da digitalização para prever melhor tais mudanças. No que diz respeito à distância percorrida, seria possível diferenciar o tempo de deslocamento de acordo com o modal de transporte. No entanto, o tipo de transporte pode variar conforme as

diferentes regiões e classes sociais. Considerar esses elementos aumenta a complexidade do modelo, mas também assegura maior precisão nas simulações.

Em relação ao custo e à sustentabilidade da digitalização, alguns pontos também merecem atenção. O preço da passagem utilizado nas simulações refere-se apenas ao transporte intraurbano, o que pode não refletir a realidade de municípios menores ou de deslocamentos intermunicipais. Nesse caso, seria necessário a construção de uma base de dados detalhada sobre as tarifas de ônibus intermunicipais. O consumo de energia de dispositivos móveis ao utilizar serviços digitais também precisa ser melhor explorado. O custo de armazenagem e processamento em máquinas TIC, a segurança cibernética e a produção de lixo eletrônico não foram abordadas neste estudo. Contudo, esses aspectos são fundamentais para uma compreensão mais ampla e detalhada dos impactos gerados pela digitalização dos serviços públicos.

Se vislumbra como possibilidade de evolução e por conseguinte novos trabalhos futuros relacionados a metodologia de mensuração de impacto de Governo Digital, questões como a avaliação, adoção e uso do cidadão (*demand side*), avaliação de impactos do governo digital na agenda 2030, uma maior automação da medição e a adoção de inteligência artificial na ferramenta, juntamente com avaliação da aplicação de tecnologias emergentes, a avaliação de múltiplos canais de entrega de serviços, dentre outros. Oportunamente há interações iniciais com a Divisão de Administração Pública das Nações Unidas e com a Escola Nacional de Administração Pública com vistas a uma maior aplicação em serviços públicos, bem como evolução da metodologia e de seu artefato.

6. Considerações Finais

Em se tratando da proposta metodológica, cumpre destacar o caráter inovador, com o desenvolvimento de um instrumento capaz de avaliar os impactos econômicos, sociais e ambientais da iniciativa, considerando diferentes segmentos da sociedade, a saber: cidadãos, empresas, terceiro setor e governo. Além disso, esse artefato demonstra sua versatilidade ao ser aplicável a diferentes serviços públicos digitais, conforme evidenciado nos estudos de caso.

Além disso, é importante ressaltar que, apesar do esforço dedicado à busca de informações em diferentes bancos de dados secundários, indicadores relevantes acabaram não sendo incorporados devido à indisponibilidade, dificuldades de acesso à base de dados ou ausência de dados, que compromete a factibilidade prática dos mesmos. Um exemplo disso é a ausência de indicadores de impacto associados ao custo de armazenagem e de processamento em máquinas TIC, lixo eletrônico, cidadania, transparência/accountability, entre outros.

Resumo: O artigo apresenta uma Revisão Sistemática da Literatura sobre a adoção de soluções de inteligência artificial (IA) como ferramenta de apoio à tomada de decisão na administração pública, destacando como essa tecnologia pode contribuir para modernizar os processos de gestão governamental. O levantamento de 38 artigos sobre inteligência artificial aplicada à tomada de decisão destaca sua versatilidade em diversas áreas, incluindo governança, serviços sociais, saúde, meio ambiente, justiça e orçamento público. Na governança, enfatizam-se a transparência, a explicabilidade e a supervisão humana, essenciais para decisões automatizadas confiáveis. Serviços sociais enfrentam desafios éticos, como impactos no bem-estar dos trabalhadores e desumanização do atendimento. Na saúde, IA otimiza cadeias de suprimentos e resposta a crises, enquanto na justiça, melhora a análise de dados e a prevenção de crimes. Na operação de sistemas de energia e em sistemas ambientais o foco está na eficiência e precisão. Embora a inteligência artificial tenha um enorme potencial para transformar a gestão pública, seu uso requer uma análise criteriosa de questões éticas, governança e transparência. Problemas como viés algorítmico e ausência de supervisão reforçam a importância de regulamentações adequadas e de diferentes abordagens que integrem a tecnologia com a supervisão humana.

Palavras-chave: Processo Decisório. Informação. Tratamento de dados. Gestão de processos. Governança.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.997

1. Introdução

A administração pública enfrenta desafios cada vez mais complexos, impulsionados pelas mudanças sociais e econômicas e pela necessidade de oferecer serviços mais eficientes e acessíveis. A recente disseminação de soluções de inteligência artificial generativa deu renovado impulso às discussões sobre o uso de soluções baseadas em IA na administração pública, para modernizar os processos de gestão governamental (Pereira *et al.*, 2021),

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

reduzindo custos e tornando-os mais eficientes e acessíveis (Brynjolfsson; McAfee, 2014) (O'Reilly, 2010) e, assim, atender melhor aos cidadãos, o que fortalece a confiança na governança (Denhardt & Denhardt, 2015).

Em 2021 foi lançada a Estratégia Brasileira de Inteligência Artificial e seus eixos temáticos, com a expectativa de permitir "que o Estado supere obstáculos burocráticos e restrições orçamentários para oferecer serviços novos, melhores e mais eficientes à população" (MCTI, 2021, p. 41). Em 2024 foi lançado o Plano Brasileiro de Inteligência Artificial (PBIA) 2024-2028 (Governo Federal do Brasil, 2024), enfatizando investimentos em infraestrutura, qualificação e avanços tecnológicos em área de IA. Essas iniciativas reforçam a necessidade de entender as funcionalidades e os impactos dessas ferramentas na administração pública em diferentes contextos, minimizando os impactos negativos de decisões equivocadas, que podem comprometer recursos, desperdiçar oportunidades, falhar em responder a ameaças ou não alcançar objetivos específicos (Maximiano, 2020). Ainda assim, as pesquisas sobre IA no governo ainda são escassas (de Sousa et al., 2019). Conforme Sampaio et al. (2024, p. 47), "é indispensável um esforço conjunto da comunidade científica nacional para questionar e superar os paradigmas tecnológicos e científicos estabelecidos". Para preencher este gap, esta pesquisa investiga as potencialidades, usos e desafios relacionados com a implantação de soluções baseadas em IA como uma ferramenta de apoio à tomada de decisão no setor público. Neste artigo, entendemos "tomada de decisão" o processo cognitivo e organizacional de escolha entre alternativas, que pode ser influenciado — ou mesmo substituído — por sistemas algorítmicos. Para tanto, foi realizada em revisão sistemática de literatura. Os resultados apontados contribuem para o entendimento de como as funcionalidades de IA auxiliam a gestão pública a se transformar em um ambiente mais dinâmico, transparente e inovado, mas também apontam os desafios e limitações relacionados à incorporação de tais tecnologias, aspectos muitas vezes negligenciados em estudos que privilegiam a eficiência técnica. A originalidade reside na articulação entre fundamentos filosóficos e práticos, oferecendo uma perspectiva crítica integradora ainda pouco explorada na literatura.

Na sequência é apresentada a revisão teórica e o percurso metodológico. Em seguida apresentam-se e discutem-se os resultados. Por fim, apresentam-se as conclusões do trabalho.

2. Tomada de decisão e inteligência artificial

A tomada de decisão em organizações requer uma abordagem estruturada para garantir escolhas bem fundamentadas e alinhadas aos objetivos estratégicos. De acordo com Simon (1997), o ciclo inicial do processo decisório é composto por etapas que envolvem a identificação do problema ou oportunidade, a coleta de informações, sua análise detalhada e a definição de alternativas para solucionar a questão. Souza e Brito (2024) propõe o Ciclo 1 - Pré-tomada de decisões, que aborda etapas para embasar decisões estratégicas. Inicialmente, é necessário compreender a situação atual, avaliando pontos positivos e negativos para definir ações corretivas ou preventivas. Em seguida, ocorre a coleta de informações qualitativas e quantitativas de diversas fontes, garantindo uma visão abrangente do problema. Essas informações são analisadas para identificar padrões, tendências e desvios que fundamentem as decisões. Com base nas análises, são propostas alternativas inovadoras, utilizando ferramentas tecnológicas, como sistemas de análise de dados e simulações, para explorar cenários e facilitar a compreensão das ações planejadas.

Na investigação sobre a influência da inteligência artificial no setor público, Silva, Silva e Rabêlo (2021) chegam à mesma conclusão, destacando que existem diversas maneiras de aplicar as ferramentas de inteligência artificial na administração pública, como interfaces de usuário, interação humano-computador para tarefas repetitivas como entrada de dados, agentes virtuais (como chatbots e avatares), análise preditiva baseada em machine learning, visualização de dados e softwares integrados a big data para análises avançadas.

Denhardt e Denhardt (2015) reiteram que a administração pública deve focar no serviço ao cidadão, enfatizando que decisões eficazes melhoram diretamente a qualidade dos serviços e fortalecem a confiança na governança. Brynjolfsson e McAfee (2014) citam que as tecnologias digitais têm permitido aos governos diminuírem os custos operacionais enquanto aprimoram a qualidade dos serviços prestados e aumentam a eficiência em suas atividades.

3. Procedimentos metodológicos

Para esta pesquisa foi adotada uma abordagem qualitativa por meio de uma Revisão Bibliográfica Sistemática (RBS), cujas etapas de entrada (definição do problema e *strings* de busca), processamento (aplicação de critérios de inclusão e filtros) e saída (análise de dados e síntese dos resultados) promovem uma análise rigorosa e sistemática, que é essencial para garantir a qualidade e a relevância dos resultados obtidos (Conforto et al., 2011). A pergunta que orientou esta RBS foi: Como a inteligência artificial está sendo utilizada na tomada de decisão pública?

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Os artigos foram pesquisados na base de dados Web Of Science, em novembro de 2024. A estratégia de busca contemplou os seguintes termos: (TS=("artificial intelligence") AND TS=("smart cit*" OR "government" OR "public sector" OR "public policy" OR "public administration") AND TI=("decision making")) AND (DT==("ARTICLE" OR "PROCEEDINGS PAPER")), considerando o período de 2019 a 2024. Foram utilizados termos em inglês para ampliar o alcance da pesquisa, considerando que mesmo artigos originalmente escritos em outros idiomas trazem título, resumo e palavras-chave nesse idioma.

Foram recuperados 66 artigos. As informações sobre os textos foram consolidadas em uma única planilha e organizados no software Microsoft Excel. Os títulos e resumos dos artigos foram lidos e avaliados. Um artigo foi excluído por ter sido retratado. Mais vinte e sete artigos foram excluídos, onze por não abordarem o tema de administração pública, treze por não disponibilizarem o texto completo e três por não abordarem inteligência artificial. Assim, o corpus da revisão contém 38 artigos, que foram lidos integralmente. O fluxograma da metodologia empregada pode ser visualizado na figura 1.

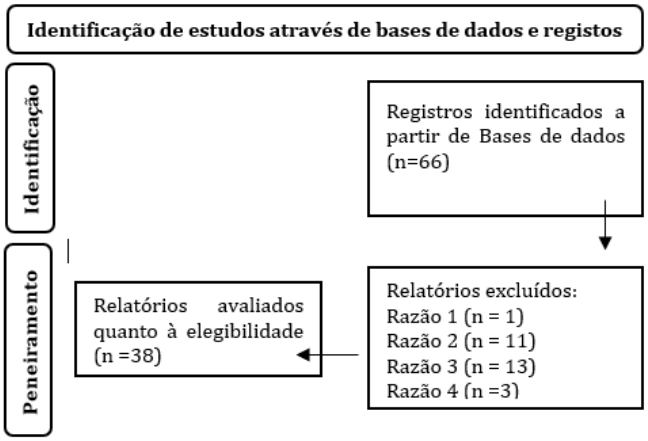

Figura 1 – Fluxograma da metodologia empregada.
Fonte: Os autores.

Os dados coletados permitiram análises quantitativas descritivas para identificar a distribuição de publicações ao longo de período. A leitura integralmente dos 38 artigos do corpus, apoiada pela técnica de análise de conteúdo (Bardin, 2010) permitiu identificar padrões, temas e categorias relevantes nos artigos.

4. Apresentação e análise dos resultados

A Figura 2 apresenta a evolução temporal dos 38 estudos selecionados. O estudo mais antigo é do ano de 2019, enquanto o mais recente é de 2024, abrangendo um período de seis anos de produção científica sobre o tema.

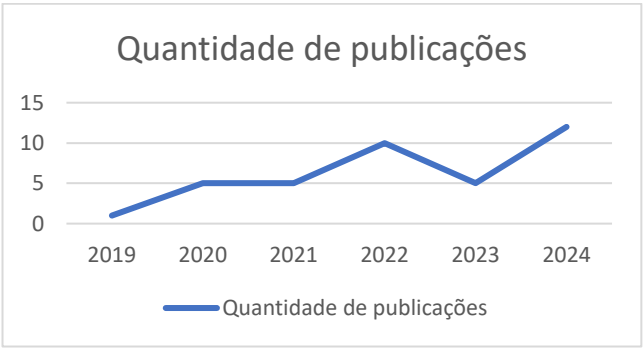

Figura. 2 Quantidade de publicações por ano.

Fonte: Os autores.

Na análise da evolução temporal das publicações, conforme figura 2, parece existir uma tendência de crescimento no número de publicações. O primeiro ano do período analisado, 2019, apresentou um número inicial modesto de apenas 1 publicação, seguido por um crescimento em 2020, com 5 publicações. Em 2021, manteve a quantidade, com 5 publicações, enquanto em 2022 atingiu 10 publicações. No entanto, em 2023, houve uma queda, com apenas 5 publicações, e em 2024 atingiu 12 publicações. Esses dados, mesmo com oscilações, sugerem uma tendência de

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

crescimento no interesse pela temática, evidenciada pelos picos em 2022 e 2024, indicando que o tema permanece relevante e ativo na literatura científica.

Quanto ao uso de IA para a tomada de decisão, identificou-se que ela tem sido aplicada em diferentes setores da administração pública. A tabela 1 sintetiza as principais informações dos artigos analisados, destacando a área de atuação e as respectivas funcionalidades ou funções, permitindo uma visão panorâmica dos usos.

Tabela 1 –Áreas de atuação e funcionalidades.

Área de Atuação	Funcionalidades/Função	Autores
Políticas Públicas, Cidades Inteligentes	Apoio à decisão política baseada em evidências tomada de decisão.	Mills et al. (2022).
Cidades Inteligentes	Tomada de decisão inteligente; Métodos de decisão aplicados em projetos de cidades inteligentes; Governança inteligente e decisão mediada por IA; Inovação social; Avaliação do impacto de respostas automatizadas na decisão cidadão.	Tayeb et al. (2024); Giang et al. (2019); Bokhari & Myeong (2022; 2023); Wang et al. (2024).
Redes e Telecomunicações	Decisão para redes autônomas em 6G e IoT.	Liu et al. (2021).
Governança	Apoio à decisão pública integrando IA e multidões; Análise da tomada de decisão algorítmica em serviços públicos; Estratégias para explicação da decisão algorítmica; Governança e desafios da IA no setor público; Transparência algorítmica e confiança nas decisões automatizadas. Setor Público	Modelo integrado para decisões sustentáveis no setor público, Ferramenta para suportar decisões; Estruturas responsáveis para IA no setor público.	Wilson & van der Velden (2022), Fischer-Abaigar et al. (2024); Hirvonen (2024).
Administração Pública	Desafios na transição para gestão sem papel com IA; Automação; Suporte à decisão algorítmica e a gestão de trabalhadores; Interação humano- IA e viés de automação.	Gelashvili & Pappel (2021); Monarcha-Matlak (2021); Doring et al. (2024); Alon-Barkat & Busuioc (2023).
Governo	Uso de IA para aprimorar a tomada de decisão; Decisão racional em e-Gov.	Di Vaio et al. (2022); Salem et al. (2024).
Psicologia	Percepção cidadã da IA em decisões governamentais.	Ingrams et al. (2021).
Serviços Sociais	Discrição digital; Mapeamento de decisões automatizadas.	Ranerup & Henriksen (2022); Sleep (2024).
Meio Ambiente	Aplicação de IA para decisões baseadas em evidências ambientais; Gestão de danos causados por inundações.	Choi et al. (2021); Zabihi et al. (2023).
Energia	Gestão energética; Modelagem de desempenho energético.	Ban (2020); Seyedzadeh et al. (2020).
Saúde	Cadeias de suprimentos; Pandemia.	Virmani et al. (2024); Deveci (2023); Mourby (2020); Guo et al. (2022).
Finanças	Orçamento governamental; Processos de recuperação de dívidas.	Valle-Cruz et al. (2022); Rinta-Kahila et al. (2022).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Direito	Impacto da IA nas decisões jurídicas.	Kolkman et al. (2024).
Segurança Pública	Sistemas inteligentes para prevenção de crimes.	Choi et al. (2024).

Seis artigos abordam métodos para a tomada de decisão inteligente. Mills et al. (2022) discutem a tomada de decisão baseada em evidências para políticas públicas, explorando como a teoria existente contribui para a sustentabilidade urbana, os autores também complementam que uma tomada de decisão mais eficiente, inclusiva e cooperativa é um componente essencial das definições e das práticas implementadas em cidades inteligentes. Já Tayeb et al. (2024) destacam um modelo mediado por IA focando em como a tecnologia pode aprimorar a tomada de decisões inteligentes em cidades através de abordagens analíticas. Os autores utilizam a teoria cognitiva social e a teoria do medo integrado para investigar como o uso de IA impacta a tomada de decisões inteligentes.

Giang Tran et al. (2019) realizaram uma revisão sistemática dos métodos aplicados em projetos de cidades inteligentes: "os métodos de tomada de decisão foram classificados em quatro grupos: tomada de decisão multicritério (MCDM), programação matemática (MP), inteligência artificial (IA) e métodos integrados (MI)" (Giang Tran et al., 2019, pg 434). Os autores concluem que "MCDM é um método popular em todos os níveis de tomada de decisão e em todos os estágios de projetos de cidades inteligentes. Enquanto isso, MP e IA são amplamente usados para tomar decisões operacionais e táticas" (Giang Tran et al., 2019, pg 444). Já Bokhari e Myeong (2022) enfocam o uso da IA como uma perspectiva de inovação social para promover decisões mais eficazes.

Wang et al. (2024) trazem um diferencial ao analisar a interação entre cidadãos e decisões automatizadas, investigando as respostas automatizadas em contatos iniciados por usuários. Este trabalho diferencia sistemas de IA baseados em regras e em aprendizagem, analisando também fatores contextuais como percepção do governo, canais de comunicação, propósito do contato e a complexidade ou urgência do tema do lado do cidadão. Liu et al. (2021), que também analisam a tomada de decisão inteligente, exploram redes de 6G auto evolutivas, destacando como estas podem possibilitar decisões automatizadas em larga escala no contexto de IoT massivo, que "consiste em cidade inteligente, agricultura digital, tráfego inteligente, etc." (Lui et al. 2021, pg 1).

Monarcha-Matlak (2021) trata da tomada de decisão automatizada na administração pública, evidenciando os desafios e as vantagens desse processo. Dentre as preocupações mencionadas por este trabalho diz respeito aos algoritmos empregados em decisões administrativas, que devem passar por monitoramento, revisão e validação contínuos por funcionários da administração pública, garantindo supervisão humana no processo. A mesma preocupação pode ser observada no estudo de caso de Rinta-Kahila et al. (2022), que analisaram os impactos negativos da automação em processos de cobrança de dívidas destacando como a transferência de responsabilidades para os cidadãos e a redução da supervisão humana resultaram em decisões algorítmicas imprecisas e prejudiciais. Eles explicam que o sistema automatizado enviava notificações de dívidas sem revisão, gerando consequências adversas para cidadãos, funcionários e o governo, incluindo perda de confiança pública e prejuízos financeiros. Esse caso evidencia os riscos éticos e morais de decisões financeiras automatizadas e acabou levando à suspensão do programa analisado.

Na área de governança, há uma crescente preocupação com a aplicação sustentável da inteligência artificial, levando em consideração desafios éticos e sociais. Bokhari e Myeong (2023) citam que "para utilizar as vantagens dos sistemas de IA e IoT para tomada de decisão inteligente, os governos municipais devem ter a confiança para realmente aceitá-los", e ainda complementam que governança inteligente é fundamental para gerenciar dados, promover transparência e garantir que as decisões automatizadas estejam alinhadas com os interesses públicos. Wilson e van der Velden (2022), por sua vez, propõem um modelo integrado para a aplicação sustentável da IA na governança pública, apresentando cinco condições de contorno para IA sustentável que o setor público deve almejar: i) diversidade e inclusão; ii) capacidade de aprendizado, transparência e explicabilidade; iii) capacidade de auto-organização, agência e responsabilização; iv) significado comum e valores incorporados; e v) confiança sistêmica e implícita. Kuziemski e Misuraca (2020) analisaram três estudos de casos, examinando a governança de IA em ambientes democráticos, abordando as tensões entre automação e supervisão humana, considerando que um modelo eficaz de governança de IA precisa garantir transparência, responsabilidade e supervisão contínua, particularmente no uso de sistemas de tomada de decisão automatizada no setor público. Liu, Tang e Chen (2020) abordam a governança como um processo participativo e inclusivo, destacando a integração da inteligência artificial com a inteligência coletiva das multidões, combinação que permite o uso de mecanismos de engajamento público para fortalecer a governança democrática, promovendo decisões que refletem de forma mais ampla os interesses e necessidades da sociedade.

Outro tema citado nos artigos é transparência e responsabilidade, englobando aspectos legais, técnicos e éticos, como responsabilização, auditoria, confiabilidade, explicabilidade, publicidade de atos, mitigação de vieses e direito de acesso. Hirvonen (2024) aborda os desafios e propostas para responsabilização e segurança no uso de sistemas de decisão automatizada (ADM) no setor público, e complementa que regras legais podem promover seu

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

uso seguro. Ingrams, et al. (2021) exploram percepções cidadãs sobre o uso de IA na tomada de decisão governamental, enfatizando o papel da confiança. Grimmelikhuijsen (2023) descobriu que o efeito do fato de o tomador de decisão ser um humano ou uma IA na confiança é significativo em todas as dimensões da confiança, o que mostra que um tomador de decisão humano é percebido como mais confiável para executar tal decisão em termos de competência, honestidade e benevolência. Esses autores destacam que a confiança no uso de sistemas de decisão automatizada no setor público depende de fatores como responsabilidade, transparência e percepções cidadãs, com a preferência por tomadores de decisão humanos sendo associada a maior credibilidade em termos de competência, honestidade e benevolência.

De Bruijn, Warnier e Janssen (2022) abordam os desafios e estratégias para explicar decisões algorítmicas de forma compreensível, considerando que a adoção de soluções de IA em decisões governamentais enfrenta desafios sociotécnicos complexos, incluindo a dificuldade de explicar algoritmos ao público, a politização do contexto e o impacto significativo das decisões. A pesquisa, ainda, sugere estratégias para ampliar o foco da IA explicável, indo além da opacidade técnica e integrando aspectos sociais, como confiança, legitimidade e processos explicáveis, ao invés de apenas algoritmos. Ainda nesse mesmo contexto, Frost (2024) analisa como a "publicidade empobrecida" das decisões algorítmicas afeta o engajamento público, e com o aprendizado da máquina, afeta ainda mais esse processo, dificultando a capacidade das burocracias de promover uma interação verdadeira entre a administração e as comunidades políticas.

Alon-Barkat e Busuioc (2023), investigam como tomadores de decisão públicos processam conselhos algorítmicos, identificando dois vieses: viés de automação (tomadores de decisão podem adotar automaticamente algoritmos, mesmo quando estes oferecem conselhos errados ou reforçam estereótipos, ignorando informações contraditórias), pouco observado, e adesão seletiva (que ocorre quando os algoritmos reforçam estereótipos). Embora a confiança nos algoritmos possa crescer com a exposição repetida, o estudo alerta para o risco de viés na interação humano-IA e destaca a necessidade de supervisão humana para evitar falhas algorítmicas. Warthon (2024), por sua vez, aborda as dificuldades para lidar com o direito de acesso à informação, devido ao controle limitado sobre os sistemas de IA e à falta de conhecimento sobre a lógica do sistema.

Janssen et al. (2022) examinam se a falta de entendimento dos algoritmos pode impedir os tomadores de decisão de avaliar corretamente os resultados, comprometendo a qualidade das escolhas feitas: “garantir a capacidade de entender e rastrear decisões não é suficiente para evitar todos os erros e tomar apenas decisões corretas” (Janessen et al. 2022, pg 478). Os autores confirmam a importância da explicabilidade para garantir que as decisões apoiadas por IA sejam transparentes e compreensíveis; para estes autores, mesmo que a explicabilidade por si só não garanta transparência e melhores decisões, ela desempenhou um papel importante na obtenção de decisões mais precisas

A recorrência deste tema nos artigos selecionados evidencia a crescente complexidade e os riscos associados à implementação de sistemas de IA na administração pública, especialmente no que se refere à transparência, à responsabilidade e à necessidade de uma supervisão humana eficaz para garantir a confiabilidade e a equidade das decisões algorítmicas. Três artigos trazem um foco na aplicação de tecnologias de tomada de decisão automatizada nos serviços sociais, Ranerup e Henriksen (2022) investigaram a discrição digital nos serviços sociais, destacando o papel crescente da automação nas decisões, enquanto os assistentes sociais ainda mantêm a responsabilidade final, eles propõem um modelo híbrido de colaboração entre humanos e tecnologia. Doring et al. (2024), conduzem um experimento para avaliar o impacto de uma ferramenta de apoio à decisão algorítmica na força de trabalho dos serviços sociais, destacando como o uso de algoritmos pode gerar um impacto negativo sobre o bem-estar dos trabalhadores, tornando-os mais cínicos e fatigados, considerando ainda que a adoção de novas ferramentas “coloca uma pressão severa sobre seus membros, razão pela qual a mudança precisa não apenas ser gerenciada, mas também planejada estrategicamente” (Doring et al. 2024, pg 10). Sleep (2024) adota uma abordagem crítica ao mapear os efeitos da tomada de decisão automatizada nos serviços sociais, argumentando que a automação pode desumanizar os serviços e criar distâncias entre os profissionais e os usuários.

Os artigos de Di Vaio et al. (2022) e Salem et al. (2024) também exploram o uso de inteligência artificial (IA) e aprendizado de máquina na tomada de decisões no setor público. Di Vaio et al. (2022), a partir de uma análise bibliométrica, apontam como a IA melhora a eficácia na gestão pública, tornando as decisões mais eficientes e transparentes. Já Salem et al. (2024) investigam como o aprendizado de máquina aprimora a racionalidade e confiança nas decisões do governo eletrônico, ao possibilitar decisões mais fundamentadas e reduzir vieses. Ainda que seu trabalho tenha uma perspectiva otimista sobre tais tecnologias, estes autores também enfatizam a necessidade de regulamentação para garantir uma adoção segura dessas tecnologias. Já no estudo de Fischer-Abaigar et al. (2024) “foi descoberto que abordagens padrão de aprendizado de máquina não são necessariamente adequadas para o contexto do setor público, exigindo que os designers de modelos expandam seu kit de ferramentas para abordar efetivamente essas questões”. Fischer-Abaigar et al. (2024), ainda defendem uma mudança no enfoque da modelagem de dados, sugerindo que a atenção deixe de ser apenas voltada para a precisão preditiva e passe a focar na melhoria dos resultados da tomada de decisão. Para isso, apresentam abordagens

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

alternativas de modelagem, como métodos de aprendizado de máquina causal, previsão contrafactual e aprendizado de política, que podem ser mais eficazes para informar decisões.

Dois artigos analisam o uso da IA para a tomada de decisão na gestão ambiental. Zabihi et al. (2023) propõem um sistema para responder a enchentes, com "monitoramento, previsão e controle" enquanto Choi et al. (2021) utilizam algoritmos para prever algas nocivas. Ambos destacam melhorias na eficiência e precisão para tomada de decisão.

Seyedzadeh et al. (2020) e Ban (2020) exploram o uso de inteligência artificial para suporte à tomada de decisão em sistemas de energia. Ban (2020) trata de gerenciamento de energia para uma cidade inteligente, como modelo de estudo usou uma siderúrgica, otimizando consumo e reduzindo desperdícios. E, Seyedzadeh et al. (2020), propõe um modelo de aprendizado de máquina para prever o desempenho energético de edifícios não residenciais, permitindo intervenções mais precisas e eficientes para maximizar a economia de energia e reduzir custos operacionais, apesar do modelo estudado seguir as regulamentações da Europa os autores afirmam que "o modelo pode ser apropriado para análise de estoque de edifícios que não é limitado por nenhum país anfitrião" (Seyedzadeh et al. 2020, pg 15).

Na área de saúde e logística, Deveci (2023) analisa obstáculos e fatores essenciais na adoção de IA na gestão da cadeia de suprimentos de saúde, analisando 22 critérios por meio do modelo fuzzy. Mourby (2020) analisa o uso do NHS Data Store durante a pandemia de COVID-19, destacando a aplicação de tomada de decisão automatizada baseada em ciência de dados. Guo et al. (2022) apresentam o sistema PaCAR (*Pandemic Control decision making framework via large-scale Agent-based modeling and deep Reinforcement learning*), que combina modelagem baseada em agentes em larga escala e aprendizado por reforço profundo para apoiar o controle pandêmico, os autores afirmam que "ao modelar a dinâmica epidêmica de toda a cidade, os tomadores de decisão teriam mais dimensões de informação e poderiam até mesmo prever as tendências". Por fim, Virmani et al. (2024) propõem um framework de tomada de decisão baseado em IA para aumentar a eficácia das cadeias de suprimentos de saúde, otimizado a gestão de recursos.

Um dos artigos analisados avaliou o emprego de soluções algorítmicas para gestão do orçamento público. Valle-Cruz et al. (2022) exploram como técnicas de IA, como redes neurais e algoritmos genéticos multiobjetivos, podem otimizar a alocação de gastos públicos, promovendo crescimento econômico, redução da inflação e diminuição das desigualdades.

Os artigos de Kolkman et al. (2024) e Choi et al. (2024) tratam de justiça e direito. O artigo de Kolkman et al. (2024) explora o impacto da inteligência artificial no sistema jurídico, destacando como ela influencia a tomada de decisões legais e a autoridade discricionária de juízes, levantando questões sobre ética e imparcialidade. Já o estudo de Choi et al. (2024) investiga o uso de IA em sistemas para apoiar a prevenção de crimes em centros de controle municipal, buscando melhorar a segurança urbana através da análise de dados em tempo real.

5. Discussão

A análise dos 38 artigos revela um interesse no uso da IA para melhorar a tomada de decisões em vários setores. A aplicação de IA não se limita apenas à melhoria da eficiência administrativa, mas também envolve aspectos críticos como sustentabilidade, transparência, governança e interação social. Esses estudos estão espalhados por uma gama de disciplinas e contextos, refletindo a crescente influência da IA nas decisões públicas. Os artigos analisados convergem em destacar que a inteligência artificial oferece benefícios significativos, como otimização de processos, eficiência operacional e inovação social.

Apesar das vantagens, a implementação da IA enfrenta desafios significativos. Em governos municipais, por exemplo, as cidades estão em estágios variados de desenvolvimento como cidades inteligentes, e fatores como resistência à tecnologia, escassez de recursos e questões políticas dificultam sua adoção (Mills et al., 2022). Além disso, experiências negativas com sistemas legados de TI e custos irrecuperáveis limitam a inovação, gerando aversão ao risco e hesitação em adotar novas tecnologias (Kuziemski & Misuraca, 2020). Gelashvili e Pappel (2021) destacaram que barreiras como resistência organizacional, baixa alfabetização em TI e desconfiança na tecnologia prejudicam o desempenho e a aceitação dos sistemas.

Problemas relacionados ao viés algorítmico, transparência e ética também são frequentemente discutidos. Em finanças, algoritmos de recuperação de dívidas podem transferir excessivas responsabilidades para os cidadãos sem supervisão humana adequada (Rinta-Kahila et al., 2022). Já na justiça, embora a IA auxilie na análise de casos, a transparência e a explicabilidade são essenciais para garantir confiança e aceitação pública (Kolkman et al., 2024).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Esses desafios evidenciam a necessidade de equilibrar inovação tecnológica com políticas robustas que garantam confiabilidade, ética e segurança nos sistemas automatizados. A transparência é necessária para mitigar riscos relacionados a vieses e erros, promovendo uma governança mais justa e responsável. Como apontam Tayeb et al. (2024), "uma ansiedade pela falta de transparência em relação a mecanismos pouco claros de comportamento de IA pode desencorajar indivíduos de usá-la" (Tayeb et al., 2024, pg 21).

A inteligência artificial deve ser encarada não apenas como uma ferramenta técnica de apoio à tomada de decisões, mas também como um recurso que exige uma gestão responsável, pautada por princípios éticos e legais. Sua aplicação no setor público demanda uma atenção especial às implicações que ultrapassam os aspectos tecnológicos, incluindo o respeito à complexidade das decisões humanas, a proteção dos direitos dos cidadãos e a promoção de transparência e equidade. Essa perspectiva reforça a necessidade de equilibrar inovação tecnológica com responsabilidade social, garantindo que a IA contribua para um futuro mais justo e eficiente.

6. Considerações finais

Este artigo visou identificar como IA está sendo utilizada na tomada de decisão pública. Os resultados apontam que IA está sendo utilizada como uma ferramenta estratégica para otimizar processos, melhorar a eficiência operacional e promover a inovação social. Os resultados demonstram que a IA não está sendo utilizada de forma homogênea, mas sim adaptada a diferentes áreas e contextos decisórios. Há variações significativas quanto ao grau de autonomia dos sistemas utilizados e ao tipo de suporte oferecido à decisão, o que demonstra a diversidade das abordagens adotadas.

A revisão identificou variações nas abordagens tecnológicas empregadas, desde sistemas baseados em regras até modelos preditivos avançados como redes neurais e aprendizado por reforço. Essa diversidade técnica reflete também distintas finalidades, como a automatização de processos administrativos, a melhoria da interação com os cidadãos, a otimização de recursos públicos. No entanto, os benefícios observados vêm acompanhados de importantes desafios. Questões como transparência, explicabilidade, supervisão humana e responsabilidade ética são recorrentes e apontam para a necessidade de uma governança robusta e inclusiva. A confiança pública, por sua vez, depende não apenas da eficácia técnica dos sistemas, mas também da sua capacidade de refletir valores sociais e garantir equidade.

Assim, conclui-se que o potencial da IA para transformar a tomada de decisão no setor público é promissor, mas sua implementação exige uma abordagem crítica, interdisciplinar e comprometida com o interesse público.

Esta pesquisa apresenta algumas limitações que devem ser consideradas. Primeiramente, a análise está baseada em um conjunto de 38 artigos, o que, embora abrangente, pode não capturar completamente a diversidade de aplicações e desafios da inteligência artificial na tomada de decisão pública. Além disso, muitos dos estudos analisados tratam de contextos e setores específicos, o que pode limitar a generalização dos resultados para outros cenários. A restrição da busca a artigos em inglês e à base Web of Science pode ter excluído estudos relevantes de outras línguas ou fontes regionais. Outra limitação está relacionada à rápida evolução da tecnologia de IA, as discussões e os dados podem se tornar rapidamente desatualizados devido ao surgimento constante de novas ferramentas, metodologias e regulamentações. Além disso, o artigo aborda de forma mais ampla os benefícios e desafios, mas carece de uma análise prática ou empírica detalhada sobre a implementação da IA em contextos específicos do setor público. Questões éticas e legais são abordadas de forma geral, sem análise prática detalhada, indicando a necessidade de estudos futuros mais específicos e contextualizados.

Nesse contexto, sugerimos a condução de pesquisas comparativas para avaliar como a IA se destaca em relação a métodos convencionais de apoio à decisão, considerando critérios como eficiência, impacto e adaptabilidade, e como ela influencia aspectos qualitativos das decisões, como criatividade, flexibilidade e intuição humana. Além disso, recomenda-se a inclusão de casos empíricos que evidenciem desafios e êxitos práticos da IA, além da ampliação da revisão bibliográfica para bases e publicações em outros idiomas, a fim de enriquecer e diversificar a análise.

Reconhecimento

- **Financiamento ou subsídio:** Esta pesquisa recebeu apoio financeiro da Fundação Araucária de Apoio ao Desenvolvimento Científico e Tecnológico do Paraná, pelo Programa de Bolsas de Produtividade em Pesquisa.
- **Declaração do Colaborador**: Autor 1: Conceitualização, Metodologia, Redação- Revisão e Edição; Autor 2: Conceitualização, Supervisão, Redação – Revisão e Edição; Autor 3: Metodologia, Redação– Revisão e Edição; Autor 4: Redação – Revisão.

Resumo. As tecnologias de *streaming* audiovisual reúnem aspectos relevantes sobre o desenvolvimento tecnológico e as formas de acesso, difusão e democratização do audiovisual. No Brasil, nos últimos anos, o crescimento do número de plataformas de *streaming* audiovisual tem representado um fenômeno social, cultural, econômico e político que desperta a atenção e o interesse de corporações privadas, governos, realizadores(as) e espectadores(as) do setor audiovisual, especificamente sobre os propósitos e usos mercadológicos, públicos, democráticos, sociais e culturais dessa tecnologia. Este artigo apresenta e contextualiza o desenvolvimento de uma plataforma de *streaming* pública, gratuita e brasileira, desenvolvida pelo Governo Federal, enquanto tecnologia social com potencial para impactar significativamente o audiovisual brasileiro. A discussão deste artigo a respeito do *streaming* público é estruturada a partir de três objetivos da plataforma: (1) formação de público, (2) difusão do audiovisual brasileiro e (3) descentralização dos espaços de exibição. Por meio de uma abordagem exploratória, são analisadas as ações implementadas e os desafios enfrentados em seu desenvolvimento, considerando um contexto marcado pela concentração geográfica da produção e da exibição, predominância de conteúdos estrangeiros em salas de cinema e plataformas de *streaming*

comerciais, bem como a fragilidade das políticas de democratização cultural. Com base em revisão de literatura - nacional e internacional - e análise de dados secundários, avaliamos se essa iniciativa pode reconfigurar as dinâmicas de acesso e difusão do audiovisual, tendo em vista a adoção estratégica de tecnologias sociais pela Secretaria do Audiovisual do Ministério da Cultura. O artigo discute o potencial de ampliação da visibilidade de produções nacionais e regionais, do(as) realizadores(as) sub-representados(as) e narrativas plurais, com vistas a promover transformações sociais, culturais e educacionais.

Palavras-chave. streaming, formação de público, difusão, ampliação do acesso, audiovisual brasileiro.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1057

1. Introdução

Uma tecnologia social é uma combinação de ideias, práticas e ferramentas que são projetadas para abordar problemas sociais complexos, frequentemente por meio de processos colaborativos que envolvem diretamente as comunidades afetadas (Mulgan, 2019). Como tal, abrange produtos, técnicas e metodologias reaplicáveis desenvolvidas por meio da interação com os grupos sociais, representando soluções de transformação social. Dessa forma, estabelece-se uma replicabilidade da inovação a diferentes grupos, tornando seu papel social mais efetivo.

No campo do audiovisual, plataformas de streaming públicas e gratuitas são entendidas como expressões de tecnologia social. Elas operam enquanto meios para ampliar o acesso a conteúdos culturais e educacionais, democratizando oportunidades e podendo fortalecer a diversidade cultural. A literatura está repleta de estudos sobre a difusão de conteúdo audiovisual por meio de plataformas gratuitas (Murray, 2021; Lobato, 2019; Hesmondhalgh, 2013; Villén Higueras & Ruiz del Olmo, 2022; Menezes, 2025) como uma estratégia em muitos países da garantia do acesso livre e democrático, inclusive na América Latina (Ministerio de Cultura de la Nación, 2022); o que significa que qualquer pessoa interessada, independentemente de sua localização ou condição socioeconômica, poderá acessar e aproveitar uma ampla gama de material audiovisual, incluindo curtas e longas-metragens, documentários, animações e videoartes.

A partir dessas tecnologias sociais, é possível oferecer à população conteúdos que refletem a diversidade étnica, linguística e regional do país. Isso contribui para o fortalecimento de saberes, modos de existir e narrativas locais que, muitas vezes, são invisibilizadas pelas grandes plataformas globais, cujo foco é atender demandas de audiências amplas e internacionalizadas (Brasil, 2020). Compreendemos como narrativas locais as histórias, as representações e as expressões culturais que emergem de contextos específicos, refletindo as experiências, tradições, identidades e valores de grupos sociais, comunidades ou região. Tais narrativas contrastam com discursos globais e hegemônicos, ao evidenciar as particularidades culturais e sociais que moldam as perspectivas locais sobre o mundo (Martin-Barbero, 2009).

A globalização do entretenimento e o domínio de produções estrangeiras dificultam a competitividade do audiovisual brasileiro, especialmente no cinema (Rosa *et al*., 2023). No Brasil, o desenvolvimento de uma plataforma de streaming pública e gratuita pode ter um impacto significativo no setor audiovisual, promovendo a ampliação da visibilidade e acesso a manifestações, bens e produtos culturais, fomentando a produção nacional e fortalecendo a diversidade cultural. Como tal, as premissas inerentes à ampliação do acesso, fomento à produção nacional, preservação e difusão da cultura, criação de novos públicos, fortalecimento da soberania cultural com a redução da dependência de produtos estrangeiros, bem como o impulso à economia, podem ser considerados os elementos condicionantes da tecnologia social de streaming pública.

Nas últimas décadas, a consolidação de leis de incentivo - Lei do Audiovisual e Lei Rouanet, por exemplo -, a criação da Agência Nacional do Cinema (Ancine), dos programas de fomento da Secretaria do Audiovisual (SAV) do Ministério da Cultura (MinC) e a criação do Fundo Setorial do Audiovisual (FSA) vêm contribuindo para o crescimento e equidade da produção cultural do país. Segundo Morais (2019), entre 2003 e 2014, os recursos para o setor cresceram 540%, e o número de longas-metragens saltou de 22 para 143 anuais – com destaque para coproduções internacionais financiadas por incentivos fiscais. Tal crescimento é resultado de uma série de fatores que envolvem estabilidade econômica, reorganização do setor e reformulação das políticas de incentivo ao cinema. Entretanto, o crescimento verificado na produção não se refletiu em um aumento de público na mesma intensidade.

Adicionalmente, em 2024, o setor audiovisual brasileiro recebeu investimentos significativos, refletindo o compromisso do governo em fortalecer e expandir essa indústria, como exemplo o FSA que destinou R$ 1,2 bilhão

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

para a cadeia produtiva do audiovisual, com foco no crescimento econômico sustentável, ampliação da produção nacional e promoção da diversidade regional e de gênero. Em junho de 2024, o Governo Federal anunciou um pacote de R$1,6 bilhão para o setor audiovisual, abrangendo diversas iniciativas para impulsionar a produção e a infraestrutura (Portal Gov.br, 2024).

Diversos autores têm analisado o impacto do streaming na produção e consumo audiovisual. Oliveira (*et al*., 2023) discutem como estes serviços modificaram a maneira das pessoas consumirem filmes e séries, gerando um impacto na indústria, originalmente dominada pelo cinema e pela televisão. Em outra perspectiva de compreensão do processo, Baute (2022) argumenta que a produção e distribuição de obras audiovisuais nessas plataformas pode resultar em processos que o autor compreende como produtores de uma homogeneização cultural. No contexto de plataformas de streaming, as produções audiovisuais tendem a se conformar a padrões e narrativas globalizadas, frequentemente moldadas por grandes corporações e mercados dominantes. Essa dinâmica ocorre porque os grandes players desse mercado buscam maximizar a audiência global, resultando em conteúdos que privilegiam histórias, linguagens, gêneros e estilos que têm maior apelo comercial.

Tais aspectos se apresentam como pilares importantes para compreender o impacto de uma plataforma pública, exemplificando o potencial transformador do streaming para a inclusão cultural, desde que apoiada por estratégias de longo prazo desenvolvidas pelo Estado – nas instâncias Federal, Estadual e Municipal.

Ao contextualizar esse cenário, este artigo tem por objetivo geral apresentar os desafios no desenvolvimento de uma plataforma de *streaming* público como uma tecnologia social de modo a cumprir três objetivos específicos: (1) formação de público, (2) difusão do audiovisual brasileiro e (3) descentralização dos espaços de exibição. Apresentamos, então, a seguinte questão de pesquisa: como um serviço de *streaming* pode contribuir para a redução das assimetrias de acesso, difusão e formação de públicos no audiovisual brasileiro, em um contexto marcado pela concentração geográfica da produção e da exibição, predominância de conteúdos estrangeiros em salas de cinema e plataformas de *streaming* comerciais, bem como fragilidade das políticas de democratização cultural?

Por meio de uma abordagem exploratória, analisamos as justificativas, os objetivos e os desafios de uma plataforma pública de *streaming*, demonstrando seu potencial como ferramenta estratégica para políticas culturais comprometidas com a democratização e a equidade na produção, difusão e recepção no audiovisual. Com base em revisão bibliográfica - nacional e internacional - e análise de dados secundários, argumentamos que essa iniciativa pode reconfigurar as dinâmicas de acesso, ampliando a visibilidade de produções regionais, realizadores sub-representados e narrativas plurais, além de discutirmos seu estágio atual de desenvolvimento.

O texto está estruturado da seguinte maneira: inicialmente, apresenta-se uma contextualização do cenário latino-americano e brasileiro, destacando os desafios e oportunidades do setor audiovisual na região. Em seguida, aborda-se o arcabouço teórico que sustenta a discussão, explorando os conceitos de tecnologias sociais e a centralidade do *streaming* no fortalecimento do audiovisual. As discussões são apresentadas em três eixos principais: formação de público, difusão do audiovisual brasileiro e descentralização dos espaços de exibição. Por fim, discutem-se as implicações práticas e as contribuições do estudo para o campo, encerrando-se com as próximas etapas do projeto e sugestões para pesquisas futuras.

2. Contextualização

Diversos estudos (Fran, 2024; Smith & Thompson, 2024; Wayne, 2020; Murray, 2021) apresentam o crescimento das plataformas de *streaming* como vetores de significativas transformações no consumo de mídia audiovisual nos últimos anos, especialmente aquelas desenvolvidas por multinacionais do mercado das empresas com base de atuação nos meios digitais - como Netflix, Amazon Prime e AppleTv, dentre outras. O mercado também testemunha a entrada de novos players, aumentando a concorrência, enquanto plataformas regionais ganham destaque ao oferecer conteúdos culturalmente relevantes. Paralelamente, o crescimento dessas plataformas está gerando debates sobre direitos autorais, regulação de conteúdo, pluralidade de obras e realizadores(as), representatividade da produção nacional e impacto na indústria tradicional de cinema e televisão. Esses fatores, combinados, destacam o *streaming* como uma das principais forças na redefinição do cenário de mídia audiovisual global.

Alguns desenvolvimentos tecnológicos têm possibilitado novas formas de consumir, distribuir e produzir conteúdo audiovisual. Assim, como elenca Shattuc (2020), o surgimento e a expansão do acesso à internet, a adoção de transmissão digital de sinais de televisão, a popularização de computadores pessoais, smartphones e tablets e o alargamento da banda de transmissão de dados para evitar que vídeos sofressem buffering ajudam a explicar a transição digital do audiovisual.

Pesquisas (Grandinetti, 2017; Lobato, 2019; Lotz, 2022) apontam que a transição em curso para plataformas de *streaming* transformou radicalmente a produção e o consumo de mídia ao introduzir serviços financiados pelos

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

assinantes e disponíveis sob demanda. Mais concretamente, o panorama atual do setor audiovisual com o seu sistema de plataformas online está, em boa medida, relacionado com o consumo de séries, filmes e documentários, segundo preconiza García-Orta (*et al*., 2019). Os autores entendem como uma mudança em curso de hierarquias historicamente estabelecidas pela indústria audiovisual em vários aspectos, como a primazia da sala de cinema, o formato do longa-metragem de ficção como produto central da cadeia, e os processos de legitimação e promoção - a exemplo de festivais e curadorias. Tal mudança decorre do processo de digitalização e o estabelecimento que os canais de *streaming* romperam enquanto forças econômicas (Bahia *et al*., 2023).

Sublinha-se que nessa arena de competição, os grandes players do setor, nacionais e internacionais, avançam na oferta de seus serviços e passam a oferecer tanto conteúdos, como infraestrutura de rede (Jambeiro *et al*., 2011). Uma característica das empresas que oferecem esse serviço é a forma como combinam a curadoria e circulação de novas produções com bibliotecas de conteúdo histórico da televisão (Gilbert, 2019).

A partir dessas premissas, quando se analisa a relevância da mídia *streaming*, Gambarato *et al*. (2022) usaram o termo "cultura da capacidade de transmissão" para descrever a lógica industrial que amplifica hoje as possibilidades da mídia conectiva. As mídias conectivas são ecossistemas formados pela convergência de tecnologias de comunicação, informação e mídia. Como tal, os autores registram que a fluidez transcende simplesmente governar atividades, objetos e relações digitalmente, gerando e respondendo aos fluxos de dados da forma mais eficiente possível. Vale ressaltar que a premissa vai além da arquitetura tecnológica das plataformas: ou autores consideram como um "campo de batalha logístico", capaz de controlar e organizar fluxos de circulação midiática.

A América Latina, com sua diversidade cultural e linguística, enfrenta assimetrias em relação à infraestrutura digital e à distribuição de conteúdos culturais. No Brasil, por exemplo, as salas de cinema estão concentradas em capitais e regiões metropolitanas, deixando vastas áreas do país sem acesso a exibições cinematográficas. Embora mais recentemente o MinC tenha apontado avanços - os últimos dados apontam que o Brasil chegou a 3.509 salas, incluindo as que foram inauguradas ou reformadas em 22 cidades do interior do país (Menezes, 2025) -, aproximadamente 7% das cidades brasileiras possuem ao menos uma sala de cinema (Rosa *et al*., 2023). Embora este número supere o recorde anterior de 3.478 salas, registrado em 2019, antes da pandemia de COVID-19, tal cenário ainda é muito distante de países como EUA - que em 2024 contava com cerca de 40.000 salas em operação (Piauí, 2022) - e China - com cerca de 90.000 salas (Xinhua News Agency, 2025).

A digitalização do setor audiovisual na América Latina ocorre ainda em um cenário de profundas desigualdades estruturais. Segundo Loureiro (2015), embora a região tenha apresentado avanços significativos na adoção de tecnologias digitais, persiste uma lacuna em relação à inclusão digital, especialmente entre populações de baixa renda e residentes em áreas remotas – distantes da zona de influência das regiões metropolitanas dos países.

Essa realidade é compartilhada por outros países da região, onde a centralização da infraestrutura cultural reflete desigualdades sociais e econômicas mais amplas. Como observa Selva (2016), a exclusão digital na América Latina é historicamente agravada por disparidades no acesso à internet de alta velocidade, particularmente em áreas rurais e periféricas. Questionamos então como o streaming – enquanto uma tecnologia que permite a transmissão de dados de áudio e vídeo pela internet, de maneira contínua e em tempo real, sem a necessidade de download completo do conteúdo antes de sua reprodução – pode apresentar-se nesse contexto como uma alternativa para superar barreiras geográficas e ampliar o acesso a conteúdos culturais.

O consumo de *streaming* audiovisual no Brasil tem crescido significativamente nos últimos anos, refletindo mudanças nos hábitos culturais e no acesso a tecnologias digitais. De acordo com o relatório Global Streaming Market Overview, o Brasil é o segundo país que mais consome serviços de streaming, ficando atrás apenas da Nova Zelândia, e pelo menos 65% dos adultos brasileiros possuem um serviço de *streaming*, enquanto a média global é de 56% (Global Streaming Market Overview, 2024).

Dados do Módulo de Tecnologia de Informação e Comunicação (TIC) da PNAD Contínua (2023) indicam que mais de 40% dos lares brasileiros com televisão tiveram acesso a plataformas de streaming de vídeo. Essa expansão é acompanhada por um aumento no tempo dedicado ao consumo audiovisual, com as plataformas de *Video on Demand* (VOD) representando aproximadamente 32% do tempo total gasto considerando todos os dispositivos (Kantar IBOPE Media, 2024). Vale ressaltar que estas plataformas são caracterizadas na referida pesquisa como aquelas que disponibilizam vídeos online, independentemente de seus modelos de negócios e de suas estratégias de produção de conteúdo - serviços financiados por assinatura e/ou por publicidade, com conteúdo gerado por seus usuários ou pela própria plataforma.

Diante desse quadro, de um mercado em crescimento e dominado por grandes corporações, de um lado, e de dificuldades de acesso aos serviços pagos por parte da sociedade, na América Latina, diversos governos têm desenvolvido plataformas de streaming gratuitas de vídeo sob demanda com o objetivo de promover a produção local e ampliar o acesso da população a conteúdos nacionais.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Há em curso uma preocupação para que governos regulamentem as empresas e identifiquem estratégias adequadas para o setor audiovisual e o seu desenvolvimento futuro (Lotz, 2022). Dentre os que tiveram maior propulsão, uma característica em comum é o fato de oferecer acesso gratuito a uma ampla gama de conteúdos, incluindo séries, documentários, filmes e animações. Temos os casos da Plataforma Contar (https://www.cont.ar), da Argentina, que também realiza transmissões ao vivo de eventos culturais; a OndaMedia (https://ondamedia.cl), do Chile, segue uma lógica parecida: disponibiliza gratuitamente obras nacionais com o objetivo de preservar e difundir a memória cultural do país; e o RTVCPlay (https://rtvcplay.co/), da Colômbia, com uma lógica que se aproxima, porém com conteúdos infantis com foco na cultura e na história nacional.

De acordo com Alvaray (2023), é possível identificar características que se assemelham entre as plataformas mencionadas, no contexto da América Latina. Temos a curadoria de conteúdos que valorizam a diversidade cultural e social do país, dando espaço a produções regionais e temáticas relacionadas à história, cultura e debates contemporâneos do país; a implementação de recursos de acessibilidade, como legendas, audiodescrição e Língua Brasileira de Sinais (Libras), para alcançar diferentes públicos, inclusive pessoas com deficiência; o investimento em parcerias com produtores locais e independentes, permitindo não apenas o financiamento de novos projetos, mas também a distribuição de obras que, de outra forma, enfrentam dificuldades para alcançar um público amplo; e a utilização de campanhas de comunicação digital para promover e engajar em torno dos conteúdos disponíveis, aproveitando as mídias sociais e canais institucionais para alcançar sobretudo o público mais jovem.

Por meio de uma parceria entre a Diretoria de Preservação e Difusão Audiovisual da Secretaria do Audiovisual do Ministério da Cultura (DPDA/SAV/MinC) e o Núcleo de Excelência em Tecnologias Sociais (NEES) do Instituto de Computação (IC) da Universidade Federal de Alagoas (UFAL), está em fase de desenvolvimento uma Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda, que pretende alcançar diversos segmentos do audiovisual, estruturando uma política pública que integra e alinha as áreas de acesso, promoção, formação, organização de dados e preservação do audiovisual nacional. A plataforma tem como meta disponibilizar produções audiovisuais de realizadores brasileiros, promovendo o acesso e a difusão desses conteúdos de forma pública e sob demanda. Entre os principais conteúdos disponíveis estarão curtas, médias e longas-metragens, além de documentários, animações e videoartes.

Para tanto, busca-se oferecer um espaço acessível a cineastas, diretores(as) de TV e vídeo, vídeo artistas, produtores(as), estudantes, entusiastas e o público em geral para compartilhar, assistir e explorar variedade de conteúdo audiovisual nacional, relativos aos domínios da ficção e não-ficção, informação e entretenimento, educação, ciência e artes.

Para tanto, dois perfis estão sendo formatados para atender aos mais diversos públicos que poderão acessar de qualquer lugar (perfil cidadão) ou ainda promover exibições das produções nos mais diversos espaços (perfil direcionado), como apresentamos na Tabela 1. Cabe esclarecer que a plataforma disponibiliza o conteúdo para o acesso público, mas a infraestrutura necessária para sua exibição e recepção - como equipamentos audiovisuais e acesso à internet - é de responsabilidade dos espaços de exibição, bem como de outras ações e/ou políticas públicas.

Tab. 1 - Definição dos perfis da Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda. Fonte: SAV/MinC.

Tipo	Descrição	Finalidades	Perfis
Perfil cidadão	Desenvolvido para o público geral, que poderá acessar a partir do direcionamento de seus públicos em seções	• Segmentar as obras de acordo com seus respectivos gêneros • Direcionar o espectador aos formatos de obras preferidos • Guiar o usuário aos conteúdos a partir de uma busca no menu principal da plataforma	Perfil único
Perfil direcionado	Criar curadorias de "trilhas espectatoriais", voltadas à formação de olhar audiovisual	• Atuar prioritariamente junto à educação, aos pontos de exibição, às mostras e festivais, à filmes de impacto e a outras direções que se mostrarem necessárias • Garantir o efetivo acesso ao audiovisual de crianças, adolescentes, idosos e outros públicos prioritários	1. Perfil educacional: escolas 2. Perfil exibidor: Cineclubes e pontos de difusão (CineCEUs, Cine Bibliotecas…), Pontos de Cultura Audiovisual, Mostras e Festivais

A estratégia busca dar visibilidade à diversidade cultural e criativa do audiovisual brasileiro, garantindo a presença da pluralidade de linguagens, formatos e estéticas. Essa diversidade será abordada com atenção às questões de classe social, gênero e étnico-raciais, promovendo o reconhecimento cultural de diversos grupos sociais. Com base em princípios de equidade, a plataforma também visa fortalecer a representatividade da produção regional e local, atuando como um espaço para que jovens criadores e produtores independentes compartilhem suas criações, promovendo a descoberta de novos talentos e projetos inovadores. Em 2024, a SAV/MinC lançou o Edital de Licenciamento de Obras Audiovisuais que visa selecionar e licenciar mais de 400 obras audiovisuais já finalizadas, incluindo curtas, médias e longas-metragens, para compor o catálogo desta plataforma, que está prevista para ser lançada ainda em 2025.

3. Desafios

De acordo Sylvestre (2024), são muitos os elementos de motivação e oportunidade para a implementação de plataformas de difusão de conteúdos audiovisuais nacionais no modelo de consumo sob demanda. Sobretudo no que concerne à obrigação constitucional do Estado, prevista no artigo 215 da Constituição Federal de 1988, na qual determina a garantia a todos do pleno exercício dos direitos culturais e do acesso às fontes da cultura nacional, cabendo ao Estado apoiar e incentivar a valorização e a difusão das manifestações culturais. Outro fator relevante é o cumprimento da meta 40 do Plano Nacional de Cultura, que prevê a disponibilização na internet de conteúdos em domínio público e licenciados. Por fim, destaca-se o eixo de ações de acesso e distribuição de produção audiovisual para as escolas públicas de educação básica, no âmbito da regulamentação da Lei nº 13.006/2014 - que estabelece as diretrizes e bases da educação nacional e obriga a exibição de filmes de produção nacional nas escolas.

Considerando estes aspectos legais, Venanzoni (2021a) aponta que a democratização do audiovisual exige políticas públicas integradas que abordam os desafios de produção, distribuição e consumo de forma conjunta. O *streaming*, com sua capacidade de alcançar públicos diversos, se configura como uma ferramenta para atender parcialmente essa demanda por democratização - ainda que precise ser atrelada a outras políticas públicas e envolva dimensões políticas e econômicas, atores e recursos além da plataforma.

Baute (2022), ao destacar esse processo, aponta a necessidade de modelos alternativos que combatam a homogeneização cultural. Iniciativas como a plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda, por exemplo, são uma resposta a essa dinâmica, à medida que estejam orientadas aos princípios da pluralidade de linguagens, formatos e estéticas, promovendo a produção regional e dando visibilidade a manifestações, expressões, discursos, ideias, lugares e sujeitos que representem a diversidade social, cultural e étnica do Brasil.

As narrativas locais desempenham um papel crucial na resistência à homogeneização cultural, ao promoverem a valorização das culturas periféricas e regionais como parte integrante de uma identidade mais ampla e diversificada (Martín-Barbero, 2019). A proposta de um *streaming* público, orientado por princípios da ampliação do acesso e pluralidade de conteúdos, tem o potencial de equilibrar os interesses globais com as necessidades locais, fortalecendo a identidade cultural e a soberania audiovisual.

Nova Filho (*et al*., 2023) destacam a presença e a consolidação de plataformas nacionais de conteúdo audiovisual - quer sejam públicas ou privadas - para a promoção da cultura local. Além disso, também são agentes importantes na preservação da identidade cultural, na inclusão digital e no desenvolvimento econômico do setor criativo à medida que as plataformas nacionais de conteúdo audiovisual são ferramentas para a divulgação e valorização da cultura local.

3.1 Formação de públicos

A formação de públicos é o primeiro aspecto que discorremos para o fortalecimento do audiovisual na América Latina. A ideia central por trás do conceito de "formação de público" refere-se às estratégias, políticas e ações voltadas para ampliar, diversificar e engajar a audiência de manifestações culturais, como cinema, teatro, literatura e música. Trata-se de um processo que visa não apenas aumentar o consumo cultural, mas também criar vínculos duradouros entre os indivíduos e as obras, promovendo um senso de pertencimento e identidade cultural.

Venanzoni (2021b) argumenta que, historicamente, o foco na produção ofuscou a importância de criar estratégias para engajar os espectadores e ampliar o alcance das produções nacionais. Bernardet (2007) já destacava no início deste século que a formação de públicos sempre foi uma questão negligenciada historicamente no planejamento cultural brasileiro, resultando em um mercado que privilegia produções globais em detrimento de narrativas locais. Este quadro não obteve maiores avanços nos últimos anos, haja vista que as salas das grandes redes - que detém o monopólio do parque exibidor brasileiro - voltam-se a promover o cinema sobretudo produzido na indústria estadunidense (Rosa & Tavares Filho, 2023).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Ao adentrarmos na discussão a respeito da formação de públicos para o audiovisual, é importante destacar que a Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda propõe um modelo integrado de educação e acesso ao audiovisual. A plataforma oferece recursos como trilhas curatoriais específicas e atividades formativas para educadores e estudantes, promovendo a alfabetização audiovisual. Por meio dessas ações, não apenas amplia-se o alcance das obras nacionais, mas também fomenta-se uma relação mais profunda entre o público jovem e a produção cultural brasileira, consolidando o cinema como uma ferramenta educacional e cultural poderosa.

Venanzoni (2021a) destaca que, enquanto política pública para o audiovisual, o foco deve estar na ampliação do acesso e na redistribuição de recursos, em vez de se restringir a produções voltadas exclusivamente para a lucratividade e a autossuficiência do setor como uma indústria global. A descentralização da produção possibilita o surgimento de novos arranjos produtivos que consideram, acima de tudo, o território e as especificidades de seus agentes locais. Esse aspecto territorial, frequentemente associado ao discurso da diversidade, também pode ser analisado em um nível conceitual, contrapondo a dimensão local à global e evidenciando o território como um espaço para a construção de novas narrativas locais.

Um dos perfis direcionados da Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda é o chamado perfil exibidor, composto por pontos de exibição diversos, a exemplo de cineclubes, que são capazes de formar público e criar comunidades de interesse. Com a intenção de integrar filmes nacionais ao currículo complementar integrado à proposta pedagógica da escola ou em salas de exibição para além dos parques exibidores, a plataforma possibilita o contato direto de estudantes, realizadores(as), cinéfilos e as mais diversas audiências com obras que refletem a diversidade e os desafios sociais do Brasil. Trata-se de um esforço para criar novas gerações de espectadores(as) mais informados(as) e com conhecimento da produção nacional e, em razão disso, aptos(as) a compreender, criticamente, o papel da produção audiovisual no fortalecimento da identidade cultural e na promoção de valores democráticos.

A plataforma pública pretende ir além da disponibilização de conteúdo ao fortalecer redes locais de exibição por meio de parcerias com cineclubes, escolas e outros pontos de difusão não comercial. Essas colaborações não apenas diversificam os meios de acesso ao audiovisual, mas também incentivam a formação de públicos em áreas menos favorecidas. A plataforma surge para atender a demandas de difusão e formação de públicos por se apresentar enquanto alternativa a parques exibidores de regiões periféricas e interiores - que no geral se apresentam em menor número e limitam o alcance de produções nacionais.

3.2 Difusão

De acordo com o informe anual mais recente "Mercado Cinematográfico", elaborado pela Ancine (ver Tabela 2), os longas brasileiros representaram apenas 3,2% do público total em 2023. Este número não difere dos dois anos anteriores, quando tivemos 1,7% (2021) e 4,2% (2022) na participação dos longas-metragens exibidos no público total – por nacionalidade da obra. O relatório apresentado pela Ancine (2024) coaduna com as pesquisas mais recentes sobre o audiovisual produzido na América Latina, como já apontado anteriormente, a respeito da incapacidade de se fazer cumprir políticas públicas de difusão do audiovisual desses países.

Tab. 2 - Panorama do mercado cinematográfico no país - 2023.

Região	Público	% Público	Renda (R$)	% Renda	Longas-metragens exibidos	Longas-metragens lançados
Longas brasileiros	3.701.853	3,2%	67.095.990,16	3,0%	271	161
Longas estrangeiros	110.374.722	96,8%	2.169.980.200,26	97,0%	438	254
TOTAL	114.076.575	100%	2.237.076.190,42	100%	709	415

Fonte: SAV/MINC.

Como resultado desse maior interesse pela produção estrangeira, temos mais dias de exibição nas salas de cinema. Um resultado também apresentado pela Ancine (2024) constatou que o número médio de dias de exibição dos longa-metragens estrangeiros em 2023 permaneceu o mesmo de 2022 (46 dias), enquanto a dos brasileiros subiu de 26 para 30 dias. Avaliando em perspectiva, são 16 dias a mais em exibição para a produção estrangeira - 52% a mais.

Como observado por Hesmondhalgh (2013), a distribuição é um aspecto central das indústrias culturais, desempenhando um papel crucial na formação de identidades e no fortalecimento das economias criativas. Na América Latina, a democratização da distribuição é fundamental para garantir que as produções regionais sejam acessíveis a públicos diversos, promovendo a inclusão e a equidade cultural.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Embora as plataformas de *streaming* aparentam estar em intensa competição e o setor enfrente constantes turbulências, a chamada "guerra dos *streamings*" reflete, em essência, uma disputa entre grandes conglomerados midiáticos e tecnológicos (Bahia *et al*., 2023). Esse cenário não necessariamente contribui para a democratização e ampliação da diversidade no mercado de vídeo sob demanda no Brasil. Pelo contrário, evidencia-se um movimento de concentração de poder e padronização dos conteúdos, o que influencia diretamente os debates sobre o direito à cultura.

Partindo desse princípio, é necessário se pensar em como dar conta de cumprir essa demanda da difusão de um audiovisual nacional. Ao ser concebida como uma plataforma pública de *streaming*, a Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda oferece um meio viável e acessível para que as instituições educacionais possam atender para além das exigências legais, pois considera um perfil direcionado – classificado como perfil educacional e tendo como objetivo facilitar o acesso a conteúdos audiovisuais diversificados e representativos da cultura brasileira. Essa dimensão educacional reflete a importância da integração entre tecnologias sociais e políticas públicas como forma de potencializar impactos sociais e culturais. A Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda não só demonstra a viabilidade de usar o *streaming* como ferramenta para a inclusão cultural e educacional, mas também contribui para o debate sobre a adoção das Tecnologias de Informação e Comunicação (TICs) pelo governo como estratégia para fortalecer o setor público, evidenciando uma criação de valor não limitada a aspectos financeiros, mas centrada nos impactos positivos gerados para os envolvidos, como maior acesso, inclusão e fortalecimento do campo da cultura nacional.

Ao utilizar o *streaming* como tecnologia social (Mulgan, 2019), a plataforma em questão responde a esse contexto ao propor um modelo de difusão que prioriza a inclusão. Diferentemente das plataformas comerciais, que frequentemente replicam as lógicas de mercado global, a referida plataforma busca valorizar a diversidade cultural em um país com dimensões continentais. Essa abordagem é essencial para enfrentar o domínio da indústria cultural que movimenta esse ciclo de produtoras e redes de parques exibidores, lançando um olhar para uma economia criativa local ou regional. Entendemos aqui a economia criativa como um modelo de desenvolvimento sustentável baseado na articulação entre cultura, território, tecnologia e inclusão produtiva, no qual bens e serviços simbólicos geram valor econômico e social.

De acordo com Leitão (2015), políticas públicas devem fomentar cadeias produtivas descentralizadas, infraestrutura digital e indicadores que evidenciam impactos simbólicos e materiais. Seu trabalho destaca ainda, a necessidade de equilibrar direitos autorais com acesso democrático, posicionando a cultura como núcleo de inovação e desenvolvimento territorial — princípios que dialogam diretamente com iniciativas como a plataforma Tela Brasil, ao integrar produção audiovisual independente, formação de públicos e democratização tecnológica.

A valorização e a promoção de narrativas locais são capazes de reforçar a representatividade cultural e ampliar o repertório de histórias acessíveis ao público. Assim, pode consolidar-se como uma ferramenta de transformação social, potencializando o papel do audiovisual como vetor da diversidade e equidade cultural. Enquanto uma iniciativa estratégica para inserir a produção nacional nesse mercado em expansão do *VOD*, amplia o alcance de curtas, longas, documentários e videoartes para públicos diversos. Além disso, ao adotar um *design* inclusivo e recursos de acessibilidade, a plataforma garante uma experiência rica para diferentes perfis de usuários.

3.3 Descentralização

Ao apontarmos o terceiro desafio, referente à descentralização, cabe considerar a princípio que o cinema brasileiro muitas vezes não consegue se inserir nas salas de cinema das grandes redes multinacionais. Esse aspecto pode se configurar como um complicador da distribuição pois, muitas vezes, os filmes circulam apenas nas chamadas salas de arte – que representam um menor número de espaços e tendem a levar um menor público. Ainda, embora a produção esteja em crescimento, a distribuição ainda é centralizada, com a maioria das obras, inclusive lançamentos, concentrados em grandes centros urbanos (Ancine, 2024).

A concentração da infraestrutura cultural nas capitais e grandes centros urbanos é um problema recorrente no Brasil. Dados do informe "Mercado Cinematográfico" (Ancine, 2024), embora o parque exibidor brasileiro aponte um crescimento nas últimas duas décadas. Esse número representou apenas 8,1% das cidades com ao menos uma sala de cinema (ver Tabela 3). Com 3.468 salas em 2023, tendo a Região Sudeste mais da metade (1.815), o resultado evidencia a exclusão de grande parte da população do acesso direto ao audiovisual em espaços tradicionais.

Tab. 3 - Total de salas em funcionamento por região geográfica - 2014 a 2023.

Região	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023

Fonte: SAV/MINC.

Em conformidade com esse recorte histórico a respeito da concentração dos parques exibidores, podemos inferir que a Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda apresenta-se como uma alternativa para enfrentar essa assimetria entre as regiões do país, utilizando o *streaming* como ferramenta de ampliação do acesso. Por meio de sua tecnologia de distribuição digital, a plataforma possibilita que conteúdos audiovisuais alcancem regiões remotas, descentralizando assim o consumo cultural e promovendo a inclusão de comunidades historicamente marginalizadas do circuito cinematográfico.

No contexto latino-americano, iniciativas como a Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda também enfrentam o desafio de descentralizar a produção e a distribuição. Como apontado em Canclini (2015) e Ortiz (2006), a centralização das indústrias culturais em grandes centros urbanos limitou o acesso às produções regionais e perpetua desigualdades históricas. O desenvolvimento de uma plataforma com a citada neste trabalho representa um esforço para romper com essa lógica, promovendo a descentralização do consumo e valorizando a diversidade cultural do país.

Nessa perspectiva, a plataforma pode garantir um espaço para produtoras nacionais corrigindo desigualdades históricas, garantindo que a pluralidade cultural do país possa ser representada e valorizada a partir das produções audiovisuais disponibilizadas na plataforma. Sua atuação pode se tornar um modelo para outros países latino-americanos que enfrentam desafios semelhantes, reafirmando o papel do Estado como promotor da cultura e da inclusão digital.

Conforme definido por Rubim (2007), as políticas públicas culturais visam garantir a diversidade e a pluralidade cultural, promovendo tanto o acesso aos bens e serviços culturais quanto o incentivo à produção e circulação de expressões artísticas e simbólicas. Elas devem também considerar as especificidades regionais, sociais e históricas, de modo a fortalecer identidades culturais e assegurar a representatividade de diferentes grupos sociais. Entendemos que plataformas com as características descritas neste trabalho podem, em complemento a outras ações estatais, contribuir para o fortalecimento das políticas de incentivo à produção e circulação do audiovisual brasileiro em seus diversos gêneros e formatos.

Procurando oferecer a visibilidade à diversidade cultural e criativa do audiovisual brasileiro, garantindo a presença da pluralidade de linguagens, formatos e estéticas e o reconhecimento cultural dos diversos grupos sociais - considerando o âmbito das questões de classe social, gênero e étnico-raciais -, a Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda pode promover uma agenda de diversidade que está intrinsecamente ligada aos valores de inclusão e equidade social.

4. Considerações Finais

Em conformidade com as discussões ora levantadas, este trabalho teve como objetivo apresentar a iniciativa da Plataforma Pública de Acesso e Difusão de Conteúdos Audiovisuais Brasileiros Sob Demanda como tecnologia social para formação de públicos, difusão e descentralização dos espaços de exibição. Apontamos no texto que, ao adotar o *streaming* como uma tecnologia social, a plataforma oferece uma alternativa para superar as limitações da infraestrutura física, descentralizar a distribuição e promover a inclusão cultural a partir de uma abordagem integrada, que combina a distribuição digital com ações educativas e culturais voltadas para a formação de públicos.

A proposta da plataforma ora apresentada exemplifica a adoção estratégica de tecnologias sociais pela Secretaria do Audiovisual do Ministério da Cultura do Brasil para promover transformações sociais, culturais e educacionais, pois procura integrar uma rede que perpassa alguns perfis de usuários: voltados para os cidadãos ou direcionados – escolas e pontos de exibição.

Conforme Sylvestre (2024), conclui-se pela necessidade de assegurar que a formulação dessa política não apenas se some às muitas outras iniciativas públicas e, essencialmente, gratuitas de difusão. Mas, que o Governo Federal viabilize tal ação se posicionando como agregador e fomentador da difusão audiovisual, consultando atores institucionais relacionados à temática e no desenho de um modelo "que traga proeminência às iniciativas públicas e gratuitas já desenvolvidas, congregando e potencializando todos os esforços e investimentos públicos e privados

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

(de interesse público) já desenvolvidos no segmento".

Com base em princípios da equidade, a plataforma tem o propósito de conferir a representatividade da produção regional e local, servindo como um espaço para que jovens criadores(as) e independentes compartilhem suas criações, promovendo a descoberta de novos talentos e projetos inovadores. Por outro lado, ao democratizar o acesso, a plataforma rompe as barreiras geográficas e dá aos produtores nacionais o alcance que, de outra forma, seria restrito.

Neste contexto de grande discrepância em relação a outros mercados, as tecnologias de *streaming* audiovisual configuram-se como marcos no avanço do consumo mediado por plataformas digitais, transformando hábitos culturais e impactando as formas de produção, distribuição e acesso a conteúdos. No Brasil, o crescimento das plataformas de *streaming* reflete não apenas a incorporação de tecnologias globais, mas também um debate sobre inclusão, democratização e o papel do audiovisual na formação de públicos, no conhecimento e promoção da diversidade cultural.

Trata-se, nessa perspectiva, de uma política pública cultural ao utilizar toda sua infraestrutura digital planejada de modo a superar os limites físicos de distribuição, um ponto crítico em países da América Latina, onde - como discutimos - apresentam no geral uma concentração dos parques exibidores para os centros metropolitanos.

Podemos considerar que o projeto não só pode ser capaz de ampliar a circulação de obras que antes ficavam restritas aos circuitos tradicionais, mas também, a médio prazo, estimular as indústrias criativas locais, potencializando a diversidade cultural como um ativo estratégico para o desenvolvimento social e econômico do Brasil.

Os resultados alcançados nesta pesquisa não levam a conclusões definitivas, uma vez que foi baseado em uma pesquisa documental. Esta deve ser organizada por meio de debates acadêmicos e políticos, resultando em políticas centradas numa combinação de estratégias do audiovisual brasileiro, incluindo a distribuição, o financiamento e a formação dos públicos para a acessibilidade da plataforma.

Abstract. Este artigo aborda o contexto dos casos em que o crescimento da disponibilidade de dados permite aos governos prover serviços a partir da identificação e análise automática dos beneficiários. Com o objetivo de entender como questões relacionadas a *datafication* e *data justice* estão sendo consideradas na implementação de serviços de governo eletrônico no Brasil, este estudo utilizou uma abordagem metodológica qualitativa baseada no estudo de caso do Auxílio Emergencial da COVID-19. Os resultados obtidos indicam que ainda há necessidade de evolução nos mecanismos para mitigar riscos e garantir aderência aos direitos básicos de dados, transparência, procedimentos justos e equidade nos resultados. Por não termos todos os conceitos relacionados aos riscos de desigualdade e injustiça de dados disseminados e endereçados entre os agentes públicos responsáveis pela implantação de serviços eletrônicos de governo baseados no uso intensivo de dados, o debate sobre exclusão digital se mantém relevante. Além disso. este artigo contribui para a literatura acadêmica com a apresentação de um modelo conceitual baseado no referencial teórico de *datafication* e *data justice*, aplicado a um caso real no Brasil.

Keywords. *Data justice. Datafication*. Auxílio Emergencial COVID19. Governo Eletrônico.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1002

1. Introdução

A evolução da tecnologia digital tem como um dos seus principais resultados o expressivo aumento da capacidade de geração, processamento e uso de dados. Com as novas tecnologias observamos um crescimento exponencial do volume e tipo de dados disponíveis, que têm proporcionado inúmeras possibilidades de desenvolver ações a partir do que estes dados informam, e transformar a sociedade através de novos serviços eletrônicos (UN, 2014). O avanço na aplicação das tecnologias de informação e comunicação (TIC), por parte dos governos e das empresas, fomenta a disseminação de serviços que têm os dados como motor principal e faz com que o crescimento do uso e impacto dos dados nos processos sociais seja um fenômeno mundial, inclusive no contexto do desenvolvimento econômico internacional (Heeks & Shekhar, 2019; Taylor & Broeders, 2015). À medida que o uso de serviços eletrônicos e dispositivos tecnológicos cresce, temos um crescimento na disponibilidade dos dados digitais e isso tem reflexo no desenvolvimento econômico e humano (Taylor, 2017).

Podemos considerar cinco formas principais de como os dados geram valor. Os dados podem ser utilizados para definir o tipo de pessoa e perfil alvo para produtos e serviços, para otimizar sistemas, para gerenciar de equipamentos e atividades, para desenvolver modelos probabilísticos, para apoiar na construção de coisas e aumentar o valor de ativos (Sadowski, 2019). Neste contexto torna-se fundamental coletar cada vez mais dados e de uma variedade cada vez maior de fontes, para gerar mais valor.

A comunidade acadêmica se aprofundou neste tema e vários conceitos foram criados para definir e analisar este fenômeno. Termos como *data revolution* (UN, 2014), *data innovations* (Porto de Albuquerque et al., 2021), *datafication* (Heeks & Shekhar, 2019; Taylor & Broeders, 2015) e *data-intensive development* (Heeks, 2017b; Heeks & Renken, 2016; Taylor, 2017) têm sido utilizados para caracterizar esse movimento de desenvolvimento econômico baseado nos dados. Sobre esses dois últimos, *datafication* representa o crescimento da presença, uso e impacto dos dados na sociedade (Heeks & Shekhar, 2019; Taylor & Broeders, 2015), e *data-intensive development*

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

representa o uso crescente dos dados no processo de desenvolvimento socioeconômico, isto é, dados desempenhando um papel cada vez mais relevante no processo de desenvolvimento uma vez que se tornam um insumo fundamental para diversas aplicações (Heeks, 2017b; Heeks & Renken, 2016; Taylor, 2017).

Ao mesmo tempo, crescem as preocupações com questões de inclusão social e sustentabilidade no desenvolvimento econômico internacional, refletidas nos compromissos estabelecidos entre os países membros da Organização das Nações Unidas (ONU), a Agenda 2030 para o Desenvolvimento Sustentável e os Objetivos de Desenvolvimento Sustentável (ODS). Estes dois fenômenos estão interrelacionados, uma vez que a tecnologia digital é considerada um fator-chave para a implementação dos ODS (Janowski, 2016) .

Se por um lado há uma grande expectativa sobre os impactos positivos que a aplicação das TIC e o desenvolvimento baseado em dados pode gerar, por outro lado, há uma preocupação com possíveis impactos adversos relacionados ao contexto social. O conceito de *data justice* traz uma perspectiva de tratamento justo para todos no contexto da aplicação das TIC e do uso intensivo dos dados. As preocupações estão relacionadas com a exclusão social que pode ser gerada em função da existência de estruturas, processos e recursos dos sistemas de dados contaminados por desigualdades sociais, entre grupos étnicos, gêneros, classes, entre outros aspectos sociodemográficos (Heeks, 2020; Heeks & Renken, 2016; Johnson, 2014; Lutz, 2019; Taylor, 2017; Zheng & Walsham, 2021). A ótica de *data justice* está relacionada à forma como as pessoas se tornam visíveis, são representadas e tratadas em função dos dados digitais produzidos por elas (Taylor, 2017).

Em resumo, o avanço na aplicação das TIC, especialmente no setor público, e, consequentemente, o crescimento exponencial de geração, uso e circulação de dados trazem uma contribuição positiva para a evolução das sociedades e construção de um futuro mais sustentável. Entretanto, é preciso discutir sobre como as questões relacionadas às desigualdades sociais estão refletidas no processo de transformação baseada em dados e na aplicação das TIC pelos governos.

O estudo se propõe a responder a seguinte pergunta de pesquisa: **Considerando os conceitos de *datafication* e *data justice*, de que forma os riscos associados ao crescimento das aplicações baseadas no uso intensivo de dados estão sendo considerados na implementação de serviços de governo eletrônico no Brasil?** O presente artigo visa contribuir para a literatura acadêmica fazendo uma análise exploratória baseada no estudo de caso do Auxílio Emergencial implementado no Brasil durante a pandemia do COVID-19. Este auxílio consiste em um programa de assistência social baseado no uso de diversas bases de dados gerenciadas pelo governo brasileiro, seguindo um modelo de serviço de governo eletrônico *datafied*.

2. Referencial Teórico

Datafication

O conceito de *datafication* está relacionado a transformação das informações sociais em dados, à obtenção de dados sobre mais coisas, à obtenção de mais dados sobre as mesmas coisas e à obtenção de dados mais pormenorizados sobre as coisas (Heeks, 2017b). Em outras palavras, implica transformar em dados diversas ações, atitudes, registros entre outras coisas (Heeks & Shekhar, 2018; Krishna, 2021; Masiero & Das, 2019). É um fenômeno crescente, fomentado pela evolução da tecnologia digital e do uso cada vez maior de soluções tecnológicas pela sociedade. Esse processo transformou os dados em um ativo de valor, capaz de se transformar no motor de novos negócios desenvolvidos com uso da tecnologia digital, e o crescimento do uso e da dependência de tecnologias orientadas por dados na sociedade é visto como propulsor de transformações em governos, negócios e na sociedade civil (Dencik & Sanchez-Monedero, 2022).

Esse movimento crescente de uso de dados atingiu o setor público, inicialmente com o conceito de *open data* (Cukier & Mayer-Schoenberger, 2013). A crescente geração e uso de dados também foi considerada como positiva para políticas públicas voltadas para a agenda de desenvolvimento sustentável, tendo em vista que os dados seriam essenciais para orientar o desenvolvimento de políticas e medir seu impacto sobre os ODS (Heeks & Shekhar, 2019; UN, 2014). Além disso, o processo de *datafication* também gera impactos nos programas sociais de proteção de renda e combate à pobreza. A disponibilidade de dados legíveis por computadores permite o reconhecimento automatizado dos beneficiários e uma redução dos erros de inclusão e exclusão destes, visando a atribuição correta de direitos (Masiero & Das, 2019). Desta forma, os processos operacionais de programas sociais têm se tornado cada vez mais computadorizados, de forma que os dados dos beneficiários passam a ter papel determinante nos processos decisórios dos programas sociais (Valente & Fragoso, 2021).

Data-intensive development

O termo *data-intensive development* é aplicado quando expandimos a discussão para o impacto que a utilização deste grande volume de dados tem sobre o desenvolvimento econômico, e se refere à crescente presença e uso de dados nos processos de desenvolvimento econômico. Os discursos sobre a "revolução dos dados" tornaram-se

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

.

comuns nas diretrizes de empresas e governos para promover o desenvolvimento econômico e social (Cinnamon, 2020; Heeks, 2017a; Heeks & Renken, 2016). Conforme as tecnologias como a microeletrônica, computação em nuvem, conectividade, internet das coisas, inteligência artificial e *data analytics* evoluem, cresce o interesse na aplicação destas tecnologias para gerar e processar um volume cada vez maior de dados e utilizá-los como recursos para o desenvolvimento econômico. Esta evolução é parte integral de como a sociedade se organiza e toma decisões (Dencik et al., 2019).

A discussão em torno dos impactos do desenvolvimento baseado em dados também envolve preocupações com a possibilidade de exclusão ou discriminação de parte da população dos serviços públicos e privados, se não houver igualdade nas condições de acesso aos dados, no manuseio e elaboração de algoritmos e aplicativos baseados nestes dados. De acordo com a forma como os dados são construídos é possível que as injustiças sociais sejam incorporadas nos próprios dados. Seja por projeto ou como consequências não intencionais, o processo de construção de sistemas de dados pode incorporar valores sociais e padrões de privilégio, e quando esses valores e privilégios são injustos, a injustiça é então uma caraterística dos próprios dados (Johnson, 2014).

Data Justice

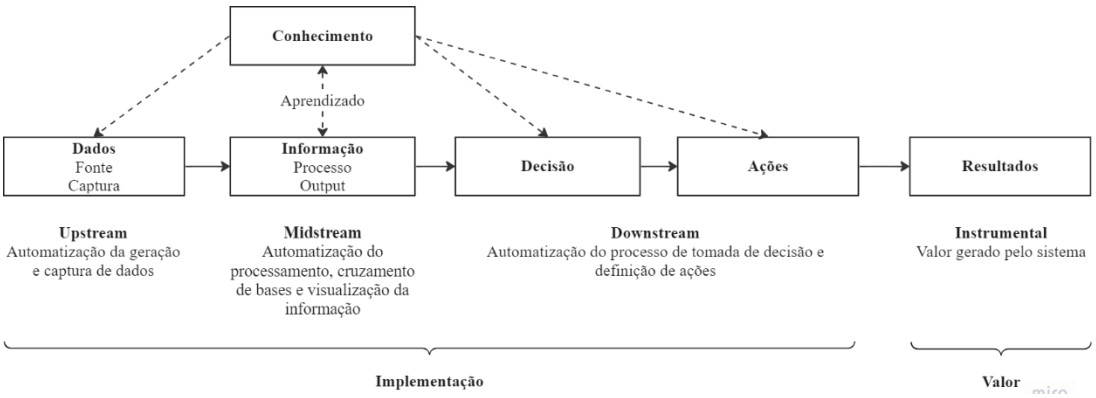
Este debate evoluiu ao longo do tempo, com contribuições de diversos autores na construção do conceito de *data justice*. Heeks & Renken (2016) definem *data justice* como padrão ético pelo qual devem ser avaliados os recursos, processos e estruturas relacionados com os dados, e argumentam que é necessário inserir este conceito em projetos relacionados ao uso, manuseio e distribuição dos dados gerados pelas diversas aplicações. A vigilância baseada em dados, a tomada de decisões e a governança relacionada ao *Big Data* são aspectos sobre os quais surgem preocupações com a incorporação de valores sociais e padrões de privilégio e que o conceito de *data justice* busca colocar em destaque (Dencik et al., 2016).

Taylor, (2017) faz uma importante contribuição para este debate, apresentando um *framework* que concilia a visão dos autores citados acima , tendo como base três pilares: visibilidade, que reforça a importância da representatividade e ao mesmo tempo a preocupação com a privacidade da informação; engajamento com a tecnologia, que envolve compartilhar os benefícios e ter autonomia para escolhas tecnológicas; e não-discriminação, que se desdobra em poder para identificar e desafiar o viés discriminatório nos dados e prevenir a discriminação. Desta forma, *data justice* representa equidade na forma como as pessoas são tornadas visíveis, representadas e tratadas como resultado de sua produção de dados digitais (Taylor, 2017).

Data justice é uma resposta a questões sobre as implicações sociais das tecnologias baseadas em dados que tendem a centrar-se em questões de eficiência e segurança, por um lado, e em preocupações com a privacidade e a proteção de dados, por outro (Dencik et al., 2019). Em uma visão mais ampla, refere-se à preocupações com justiça social nos sistemas de informação, desde ética e diretos humanos até a orientação de ativismo e movimento sociais (Dencik & Sanchez-Monedero, 2022).

Heeks & Shekhar (2018) apresentaram um *framework* com objetivo de aplicar o conceito de *data justice* na análise de sistemas de uso intensivo de dados (*datafied systems*). A expectativa era que o modelo fosse capaz de incorporar todos os tipos de justiça de dados e fosse utilizado para compreender como o poder sobre os dados é exercido no processo de desenvolvimento com uso intensivo de dados As dimensões de *data justice* propostas por Heeks & Shekhar (2018) estão relacionadas a diferentes aspectos desta interação entre o sistema de dados e o contexto que o envolve, conforme **Tabela *1***.

Tabela 1- Descrição das dimensões de *data justice*



Dimensões	Descrição
Procedural	Justiça na forma como os dados são tratados.
Instrumental	Justiça no resultado do uso dos dados.
Rights-based	Aderência, em todas as fases da cadeia, aos chamados direitos associados aos dados, como representatividade, privacidade, acesso e propriedade.
Structural	Como a distribuição e o fluxo de poder e interesses suportam resultados justos ou não.
Distributive	Dimensão abrangente, como um guarda-chuva para as demais, avaliando se há resultados justos em todas as outras dimensões.

Fonte: (Heeks & Shekhar, 2018)

Neste modelo, o tratamento dos dados pode ser avaliado com base no modelo da cadeia de valor da informação (Heeks, 2017c; Heeks & Shekhar, 2018), que representa o processo de captura e coleta de dados, processamento e visualização, uso da informação para tomada de decisões e definição de ações e, por fim, entrega dos resultados (**Figura 1**).

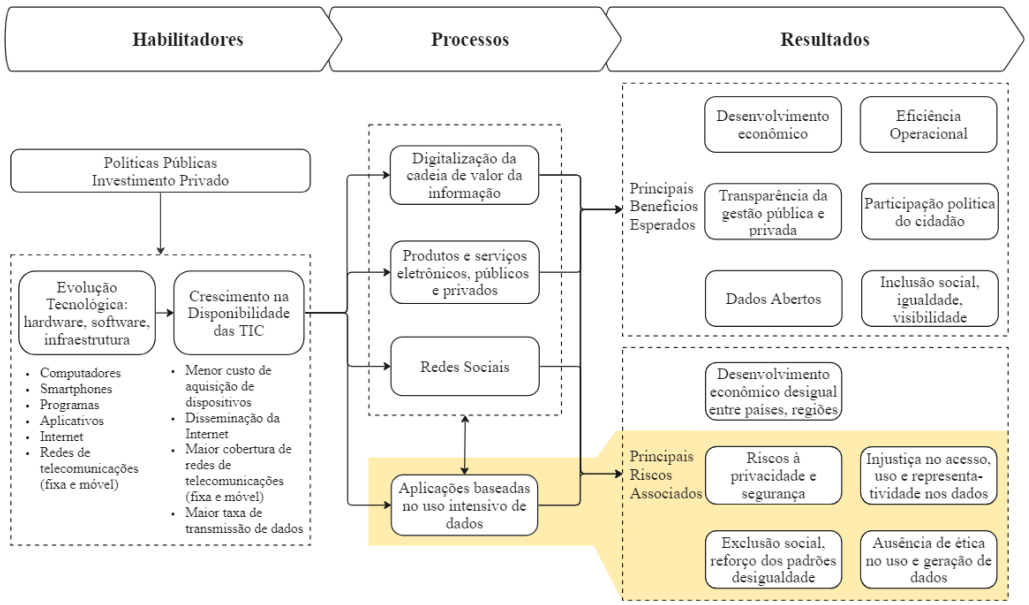
Figura 1 - Cadeia de valor da informação

Fonte: (Heeks, 2017c); (Heeks & Shekhar, 2018)



A combinação desta visão das etapas da cadeia de valor com as cinco dimensões do framework de análise de *data justice*, serve de base para as discussões sobre os desafios do desenvolvimento baseado no uso intensivo de dados e da garantia de justiça social.

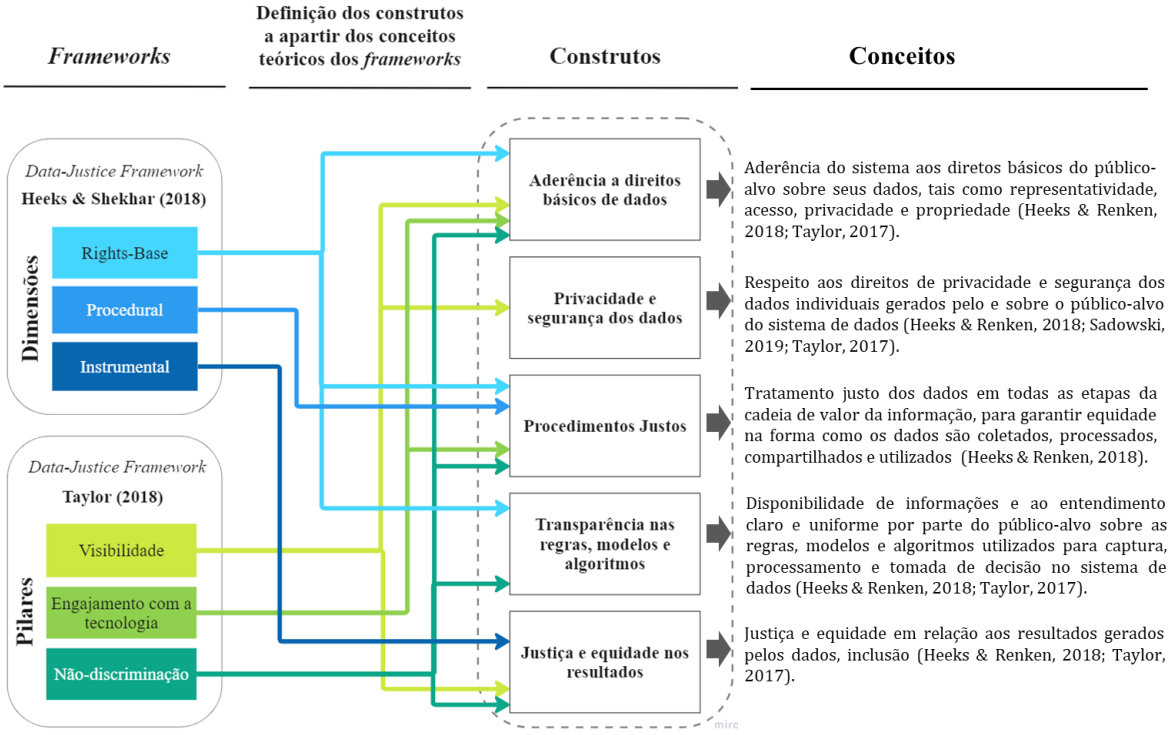
3. Modelo conceitual

Para cumprir o objetivo proposto, a análise foi baseada no modelo conceitual elaborado a partir do fluxo de impacto das TIC (**Figura 2**), dos frameworks de *data justice* (Heeks, 2017a; Heeks & Shekhar, 2018) e da cadeia de valor da informação (Heeks, 2017a).

O fluxo de impacto das TIC (Vargas, 2024) ilustra que a evolução tecnológica e aumento da disponibilidade das TIC habilitaram processos de transformação digital, novos serviços eletrônicos e aplicações baseadas no uso intensivo de dados que geram benefícios para a sociedade, mas que também implicam em riscos. Tendo este *framework* como base, o foco deste estudo concentra-se nas aplicações baseadas no uso intensivo de dados e nos riscos à privacidade, segurança, exclusão social, ética e representatividade nos dados, que estão associados aos resultados gerados por estas aplicações.

Figura 2 – Fluxo de Impacto das TIC

Fonte: Vargas (2024)



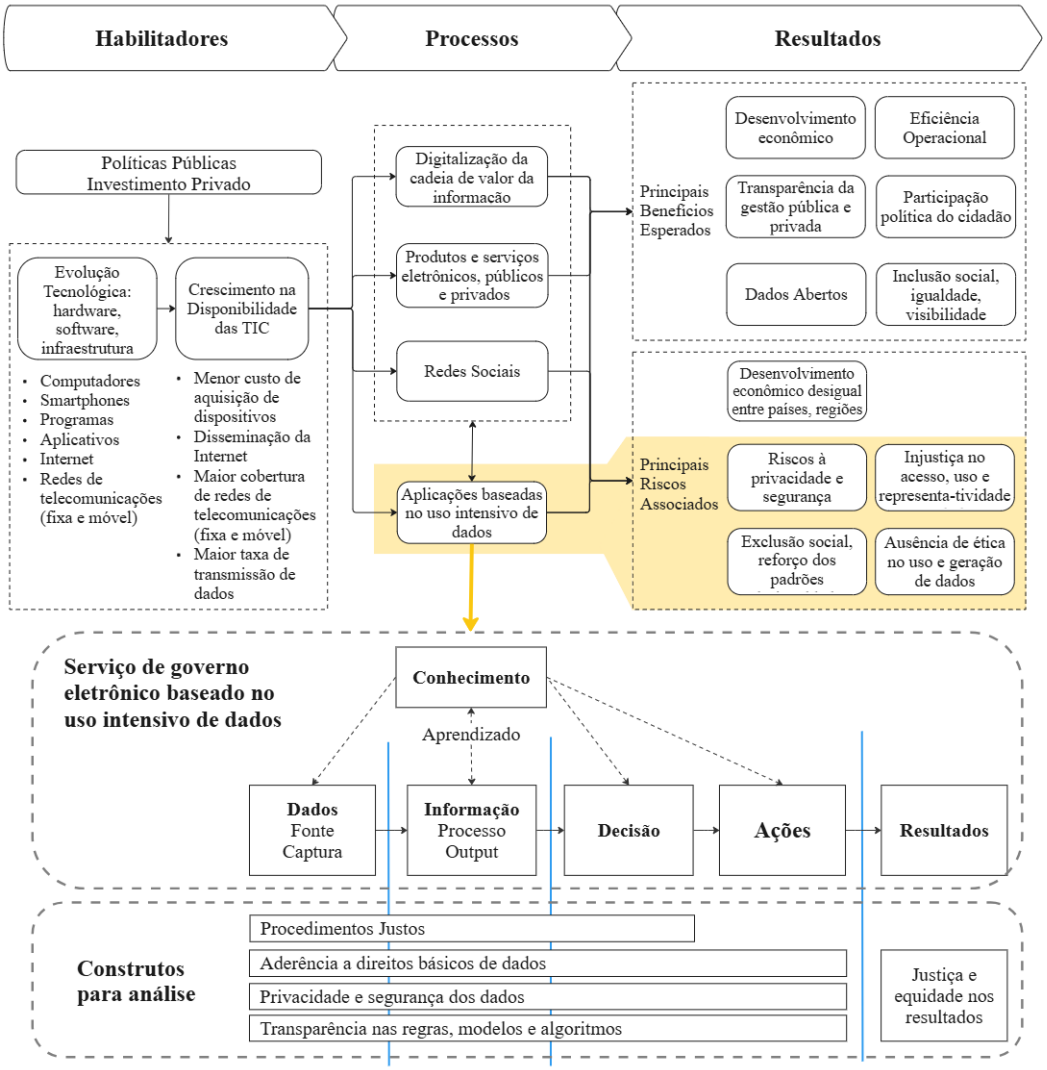
Os *frameworks* desenvolvidos por Taylor (2017) e Heeks & Renken (2018) foram utilizados para a concepção dos construtos do modelo conceitual (**Figura 3**), uma vez que estes se ocupam de temas relevantes na discussão sobre justiça no contexto de uso intensivo de dados por um programa social de proteção de renda e combate à pobreza,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

.

que são visibilidade, elegibilidade, representatividade, transparência sobre o tratamento e proteção dos dados da população que será beneficiada.

Figura 3 – Frameworks e Construtos



Fonte: Elaborado pelos autores

O modelo conceitual (**Figura 4**) concentra-se em aplicações baseadas em uso intensivo de dados e avalia como os riscos associados aos resultados gerados estão sendo considerados ao longo do processo operacional representado pela cadeia de valor da informação. Os construtos para a análise são relacionados às etapas operacionais da referida aplicação e servem de base para a coleta e análise dos dados do estudo de caso.

4. Metodologia

Este estudo utilizou uma abordagem metodológica qualitativa, baseada no método de estudo de caso (Creswell, 2007). Esta estratégia de pesquisa é aplicável quando se deseja explicar ou explorar um fenômeno cuja análise não exige controle sobre eventos comportamentais e focaliza acontecimentos contemporâneos (Yin, 2001). Assim, o caráter exploratório observado nesta pesquisa visa entender como cidadãos são impactados pelo processo de *datafication* na prestação de serviços de governo eletrônico no Brasil.

Assim foi definido como unidade de análise primária um programa social oferecido pelo pelo governo brasileiro, o Auxílio Emergencial da COVID-19, que teve enorme visibildiade e relevância como ação governamental. Este caso foi selecionado porqe o fluxo de cadastramento e controle se baseia na coleta, análise e tomada de decisão baseada em dados da população, logo podemos considerá-lo como um exemplo de *datafication* no contexto de serviço eletrônico em governo.

A coleta de dados se deu por meio de três tipos de fontes: entrevistas com agentes públicos que atuaram no caso, artigos acadêmicos (Bacchiegga et al., 2022; Cardoso, 2020, 2021; Marins et al., 2021; Valentin et al., 2022), que analisaram o caso, documentos como atos normativos publicados entre abril de 2020 e março de 2023 e relatórios (CNJ, 2022; Dataprev, 2020, 2021, 2022). O objetivo das entrevistas era capturar a visão de uma amostra de agentes públicos que atuaram no Auxílio Emergencial sobre a aplicação dos conceitos de *data justice* na construção do serviço de governo eletrônico. O objetivo da análise de artigos acadêmicos e documentos era descrever e construir o histórico do caso, para servir de referência para a narrativa e triangulação com as entrevistas.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

.

Com base no levantamento inicial de informações feito através da pesquisa documental e no referencial teórico, foram realizadas entrevistas semiestruturadas com um grupo de 12 agentes públicos que atuavam no Ministério da Cidadania, na Caixa Econômica Federal e na Dataprev, no período de vigência do Auxílio Emergencial. Estas entrevistas foram realizadas entre os meses de dezembro de 2023 e fevereiro de 2024.

A análise dos dados ocorreu em seis etapas (Creswell, 2013): (i) organização e estruturação dos registros das entrevistas; (ii) leitura preliminar dos dados; (iii) codificação dos dados; (iv) descrição e organização temática do conteúdo; (v) avaliação de como os temas poderão ser representados em uma visão qualitativa; e (vi) interpretação dos significados dos resultados obtidos através da análise do conteúdo. Este trabalho análise do conteúdo foi realizado com auxílio do software Atlas.TI e a codificação do conteúdo foi realizada a partir dos construtos e do modelo conceitual desta pesquisa. Inicialmente, alguns códigos foram pré-estabelecidos e serviram de ponto de partida para a análise, mas outros códigos que emergiram do conteúdo foram incorporados à estrutura, e agrupados em categorias relacionadas aos construtos.

5. Auxílio Emergencial da COVID-19

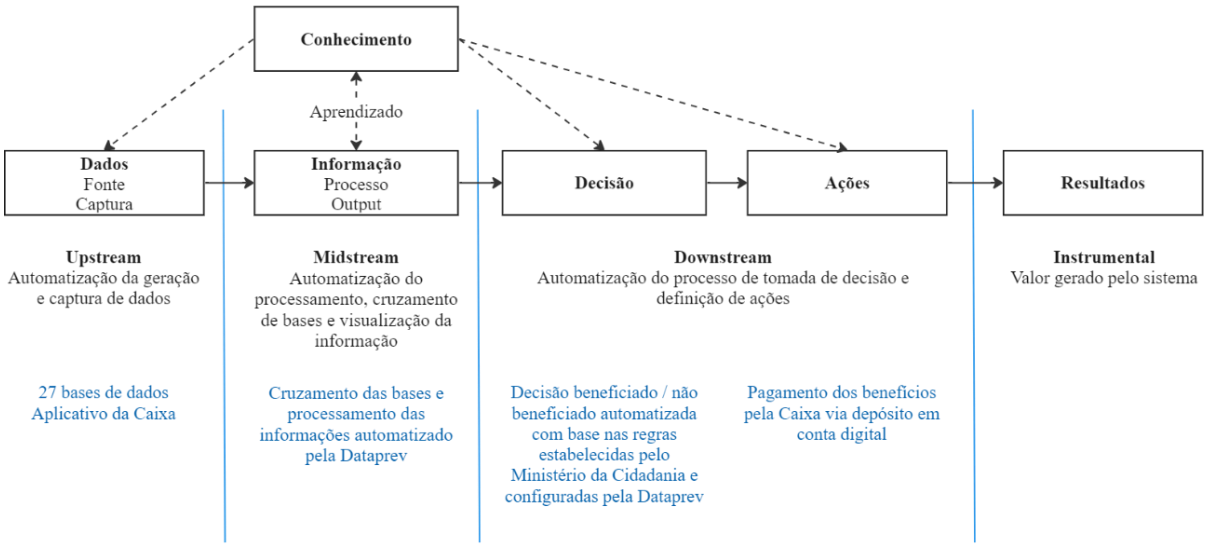
O Auxílio Emergencial foi uma das medidas de enfrentamento da pandemia estabelecidas pelo Decreto 10.316/2020 que regulamentou a Lei 13.982, de 2 de abril de 2020, criada para garantir uma renda mínima aos brasileiros em situação mais vulnerável, beneficiando trabalhadores desempregados, informais, autônomos que ficaram desprovidos de renda em função da pandemia.

Previsto para durar 3 meses, o Auxílio Emergencial de R$ 600,00 (seiscentos reais) foi prorrogado por mais dois meses através do Decreto 10.412 de 30 de junho de 2020, em função da continuidade da pandemia e, consequentemente, do isolamento social. Em 3 de setembro de 2020, a Medida Provisória Nº 1.000 instituiu o Auxílio Emergencial Residual, a ser pago em 4 parcelas de R$ 300,00 (trezentos reais) aos beneficiários do Auxílio Emergencial. A Medida Provisória Nº 1.039 estabeleceu Auxílio Emergencial 2021, benefício pago em quatro parcelas mensais R$ 250,00 (duzentos e cinquenta reais), aos trabalhadores beneficiários do Auxílio Emergencial. O Auxílio Emergencial foi encerrado em 30 de outubro de 2024, com a liberação da última parcela para o último lote de beneficiários.

Desde o início, o Ministério da Cidadania atuou como gestor do Auxílio Emergencial e definiu os critérios para identificação dos beneficiários em conjunto com o Ministério da Economia , conforme estabeleceu o Decreto 10.316/2020 (Cardoso, 2020). A Portaria 351 de 7 de abril de 2020 regulamentou os procedimentos de que tratava o Decreto 10.316/2020, designou a Dataprev como agente operador considerando sua infraestrura e experiência com processamento de dados em grande escala Esta portaria cita a figura do agente pagador, mas sem definir uma instituição financeira como responsável por esta função (Cardoso, 2020). A Caixa Econômica Federal (CEF) tornou-se a instituição financeira encarregada de ser o agente pagador, uma vez que já era responsável pelo pagamento de outros programas assistenciais como o Bolsa Família e o Seguro-Desemprego.

Fluxo Operacional

O desafio imposto pela pandemia era a implantação de um benefício com amplitude nacional em curtíssimo tempo e identificar os beneficiários e conceder o benefício sem que houvesse contato presencial entre os cidadãos e os agentes públicos. Com a definição do público-alvo, as bases de cadastro do Bolsa Família e do Cadastro Único tornaram-se os pilares do processo operacional.



O aplicativo de solicitação da CEF foi criado para incluir o público que não estava mapeado nestas bases, evitando a ida dos requerentes aos Centros de Referência da Assistência Social (CRAS), unidade pública de atendimento à população e que servia de apoio para cadastramento de cidadãos e famílias nos programas assistenciais.

Portanto, o Auxílio Emergencial nasce com a necessidade de ter um fluxo operacional eletrônico e automatizado, usando as bases de dados existentes no governo brasileiro como fonte de informação. Foi necessário utilizar outras bases de dados para validação dos critérios de elegibilidade, uma vez que o benefício seria concedido por unidade familiar e apenas para aquelas pessoas que, de fato, estavam privadas de alguma renda para subsistência. Ao todo, a Dataprev utilizou 8 bases de dados internas e 19 externas, de órgãos como Receita Federal, Sistema Penal, Tribunal Superior Eleitoral, entre outras.

Desta forma, o Auxílio Emergencial foi um exemplo de aplicação do governo baseada no uso intensivo de dados, cujo fluxo pode ser representado de forma simplificada através do *framework* da cadeia de valor da informação (Heeks & Shekhar, 2019), conforme **Figura *5***.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Figura 5 - Cadeia de valor da informação para o Auxílio Emergencial

Fonte: Adaptado de Heeks & Shekhar (2019)

6. Análise e Discussão dos Resultados

Considerando as informações coletadas, pode se entender que o Auxílio Emergencial foi um exemplo de serviço de governo baseado no uso intensivo de dados, dentro do conceito de *datafication* e que alguns conceitos de *data justice* se fazem presentes na sua construção.

É importante destacar que a pandemia foi um fator relevante no contexto do Auxílio Emergencial, por ter motivado a criação deste programa de proteção de renda, por ter influenciado a arquitetura do sistema de dados, que precisava ser totalmente digital devido o isolamento social, pela influência na velocidade de implantação e no engajamento dos órgãos públicos envolvidos.

As entrevistas indicam que havia uma preocupação com situação de vulnerabilidade de uma parcela significativa da população, e isso fez com que discussões que antes levavam muito tempo para evoluir, como troca de informações entre órgãos, fossem tratadas rapidamente em prol da celeridade necessária para a concessão do benefício.

Aderência a direitos básicos de dados

Representatividade e responsabilização foram categorias com quantidade significativa de citações nas entrevistas. Os relatos afirmam que os órgãos de controle tiveram presença ativa no processo do Auxílio Emergencial visando garantir que houvesse o pagamento correto dos benefícios para quem de fato deveria recebê-lo. Podemos considerar que a atuação dos órgãos de controle, com foco na concessão justa dos benefícios, através da identificação e coleta de dados do público-alvo, e no direcionamento de questionamentos da população vai de encontro à visão de *data justice*.

> *Então, o que eles estavam preocupados se a gente não estava, vamos dizer, excluindo algumas pessoas que teriam direito e incluindo pessoas que não têm direito. Isso era uma preocupação tanto do Ministério Público como da Justiça. (Entrevistado 2)*

Os entrevistados comentaram sobre a responsabilidade que eles tiveram com relação ao tratamento dos dados e tomada de decisão sobre os benefícios. Os relatos demonstram que na Administração Pública em geral a responsabilização e suas consequências legais são pontos de atenção e determinantes para o desenvolvimento de iniciativas como o Auxílio Emergencial.

Contudo, os entrevistados não mencionaram a necessidade de consentimento dos cidadãos para uso dos seus dados. O Auxílio Emergencial considerou informações que foram coletadas originalmente para outros fins, mas sem que houvesse mecanismo de consentimento prévio para utilização dos dados. Apenas um entrevistado trouxe

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

.

uma situação na qual houve tentativa, que não se manteve na sequência, de buscar o consentimento do cidadão para aproveitamento de dados previamente obtidos no Cadastro Único para o Auxílio Emergencial.

Da mesma forma, os mecanismos de contestação tiveram pouco destaque nos relatos dos entrevistados. Em um dos relatos este ponto foi considerado como uma das premissas para inclusão da DATAPREV no processo, tendo em vista sua experiência com os requisitos de armazenamento de dados para eventuais contestações.

> *Desde a primeira discussão, a gente aportou toda essa nossa experiência para debater como vai controlar, como vai ser o judicial depois, como a gente vai garantir a consistência das famílias, como que a gente vai fazer a disponibilidade? Então, toda essa cercania de coisas que parecem acessórias, mas que no dia seguinte se tornam principais, foram colocadas desde o primeiro momento. (Entrevistado 12)*

Em contrapartida, outro entrevistado relatou que não houve uma preocupação em criar canais e mecanismos específicos de contestação dos dados. Na sua visão isso é reflexo de uma premissa adotada na Administração Pública em geral que diz respeito a assumir que a informação que consta nas bases de dados do governo é válida até prova contrária. Mas não há mecanismos que facilitem o acesso aos dados e a sua validação por parte do cidadão.

> *Então, esse foi um processo que foi, na minha visão, negligenciado, né, e quando você fala em data justice, eu entendo que não houve essa justiça de dados, né? Ouvi assim, a informação que tá aqui é que eu vou utilizar e você que se vire para provar o contrário. Isso é algo que é comum na administração pública. (Entrevistado 1)*

Garantir que os cidadãos estejam conscientes e de acordo com o uso de dados sobre e por eles gerados é um desafio, impacta a velocidade do processo, mas é crítico para inibir o uso indevido e injusto (Dencik et al., 2016; Hintz et al., 2018; Taylor, 2017). No contexto da pandemia, seria inviável uma ação de consentimento do uso dos dados pelo volume de pessoas no universo do público-alvo e pela urgência em conceder o benefício no momento de isolamento social.

A ausência de mecanismos claros para contestar os dados vai contra a ótica de *data justice*. No caso do Auxílio Emergencial houve a possibilidade de acionar o Judiciário para contestar a negativa do benefício e, consequentemente, os dados. Ou seja, o Judiciário é um caminho para contestação, mas que extrapola o escopo do sistema de dados que deveria prever canais de contestação.

Privacidade e segurança dos dados

No que diz respeito à privacidade das informações dos cidadãos, a percepção dos entrevistados é que o processo do Auxílio Emergencial dava essa garantia aos requerentes, sendo que nove entrevistados afirmaram que houve cuidado com aspectos de privacidade das informações e cinco destes mencionaram que as regras da Lei Geral de Proteção de Dados (LGPD) foram seguidas.

> *Então a questão da LGPD desde o início, e a gente sabe que a LGPD já tem alguns anos aí de estrada, então ela sempre foi uma preocupação do Ministério com suas bases de dados, seja dentro do próprio Ministério ou com as partes que se relacionam. (Entevistado 8)*

Em relação à segurança de dados, oito entrevistados afirmaram que havia procedimentos e condições estruturais para garantir a segurança dos dados. A participação da Dataprev e da CEF gerou confiança para os agentes do Ministério da Cidadania.

> *Do ponto de vista técnico, tecnológico, aí aplicam-se os nossos processos de segurança que a gente usa na previdência, que a gente usa nos outros processos todos, que são as seguranças dos nossos data centers, que são certificados e tudo mais. (Entrevistado 12)*

Apenas um entrevistado apresentou dúvidas quanto a se houve uma avaliação criteriosa por parte da equipe de implementação em relação às necessidades de procedimento de segurança de dados, mas sem ser conclusivo.

> *... a impressão que eu tenho é que num primeiro momento isso ficou em um certo segundo plano, tá? (...) Mas, por exemplo, eu não lembro das pessoas falarem assim, a gente precisa usar uma plataforma XYZ que ela é mais protegida ou garante criptografia ponta a ponta ocorre desse gênero. Eu não me recordo de nada dessa natureza. (Entrevistado 6)*

As entrevistas revelam que estar em conformidade com a legislação vigente relativa à privacidade e proteção de dados foi uma premissa básica do Auxílio Emergencial. Aqui não houve uma discussão sobre eficácia da LGPD em proteger o direito à privacidade dos cidadãos, mas é importante que a legislação vigente esteja sendo observada e respeitada. Portanto, estas constatações indicam que houve preocupação em mitigar os riscos relacionados à privacidade e segurança e que este é um tema presente nas discussões sobre uso de tecnologia pelos governos, em especial quando envolve dados pessoais.

Procedimentos justos

Os relatos apontam que houve preocupação dos agentes públicos com o risco de as bases não cobrirem totalmente o público-alvo do Auxílio Emergencial e, consequentemente, em fornecer alternativas para acesso ao sistema. As entrevistas destacam a implementação do aplicativo de cadastro e a implementação de processo via Correios como medidas necessárias para garantir que os cidadãos que não estavam contemplados nas bases de dados pudessem ter acesso ao Auxílio Emergencial.

> *...tinha muita gente que não estava no cadastro. aqui, o tal do invisível, né? Então, tinha várias pessoas que não estavam no cadastro, mas estavam necessitados, eles não tinham como comer mesmo, não. Por isso que nós contratamos a Caixa (...) Para conseguir fazer o cadastro do pessoal o mais rápido possível. (Entrevistado 2)*

O cadastro via Correios tinha foco na parcela mais vulnerável da população, constituída por moradores de rua e pessoas sem acesso a celular. Entretanto, a baixa adesão, conforme relato das entrevistas, é um indício é que essa parcela da população recorreu a ajudas informais para requerer o benefício ou desistiu.

> *Não se sabe se a população já estava cansada de pedir. A população mais vulnerável, eu tenho uma visão que muitas vezes quem tá mais vulnerável cansa de buscar o Estado ou não acredita mais no Estado ele se vira. (Entrevistado 10)*

A assimetria, falhas de informação e defasagem de atualização dos dados foram os principais pontos citados nas entrevistas em relação ao processamento dos dados. O alto volume de bases de dados utilizadas se justifica pela necessidade de buscar informações de maior qualidade para atender um dos principais objetivos que era pagar corretamente para quem precisava.

> *Primeiro que, como eu falei, nós tínhamos bases muito amplas e maduras, mas ainda assim, naquele momento mostrou-se insuficiente, dado o tamanho do desafio (...) Mas sim, havia gaps, coisas que não estão dentro dessas áreas principais de atuação dessas bases, por exemplo, candidatos, militares, coisas que a gente via que estavam fora de alguns dados da Receita Federal. (Entrevistado 12)*

Integração e interoperabilidade entre as bases de dados foram dois pontos críticos apontados nas entrevistas. Há uma constatação que as bases de dados do setor público eram específicas para cada órgão e não havia interesse político para prover essa integração com padrões de governança de dados que garantissem fluidez em situações de alto impacto em processamento como o Auxílio Emergencial.

> *A questão da interoperabilidade, a questão da integração, isso quando se trabalha com grande base de dados, uma coisa que sempre se buscou, mas de difícil execução barra operação, porque cada ministério se acha dono do seu quintal, entendeu? (Entrevistado 8)*

Desde o início havia a preocupação com a lacuna dos dados em relação à identificação do público-alvo, e este é um ponto importante na discussão de procedimentos justos porque aborda uma questão que impacta toda cadeia, uma vez que havendo discriminação na coleta dos dados, esta tende a se perpetuar nas demais etapas.

O benefício de eliminação dos erros de exclusão e inclusão gerados pelo movimento de *datafication* (Masiero & Das, 2019) não foi verificado no Auxílio Emergencial. Este fato traz risco relevante para iniciativas futuras e precisa ser discutido de forma mais ampla, fora dos limites das áreas. A interoperabilidade e integração é um tema latente nos discursos dos entrevistados, mas observa-se que uma iniciativa estruturante ainda está distante.

A característica do Auxílio Emergencial faz com que a discussão sobre procedimentos justos se concentre na questão das bases de dados. A teoria sobre *data justice* traz uma preocupação com a discussão sobre algoritmos de inteligência artificial e modelos de *machine learning*, em especial em soluções voltadas para vigilância de dados (Hintz et al., 2018; Taylor & Broeders, 2015), mas a arquitetura do Auxílio Emergencial estava baseada nos cruzamentos de bases seguindo regras de inclusão e exclusão, sem a aplicação de algoritmos mais sofisticados.

Transparência nas regras, modelos e algoritmos

Neste ponto os entrevistados ficaram bem divididos entre visões positivas e visões críticas sobre a forma como a comunicação com o público foi realizada. Aqueles que demonstraram opinião positiva sobre a transparência do processo destacaram o cuidado com a forma de comunicar as regras, os caminhos para entender o motivo de corte ou negativa do benefício, a utilização de Internet, atendimento telefônico e programas de TV como canais de comunicação e o processo de transparência ativa, quando as informações disponibilizadas pelos órgãos e entidades, independentemente de solicitação, utilizando principalmente a internet.

> *No nosso processo de comunicação também teve um zelo com as expressões que a gente deveria usar, essa população muitas vezes tem um limite de compreensão. Então até um glossário de termos diferentes*

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

.

> *a gente precisou construir ao longo do tempo e no auxílio emergencial a gente também aplicou isso. (Entrevistado 3)*

Por outro lado, outros entrevistados destacaram a ausência de clareza das regras para o público e até dos motivos de negativa de benefícios. Os relatos citam que no início do processo, havia uma preocupação muito grande com iniciar o pagamento e a comunicação sobre quem teria direito ficou confusa. Posteriormente, foram feitas ações de comunicação, mas ainda havia dificuldade de entendimento do público sobre as regras, que passaram por mudanças à medida que surgiam questionamentos dos órgãos de controle e ações judiciais.

> *Não, no início houve uma confusão infernal de quem que era o público-alvo. A priori foi entendido assim, o governo está dando dinheiro para o povo e as pessoas queriam saber se poderiam ter ou não, e uma das formas que elas descobriam isso era justamente fazendo o requerimento. A área que eu trabalhei lá criou algumas cartilhas, que são documentos em PDF. (Entrevistado 1)*

O conceito de transparência que está consolidado no setor público foca na questão dos dados abertos, ou seja, dar visibilidade dos resultados e insumos relacionados às ações. Entretanto, aqui espera-se que a preocupação vá além, com uma comunicação clara sobre o processo e suas premissas. Havia lacunas de informação que impactavam os critérios de aprovação dos pedidos, mas estas fragilidades ficaram transparentes somente quando houve denúncia ou questionamento judicial. Em resumo, o caso do Auxílio Emergencial indica que transparência é um tema que demanda um debate mais amplo.

Justiça e equidade nos resultados

Não há uma percepção dominante entre os entrevistados sobre justiça e equidade nos resultados. Há um entendimento comum que conceder o benefício para todos que realmente precisavam era uma premissa do Auxílio Emergencial, e como a definição do público-alvo era baseada nas condições de emprego e renda, não haveria discriminação em função de fatores sociodemográficos.

> *Creio que sim, acho que porque quando a gente escreveu ou colocou na rua o auxílio emergencial não importa a cor da pele, não importa o sexo, não importa de onde ele era, a única coisa que importava naquele momento era um público mesmo, que era público-alvo, que era uma população de baixíssima renda ou sem nenhuma renda. (Entrevistado 8)*

Entretanto, as opiniões do grupo apontam dúvidas com relação a ter atingido ou não este objetivo.

> *Olha, eu acredito que é sempre possível que alguns grupos tenham ficado de fora, ou não tenham recebido a cobertura que deveriam, né? Mas eu acho, sinceramente, que essa possibilidade é pequena, pelo menos olhando no agregado. (Entrevistado 6)*

Para os que entendem que o resultado do uso dos dados não garantiu justiça e equidade, a ausência de mecanismos para contestação e correção dos dados e as dificuldades de acesso à tecnologia da população residente em áreas mais afastadas foram fatores determinantes para esse resultado.

> *Eu não acho que a gente alcançou todo mundo, faltou, tem o pessoal do, sei lá, ribeirinho, será que a gente chegou nessas pessoas? A gente chegou lá no interior da Bahia? Não sei, eu de vez em quando me pergunto isso, mas acho que é algo muito ousado para tentar levantar quem ficou fora, né? (...) eu acho que a gente não chegou em todo mundo. (Entrevistado 5)*

Quando o conteúdo das entrevistas indica que não há uma avaliação dominante em relação ao Auxílio Emergencial ter proporcionado ou não um resultado justo, isso significa que este ainda é um ponto que precisa ser discutido pensando na evolução do uso de TIC pelo governo. Em tese, se alguém que deveria ter sido beneficiado pelo resultado do sistema de dados foi excluído indevidamente, não houve total justiça no resultado. E, havendo essa consciência, a questão passa a ser entender o que gerou a exclusão e combater, para evitar que essa situação se perpetue (Dencik et al., 2016; Dencik & Sanchez-Monedero, 2022; Heeks, 2017b; Masiero & Das, 2019).

É fato que o Auxílio Emergencial atingiu resultados expressivos, beneficiando uma parcela muito significativa da população brasileira. Foram 68 milhões de cidadãos elegíveis em 2020 e 39 milhões em 2021 (Dataprev, 2022), se considerarmos pessoas impactadas tendo em vista que o benefício era voltado para a unidade familiar, estima-se 119 milhões em 2020 e 78 milhões em 2021. Quando olhamos para o agregado, isso gera a percepção que o benefício chegou para quem estava precisando, atingindo seu objetivo.

Entretanto, o entendimento que uma pequena parcela de potenciais beneficiários não foi alcançada deve despertar discussões para melhoria no processo e eliminação das causas. Os relatos trazem indícios de que há dificuldade de incluir as populações residentes em áreas mais remotas, como áreas rurais e territórios indígenas, assim como populações em situação de vulnerabilidade como moradores de rua. Ou seja, se não houver uma discussão sobre mecanismos para incluir esses perfis nas bases de dados, o desenvolvimento de serviços eletrônicos de governo baseados no uso intensivo destes dados tende a perpetuar essa exclusão.

7. Considerações finais

O caso do Auxílio Emergencial demonstra que os principais riscos de discriminação e exclusão social estão sendo considerados, mas ainda há necessidade de aprofundamento da discussão em aspectos relacionados a aderência aos direitos básicos de dados, procedimentos justos, transparência e justiça e equidade nos resultados. A preocupação com riscos relacionados à privacidade e segurança de dados parece estar bem consolidada na perspectiva dos agentes públicos, sendo considerada premissa básica para a operação. E, em relação à aderência a direitos básicos de dados, a responsabilização é um tema consolidado e de muita atenção por parte dos agentes públicos.

Contudo, ainda há necessidade de se evoluir nas discussões sobre transparência. A divulgação de resultados ou investimentos realizados através dos portais de transparência é importante, mas deve-se discutir como melhorar a comunicação com o público visando o entendimento claro de todo processo, suas regras e consequências. Deve-se discutir mecanismos para garantir aderência aos direitos básicos sobre os dados e questões como ausência de representatividade e consentimento de uso dos dados para que os cidadãos possam exercer sua autonomia e participar das escolhas relacionadas ao sistema de dados.

A discussão sobre procedimentos justos precisa ser recorrente, e, possivelmente, ser considerada como item padrão de análise na concepção de qualquer aplicação. No Auxílio Emergencial, percebe-se a presença deste tema nas discussões. Mas esta discussão precisa estar incorporada a qualquer processo similar.

É importante destacar que havia a preocupação com a justiça e equidade nos resultados, mas, por se tratar de um conceito impactado pelos demais citados acima, é importante que seja discutido com mais profundidade e com foco nas minorias. Observa-se através dos relatos um viés de avaliação pelo agregado, que é importante, mas que pode esconder riscos de exclusão.

Este estudo propõe um modelo conceitual inspirado no referencial teórico de *datafication* e *data justice* e o aplica em um caso real, trazendo a discussão sobre estes conceitos para o contexto do Brasil e ampliando a análise sobre os países do Sul Global.

Além disso, traz algumas contribuições importantes para futuras iniciativas de implementação de serviços baseados no uso intensivo de dados. A primeira delas é a necessidade de uma legislação que sustente e confira clareza em relação às regras, público-alvo e benefícios que serão concedidos. A LGPD garante que os agentes públicos e as instituições estejam preocupados com as regras de proteção de dados. Da mesma forma, os atos normativos foram a linha-mestra para todo processo de implantação do auxílio e favoreceu, de certa forma, a transparência na comunicação com o público.

A segunda contribuição está relacionada à importância que as empresas públicas de tecnologia da informação (TI) podem ter para processos como este. A Dataprev, em função da sua infraestrutura de TI e da experiência com processamento de dados em larga escala foi fundamental para a operação. Portanto, uma discussão sobre a ampliação de uso de TIC para serviços de governo eletrônico deve considerar o papel das empresas públicas de TI, bem como deve-se avaliar como essas estruturas podem contribuir para avanço no debate sobre interoperabilidade e integração de bases de dados.

A terceira contribuição refere-se ao fato de que, apesar da evolução da tecnologia, ainda temos desigualdades no que diz respeito ao uso da tecnologia pelos cidadãos no Brasil. Apesar do alcance obtido pelo Auxílio Emergencial em termos de cidadãos e famílias, determinados grupos precisaram encontrar alternativas informais para acessar o aplicativo para se cadastrar. Essa desigualdade de acesso e capacidade de uso da tecnologia ainda precisa ser discutida.

Por fim, considerando que a pandemia foi um fator relevante no contexto do Auxílio Emergencial, questiona-se como a implantação do benefício teria evoluído se não fosse este cenário pandêmico.

Em relação às limitações da pesquisa, há uma preponderância de entrevistados do Ministério da Cidadania (líder da iniciativa), fato que pode acarretar um viés na perspectiva das respostas. A pesquisa não considerou a perspectiva dos usuários que, apesar do objetivo ser obter a perspectiva dos agentes públicos, poderia trazer reflexões importantes sobre as desigualdades no processo.

Desta forma, recomenda-se que estudos futuros ampliem a análise para outros casos que tenham ocorrido pós pandemia da COVID19 e que seja feita uma análise voltada para outras modalidades de serviços de governo eletrônico, como por exemplo, aqueles voltados para a área de segurança pública, onde os riscos relacionados a vigilância de dados são críticos.

Smart Communities in Climate Disasters: A Case of Porto Alegre, Brazil

Carolina Tavares Lopes [a*], *Edimara* Luciano [a*], *Lucas* Roldan [a*].

[a] Graduate Program in Business Administration (PPGAd), PUCRS Business School, Pontifical Catholic University of Rio Grande do Sul (PUCRS), Porto Alegre, Brazil, email address [carolina.lopes004@edu.pucrs.br], ORCID number [0009-0004-4654-8503].

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 23 May 2025

Abstract. This study explores the role of smart communities in responding to climate disasters, focusing on the 2024 floods in Porto Alegre, Brazil, as a case study. Grounded in existing concepts of smart communities and based on 23 in-depth semi-structured interviews with community leaders, community members, community collaborators, and local government authorities, this research employs an existing framework designed to understand how these communities evolved into smart communities and whether their adoption of smart governance practices helped them mitigate the disaster's impacts and navigate the recovery process more effectively. The findings, derived from a qualitative data analysis, reveal that pre-existing smart communities demonstrated greater effectiveness in coordinating disaster response efforts, mobilizing resources, and building resilience. Community cohesion was reinforced during the crisis, largely due to established networks, collective trust, and decentralized governance mechanisms. However, the study also identifies significant challenges, particularly concerning the availability and reliability of ICT-based communication systems during crises, difficulties in coordinating across different levels of government, and broader governance barriers that are especially pronounced in developing countries like Brazil. By highlighting these dynamics, this study offers valuable insights into how smart communities can be strengthened to enhance disaster response and resilience, particularly in urban areas facing increasing climate risks. More than just showcasing best practices, this study emphasizes the importance of human connections, local knowledge, and governance innovations, demonstrating that integrating community-led governance into formal disaster planning is essential for proactive and adaptive urban resilience.

Keywords. Smart Community, Climate Disaster, community-led governance, urban resilience, disaster governance.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1026

1. Introduction

Over half of the world's population lives in urban areas, a figure expected to reach 75% by 2050 (McKinsey, 2011). This rapid urbanization, combined with climate change, heightens vulnerability to climate-related hazards, such as urban flooding and extreme weather events (United Nations, 2019). Densely populated cities, particularly in Latin America, are highly susceptible to extreme weather events such as heavy rainfall and urban flooding, exacerbated by the urban heat island effect (Shastri et al., 2015; Li et al., 2020).

This reality is evident in Latin America, where 80% of the population already resides in cities, a figure expected to reach 85% by 2040 (UN-Habitat, 2022). Nearly half of Latin America's capital cities are at extreme risk due to climate change (CAF, 2014), emphasizing the need for resilience strategies in urban governance.

The growing frequency and severity of climate disasters further highlights the urgency of urban resilience strategies. According to the World Meteorological Organization (WMO), between 2020 and 2022, 88% of extreme events recorded in Latin America were caused by meteorological, climatic, and hydrological factors, accounting for 40% of disaster-related deaths and 71% of economic losses (WMO, 2022). As the frequency and intensity of these

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

disasters escalate, it becomes evident that enhancing urban resilience is not just necessary but urgent. Among these hazards, flooding stands out as one of the most recurrent and destructive, driven by climate change projections and rapid urban expansion (Rozer et al., 2021). The economic and social costs of flood-related damages continue to rise, disproportionately affecting low-income and socially vulnerable urban communities (Nkwunonwo et al., 2020; Nasiri et al., 2016).

As Latin American cities grapple with increasing climate risks, Porto Alegre, Brazil, stands out as a compelling case study, particularly due to its long-standing tradition of participatory governance and community engagement. The devastating 2024 floods, which affected large parts of the city, faced the urgency of understanding how urban communities can build resilience in climate disasters (World Meteorological Organization [WMO], 2024). On top of that, this event triggered urgent discussions on disaster governance and flood resilience.

Porto Alegre's pioneering participatory governance, notably through the Participatory Budgeting (PB) process, provides a unique lens to examine how smart communities can enhance resilience in disaster scenarios (Baiocchi, 2003; Goldfrank, 2011). This long-standing tradition of community participation in municipal decision-making offers a valuable lens through which to examine the role of smart communities in disaster response. Additionally, the city has been actively involved in smart communityinitiatives and innovative governance practices, making it a compelling case for understanding how local governance contributesto disaster resilience (Pereira et al., 2017).

While *smart cities* have been extensively explored (Harrison & Donnelly, 2011; Komninos, 2013; Caragliu et al., 2011), research on *smart communities*, particularly in the context of disaster resilience, remains limited. Much of the existing research emphasizes technological solutions (Janssen, Charalabidis, & Zuiderwijk, 2012) and infrastructure-driven adaptation strategies (Alawadhi et al., 2017), while the role of community-led governance in climate disasters remains understudied (Craig et al., 2004). There is limited research on how smart communities develop in crisis contexts, particularly in urban areas of developing countries, where challenges such as institutional fragmentation, lack of coordinated response mechanisms, and social vulnerabilities pose additional complexities (Reardon & Forester, 2015).

This study examines how Porto Alegre's *smart communities* adapted to the 2024 floods, offering insights into how localized governance and community-driven initiatives can enhance resilience in the face of climate disasters. More specifically, it investigates whether their adoption of smart governance practices played a role in mitigating the disaster's impacts and how facilitating an effective recovery.

To guide this discussion, the paper is organized as follows: Section 2 reviews the concept of smart communities and introduces the conceptual framework used to analyze their structure. This is followed by an overview of Porto Alegre's geographic and historical context, with a focus on the 2024 floods. Section 3 details the research methodology, outlining the data collection process, which combined in-depth interviews with document analysis of secondary data sources. Section 4 presents the key findings, exploring how communities engaged with the disaster response and recovery efforts. The discussion that follows cross-analyzes these results, offering insights into the mechanisms of community governance and the role of smart communities in fostering resilience. Finally, the conclusion highlights the importance of strengthening smart local communities and ensuring their integration into decision-making processes as a strategy to enhance climate disaster resilience.

2. Theoretical Background

This section introduces the concept of smart communities and their role in urban resilience, followed by a conceptual framework to analyze how these communities' function in Porto Alegre, particularly during the 2024 floods. Finally, we provide an overview of the city's geographic and historical background, highlighting the factors that influence its governance and disaster response strategies.

2.1 Smart community and Climate Disasters

Smart communities, an extension of smart cities, focus on collaborative governance, technological integration, and social resilience, especially in the face of urban challenges like climate disasters. Unlike traditional top-down governance models, smart communities prioritize citizen engagement, participatory decision-making, and decentralized problem-solving (Komninos, 2013; Craig et al., 2004). Smart communities leverage technology and local resources to enhance governance and community well-being, playing a critical role in building urban resilience during climate disasters (Ahvenniemi et al., 2017). They also function as microcosms of larger urban ecosystems, subdividing cities into smaller, interconnected networks that facilitate more efficient governance and localized problem-solving (Tang, 2022).

Instead of depending exclusively on top-down government policies, smart communities promote a participatory approach that enhances local governance, improving urban planning, and social cohesion (Bartoletti & Faccioli, 2016). In this sense, smart communities operate through intersectoral collaboration, promoting active citizen

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

participation in decision-making, public service monitoring, and direct engagement with government agencies (Alawadhi et al., 2017).

O'Toole et al. (2010) reinforce that community governance flourishes when residents feel a sense of ownership and collective responsibility, making them key actors in shaping local policies and ensuring that resources are allocated effectively. In this context, smart communities thrive when supported by strategic collaborations with local governments and other entities, ensuring that services align with the specific demands of the population. These partnerships enhance the adaptability of governance models, making policies more responsive to evolving social and environmental challenges. Differ than functioning independently, smart communities work alongside existing governance structures, using citizen participation and technology to enhance decision-making (Bowles & Gintis, 2002). Instead of replacing governments or markets, they act as interconnected actors that reinforce governance through collaboration. O'Toole & Burdess (2004) expand on this argument, showing that when local governance structures actively encourage community participation, residents and organizations take on a more proactive role in shaping and delivering public services.

Smart communities rely on social capital, fostering trust between citizens and institutions, which is essential for effective governance during crises (Hautekeur, 2005). However, the sustainability of these governance models is not always guaranteed. While self-organized communities enhance urban resilience, particularly through organic adaptation strategies, their long-term success depends on alignment with formal governance structures (Marasco et al., 2022). Nam & Pardo (2011) point out that maintaining adaptability is a growing challenge, as communities must continuously evolve with technological advancements, ensuring that residents can fully engage with and benefit from smart governance structures.

Yet, the reality is that many community-driven initiatives struggle to sustain long-term engagement. Farmer et al. (2015) argue that despite initial enthusiasm, many of these efforts face significant challenges in translating participation into lasting structural changes. One of the key barriers is the lack of integration with formal governance structures, which can result in community-led solutions being overlooked or failing to gain institutional support. Without clear mechanisms for long-term implementation, mobilizing local actors can lead to frustration and disengagement. Berardi (2013) and Alawadhi et al. (2012) echo this concern, showing that while smart communities represent an evolution of social governance, their effectiveness depends on a continuous process of innovation, adaptation, and institutional backing.

Despite these challenges, smart communities play a key role in urban governance, especially in disaster scenarios like the 2024 floods in Porto Alegre, where institutional inefficiencies hinder rapid response (Phong & Shaw, 2009). In developing countries like Brazil, issues such as fragmented governance, limited digital infrastructure, and a lack of coordinated response mechanisms often exacerbate the impacts of climate disasters (Mutiarni et al., 2022). Community-led adaptation strategies, such as those seen in Indonesia — a country frequently impacted by climate disasters — have been shown to improve disaster mitigation and post-crisis recovery by formally recognizing and supporting local climate action efforts (Azizi et al., 2022). Moreover, Parvin et al. (2023) emphasize that addressing climate risks effectively requires expanding collaboration beyond government agencies, incorporating a diverse network of stakeholders, including local communities, private organizations, and international institutions.

A key element of disaster-resilient smart communities is the integration of ICT-based communication systems**,** which allows for real-time information sharing and enhanced coordination between citizens and public authorities (Pereira et al., 2017). Communities with well-established governance structures and active digital platforms are often more effective at mitigating disaster risks and accelerating recovery efforts (Janssen, Charalabidis, & Zuiderwijk, 2012). However, technology alone is not enough — without strong social cohesion and well-structured governance models, digital solutions may fail to achieve their full potential in crisis situations. Reardon & Forester (2015) illustrate this risk through the example of post-Katrina New Orleans, where institutional efforts to increase urban resilience ultimately resulted in the exclusion of vulnerable communities from the recovery process, reinforcing socioeconomic disparities rather than reducing them. This case presents the importance of ensuring that smart governance frameworks prioritize inclusivity, preventing marginalized groups from being left out of resilience-building efforts.

The intersection between smart governance and climate resilience highlights the need for cross-sector collaboration, particularly in urban contexts where government agencies, NGOs, local businesses, and community representatives must work together to strengthen disaster preparedness (Reardon & Forester, 2015). Tedong & Zyed (2021) further emphasize that communities serve as the foundation of sustainable urban development, reinforcing the idea that resilient communities are essential to the long-term success of smart city initiatives. The case of Porto Alegre provides an opportunity to explore how smart communities emerge in times of crisis, offering insights into both their strengths and the challenges they face when integrating community-led initiatives with formal governance frameworks.

2.2 Conceptual Framework for Smart Communities in Porto Alegre

Building on existing theoretical perspectives, this study applies a previously developed conceptual framework to analyze how communities in Porto Alegre develop and function as smart communities. This framework offers a relevant foundation for understanding the governance mechanisms and institutional responses that shape their evolution. Illustrated in Figure 1, the model is grounded in insights from 25 in-depth interviews conducted with community leaders, community social center personnel, citizens, entrepreneurs and consultants, and city hall representatives. Its primary objective is to map the interactions between community-driven governance mechanisms and institutional response strategies, providing a structured perspective on how these communities emerge, evolve, and establish smart governance practices.

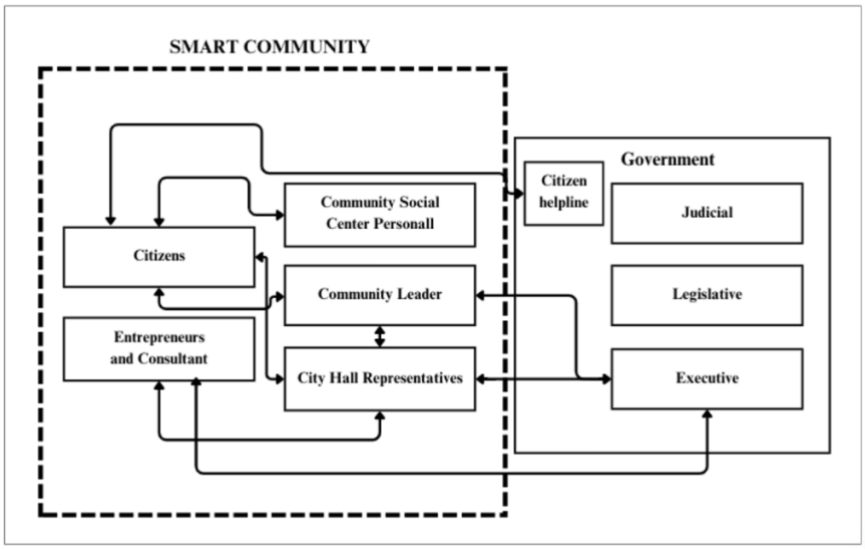

Fig. 1 - Figure caption. Smart Community Framework (Lopes et. al.,2024)

This framework presents how communities address local challenges, filling communication gaps and compensating for inefficiencies in government action. These communities are not formed arbitrarily; rather, they emerge as individuals come together, building networks to draw attention to pressing issues, advocate for public services, and, in some cases, bypass bureaucratic barriers to implement solutions themselves.

The framework reveals the diverse roles that smart communities play — not just as spaces for collaboration, resource sharing, and civic engagement, but also as meeting points that foster local innovation. Participants express a shared need for governance structures that are more inclusive and responsive, where citizen input is not only acknowledged but actively incorporated into decision-making processes. Over time, these communities establish credibility, making it harder for institutions to overlook their demands.

The proposed framework seeks to understand how communities become smart, shedding light on the mechanisms that allow a group of individuals to self-organize, communicate, and advocate for solutions that address local challenges. Ideally, once a community identifies its needs, leaders engage directly with local representatives, such as city councilors, to push for improvements, facilitating dialogue and resource allocation. However, if direct engagement with government structures remains ineffective over time, communities seek alternative channels — whether through city council representatives, local media, or the legislative chamber — to escalate their concerns. In certain cases, organized demonstrations, advocacy campaigns, or legal actions are necessary to ensure that institutional actors acknowledge and respond to their demands.

This model, grounded in the data collected, portrays a pragmatic vision of smart communities—one that is not solely focused on long-term structural change but also on the capacity to address recurring challenges through collective action and strategic partnerships. In the Section 4, we explore how this structure operates in the context of climate disasters, examining the role of smart communities in mitigating risks and enhancing local resilience.

2.3 Porto Alegre's geographic and historical context

Porto Alegre, the capital of Rio Grande do Sul, is Brazil's southernmost state, bordering Uruguay and Argentina. Founded in 1772 as a strategic port city, it quickly became an economic and political hub, shaped by waves of European immigration that played a central role in the city's urban development and social fabric (Constantino, 1998). German, Italian, Portuguese, and other immigrant communities settled in distinct neighborhoods,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

establishing businesses, industries, and civic institutions that contributed to the city's economic growth and cultural identity. Over the decades, Porto Alegre has distinguished itself as a leader in participatory governance, particularly through its internationally recognized Participatory Budgeting (PB) initiative, which has influenced urban management models worldwide (Baiocchi, 2003; Goldfrank, 2011).

Geographically, Porto Alegre is located along the Guaíba River, a defining feature that has historically shaped its economy, infrastructure, and urban expansion. However, this proximity to a vast hydrographic system also makes the city highly susceptible to flooding, a vulnerability that has been exacerbated by rapid urbanization, insufficient drainage infrastructure, and climate change effects (Rozer, Vogel, & Costa, 2021). The topography of the city, characterized by low-lying areas interspersed with hills, further complicates flood management, with several neighborhoods frequently experiencing inundation during extreme weather events (Silveira, 2023).

Historically, Porto Alegre has faced severe flooding events, with two particularly significant disasters shaping urban resilience strategies. The 1941 flood was one of the most catastrophic in the city's history, when extreme rainfall caused the Guaíba River to rise to an unprecedented 4.75 meters, submerging large parts of the city, including its downtown area. Nearly 70,000 people — approximately 26% of the city's population at the time— were displaced, and a third of the city's businesses and industries wereaffected (Silveira, 2023). The flood lasted approximately 40 days, marking it as one of the most extreme climate events recorded in southern Brazil. In response, authorities implemented structural flood control measures, culminating in the Porto Alegre Flood Protection System, completed in 1974, which includes a network of levees, pumping stations, and the controversial Mauá Wall, built along the waterfront to prevent future disasters (Guimaraens, 2009).

Despite these structural interventions, Porto Alegre continues to face significant flood risks. As highlighted by Valenti, Rolim & Rocha (2012), the city is particularly vulnerable due to its low altitude, with an average elevation of 4 meters above sea level, making floodwaters harder to control. The hydrographic system of Porto Alegre is complex, with the Guaíba River receiving water from four major tributaries — the Jacuí, Sinos, Caí, and Gravataí Rivers — which significantly increases runoff volume during heavy rainfall events. Moreover, the impermeabilization of urban surfaces due to rapid expansion has further reduced natural drainage, exacerbating flood impacts.

The 2024 floods, one of the most devastating climate disasters in the city's recent history, reinforced these concerns (WMO, 2024). As seen in previous flood events, community-led initiatives played a critical role in response and recovery, stepping in where governmental structures faced delays or inefficiencies. The disaster renewed urgent discussions on urban resilience and disaster governance, emphasizing that while Porto Alegre has a history of participatory governance, its institutional framework and infrastructure must continue evolving to address increasing climate risks.

Given Porto Alegre's historical legacy of civic participation and its ongoing exposure to climate risks, it serves as an important case to analyze the role of smart communities in disaster resilience. Understanding how grassroots networks interact with formal governance structures allows for a broader discussion on disaster preparedness, crisis management, and long-term climate adaptation strategies.

3. Research Method

This section outlines the methodological approach used in the study, applying qualitative research frameworks to explore governance within smart communities. The methodology follows Arksey and O'Malley (2005) and Godin et al. (2015), integrating literature reviews, semi-structured interviews, and grey literature analysis to explore how smart communities respond to climate disasters. The research examines smart community responses to the 2024 floods in Porto Alegre, structured into five phases: 1) Analysis of a previously developed conceptual framework on how communities become smart. 2) A systematic literature review to establish a theoretical foundation on smart communities and climate resilience. 3) First-hand observation of the 2024 floods and how smart communities mobilized during the crisis. 4) Reanalysis of semi-structured interviews with diverse stakeholders conducted before the disaster, and 5) a scoping review of grey literature and secondary data sources to further understand institutional responses and governance gaps. Each phase contributed to a deeper understanding of how community-driven governance mechanisms operate before, during, and after climate disasters. The combination of multiple qualitative research methods allowed for a comprehensive analysis, ensuring methodological rigor while capturing the complexity of smart community dynamics in crisis contexts.

3.1 Research design

This study employs a qualitative approach to examine governance dynamics within smart communities in Porto Alegre. Since this study aims to understand how communities mobilize, organize, and interact with governance structures, qualitative methods offer the depth needed for an in-depth exploration (Pozzebon, 2004). However, considering the use of secondary data and the scoping review of grey literature, the study also integrates elements

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

of a mixed-methods approach, allowing for a broader analysis that includes policy reports and institutional documents.

The study builds upon a pre-existing conceptual framework, presented in 2.2, (Lopes et al., 2024) that explores how communities adopt governance practices and use technology to engage with public authorities and other stakeholders. This framework serves as a reference for analyzing the governance structures of smart communities in Porto Alegre.

Following this, a systematic literature review was conducted to strengthen the theoretical foundation on smart communities and climate disasters. The review followed Ridley's (2012) methodology, involving the selection and organization of relevant studies, the interpretation of key texts, and the synthesis of findings in alignment with the research objectives. The search focused on the terms "smart community" and "climate disasters" in the Scopus database, yielding 24 relevant academic sources, which were analyzed and integrated into the study.

3.2 Data collection

To better understand governance mechanisms in smart communities, we conducted semi-structured interviews, which provided flexibility for open-ended responses while ensuring comparability across participants (Benz & Eberlein, 1999). Given the complexity of governance structures, we adopted a multi-level approach to capture diverse stakeholder perspectives.

We conducted 25 interviews in Porto Alegre over two months in 2023, focusing on governance in climate-related contexts. A total of 23 interviews were selected for analysis. Participants were chosen based on their involvement in Community governance and their ability to provide insights into how smart communities function during crises. The selected interviews included representatives from four primary groups: a) Community leaders who organize and advocate for local initiatives, b) community collaborators who work within these communities, often sharing the same values and goals, c) community members who actively participate in governance and neighborhood associations, and d) local government representatives responsible for urban policies and disaster response efforts.

Interview sessions lasted between 40 and 100 minutes and were recorded with participant consent. The discussions focused on how smart communities interact with public authorities, coordinate internally, and organize around collective challenges. The interviews also provided a means of triangulating insights gathered from literature reviews and document analysis, reinforcing the study's findings.

Following the floods of May 2024, the lead author conducted additional fieldwork, initially as a volunteer supporting affected communities. This direct engagement provided an opportunity to observe smart community dynamics in real-time. Unlike the previous phase, no new interviews were conducted due to the sensitivity of the situation. Instead, observations focused on identifying how previously studied governance structures adapted in response to the crisis. Given the scale of the disaster, extensive secondary data was also available from reports produced by community organizations, local governments, and research institutions.

To complement primary data, a scoping review of grey literature was undertaken, drawing on reports from international and national institutions, including the World Bank, IBGE, and municipal research centers. Arksey and O'Malley (2005) note that scoping reviews are particularly useful in emerging research areas where empirical studies may still be limited. Similarly, Godin et al. (2015) highlight the value of grey literature in bridging academic research with policy and practice. Our review included policy briefs, governmental documents, and community-led publications, offering broader institutional perspectives on urban resilience and governance.

3.3 Data analysis

Data was analyzed using qualitative content analysis to identify governance patterns and themes within smart communities. A deductive coding strategy was applied, drawing from theoretical insights and key themes identified in the literature (Pozzebon, 2004). All interview recordings were transcribed using the qualitative data software Transkriptor. The transcripts were then imported into NVivo for thematic analysis, enabling the identification of central themes and recurring concepts. The analysis followed three stages: 1) Coding of key governance interactions and smart community structures. 2) Clustering of themes into broader categories aligned with research questions. 3) Identifying patterns across stakeholder groups to detect trends in governance models. In parallel, the scoping review of grey literature was analyzed using document analysis techniques to extract relevant policy insights and governance responses. This allowed us to integrate multiple sources of evidence, further validating the study's findings.

The final phase of analysis involved revisiting the conceptual framework to incorporate insights from the case study. By examining how smart communities in Porto Alegre mobilized before, during, and after the 2024 floods, the study refined the existing framework, expanding it into a more comprehensive model—Smart Communities

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

2.0. This revised model accounts for the practical governance challenges faced by communities in crisis situations, emphasizing adaptive mechanisms and multi-stakeholder collaboration.

By combining literature review, semi-structured interviews, ethnographic fieldwork, and grey literature analysis, the study provides a nuanced examination of how smart communities navigate climate disasters. The integration of these methodological steps ensures that findings are grounded in both theoretical perspectives and empirical observations, offering valuable insights into the intersection of community resilience and urban governance.

4. Discussion

This discussion synthesizes insights from 23 in-depth interviews with community leaders, local residents, and government officials, along with documentary analysis, to explore how smart communities responded to the 2024 floods in Porto Alegre. It examines the challenges faced and the role of community governance in enhancing urban resilience.

4.1 The Porto Alegre 2024 Floods: A Case Study

The May 2024 floods reached unprecedented levels, with the Guaíba River peaking at 5.37 meters at Cais Mauá, surpassing the highest recorded flood in the city's history by 45 cm (Serviço Geológico do Brasil [SGB], 2024). The disaster had a devastating impact on urban infrastructure, exposing Porto Alegre's vulnerability to climate-related hazards. The city's main bus terminal remained closed for a month due to flooding (Prefeitura de Porto Alegre, 2024), while the Salgado Filho International Airport was shut down for over eight months, severely disrupting mobility, and logistics across the state (Governo do RS, 2024). Additionally, several stations of the Trensurb urban train system were submerged, interrupting railway connections between the capital and its metropolitan region for four months. By December 2024, three stations were still closed, further complicating daily commutes for thousands of residents (Governo do RS, 2024).

The social impact of the disaster was equally severe. More than 377 people remained displaced months after the event, while many families were relocated through the Compra Assistida program, which provided homes worth up to R$ 200,000 to those who lost their properties (United Nations, 2024). The destruction of residential areas was exacerbated by the failure of the Muro da Mauá, a flood protection structure built over fifty years ago. Its floodgates, designed to prevent water from entering the historic downtown area, failed to seal properly, allowing extensive inundation in one of Porto Alegre's oldest and busiest districts (Prefeitura de Porto Alegre, 2024).

Institutional analyses of the event indicate that the flooding was intensified by a combination of the El Niño phenomenon and the effects of climate change. El Niño, characterized by the abnormal warming of Pacific Ocean waters, disrupts weather patterns, and leads to increased rainfall in southern Brazil (World Meteorological Organization [WMO], 2024). This scenario underscores the urgent need to strengthen urban resilience by enhancing local governance mechanisms to mitigate the impact of extreme climate events in the future.

4.2 Communities Becoming Smart Communities in Climate Disasters

The literature on smart communities highlights their ability to self-organize, engage in civic participation, and collaborate with government institutions and private ones (Komninos, 2013; Hautekeur, 2005). During the 2024 floods, these three characteristics proved essential in disaster response.

Interviewee 1 emphasized that "when a community is organized, it gains political leverage to negotiate directly with the government — whether to veto projects or demand emergency actions" (Interview 1, 2023). Similarly, Interviewee 19 noted that, while community organization has weakened in recent years, leaders still manage to mobilize people more effectively than government agencies in times of crisis (Interview 19, 2023). This mobilization was instrumental in ensuring the swift implementation of the Compra Assistida housing program, which provided housing solutions for displaced families (United Nations, 2024). Beyond political advocacy, structured community networks were key to emergency response efforts. Interviewee 6 stressed that building partnerships with the government was crucial in securing resources and ensuring assistance reached the most vulnerable groups (Interview 6, 2023).

The findings align with the DRRS Porto Alegre Report (2024), showing that community-led networks were more agile than institutional responses, particularly in organizing donations, evacuations, and rescue operations. This highlights the critical role of community governance in urban resilience during climate disasters. Additionally, the Prefeitura de Porto Alegre (2024) recognized that many emergency shelters were initially organized by community groups rather than governmental institutions, demonstrating the power of grassroots mobilization. The effectiveness of these networks also reflects previous research indicating that well-organized grassroots communities play a crucial role in disaster governance, particularly when official response systems face delays (Krongthaeo et al., 2021). The Porto Alegre case reinforces that disaster governance must include community-led

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

initiatives as an integral component of urban resilience strategies (Marasco et al., 2022).

4.3 Community Credibility and Trust

The credibility of smart communities was crucial in mobilizing resources and fostering effective engagement with governance structures, enabling them to act swiftly and effectively during the crisis. According to Hautekeur (2005), community credibility—the trust communities hold—enables effective interaction with formal institutions. The trust in community-led mechanisms was evident during the 2024 floods, particularly through organizations like Fundação Cultural Floresta, which coordinated fundraising and distribution of essential goods. This highlights how strong community networks can complement and even enhance official disaster response efforts. Meanwhile, the Ação da Cidadania Sul, a local branch of the national Ação da Cidadania initiative, was instrumental in organizing emergency shelters and ensuring food security for displaced residents (Ação da Cidadania, 2024).

The long-standing credibility of these organizations played a critical role in their ability to attract donations and mobilize volunteers, reinforcing the argument that well-established community networks are essential for urban resilience (Marasco et al., 2022). This supports previous research indicating that communities with strong credibility can influence public policies and shape disaster response strategies (Craig et al., 2004).

Another key aspect was the role of community spaces as coordination hubs. Interviewee 9 described how community centers became “meeting points for organizing relief efforts and disseminating critical information” (Interview 9, 2023). This reflects research suggesting that community spaces act as focal points for collective action and mutual support during crises (Hautekeur, 2005). One striking example was the Velejadores Solidários RS, a sailing group that mobilized boats to rescue stranded families and later shifted to organizing donations of clean clothes, personal hygiene kits, and pet food for affected communities.

4.4 ICT and Smart Communities

The use of Information and Communication Technologies (ICTs) during the floods showed the potential of smart governance to improve climate resilience. For example, the interactive mapping platform by the municipal government helped track flood levels and coordinate emergency actions, demonstrating how ICT can enhance disaster response (Prefeitura de Porto Alegre, 2024b). Additionally, the ObservaPOA platform provided real-time data on the most affected neighborhoods, allowing communities to organize relief operations more effectively (Prefeitura de Porto Alegre, 2024a).

Digital governance research suggests that data-driven decision-making significantly improves crisis management (Lassa, 2019). Social media also played a critical role in facilitating decentralized coordination during the floods (Krongthaeo et al., 2021). However, technological solutions alone are insufficient—smart disaster governance must integrate local knowledge, citizen participation, and institutional support to be effective (Nam & Pardo, 2011). The Porto Alegre case illustrates that pre-established community hubs significantly enhance urban resilience, accelerating coordination and resource distribution.

4.5 Porto Alegre’s Institutional Coordination and Smart Community Gaps

Despite the effectiveness of community-led networks, several governance challenges were identified. A major issue was the lack of coordination among different levels of government, which delayed response efforts. The DRRS Porto Alegre Report (2024) found that there were 3,500 open emergency protocols during the disaster, highlighting bureaucratic inefficiencies and response fragmentation.In a 2023 interview, a local government representative acknowledged these difficulties, stating that "there is no alignment between the objectives of secretaries, council members, and the mayor. Each has their own priorities, with no clear strategy” (Interview 18, 2023). This confirms findings by Takara (2018) and Meijer & Rodríguez (2016), which highlight administrative fragmentation as a barrier to adaptive governance.

The breakdown of official communication systems further complicated the response. According to the Prefeitura de Porto Alegre (2024), the collapse of ICT-based monitoring systems and early warning alerts left many residents without real-time updates, forcing them to rely on community networks for critical information.

Interviewee 17 recalled that during a smaller flood in September 2023, "Civil Defense came to talk to us, but did nothing. It was through the internet and community networks that we learned how to respond” (Interview 17, 2023). This sentiment was echoed in the DRRS Porto Alegre Report (2024), which noted that government agencies lacked real-time situational awareness due to system failures, increasing reliance on informal communication channels.

Another significant challenge was infrastructure failure, which exacerbated the flood’s impact. The Muro da Mauá

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

flood barrier, built over 50 years ago, failed to prevent water from entering downtown Porto Alegre due to structural weaknesses in its floodgates (Prefeitura de Porto Alegre, 2024). The United Nations (2024) attributed part of the disaster's severity to the combination of El Niño and climate change, highlighting the urgent need for urban resilience planning.

The Porto Alegre case highlights the need for disaster response strategies that integrate multi-level governance, community engagement, and resilient digital infrastructure. Institutionalizing hybrid governance models that include smart community networks is crucial for improving crisis management in the future.

5. The Role of Smart Communities in Disaster Response

The 2024 floods in Porto Alegre presented significant challenges to urban governance and the city's response capacity. In this crisis, smart communities played a critical role in mobilizing resources, advocating for political action, and providing emergency support, effectively filling the gaps left by institutional responses. This experience reinforces the importance of community-driven governance models in strengthening resilience, fostering local coordination, and building trust networks (Hautekeur, 2005).

During the disaster, citizen-led initiatives proved essential in mitigating damages and organizing recovery efforts. Community-led mapping efforts utilized georeferenced tools to identify the hardest-hit areas, ensuring the efficient allocation of resources and prioritizing aid distribution. (Prefeitura de Porto Alegre, 2024a). Additionally, emergency relief coordination — largely driven by collaborative networks and social media — enabled faster distribution of food, medical supplies, and temporary shelter to displaced individuals (United Nations, 2024). In the aftermath of the floods, volunteers organized large-scale cleanup efforts, removing more than 13,000 tons of debris, demonstrating the power of collective action in disaster recovery (Prefeitura de Porto Alegre, 2024b).

The effectiveness of these community-driven responses not only helped alleviate the immediate crisis but also highlighted structural governance deficiencies that complicated disaster management. Local governments faced logistical and bureaucratic barriers, a common issue in Latin America, where institutional fragmentation hampers public sector efficiency (O'Toole & Burdess, 2004). The Porto Alegre case exemplifies this issue, revealing the urgent need to strengthen coordination between governments and communities to ensure a more agile and integrated response to future disasters. Based on the 2024 flood experience and insights from interviews, we identified three layers of community governance that played a pivotal role in disaster response:

Internal Community Dynamics – Autonomous grassroots networks that organize self-managed crisis responses, mobilizing resources and providing immediate support independently of government agencies.

Intermediary Actors – Social organizations, entrepreneurs, and non-profits that act as connectors, bridging the gap between communities, institutional resources, and the private sector to enable decentralized yet effective solutions.

Government Interaction and Institutional Support – Public policies and listening mechanisms that foster community engagement, reduce bureaucratic hurdles, and integrate grassroots efforts into official disaster response strategies.

These interconnected layers demonstrate the need for hybrid governance models, combining digital technologies, community engagement, and coordinated public policies, to build resilient urban environments capable of responding to climate crises (Reardon & Forester, 2015). Learning from the 2024 floods, we propose an updated Smart Communities Framework (Smart Communities 2.0) that integrates governance and technological innovations to enhance urban resilience (see Figure 2).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

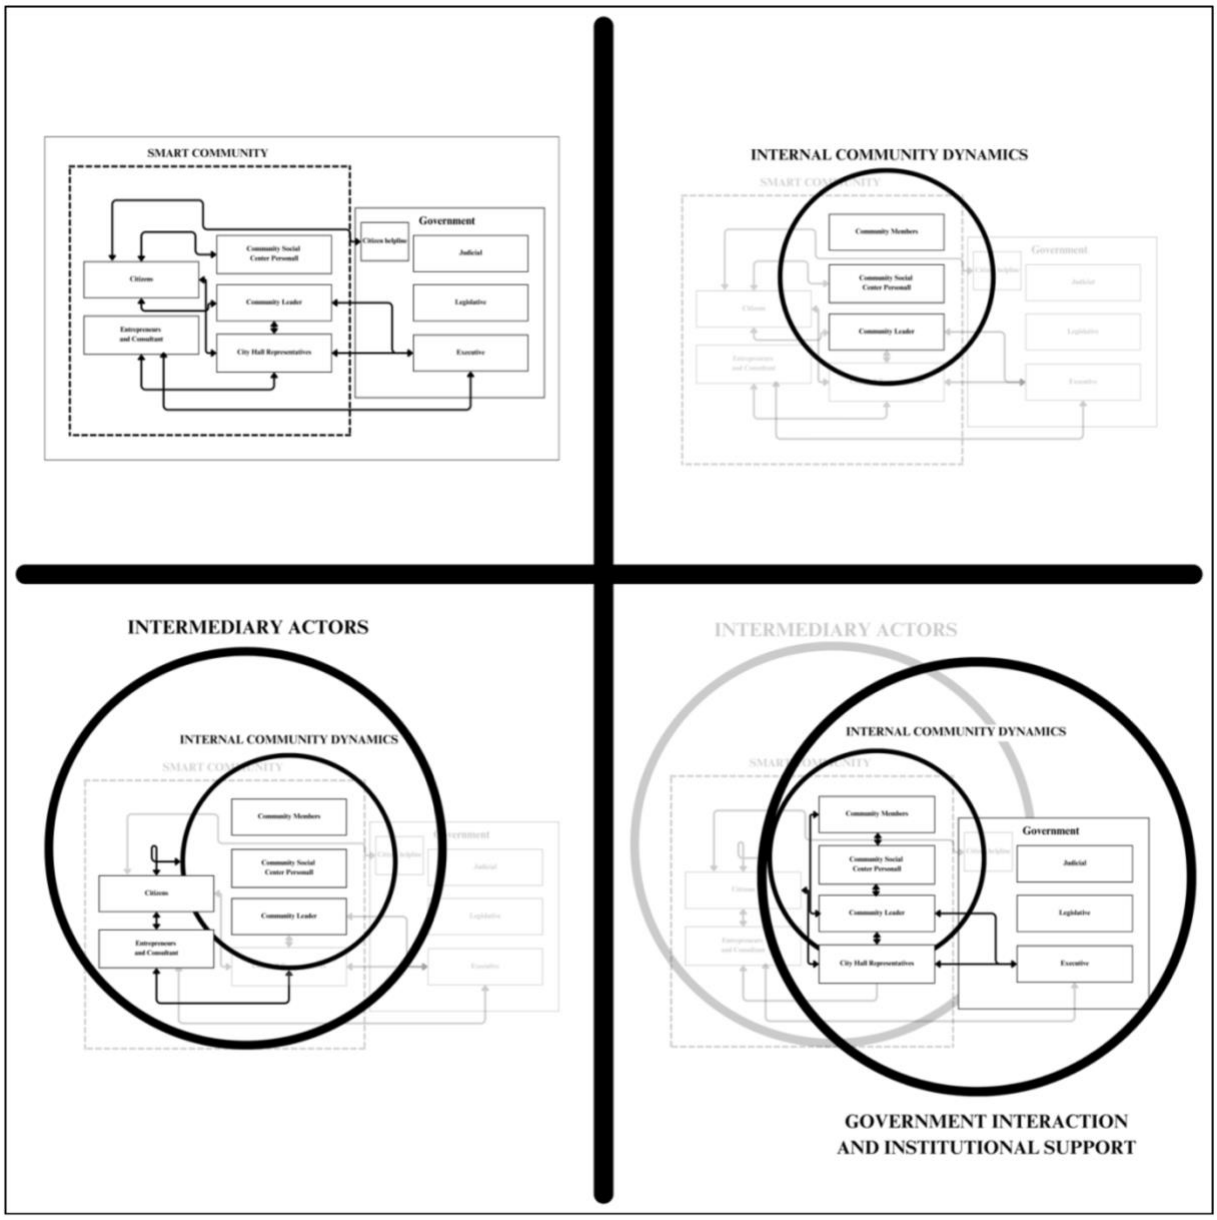

Fig. 2 - Smart Community Framework 2.0 (Created by the authors)

The evolution of Smart Communities as a concept is crucial for understanding their role in climate resilience. The Smart Communities 2.0 Framework aims to define how these networks function as key resilience-building actors, ensuring that climate-vulnerable cities are better equipped to withstand extreme events. This model is based on systematic literature review, qualitative interviews, fieldwork observations, and institutional reports, reinforcing the idea that decentralized governance structures are essential for disaster management.

Despite the proven effectiveness of community-led responses, there is still a significant gap in institutional policies recognizing and integrating smart communities as legitimate urban planning stakeholders. The Porto Alegre case illustrates this disconnect, while institutional responses were slow and fragmented, community-led initiatives were rapid, well-coordinated, and highly effective, forming support networks and accelerating recovery efforts. This finding highlights the importance of incorporating decentralized, participatory models into crisis governance, reducing the sole dependence on state agencies, and strengthening civil society's response capacity.

In the Latin American context, where challenges like inadequate infrastructure, social inequality, and political instability amplify the impacts of climate disasters, adopting the Smart Communities 2.0 Framework represents a transformative step forward. This model not only addresses immediate disaster response needs but also provides structural, long-term solutions, integrating technology, governance innovation, and community networks to create cities that are more resilient and prepared for future climate risks.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

6. Final remarks

The 2024 floods in Porto Alegre underscored the crucial role of smart communities in resource mobilization, emergency response, and urban recovery. While institutional responses faced logistical and bureaucratic challenges, community networks proved to be more agile and effective, reinforcing the importance of decentralized governance in crisis scenarios. The collaboration between citizens, intermediary actors, and government agencies was crucial in mitigating the disaster's impacts and ensuring direct assistance to affected populations.

This study emphasizes the importance of the Smart Communities 2.0 Framework, illustrating how hybrid governance models can enhance urban resilience and better equip cities to respond to future climate disasters. Porto Alegre serves as a real-world case study that bridges theory and practice in the fields of adaptive governance and disaster management. Additionally, this research contributes to the broader discourse on smart governance, multi-level governance, and social innovation, offering new perspectives on the role of communities in crisis management.

Based on these findings, governments must institutionalize smart communities in disaster response, ensuring direct access to resources, information, and decision-making processes. This requires the development of formal support mechanisms, ensuring that community networks have direct access to resources and information. Moreover, policies promoting digital infrastructure and real-time communication are vital to empowering community-led responses and improving disaster preparedness. Advancing decentralized governance, where communities have greater autonomy in coordinating local responses, can reduce over-reliance on state intervention and foster more resilient cities.

This study has some methodological limitations, including the lack of post-flood interviews, which could offer further insights into the long-term impacts of community-led governance. Additionally, quantitative research is needed to measure how smart communities contribute to urban resilience. Future studies should explore comparative analyses between Porto Alegre and other Latin American cities facing similar climate challenges to validate the framework in diverse contexts.

Another crucial area for further research is the vulnerable communities residing in high-risk areas, such as riverside settlements and hillside neighborhoods. Many of these groups faced forced displacement and difficulties in resettlement, exposing critical gaps in urban planning and disaster preparedness. Understanding how these communities organized themselves, accessed emergency support, and navigated institutional responses would provide valuable insights for developing more effective policies to prevent similar crises in the future.
