In conclusion, this study emphasizes that urban resilience requires a collective effort, where governments, communities, and technologies collaborate to enhance disaster preparedness and recovery. The experience of Porto Alegre demonstrates that organized communities are strategic actors in disaster response. If cities aim to be better prepared for climate crises, they must embrace new governance models that balance citizen participation, technological innovation, and institutional support. Resilience is not just a theoretical concept, it is a practice built collectively.

Appendix A

What is your vision regarding the 4th District development process?

What short-term and long-term results are expected with the implementation of +4D?

Are there specific strategies to promote social inclusion and generate employment for citizens?

How is the local community involved in the development process?

Are there specific forums or channels for residents' participation in decision-making?

How does the program collect feedback and address the needs of residents?

What are the transparency and accountability mechanisms to inform residents about decisions and allocated resources?

Is there any incentive to encourage civic engagement among residents?

What is the role of civil society in district planning?

What are the main benefits for the government in actively including communities (small governance) in Master Plans?

How are challenges of representativity and diversity addressed when including these communities in governmental planning processes?

What are the main barriers faced by citizens when trying to participate in these plans and solutions?

What is the importance of ongoing collaboration between the government and communities in building "smart city" strategies?

Should there be a more consistent approach to active public listening in the development of these plans?

How do you anticipate the evolution of citizen participation considering innovations, not only in data collection but in general collab?

How does the government establish contact and involve these groups in the development of these plans?

Abstract. O presente estudo analisa o uso de Dados Abertos Governamentais (DAG) e Inteligência Artificial (IA) para inovação em Santo Antônio da Patrulha - Rio Grande do Sul sob a ótica de gestores públicos e gestores privados. A pesquisa é de cunho qualitativo, e os dados foram coletados por meio de entrevistas realizadas com oito gestores, sendo eles cinco da administração pública e três do setor privado, e também a partir do portal de dados abertos do município. A análise revela que, apesar do reconhecimento dos potenciais benefícios advindos dos Dados Abertos Governamentais e da Inteligência Artificial, sua adoção efetiva é limitada. Foram identificadas deficiências críticas na qualidade, acessibilidade e divulgação dos Dados Abertos Governamentais, além da falta de capacitação técnica em Inteligência Artificial, especialmente no setor público. A resistência à mudança também é uma barreira significativa, contudo, os gestores vislumbram o potencial da Inteligência Artificial no intuito de otimizar processos e impulsionar a inovação, e destacam a colaboração público-privada como crucial. O estudo conclui que o município de Santo Antônio da Patrulha pode se beneficiar dessas tecnologias, mas precisa investir na melhoria dos Dados Abertos Governamentais, na capacitação técnica e na promoção de uma cultura orientada a dados. Este trabalho contribui para auxiliar na compreensão do tema ao fornecer insights sobre a realidade de um município brasileiro e delinear caminhos para a adoção bem-sucedida de Dados Abertos Governamentais e Inteligência Artificial, visando à promoção da transparência, eficiência e desenvolvimento socioeconômico. As limitações da pesquisa, como a amostra reduzida, apontam para a necessidade de estudos futuros.

Keywords. Dados Abertos Governamentais; Inteligência Artificial; Inovação; Administração Pública; Administração Privada.
Research paper, DOI: https://doi.org/10.59490/dgo.2025.999

1. Introdução

Os dados abertos governamentais (DAG) surgiram com o objetivo de promover a participação cidadã, aumentar a transparência governamental e fortalecer a accountability. No entanto, foi durante o governo de Barack Obama, em 2009, que os DAG ganharam maior destaque, impulsionando a criação de portais de dados abertos governamentais e oferecendo aos cidadãos e partes interessadas acesso facilitado a informações públicas (Attard et al., 2015). Com o avanço da tecnologia e a crescente disponibilidade de dados, qualquer indivíduo ou instituição pode aprimorar, reutilizar, inovar, compartilhar e analisar informações conforme seus interesses (Kawashita et al., 2024). Esses dados, ao serem acessíveis ao público, oferecem uma gama de oportunidades para a inovação e o

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

desenvolvimento em diversos setores. A inteligência artificial (IA), definida por Nitzberg e Zysman (2022) como "a tecnologia que usa computação avançada para realizar tarefas com capacidade cognitiva [...]", é uma ferramenta poderosa que tem o potencial de transformar a maneira como são utilizados os DAG.

No entanto, os autores Nitzberg e Zysman (2022) reforçam que a IA é altamente dependente da alimentação de dados para se aproximar ou se igualar à capacidade cognitiva humana. A integração eficaz de IA com DAG pode potencializar a capacidade de análise e interpretação de grandes volumes de dados, gerando insights valiosos e permitindo a automação de processos complexos. A combinação da IA e dos DAG abre portas para diferentes possibilidades, mas exige um cuidado especial.

Conforme apontado por Taylor (2023), a quantidade de dados gerados no mundo está crescendo exponencialmente. Essa explosão de dados representa tanto uma oportunidade quanto um desafio. Para transformar esses dados em informações acionáveis, é preciso garantir que eles sejam precisos e confiáveis. Além disso, como ressaltam Wang et al. (2022), a habilidade de captar e lapidar os dados relevantes é essencial para fomentar a inovação e otimizar processos de tomada de decisão. A capacidade de transformar grandes volumes de dados brutos em informações acionáveis é essencial para manter a competitividade e a eficiência tanto no setor público quanto no setor privado (Makridakis, 2017; Wang; Teo; Janssen, 2021). O uso da IA está se tornando cada vez mais frequente na sociedade contemporânea devido à grande quantidade de dados produzidos diariamente, a IA causa impacto em diversas áreas e indivíduos, sendo utilizada para melhorar serviços, criar novas oportunidades de negócios e resolver problemas complexos (Ghani et al., 2019).

Com base no exposto acima, diante de uma economia diversificada, que abrange desde a agricultura até o comércio e a prestação de serviços, Santo Antônio da Patrulha, um município brasileiro, enfrenta desafios constantes em várias áreas ao buscar soluções inovadoras e sustentáveis para seu desenvolvimento econômico, infraestrutura e qualidade de vida dos cidadãos. A utilização eficaz de DAG, combinada com a IA, pode ser uma solução promissora para enfrentar esses desafios.

Diante disto, esta pesquisa busca responder à seguinte questão: Como gestores da administração pública e privada de Santo Antônio da Patrulha podem utilizar Dados Abertos Governamentais com o auxílio da Inteligência Artificial para gerar inovação? A análise dessa questão permite entender se os gestores públicos e gestores privados estão aproveitando os DAG para oferecer serviços mais eficazes e impulsionar a inovação.

Além disso, é fundamental investigar como essas tecnologias podem ser adaptadas e aplicadas às necessidades específicas de Santo Antônio da Patrulha. Considerando as características únicas do município, a pesquisa pretende oferecer uma visão das oportunidades e desafios associados à integração de IA e DAG. Com isso, espera-se contribuir para o desenvolvimento de estratégias que promovam a inovação, a eficiência administrativa e o bem-estar dos cidadãos.

2. Referencial teórico

Esta seção dedica-se à apresentação dos fundamentos teóricos e a revisão da literatura utilizada neste estudo. Neste capítulo serão abordados os temas IA com ênfase em DAG e como o uso em conjunto destes podem gerar inovação no setor público e privado.

2.1 Inteligência Artificial

Na contemporaneidade, segundo Mutascu (2021), a IA não está sendo utilizada somente para o desenvolvimento de processos de automação, mas também possui grande uso na conclusão de projetos.

A IA é definida como a capacidade de um sistema interpretar corretamente dados externos, aprender a partir desses dados e utilizar essas aprendizagens para alcançar objetivos e realizar tarefas específicas por meio de adaptação, conforme Sellitto (2002). Este é um dos horizontes da ciência da computação que busca desenvolver formas de simular a capacidade humana. Suas principais características incluem a resolução de problemas, tomada de decisões, raciocínio e o reconhecimento de padrões.

De acordo com Yigitcanlar, Degirmenci e Inkinen (2022), a IA é adotada em setores privados e públicos por seu principal fator de estar disponível 24 horas por dia possuindo assistências digitais, decisões ágeis, eficiência na redução de erros humanos, auxiliando em serviços repetitivos e até assumindo riscos humanos.

Contudo, autores como Mak e Pichika (2019) alegam que a IA aprende através de máquinas e técnicas de aprendizado profundo. Ela usa métodos estatísticos para aprender sem precisar de programação direta. Com muitos dados, as máquinas podem desenvolver estratégias para realizar uma tarefa específica.

Segundo Yigitcanlar e Cugurullo (2020), as inteligências artificiais (IAs) reparam e gerenciam setores do dia a dia,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

e as áreas em que estão vinculadas vão desde agricultura, saúde, segurança, marketing, finanças, robótica e transportes, com o objetivo de adquirir conhecimento, tanto diretamente, por meio da detecção do ambiente, quanto indiretamente, por meio de grandes conjuntos de dados instalados pelos desenvolvedores, sendo classificada como um conglomerado de conhecimento que auxilia na tomada de decisões de maneira mais precisa e simples do que outros métodos, como por exemplo modelagem e gestão de indicadores.

Conforme Paschen, Pitt e Kietzmann (2020), a IA é capaz de analisar e combinar conjuntos de dados sendo possível obter excelentes resultados com ações baseadas em dados criados por ela mesma. Além disso, a IA engloba tecnologias como aprendizado automático, tecnologias de captura, análise e compartilhamento de dados, redes neurais, processamento de linguagem natural, sistemas especializados, visão computacional, reconhecimento de fala, planejamento e robótica, entre outras. A IA possui a capacidade de revolucionar diferentes aspectos empresariais, incluindo operações, processos decisórios, criação de produtos e interações com os clientes (Singh et al., 2020; Yigitcanlar et al., 2020; Alter 2022, Barns 2021).

Por fim, Sandeep Ganesh (2022) relata que a IA apresentou proficiência na resolução de problemas que vão desde: pensamento crítico, tomada de decisão, redução de erros e transferência de conhecimento. Este avanço significativo também pode ser observado no uso de DAG. A aplicação de IA no contexto de DAG potencializa ainda mais esses benefícios, proporcionando novas oportunidades para a inovação e a eficiência em diversas áreas.

2.2 Dados Abertos Governamentais

Conforme Nurakmal et al. (2022) no ecossistema de DAG, existem três participantes-chave: os provedores de DAG, os usuários de DAG e os beneficiários de DAG, respectivamente, os provedores de DAG são as partes interessadas, principalmente em órgãos governamentais, responsáveis por disponibilizar os DAG em uma plataforma online (sites ou aplicativos), os usuários e beneficiários de DAG podem ser qualquer indivíduo ou instituição que queira reutilizar, replicar, compartilhar, analisar, manipular e também replicar os DAG.

De acordo com Calaça et al. (2022), para um dado ser considerado aberto ele deve estar disponível sem qualquer custo para todos poderem usar e compartilhar sem nenhum tipo de restrição de direitos autorais, ou outros meios de controle e limitações. Pereira et al. (2017), relata que utilizando as tecnologias da informação de forma inovadora pelas administrações públicas e governos obtêm-se um aprimoramento na interação com a área de prestação de serviços, cidadãos e partes interessadas.A publicação de dados precisa de ser acompanhada por uma infraestrutura que seja capaz de lidar com os dados de uma forma fácil de utilizar, a fim de reduzir o limiar para os utilizadores (Janssen; Zuiderwijk, 2014).

Os DAG têm o intuito de fortalecer a transparência conforme Lourenço (2015), contribuindo assim para o processo na tomada de decisão de gestores públicos e também geração de valor para os cidadãos (Ruijer; Grimmelikhuijsen; Meijer, 2017), o que consequentemente irá proporcionar serviços públicos mais eficazes de acordo com Janssen, Charalabidis e Zuiderwijk (2012).

Com o adequamento dos DAG eficientes para a geração de inovação, serviços de valor agregado, empregos íntegros e de alta qualidade, esses dados são reconhecidos como high value data (HVD) e sua tradução se dá por “dados de alto valor”, na qual seu reaproveitamento traz benefícios e vantagens significativas para a sociedade, ambiente e economia (Karamanou et al., 2022).

Perante os autores como Attard et al. (2015) existem três principais razões para um governo implementar dados abertos governamentais, sendo elas:

- Transparência: Para garantir uma sociedade democrática e eficiente, é essencial que cidadãos e outras partes interessadas possam monitorar as ações e a legitimidade do governo. A transparência envolve não apenas o acesso aos dados, mas também a capacidade de usá-los, reutilizá-los e compartilhá-los. O êxito em promover a transparência resulta em um aumento considerável no controle social exercido pelos cidadãos.

- Liberando valor social e comercial: Os governos geram e coletam uma vasta quantidade de dados em muitos setores diferentes (Alexopoulos et al., 2014). Esses dados, que incluem informações como endereços de escolas, dados geoespaciais, dados ambientais, dados de transporte e planejamento, e informações orçamentárias, possuem valor tanto social quanto comercial e podem ser aplicados para diversos propósitos além dos previstos inicialmente. Ao tornar esses dados públicos, o governo encoraja as partes interessadas a inovar e criar novos serviços com base neles.

Diante de Nikiforova, Aloqaily e Alsmirat (2021), cada vez mais governos estão lançando portais abertos de dados governamentais que podem ser acessados e utilizados por todos. Com essa rápida disponibilidade, as tomadas de decisões estão cada vez mais ágeis e corretas, ocasionando a confiança, satisfação e transparência.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Nikiforova, Aloqaily e Alsmirat, por sua vez consideram que estes dados “mais inteligentes” têm fortes incentivos para uma economia sustentável e com uma grande importância na inovação das tecnologias de informação e comunicação (TIC).

Segundo Mutambik et al. (2023), uma das formas do governo enfrentar os desafios e o rápido crescimento da urbanização, é capacitando os próprios cidadãos para assim terem mais autonomia e capacidades para tomarem suas decisões através do acesso de portais online de dados abertos. Tais portais são capazes de conceder definições ainda mais esclarecidas aos profissionais e também aos cidadãos em uma grande dimensão de áreas, envolvendo temas desde saúde e trânsito até o desenvolvimento de novos negócios, sendo capaz de estimular os cidadãos a fazerem parte da criação de políticas sociais mais eficazes.

2.3 Inovação, inteligência artificial e dados abertos

Segundo Karamanou, Kalampokis e Tarabanis (2022) os DAG quando utilizados juntamente com IA resultam em novos insights produtivos facilitando a interligação e reutilização de dados oriundos de várias fontes. De acordo com Spalević et al. (2023) os governos podem utilizar IA para automatizar a análise de conjuntos de dados governamentais disponíveis publicamente, permitindo que eles reconheçam padrões, entendam os fatores socioeconômicos e tomem decisões políticas baseadas em dados de forma eficaz. Por fim, Spalević et., (2023) destacam que a aplicação da IA no governo eletrônico otimiza a alocação de recursos, aborda questões sociais e aprimora os serviços, enfatizando a importância da educação em IA para uma implementação de alta qualidade em diferentes setores.

Com o aumento da computação em nuvem e da tecnologia de IA, os governos tendem a empregar a análise de dados através da IA para criar mais valor a partir dos dados abertos (Gao; Janssen; Zhang, 2020). Pereira et al. (ibidem) relata que tecnologias da informação e comunicação (TIC) estão permitindo através de dados gerados por organizações públicas e serviços automatizados a resposta de problemas e dúvidas relacionadas às questões públicas.

Diante de Kucera e Chlapek (2014), os benefícios dos DAG são avaliados com base em sua capacidade de promover transparência, eficiência e inovação. Kucera e Chlapek também citam como benefícios dos DAG as seguintes inovações:

- Aumento da transparência: Os dados abertos permitem que os cidadãos tenham acesso a informações governamentais, promovendo a transparência e a prestação de contas.
- Melhoria dos Serviços Governamentais: Ao disponibilizar os dados abertos, os governos podem melhorar a prestação de serviços públicos e responder de forma mais eficaz às necessidades da população.
- Facilitação de Mercados: Os dados abertos podem impulsionar a inovação e o desenvolvimento de novos produtos e serviços, beneficiando tanto os consumidores quanto as empresas.
- Estímulo ao Crescimento Econômico: A disponibilidade de dados abertos pode impulsionar a economia, gerando oportunidades de negócios e promovendo o desenvolvimento econômico.
- Melhoria da Gestão de Dados: Os dados abertos podem ajudar as organizações governamentais a compreender e gerir melhor suas informações, resultando em processos mais eficientes e eficazes.

Esses benefícios são essenciais para promover a inovação, a participação cívica e o progresso social em uma sociedade cada vez mais orientada pela informação.

3. Método de pesquisa

O método de pesquisa adotado neste trabalho foi de origem qualitativa conforme Sampieri, Collado e Lucio (2006), com foco em um estudo de caso único, o município de Santo Antônio da Patrulha - Rio Grande do Sul, conforme Yin (2002). A pesquisa foi estruturada em três fases principais: planejamento, coleta de dados e análise de dados. A seguir, detalha-se cada uma dessas etapas:

1. **Planejamento:** A primeira fase consistiu em uma revisão sistemática da literatura, com o objetivo de identificar as categorias e conceitos relevantes para a elaboração do instrumento de pesquisa, utilizando a base de dados Web of Science e focando em artigos que abordavam IA, DAG e Inovação, com combinações de palavras-chave como "Artificial Intelligence", "Open Data", "Open Data Government" e "Innovation", além da aplicação de filtros para exclusão de artigos de revisão (Review Article) e periódicos Open Access. Como resultado, foram encontrados 269 documentos, publicados principalmente em 2023, o que permitiu

uma análise atualizada do tema, a partir da qual foram identificadas três categorias principais para análise: Qualidade dos Dados Abertos Governamentais (acesso, disponibilidade, legibilidade, representatividade, confiabilidade e transparência), Processamento de Dados com IA (triagem, análise, interpretação e tratamento de dados) e Inovação e Automação Governamental (portais de dados abertos, digitalização governamental, e-governo, serviços públicos automatizados), que serviram de base para a elaboração do roteiro de entrevista, validado por três mestrandos e um doutorando em Administração com experiência em DAG e IA.

2. **Coleta de Dados:** A segunda fase foi realizada por meio de duas estratégias principais, as quais foram: análise do portal de dados abertos do município de Santo Antônio da Patrulha e entrevistas semiestruturadas. No portal, foram avaliados critérios como acesso aos dados (facilidade de acesso e necessidade de login), disponibilidade (frequência de atualização e completude), legibilidade (formato e facilidade de compreensão), representatividade (abrangência em relação a setores e grupos populacionais), confiabilidade (precisão e fontes) e transparência (clareza e ausência de omissões). Já as entrevistas foram conduzidas com 08 gestores (05 da administração pública e 03 do setor privado), utilizando um roteiro dividido em três partes: conceitos e consentimento (explicação de DAG, IA e inovação, além da apresentação do Termo de Livre Esclarecimento e Consentimento - TLEC), perguntas sobre DAG e IA (11 questões sobre a percepção dos gestores quanto ao uso dessas tecnologias para inovação) e dados sociodemográficos (06 perguntas para caracterizar o perfil dos respondentes, como idade, gênero, nível de escolaridade, área de atuação, cargo e tempo de experiência). As entrevistas foram gravadas e transcritas com o auxílio de ferramentas de IA, como Tactiq (para entrevistas online) e Transcriby e TurboScribe (para entrevistas presenciais).

3. **Análise de Dados:** A terceira fase, dedicada à análise dos dados, foi realizada em duas etapas principais. Primeiramente, os dados coletados do Portal de Dados Abertos do Município de Santo Antônio da Patrulha e foram organizados e analisados em um quadro classificatório (localizado na seção 4.1.2 Análise classificatória do portal de dados abertos do município) que avaliou o atendimento aos critérios de qualidade dos Dados Abertos Governamentais. O quadro utilizou três status: “Atende totalmente” (critério plenamente atendido), “Atende parcialmente” (critério parcialmente atendido, mas com necessidade de melhorias) e “Não atende” (critério não atendido ou com deficiências críticas). Em seguida, as transcrições das entrevistas realizadas com 08 gestores (05 da administração pública e 03 do setor privado) foram analisadas com o auxílio do software Sphinx, que facilitou a codificação e categorização dos dados. Os trechos das entrevistas foram agrupados em códigos e categorias predefinidas na Revisão Sistemática da Literatura, como Qualidade dos DAG (fácil acesso, falta de divulgação, dificuldade de acesso), Processamento de Dados com IA (triagem, análise, interpretação, ética na gestão de informações e falta de capacidade técnica) e Inovação e Automação Governamental (serviços públicos automatizados, geração de novos empreendimentos, colaboração público-privada e auxílio na tomada de decisão). A análise permitiu identificar padrões e tendências nas respostas dos gestores, além de comparar os resultados com os conceitos teóricos da RSL. Para a análise de conteúdo, foi utilizado o método proposto por Bardin (2002), que consiste em três etapas principais: pré-análise (organização e leitura flutuante dos dados), exploração do material (codificação e categorização dos trechos das entrevistas) e interpretação dos resultados (identificação de insights e elaboração de conclusões). Essa abordagem metodológica garantiu uma análise robusta e detalhada, permitindo a extração de informações relevantes e a conexão entre os dados empíricos e o embasamento teórico.

Na seção 4 (Resultados), serão apresentados os resultados obtidos a partir da análise dos dados coletados, tanto da avaliação do Portal de Dados Abertos quanto das entrevistas realizadas com os gestores, destacando os principais insights relacionados à qualidade dos DAG, ao processamento de dados com IA e à inovação e automação governamental.

Para embasar essa discussão, a seção 3.1 (Descrição do Caso) trará um panorama detalhado do município em estudo (incluindo dados demográficos, econômicos e geográficos) e o contexto das organizações entrevistadas (setor privado e público), fundamentais para interpretar os resultados referente às particularidades locais.

3.1 Descrição do caso

O município de Santo Antônio da Patrulha possui 42.947 habitantes, Índice de Desenvolvimento Humano (IDH) de 0,717, renda per capita de R$ 38.723,81, área territorial de 1.049,583 km^2 e área urbanizada de 20,64 km^2, conforme dados do IBGE, que representam, respectivamente, os anos de 2022, 2010, 2021, 2022 e 2019.

O município encontra-se localizado a cerca de 75 km da capital gaúcha - Porto Alegre e 53,7 km do litoral, sendo atravessado pela BR-290 (Freeway), conforme Google Maps (2024). Diante da sua excelente localização e facilidade de acesso, a cidade está muito bem posicionada para atrair novas oportunidades de negócios.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Para compreender melhor o cenário local, foram realizadas entrevistas com gestores de empresas de grande porte do município que utilizam ferramentas de IA em suas operações, como empresa de telecomunicação, cooperativa de beneficiamento de sementes e instituição bancária, além de representantes estratégicos da administração pública.

4. Resultados

Neste capítulo, são apresentados os resultados da pesquisa, com a avaliação dos dados e informações disponibilizados no portal de dados abertos oficial de Santo Antônio da Patrulha, visando identificar a apresentação, o acesso e a utilização potencial dos DAG. Além disso, são apresentados os resultados das entrevistas com gestores públicos e privados nas quais foram divididas em três tabelas, onde foram denominadas como: "Tab. 1 - Comparativo da revisão sistemática da literatura sobre Qualidade dos DAG", "Tab. 2 - Comparativo da revisão sistemática da literatura sobre Processamento de dados com IA" e "Tab. 3 - Comparativo da revisão sistemática da literatura sobre Inovação e Automação governamental", explorando suas percepções sobre o uso desses dados em conjunto com a inteligência artificial para promover a inovação em suas organizações. Já na Tabela 4 são demonstrados os resultados obtidos através da análise do portal de dados abertos do município.

4.1 Análise classificatória das entrevistas

Com base em entrevistas semiestruturadas, esta análise busca classificar as respostas dos participantes em categorias relevantes, fornecendo uma compreensão aprofundada das diferentes visões e experiências relacionadas ao objeto de estudo.

Tab. 1 – Comparativo da revisão sistemática da literatura sobre Qualidade dos DAG.

Categoria	Descrição categórica	Código	Evidência	Frequência de códigos citados
Qualidade dos Dados Abertos Governamentais	Engloba um conjunto de atributos que determinam o valor e a utilidade dos dados disponibilizados pelo governo para o público. Ao avaliar a qualidade desses dados, busca-se garantir que eles sejam precisos, completos, acessíveis e utilizáveis para diversos fins.	Fácil acesso aos dados	E6 - [...] eu entendo que são bem acessíveis, o nosso portal da transparência da prefeitura inclusive já foi premiado pelo Tribunal de Contas, então eu os vejo acessíveis [...] E8 - [...] eu acredito que é fácil da população pesquisar [...]	3
		Falta de divulgação de DAG	E2 - [...] acredito que a dificuldade possa ser a falta de divulgação [...] E4 - [...] nunca vi divulgado em lugar algum [...] E8 - [...] as gestões dos governos poderiam melhorar, divulgar talvez mais dados além daquilo que a lei obriga [...]	3
		Dificuldade de acesso aos dados	E3 - [...] realmente não foi algo que a gente conseguiu ter um acesso tão facilitado porque teve algumas informações que eu por conhecer as pessoas e alguns conhecidos da prefeitura que a gente consegue ter um acesso diferente quanto algumas informações e elas não estavam todas disponibilizadas, e quando a gente acaba pegando um dado mais específico, ele não está no domínio da prefeitura [...]	3

Fonte: Elaborado pelos autores (2025).

A tabela 1 revela contradições significativas na implementação dos DAG. Enquanto alguns entrevistados destacam acessibilidade (como o portal premiado citado por E6), outros apontam três problemas principais: acesso desigual a informações específicas (E3), falta de divulgação eficaz (E2, E4, E8) e dificuldades técnicas persistentes.

Os dados expõem uma política de transparência que opera mais no cumprimento formal do que na efetiva abertura.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

A necessidade de "contatos internos" para certos dados (E3) e a crítica sobre divulgar "além do que a lei obriga" (E8) revelam uma abordagem burocrática, não cidadã. Apesar de portais tecnicamente avançados, persistem barreiras que limitam o uso prático das informações tanto por cidadãos quanto por gestores.

Esses achados sugerem que a qualidade dos DAG vai além da publicação técnica diante da Lei Complementar nº 101/2000, requer estratégias ativas de divulgação, design centrado no usuário e mecanismos contínuos de melhoria. A verdadeira abertura de dados exige superar a lógica do cumprimento mínimo para adotar uma cultura de transparência efetiva e inclusiva diante de (Calaça et al., 2022).

Tab. 2 - Comparativo da revisão sistemática da literatura sobre Processamento de dados com IA.

Categoria	Descrição categórica	Código	Evidência	Frequência de códigos citados
Processamento de dados com IA	Consiste em um conjunto de técnicas e ferramentas que utilizam a IA para coletar, organizar, analisar e interpretar grandes volumes de dados. Esse processo é fundamental para extrair insights, tomar decisões e automatizar tarefas.	Triagem dos dados	E2 - [...] o benefício que eu vejo é amplitude, porque ela vai filtrar melhor do que o humano. Então se tu quer ver onde está errado, tu vai filtrar para localizar o defeito e a inteligência artificial vai achar, ou até mesmo tu está procurando um defeito e tu não acha, ao usar a IA ela vai achar. Então eu acredito que nessa parte para melhoria e filtragem vai ser muito bom. Se sobressai sobre o ser humano. [...]	5
		Análise dos dados	E5 - [...] A partir da análise desses dados, você tem uma inovação [...]	6
		Interpretação dos dados	E8 - [...] a inteligência artificial, se tu alimentares, pedir para ela cruzar informações, ela já foi preparada para isso, ela vai ser mais ágil. O tempo utilizado para isso vai ser menor do que o ser humano que vai estar ali fazendo. E eu acredito que a propensão de risco de erro, margem de erro, seja menor [...]	6
		Falta de capacidade técnica	E7 - [...] a gente que não faz uso ainda em todas as áreas, eu acho quehoje nós não estamos preparados. Mas a gente vai ter que, de forma muito acelerada, se preparar [...]	5

Fonte: Elaborado pelos autores (2025).

A análise demonstra como o processamento de dados com IA, detalhado na tabela 2, funciona como alicerce tecnológico indispensável para as inovações governamentais apresentadas na tabela 3. A capacidade da IA em triar, analisar e interpretar grandes volumes de dados de forma rápida e precisa cria as condições necessárias para transformações profundas em ambas as administrações conforme Paschen, Pitt e Kietzmann (2020).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

A análise de dados com IA (6 citações) revela capacidade única para identificar padrões complexos invisíveis aos métodos tradicionais, enquanto a interpretação de dados (6 citações), como destacado por E8, permite cruzamentos ágeis de informações com menor margem de erro que processos manuais diante de Sandeep Ganesh (2022). Contudo, como alerta E7, a falta de capacidade técnica (5 citações) representa um obstáculo crítico, exigindo preparo acelerado das equipes para plena implementação dessas soluções.

Estas capacidades técnicas, quando aplicadas ao contexto governamental, viabilizam as inovações documentadas na tabela 3, a automação de serviços públicos, mencionada em 8 citações, depende diretamente da capacidade de processar rapidamente solicitações e dados dos cidadãos conforme Nitzberg e Zysman (2022). Da mesma forma, o apoio à tomada de decisão estratégica (também com 8 citações) só é possível graças à análise preditiva e à visualização de cenários complexos proporcionadas pela IA conforme (Wang et al., 2022).

Tab. 3 - Percepções sobre Inovação e Automação governamental.

Categoria	Descrição categórica	Código	Evidência	Frequência de códigos citados
Inovação e Automação Governamental	Conjunto de iniciativas que modernizam a gestão pública por meio de tecnologias digitais e automação, visando eficiência, transparência, qualidade dos serviços e inovação governamental.	Serviços públicos automatizados	E3 - [...] essa questão de a gente ter a possibilidade de aumentar a experiência, reduzir as falhas, reduzir prejuízo, conseguir ter estratégias mais assertivas, pode contribuir para formas de ser mais eficientes. E, para a inovação do município, a gente consegue realizar pesquisas mais aprofundadas, mais práticas, aumentar essa segurança digital e tentar contribuir de alguma forma com a produtividade [...]	8
		Processos automatizados no setor público	E1 - [...] um chatbot que eu possa direcionar perguntas e já ela já vai conseguir trazer um retorno automático até a própria câmara de vereadores, se precisar colocar alguma reclamação não precisa mais ter um humano para tratar isso, porque o chat consegue compilar todos os aspectos [...]	8
		Geração de novos empreendimentos locais	E5 - [...] a análise desses dados poderia focar em determinados setores. Por exemplo, uma realocação de recursos, possibilidade de novos empreendimentos [...]	7
		Colaboração público-privada	E8 - [...] uma parceria público-privado, sabendo utilizar tanto o público quanto o privado, essa ferramenta, usando os dados abertos governamentais, os dados privados também da empresa, isso pode vir a agilizar, tanto para a empresa, no sentido de uma análise interna da prefeitura, para concessão de um alvará, uma certidão que ela precise, quanto para a prefeitura [...]	8
		Auxílio na tomada de decisão	E7 - [...] entendo que vai facilitar nesse sentido para a tomada de decisão. Tanto do ponto de vista da gestão pública, mas também da iniciativa privada [...]	8

As tabelas são compostas por quatro colunas. A primeira coluna, denominada "Categoria", apresenta os temas analisados no contexto do estudo. A segunda coluna, "Descrição da categoria", contém a explicação detalhada de cada tema listado anteriormente. Já a terceira coluna, intitulada "Código", reúne os códigos identificados tanto na literatura quanto durante as entrevistas realizadas. Na quarta coluna, "Evidência", são exibidos trechos das falas dos participantes, codificados com a letra "E" seguida de um número para manter o anonimato. Por fim, a última coluna, "Frequência de citações dos códigos", indica a quantidade de vezes que cada código foi mencionado ao longo das entrevistas. As informações obtidas foram organizadas e classificadas com o auxílio do software Sphinx, a fim de identificar padrões, semelhanças e tendências significativas.

A análise das entrevistas com gestores públicos e privados de Santo Antônio da Patrulha, organizada em formato de tabelas, revela percepções importantes sobre o uso de DAG e IA para a inovação. No que tange à categoria de qualidade dos DAG (Tab. 1), observa-se uma dualidade de percepções entre gestores: enquanto alguns gestores consideram os dados facilmente acessíveis (E6, E7 e E8), citando como exemplo o portal da transparência da prefeitura, outros relatam dificuldades no acesso (E2, E4 e E6) especialmente para informações mais específicas.

A falta de divulgação dos DAG citada novamente pelos gestores (E2, E4 e E8) emerge como um fator crítico, limitando o conhecimento sobre sua disponibilidade e potencial. A dificuldade de acesso aos dados que é apontada pelo gestor E3 é outro ponto de atenção, deve-se levar em conta a citação do E6 com o relato sobre a falta de familiaridade da população com os meios de busca e a ausência de dados mais detalhados nos canais oficiais.

Quanto à categoria de processamento de dados com IA (Tab. 2), os gestores E2, E4 e E5 reconhecem o potencial da tecnologia principalmente para fins de triagem automatizada, enquanto E1, E4 e E5 destacam sua utilidade para análise e interpretação de dados. Um ponto de convergência entre os respondentes é o reconhecimento da capacidade da IA de proporcionar maior eficiência, precisão e agilidade nos processos analíticos quando comparada aos métodos tradicionais, aspecto particularmente enfatizado pelo gestor E2.

Contudo, os entrevistados destacaram desafios significativos na implementação dessas tecnologias. A questão ética no gerenciamento de informações emergiu como uma preocupação unânime entre E1, E2, E3, E4 e E6, exigindo a implementação de mecanismos robustos de controle e fiscalização. Paralelamente, os gestores E1, E3, E4, E7 e E8 apontaram limitações técnicas na operacionalização dessas ferramentas, revelando uma carência de profissionais qualificados para lidar adequadamente com os sistemas de IA. Esses achados sugerem que, além dos evidentes benefícios operacionais, a adoção de IA no processamento de dados enfrenta obstáculos críticos que englobam tanto dimensões ético-governamentais quanto lacunas de competência técnica, fatores que demandam atenção especial no planejamento estratégico de implementação tecnológica. Os gestores entrevistados reconhecem o papel transformador da IA e dos DAG no âmbito da inovação e automação governamental (Tab. 3). De acordo com os respondentes E1, E3, E4, E5, E6, E7 e E8, essas tecnologias emergem como poderosos impulsionadores para a geração de novos empreendimentos, demonstrando seu potencial para fomentar o ecossistema de inovação. Além disso, todos os gestores entrevistados (E1 a E8) destacam a capacidade dessas ferramentas para aprimorar a tomada de decisão e promover a automação de serviços e processos governamentais, indicando um consenso sobre seu valor estratégico na modernização da administração pública.

Um aspecto particularmente relevante que emerge da análise é a ênfase unânime (E1 a E8) na colaboração público-privada como fator determinante para acelerar a inovação em ambas as administrações, tanto pública quanto privada. Essa percepção compartilhada pelos entrevistados sugere que, embora as tecnologias de IA e DAG ofereçam oportunidades significativas para transformação digital, sua implementação eficaz requer parcerias estratégicas entre governo e iniciativa privada. Esses resultados alinham-se às concepções contemporâneas sobre governança colaborativa e inovação aberta no município.

Apesar do reconhecimento do potencial dessas tecnologias, a falta de capacitação técnica é apontada como um obstáculo significativo para sua implementação. Conforme supracitado, a análise indica que os gestores de Santo Antônio da Patrulha percebem a combinação de DAG e IA como uma oportunidade para impulsionar a inovação e melhorar a gestão pública, mas a efetiva adoção dessas tecnologias ainda enfrenta desafios relacionados à qualidade, acessibilidade e divulgação dos dados, além da necessidade de capacitação técnica e da superação de barreiras como a resistência à mudança e a falta de familiaridade com as ferramentas de busca e análise.

4.1.2 Análise classificatória do portal de dados abertos do município

Essa seção se dedica à análise detalhada do portal de dados abertos do município de Santo Antônio da Patrulha, utilizando critérios para classificar sua conformidade com as melhores práticas de transparência, disponibilidade e qualidade da informação pública digital, expostos nas tabelas 1, 2 e 3.

Tab. 4 - Classificação do portal de dados abertos do município.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Critério	Status	Pontos Principais
Acesso aos Dados	Parcialmente	Acesso público, mas alguns documentos exigem login.
Disponibilidade dos Dados	Totalmente	Atualizações diárias (notícias) e mensais (financeiro). Informações atualizadas e contínuas.
Legibilidade	Parcialmente	Fácil compreensão, mas problemas de legibilidade após download em alguns formatos.
Representatividade	Não Atende	Não reflete a diversidade populacional e setorial. Exclui áreas rurais, segmentos sociais e econômicos. Limita o planejamento estratégico e a eficácia das políticas públicas.
Confiabilidade e Transparência	Parcialmente	Falta de transparência na origem e nos métodos de coleta dos dados, com lacunas que afetam sua confiabilidade e análise.
Triagem dos Dados	Parcialmente	Permite filtragem básica, mas sem funcionalidades avançadas.
Análise dos Dados	Não Atende	Falta de informações detalhadas impede a extração de insights. Prejudicando a tomada de decisões baseadas em evidências.
Interpretação dos Dados	Parcialmente	Apresentação clara, mas a falta de detalhes limita a aplicabilidade prática.
Tratamento dos Dados	Totalmente	Filtros internos auxiliam na organização e eliminam inconsistências. Melhora a experiência do usuário.
Incompletude dos Dados	Não Atende	Ponto Crítico: Lacunas importantes em informações sobre setores e grupos populacionais. Afeta a confiabilidade das análises.
Processamento de Dados	Não Atende	Problemas técnicos com formatos de dados e falta de detalhes dificultam a manipulação técnica.
Portais de Dados Abertos	Totalmente	Plataforma de acesso público com dados em formatos abertos. Promove transparência e acessibilidade.
Digitalização Governamental	Parcialmente	Apenas 10 tipos de serviços online, sendo 2 exclusivos para servidores públicos.
Processos e serviços automatizados no Setor Público	Parcialmente	Recursos automatizados escassos, aumentando a dependência de processos presenciais e manuais.

Fonte: Elaborado pelos autores (2025).

A análise do portal de dados abertos de Santo Antônio da Patrulha revela um desempenho misto em relação aos critérios avaliados. A disponibilidade dos dados e o tratamento dos mesmos são pontos em destaque, com atualizações regulares e ferramentas de organização eficientes (Janssen; Zuiderwijk, 2014). O portal eletrônico de dados abertos do município cumpre com as obrigações conforme o Ministério do Planejamento e Orçamento (2023) diante da Lei Complementar nº 101/2000, onde estabelece o requisito fundamental que entidades públicas, incluindo prefeituras, mantenham um portal oficial na internet. Esta disposição legal tem como propósito principal garantir a confiabilidade e a transparência ativa, exigindo a divulgação de informações de relevância coletiva, com ênfase especial na disponibilização de dados abertos governamentais. Tal previsão normativa representa um importante mecanismo para a efetivação dos princípios constitucionais de acesso à informação pública e de transparência administrativa, além de servir como alicerce para a política de dados abertos no âmbito da administração pública.

Conforme (Silva, 2022) a obrigatoriedade de manutenção de websites oficiais por parte dos entes públicos configura-se assim como instrumento essencial para: Promover a accountability governamental; facilitar o controle social; fomentar a participação cidadã; e permitir o reaproveitamento de informações públicas por parte da sociedade. Esta exigência legal reflete o entendimento contemporâneo de que a confiabilidade e a transparência ativa constituem o dever essencial do estado democrático, sendo a tecnologia digital ferramenta indispensável para sua concretização.

No entanto, áreas críticas como representatividade, análise e incompletude dos dados apresentam deficiências significativas. A falta de representatividade dos dados, que não contemplam a diversidade populacional e setorial do município, limita o planejamento estratégico e a formulação de políticas públicas eficazes. Como destacam

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Ruijer, Grimmelikhuijsen e Meijer (2017), a escassez de informações detalhadas prejudica análises robustas, limitando insights cruciais e comprometendo decisões baseadas em evidências. Quando os dados têm lacunas essenciais, a confiabilidade das conclusões se enfraquece, levando a políticas públicas com bases frágeis, um ciclo que distancia a gestão da eficácia e transparência ideais. Como observado e relatado pelo entrevistado E8 (gestor da administração pública municipal), "os dados que se tem hoje são aqueles exigidos por força da lei", situação que reflete uma cultura de transparência mínima e reativa. Essa restrição à divulgação apenas do estritamente obrigatório resulta em informações incompletas e superficiais, que comprometem a qualidade das análises e a confiabilidade das decisões baseadas nestes dados.

A falta de detalhamento e a presença de lacunas em informações essenciais impedem uma análise mais profunda e a extração de insights relevantes, perpetuando um ciclo de gestão pouco informada e pouco transparente. O próprio entrevistado E8 reconhece o potencial de melhoria, sugerindo que "as gestões dos governos poderiam melhorar, divulgar talvez mais dados além daquilo que a lei obriga", indicando a necessidade de superar a abordagem minimalista atual em prol de uma cultura de transparência ativa e abrangente.

A legibilidade, triagem, confiabilidade e transparência dos dados apresentam pontos que necessitam de melhorias Nikiforova, Aloqaily e Alsmirat (2021). Apesar de as informações serem geralmente de fácil compreensão (boa legibilidade), o relato do entrevistado E8 "[...] eles querem que seja publicado em Excel, PDF, Word, todas as formas, e alguns a gente ainda não consegue fazer em quatro formatações [...]" revela desafios práticos na disponibilização dos dados, especialmente após o download em diferentes formatos. Essa situação evidencia a necessidade urgente de padronização, conforme já apontado por Kalampokis et al. (2011), pois a falta de uniformidade nos formatos disponíveis pode comprometer a acessibilidade e utilidade dos dados para os cidadãos e organizações que dependem dessas informações. A falta de clareza sobre a origem e o método de coleta dos dados (confiabilidade) e a presença de lacunas em informações importantes (transparência) também são pontos de atenção. A triagem de dados, embora permita filtragens básicas, carece de funcionalidades avançadas para uma análise mais aprofundada.

Em relação à digitalização governamental e automação, o portal apresenta um estágio inicial de implementação. A oferta limitada de serviços online e a dependência de processos presenciais demonstram que há um longo caminho a percorrer para alcançar um modelo digital eficiente conforme já dito por (Janssen et al., 2022).

Em resumo, o portal de dados abertos de Santo Antônio da Patrulha demonstra potencial, mas enfrenta desafios consideráveis que limitam sua efetividade como ferramenta para a gestão pública e a promoção da inovação. Investimentos em representatividade, completude, análise e processamento de dados, além de melhorias na digitalização, e-governo e automação, são essenciais para que o portal atinja seu potencial máximo.

5. Discussão dos resultados

As entrevistas realizadas com gestores de Santo Antônio da Patrulha revelam um cenário complexo quanto ao uso de DAG e IA no município. Enquanto alguns gestores, como o E6, destacam a acessibilidade do portal de transparência, inclusive premiado pelo Tribunal de Contas, outros, como o E3, apontam a necessidade de recorrer a contatos pessoais na prefeitura para acessar informações mais específicas, não disponibilizadas publicamente. Essa disparidade de percepções, conforme discutido por Nikiforova, Aloqaily e Alsmirat (2021), evidencia como a acessibilidade efetiva varia significativamente conforme o perfil e as conexões institucionais de cada gestor.

No que diz respeito à IA, os desafios se mostram ainda mais pronunciados. O E1 chamou atenção para a escassez de profissionais qualificados na região, um obstáculo crítico que demanda investimentos em capacitação, como sugerem (Spalević et al., 2023). Contudo, mesmo reconhecendo essas limitações, gestores como o E8 enxergam na IA um potencial transformador para o processamento de dados municipais, destacando sua capacidade de analisar informações com maior agilidade e precisão do que métodos tradicionais, particularmente em análises populacionais e projeções estratégicas, conforme demonstrado por Gao, Janssen e Zhang (2020).

O contexto específico de Santo Antônio da Patrulha apresenta particularidades que merecem destaque. Por um lado, a existência de um portal de transparência reconhecido indica uma base promissora para o avanço na política de dados abertos. Por outro, persiste uma cultura de transparência mínima, onde a divulgação de informações muitas vezes se limita ao estritamente exigido por lei, como observado pelo E8, restringindo assim o potencial inovador desses dados. Além disso, a dependência de redes de contatos pessoais para acesso a certas informações, conforme relatado pelo E3, fragiliza os princípios de equidade e transparência.

As oportunidades, contudo, são significativas. Os dados locais disponíveis, como aqueles relativos ao perfil populacional, poderiam alimentar modelos preditivos para subsidiar políticas públicas mais eficazes, na linha do proposto por Karamanou, Kalampokis e Tarabanis (2022). Para tanto, será necessário superar desafios estruturais, começando por uma mudança cultural que transcenda a transparência meramente formal em direção a uma abertura proativa de dados. Investimentos em capacitação técnica, seja através da formação de talentos locais ou

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

de parcerias estratégicas, e a padronização dos dados disponibilizados serão igualmente cruciais para viabilizar análises automatizadas mais sofisticadas.

Em síntese, Santo Antônio da Patrulha se encontra em uma encruzilhada tecnológica. O município possui as condições iniciais necessárias para se tornar um caso exemplar de aplicação inovadora de DAG e IA em contexto municipal, mas precisa enfrentar decisivamente suas limitações culturais e estruturais para transformar esse potencial em realidade. O caminho a seguir exigirá não apenas recursos técnicos, mas sobretudo vontade política e visão estratégica para aproveitar as oportunidades que a era digital apresenta para a gestão pública local.

6. Considerações Finais

Este estudo investigou o potencial da integração entre DAG e IA para fomentar a inovação em Santo Antônio da Patrulha, sob a perspectiva de gestores públicos e privados. Os resultados apontam um cenário paradoxal: enquanto há amplo reconhecimento do valor estratégico dessas tecnologias, sua implementação efetiva esbarra em desafios estruturais.

A análise revelou que, embora o município disponibilize DAG, esses dados demonstram lacunas críticas e problemas técnicos que limitam sua reutilização. As entrevistas destacaram barreiras como a cultura de transparência mínima "apenas o exigido por lei", dependência de contatos pessoais para acesso a informações e carência de infraestrutura para análise avançada. Curiosamente, mesmo reconhecendo o potencial da IA para automação, redução de erros e geração de insights (como projeções populacionais), apenas dois gestores relataram uso efetivo, evidenciando um abismo entre percepção e prática.

6.1 Limitações e Fronteiras para Pesquisa Futura

Como estudo em contexto municipal, esta pesquisa enfrentou limitações metodológicas (amostra reduzida) e empíricas (dados incompletos). Tais restrições, contudo, apontam direções promissoras para investigações futuras:

- Interlocuções Críticas entre DAG e IA: Como diferentes formatos de abertura de dados (ex.: high-value e datasets) impactam a eficácia de algoritmos de IA? Quais são os limites éticos do uso de dados governamentais incompletos em sistemas automatizados?

- Governança Híbrida: Quais arranjos institucionais podem mediar as tensões entre demandas por inovação e limitações da administração pública (ex.: infraestrutura tecnológica)?

- Viés e Representatividade: Como desenvolver frameworks para auditar não apenas a qualidade técnica dos DAG, mas sua capacidade de representar grupos defeituosos em modelos preditivos?

Para além das recomendações práticas já destacadas (capacitação técnica, parcerias público-privadas), os achados sugerem uma agenda urgente pautada na necessidade de repensar políticas de dados abertos não como fins em si mesmas, mas como infraestruturas digitais para inovação responsável. Isso exigirá:

- Padrões de interoperabilidade que compatibilizem DAG com pipelines de IA (Kalampokis et al., 2011);

- Experimentos locais que testem modelos de cocriação entre governo, academia e setor privado, como living lab**s** focados em problemas municipais específicos (ex.: otimização de rotas de transporte público usando DAG e IA generativa).

Este trabalho não encerra, mas inaugura uma discussão crítica: em um cenário onde mesmo dados "abertos" podem ser estruturalmente excludentes, como garantir que a revolução da IA não amplifique assimetrias já existentes? A resposta exigirá não apenas tecnologia, mas novas formas de governança democrática dos dados.

Agradecimentos

- **Financiamento:** O presente trabalho foi realizado com o apoio da Fundação Coordenação de Aperfeiçoamento de Pessoal de Nível Superior, CAPES - Brasil e da Fundação de Amparo à Pesquisa do Estado do Rio Grande do Sul - Fapergs, salientando o mérito ao projeto “Governança Pública Inteligente e Políticas Públicas: Uma Abordagem Integrativa de Boas Práticas Internacionais para Mitigar os Impactos Econômicos e Sociais de Eventos Climáticos Extremos”, nº **90870.861.15286.12112024**.

Track 22: Digital Government Ecosystem Cases: Collaboration for enhancing transformative innovations and overcoming challenges

Track Description

This track aimed to explore real-world case studies showcasing how industry partners are facing challenges in digital government, highlighting the synergy between Industry 4.0 and the evolving concepts of Government 4.0 and 5.0. As public and private sectors increasingly collaborate in the digital transformation era, sharing experiences and lessons becomes necessary. The track aims to provide practical insights from industries that have successfully partnered with governments to implement transformative digital solutions. By showcasing these forward-thinking case studies, we aim to support the implementation of actionable solutions that align business goals with social impact, while fostering cross-sector collaboration in facing future challenges in the digital government landscape.

Track Chairs

C. Cappelli, University of Rio de Janeiro State, Brazil
V. Nunes, Inteli Leadership and Technology Institute, Brazil

Contents

Abstract. Recently, GovTech has gained prominence as a novel approach to fostering government-driven innovation by leveraging technology startups, academia, and innovators to develop digital public services. Although it promises more agile, user-centric, and cost-effective solutions, limited research explores how academic-based startups navigate public procurement models. This paper addresses that gap by presenting three cases of an academic-based Brazilian startup engaging in the public procurement process introduced by the Legal Framework for Startups (Marco Legal das Startups). The company proposed solutions adapted from its principal product for three public agencies: Tribunal de Contas da União (TCU), Correios, and Copasa, focusing on remote oversight of construction projects and building maintenance management. The lessons learned underscore the importance of predictable project scope and costs, emphasizing that unclear requirements can undermine competitiveness. Moreover, strong teams and reputable track records significantly enhance success prospects while balancing technological maturity with innovation, which remains critical for meeting specific public sector needs. Additionally, positioning a product at the technological frontier only proves beneficial when addressing actual government challenges. Effective communication, including well-crafted video pitches and presentations, further ensures evaluators grasp the solution's value. These insights aim to guide both aspiring and established academic entrepreneurs in bridging their research-based innovations with GovTech opportunities, ultimately strengthening collaboration between the public sector and academia.

Keywords. Govtech, Startup, Product Management, Innovation, Public Sector, Digital Transformation
Short case practical report, DOI: https://doi.org/10.59490/dgo.2025.1005

1. Introduction

Governments have long played a central role in fostering technological development by investing directly in research and development (R&D) and implementing policies encouraging private sector participation. Historically, these efforts have included financial incentives that stimulate private R&D investments, although their effectiveness varies depending on factors such as incentive type, industry characteristics, and policy design (Choi, 2022). In addition to direct funding, governments have shaped innovation ecosystems through intellectual property protection, tax credits, regulatory standards, and public procurement, all of which increase the potential returns on successful innovations (Nemet, 2009).

More recently, a new model for government-driven innovation has emerged with the rise of GovTech. This approach leverages technology startups, academia, and innovators to develop digital solutions for public services. GovTech initiatives aim to modernize government operations, drive economic development, and enhance service delivery efficiency (Silve and Moszoro, 2023). By fostering collaboration between the public and private sectors, GovTech represents a shift toward more agile, user-centric, and cost-effective solutions for digital governance (OECD, 2021). According to the OECD Digital Government Index (DGI) 2023, GovTech is becoming a widespread practice, with 70% of OECD countries implementing digital strategies to collaborate with the GovTech ecosystem, while 55% use it to foster innovation and experimentation. Additionally, 42% of OECD members employ GovTech to test and adopt emerging technologies such as artificial intelligence. Despite its potential, many countries still face challenges in fully leveraging GovTech, with only 40% having dedicated funding for collaborations and 24%

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

establishing procurement mechanisms to support partnerships. This highlights the need for further investment in digital public infrastructure and strategic frameworks to enable its full potential.

Hoekstra et al. (2023) present an explorative case study of GovTech ecosystems in the Netherlands and Lithuania. They observed differences in ecosystem structure, Lithuania's being more centralized compared to the Netherlands' more scattered setup, and identified success factors such as public-private collaboration, a clear vision and strategy, space for experimentation, and active knowledge-sharing networks. Similarly, Reichardt (2022) analyzes factors influencing GovTech development in Germany and France between 2017 and 2022, employing a realist review method to uncover how procurement frameworks, technical access to the state, and meetup opportunities between startups or SMEs and the public sector can either enable or impede GovTech growth. Nose (2023) investigates the potential of GovTech to improve budget processes and execution efficiency, noting that the introduction of digital budget payments and e-procurement can enhance budget transparency and widen social assistance coverage, particularly benefiting the bottom 50th percentile and female workers in emerging market and developing countries. The study also emphasizes that effective outcomes hinge on supportive policies, regulatory frameworks, robust digital infrastructure, and coordinated efforts facilitated by a dedicated GovTech institution. Meanwhile, Mortati et al. (2023) explore how design thinking can aid in establishing an EU GovTech ecosystem, describing a methodology synthesizing co-design and service design with experiential learning. They conclude that adopting and adapting design thinking principles helps align collaborative efforts and foster organizational learning, ultimately promoting a more cohesive and innovative GovTech environment.

Despite significant advancements in the field and academic efforts to understand the GovTech phenomenon, little research explores how startups from academia can leverage their products and navigate new public procurement models. Moreover, studies examining these challenges from the perspective of startups remain scarce.

This paper presents three cases that highlight key challenges and lessons learned. It examines how Lemobs, an academic-based startup in the Brazilian govtech sector, engaged in the public procurement process introduced by the Marco Legal das Startups (Legal Framework for Startups). Focusing on innovation, Lemobs proposed tailored solutions for three Brazilian agencies: Tribunal de Contas da União (TCU) - (the Federal Court of Accounts), Correios (Brazilian state-owned postal service), and Copasa (Brazilian sanitation company). In the TCU and Copasa calls, the focus was on remote oversight of construction projects, while in the Correios case, the objective was to develop a building maintenance management system for the organization's facilities. Leveraging its mature Sigelu platform, LEMOBS adapted its solution to meet the specific needs of these agencies. We hope these insights will inspire researchers who aspire to become entrepreneurs and, support those who already have a product derived from their academic work and seek to offer solutions to the public sector.

The remaining of text is organized as follows: section 2 provides the background with the necessary content to support this research. Section 3 presents the cases of TCU, Copasa, and Correios and some of the challenges faced. Section 4 presents the lessons learned by Lemobs, and conclusions are established in section 5.

2. Theoretical background

2.1 Marco Legal das Startups (Legal Framework for Startups)

The theme of governmental innovation is increasingly relevant as nations worldwide seek regulatory environments that foster private sector growth and entrepreneurship. Within this context, Brazilian Complementary Law No. 182/2021, the Legal Framework for Startups (Marco Legal das Startups), emerged as a flexible framework encompassing multiple innovation models, including public investment in science, technology, and innovation (de Almeida Veneziani and Vaz, 2023). By aligning with global trends in innovation policy, the law addresses the need for governments to act as catalysts for development, ensuring that technological advancement and public service innovation coexist.

Startups have become indispensable players in the global economy, significantly contributing to job creation and revenue (Anunciação and Fernandes, 2021). Worldwide, multiple governments are revising their legislative structures and cultural perceptions to incentivize emerging entrepreneurs (The World Bank, 2019). This trend is particularly salient among BRICS nations, where high-potential ventures correlate with increased domestic R&D and the rise of formidable unicorns (CB Insights, 2020). The rapid pace of technological change requires an agile regulatory stance, which the Marco Legal das Startups aims to provide by balancing entrepreneurial freedom and state oversight.

The new law fosters startup participation through the Contrato Público para Solução Inovadora (CPSI) - (Public Contract for Innovative Solution)- and regulatory sandboxes. As outlined, CPSI enables startups to collaborate with public entities by proposing innovative solutions to governmental challenges, thus harnessing state purchasing power for technological and economic progress (Batista, 2022). Overall, the Marco Legal das Startups places Brazil

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

within a global trend that recognizes the impact of innovative enterprises on economic development. Comparable legislative measures have been adopted in Argentina and Chile, highlighting the regional importance of thriving startup ecosystems (Anunciação and Fernandes, 2021).

2.2 Lemobs

Lemobs is a technology startup established by researchers holding master's and doctoral degrees in Systems Engineering and Computer Science from the Federal University of Rio de Janeiro (UFRJ). Its work centers on developing innovative solutions for the public sector. The Lemobs's team comprises 60 professionals, two-thirds specializing in technology, and approximately 44% hold advanced degrees such as MBAs, master's, or doctoral qualifications. This strong background in systems engineering, computing, and knowledge management underpins its drive toward research and innovation.

Operating as a GovTech, Lemobs focuses on creating tools that help cities become more efficient and responsive. Its flagship platform, Sigelu, exemplifies this approach by providing web, mobile, map-based, and business intelligence features that automate and enhance various governmental processes. With over 300,000 development hours and a user base of around 2,400 individuals across more than ten public institutions, Sigelu covers tasks ranging from planning and monitoring public works to inventory control, urban maintenance, and oversight of city operations. Its integrated dashboards and analytics offer decision-makers actionable insights based on real-time data.

Lemobs has also earned notable recognition within the public domain. It was awarded Brazil's first Public Contract for an Innovative Solution (CPSI) by Petrobras, receiving the highest scores for innovation, execution capability, and maturity of its platform. In 2020, it was acknowledged by the Municipal Strategy for Science, Technology, and Innovation of Maricá City for its contributions at the municipal level. Under the Software as a Service (SaaS) model, Lemobs provides licensing, training, support, and software customization. Maintaining a strong commitment to research and development, it continuously refines its product offerings, exploring new methods and technologies to enhance public-sector operations and contribute to the broader field of digital transformation in governance.

3. Cases

The three cases discussed were proposals submitted by Lemobs for calls under the CPSI modality. The solutions described represent the technological tools that would be developed if Lemobs were chosen. It should be noted that in the TCU call, Lemobs was not selected, placing fourth, while three winners were chosen. However, in the calls from Correios and Copasa, Lemobs was selected, though at the time of writing this article, no contracts had been signed, and, in keeping with the CPSI bidding process, the project scope will still be negotiated with these public entities. As a result, the proposed projects and the main challenges encountered in adapting the current Sigelu version to meet the specific demands of these calls are as follows.

3.1 Tribunal de Contas da União (TCU)

The Tribunal de Contas da União (TCU) is the Federal Court of Accounts - the Brazilian supreme audit institution - responsible for overseeing the proper use of public funds and ensuring transparency and accountability in government projects. TCU's main challenge is gathering evidence of public works' execution and progress without requiring an on-site visit. This process involves comparing non-geolocated project and execution data published in various government systems with current realities in often remote municipalities. The objective is to detect potential irregularities cost-effectively and promptly present them on a risk dashboard and in detailed reports, allowing TCU auditors to focus on critical issues without incurring high travel expenses.

We presented Sigelu as a crowdsourcing-based solution with two core components: a cloud-based software platform and comprehensive services covering recruitment, training, and ongoing support, as seen in Figure 1. The software aspect begins by integrating directly with TransfereGov through an API, automatically retrieving key information on public works. This data is then used to plan evidence collection, with artificial intelligence and geoprocessing tools helping TCU technicians identify strategic sampling areas for inspection. Once those areas are defined, a diverse group of collaborators, including roadwork specialists, technical professionals such as architects, engineers, and even laypeople, receives task recommendations via a system that applies different crowdsourcing methods.

In the mobile crowdsourcing approach, individuals with smartphones can capture local evidence in real time. In contrast, drone crowdsourcing employs civilian-operated drones to gather aerial data, reducing the need for costly or cumbersome inspections by TCU staff. The Public Participation Geographic Information System (PPGIS) approach integrates local communities directly into the data collection and decision-making process, enhancing

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

transparency and inclusivity by allowing residents to contribute spatial information relevant to the projects in their regions. Once participants collect these images, videos, and other forms of evidence, Sigelu processes the material to validate reliability and compare it against official project requirements. Artificial intelligence further refines this process by detecting inconsistencies or anomalies in the collected evidence.

After successful validation, Sigelu authorizes payment to the crowdsourced collaborators and incorporates information on potential noncompliance into a risk management workflow, accessible via reports and data visualization dashboards. These outputs enable TCU auditors to quickly pinpoint areas of concern and determine the level of scrutiny needed. Beyond software, Sigelu also provides services for recruiting the required pool of collaborators, training them on best practices for collecting evidence, and ensuring TCU technicians know how to use the system to optimize their oversight activities. The innovative approach blends the efficiency gains offered by artificial intelligence with the collective expertise of on-the-ground contributors, yielding more context-rich data while refining AI models through domain-specific training. It also pioneers a novel business model in the public sector by compensating citizens and professionals for auditing tasks that were once solely the responsibility of government officials. By integrating technology, human collaboration, and ongoing support services, Sigelu represents a forward-looking solution poised to enhance TCU's capacity to monitor works across vast and varied locations, ultimately improving transparency and accountability in public expenditures.

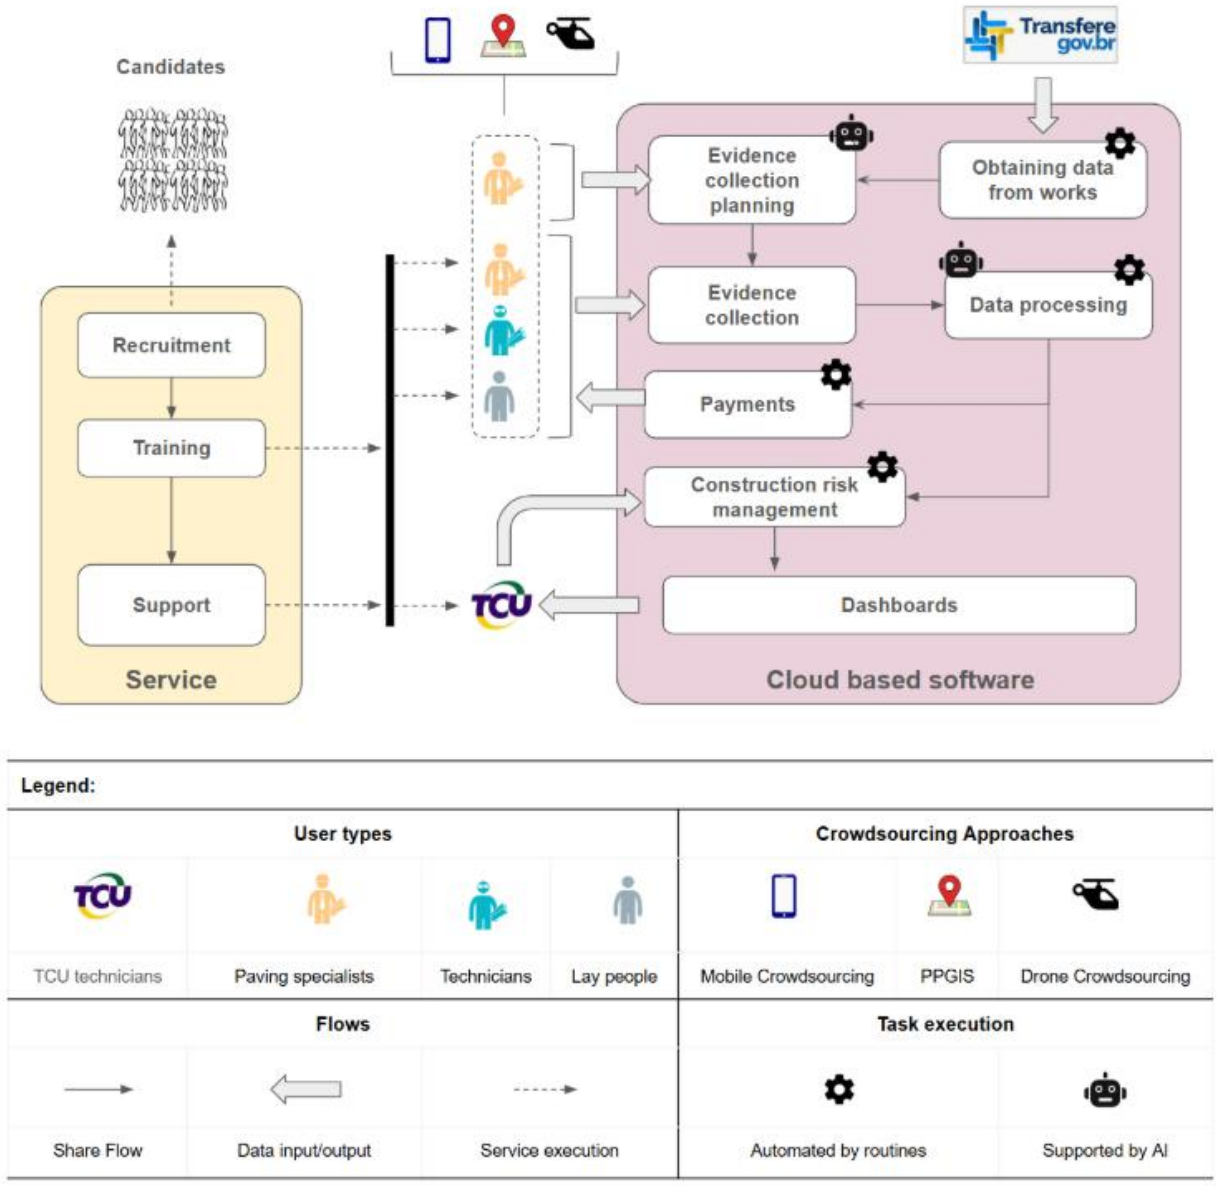

Fig. 1. General Solution Architecture proposed for TCU.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

In this project proposal, the main challenges revolved around two primary aspects: first, how to ensure timely evidence collection across Brazil through a crowdsourcing approach, given that some worksites are located in extremely remote areas far from major centers, and second, how to establish predictable costs for paying inspection fees, particularly if multiple inspections become necessary due to substandard task execution. In response to the first concern, the proposed solution involved strategies for recruiting and training inspectors nationwide and providing financial incentives to encourage participation in inspections far from major hubs, thereby compensating for any lack of initial interest. As for the second challenge, the system was envisioned to include functionalities controlling the monthly financial resources allocated to inspections, ensuring cost predictability. However, while this approach might resolve financial forecasting issues, it does not necessarily guarantee the minimum number of high-quality inspections required to maintain consistent standards.

3.2 Correios

Correios is Brazil's state-owned postal service, providing logistics and correspondence solutions nationwide. Within this vast organization, the Regional Engineering Management area is part of the broader support macro process, overseeing building and equipment maintenance, construction and renovation projects, and the upkeep of key systems. As outlined in Correios's 2023–2027 strategic plan, "Digital Transformation" stands as a critical priority. This initiative emerged in response to numerous operational hurdles: multiple non-integrated systems (both internal and external), a reliance on tedious manual routines, fragmented data scattered across varied sources, delays resulting from document processing (including invoices and official records), and limited capabilities for analyzing usage or consumption patterns. These factors create vulnerabilities such as missed deadlines, administrative bottlenecks, and inconsistencies in preventive, predictive, and corrective maintenance tasks. By deploying innovative technological solutions, Correios aims to modernize and streamline engineering processes in light of these challenges. The goal is to consolidate information, reduce human error, expedite service management, and ultimately fortify the reliability of building and system maintenance. By doing so, Correios hopes to strengthen operational efficiency and elevate the quality of services, paving the way for smoother, more cohesive engineering workflows across its extensive network of facilities and equipment.

Sigelu, proposed by Lemobs, was presented as a robust software platform designed to handle the full spectrum of Correios maintenance workflows, from initial request creation to post-service analysis and payment. When a maintenance need arises, whether it involves plumbing, lighting, generators, elevators, or specialized equipment, users can register a request through a mobile application or a web-based interface. This flexibility suits diverse operational scenarios, allowing on-site staff or remote personnel to initiate new tasks, attach supporting documents and images, and even set up recurring maintenance schedules. Once requests enter the system, they appear on customizable dashboards that organize them by priority, location, or type of service. Administrators can then triage, assigning tasks based on team expertise, workload, or geographic proximity. The mobile app assists technicians by displaying request details, offering integrated map views for route optimization, and enabling real-time progress updates, even in areas with limited connectivity, which are later synced when the device regains network access.

A dedicated inspection feature allows managers or external auditors to create separate verification requests, ensuring that completed services meet quality standards. If discrepancies are identified, they can be documented and automatically sent back to technicians for review or correction. In parallel, Sigelu supports contract management and payment workflows by consolidating all relevant records, such as costs, service dates, and performance metrics, into a unified environment. This integration ensures a clear audit trail, simplifies invoice validation in the ERP system, and reduces the risk of inconsistencies or delayed payments. Across the entire maintenance lifecycle, Sigelu's analytical capabilities provide insights through visual dashboards and performance indicators, helping decision-makers identify trends, allocate resources more efficiently, and address recurring issues proactively. By merging powerful field tools with seamless back-office processes, Sigelu delivers a comprehensive solution that advances Correios's digital transformation goals and empowers the engineering division to manage complex maintenance operations with greater agility and transparency.

In this project proposal, the primary challenge lies in determining how Sigelu would be integrated with the numerous applications already in use by Correios. We observed that Sigelu could replace many existing systems by functioning as a central platform while allowing integration with other tools. The features included in this project demonstrate a high level of technological maturity and flexibility, as they have been successfully employed in both urban and building maintenance contexts. Due to its high technological maturity and its ability to support a wide range of operational processes, Sigelu gave us the confidence to present it as a viable alternative to the technological patchwork developed by Correios over the years.

3.3 Copasa

Copasa is a Brazilian sanitation company responsible for expanding and maintaining water supply and sewage systems across more than 640 municipalities in the State of Minas Gerais. Its current investment program, valued

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

at approximately R$1.67 billion in 2024, drives the construction and enhancement of pipelines, water and sewage treatment facilities, and associated infrastructure. These projects can be highly diverse: some are linear, like pipelines laid in densely populated urban areas or remote forests, while others involve the erection or refurbishment of large-scale treatment stations. Because the work is spread over wide geographical areas, Copasa faces logistical hurdles in delivering timely and detailed oversight. Engineers and technicians cannot always be present on-site, so there is a risk of undetected irregularities, such as delays, subpar materials, noncompliant safety measures, and poorly executed construction techniques. As Copasa seeks to meet its universal sanitation goals and ensure its contractual commitments, it aims to integrate advanced technologies that enable remote tracking, monitoring, and analysis of the progress of these simultaneous works.

Sigelu was presented as a smart, data-driven platform designed to centralize Copasa's project oversight while enabling remote and automated inspections. The solution begins by streamlining the registration and management of ongoing projects within an integrated environment that uses georeferencing to locate each work site. A unified dashboard organizes daily logs, comments, and documents, linking them to a Gantt chart that displays timelines, milestones, and deadlines. By importing schedules directly from MS Project, Sigelu creates a coherent list of deliverables and tasks, all updated in real-time whenever field data is recorded during inspections. Whether images and videos are gathered via smartphones, 360-degree cameras, or drones, the system continuously populates its database with fresh visual evidence. It generates time-lapse sequences of particular work sites to document progress over days or weeks.

Sigelu applies artificial intelligence from these data sets to analyze inconsistencies or highlight potential risks. The AI system draws upon Copasa's historical records to refine its model through supervised machine learning. Comparing current imagery to baseline plans can detect deviations from proposed designs, estimate earthwork volumes, calculate distances, and measure surface areas. All these insights contribute to creating a live picture of the works' development, allowing Copasa's engineers and auditors to make decisions based on near real-time data without sending personnel to each location. If issues arise, such as inadequate safety compliance, Sigelu provides instant notifications to help teams address them quickly.

In addition to the technical components, Sigelu supports remote inspections through video calls, geolocation services, and other collaborative tools. Engineers can schedule virtual site visits, specify inspection parameters, and rely on the platform's AI to suggest priority checks based on risk indicators. By collecting and processing information efficiently, Sigelu generates comprehensive reports detailing each project's quality and safety and adherence to schedule and budget. These findings are visualized in interactive management panels that synthesize performance metrics across multiple works. Through this intelligent approach, Copasa can ensure greater oversight and accountability in its construction activities, maximizing the value of its investments and strengthening the reliability of its services for communities throughout Minas Gerais.

In this project proposal, the main challenges involve adapting three essential features within Sigelu. First, the system must support synchronous remote inspections through videoconferencing, for which we plan to provide mobile data packages as part of the contract, as well as offline functionality for emergency scenarios that lack full connectivity. Second, integrating multiple inspection methods, drones, fixed cameras, and smartphones into a cohesive workflow is critical. For example, orthophotos generated from drone images can detect earth movements; fixed cameras at the construction site can capture occupational safety anomalies; and smartphone-based records collected by the supervising engineer can provide detailed information on work progress. Finally, the third element centers on generative AI to consolidate notes recorded during remote inspections. This AI-generated report organizes the data by key managerial concerns such as workplace safety, the quality of executed services, and overall project progression according to the established schedule.

4. Lessons Learned

Predictability is essential in public-sector sales processes, providing clear expectations regarding outcomes and costs. One of our key insights from participating in the TCU CPSI bidding process is that the absence of predictable parameters can negatively impact how advantageous a proposal appears to public managers. Although CPSI contracts are designed to test market-based solutions for public-sector issues, thereby sharing risks, unpredictability can make a project appear less competitive than other proposals.

Building strong teams and a solid reputation is another critical factor. Originating in academia, Lemobs boasts a highly qualified technical staff with experience in both industry and government. Over time, we have earned multiple awards in the govtech and smart cities sectors and worked with major national clients. Such credentials and demonstrated market experience have consistently placed Lemobs among the top-rated companies in CPSI calls, influencing our successful selection by Correios and Copasa. For startups, it is advisable to strengthen teams

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

with qualified personnel and establish a continuous process of gaining credentials, such as certifications, awards, intellectual property, and reputable clients, to enhance credibility.

Balancing the introduction of new functionalities with leveraging existing strengths is another lesson learned. CPSI calls often consider a solution's technological maturity and innovative potential to address the presented challenge. In practice, the public-sector issue rarely aligns perfectly with an existing solution, resulting in a gap between the agency's needs and the startup's current offerings. When a proposal emphasizes many new features that deviate significantly from existing functionalities, it may gain points for innovation but risk losing points for technological maturity. Thus, an optimal balance is needed to demonstrate that the startup has a sufficiently mature solution while accommodating the organization specific requirements.

Positioning a product at the technological frontier can be equally important, particularly when the public sector explicitly seeks solutions involving cloud computing, artificial intelligence, machine learning, the Internet of Things, blockchain, etc. However, incorporating the latest technologies does not guarantee success; the chosen technology should genuinely address a pain point for the client. In other words, integrating cutting-edge tools must clearly deliver value to the public agency.

Finally, every CPSI call we have participated in has required a video pitch of the solution, followed by a live presentation. Developing a concise, easily understandable presentation highlighting the solution's core aspects is relevant. Evaluators often review dozens of proposals, and while they may have notes or specific questions, they may still struggle to grasp the fundamental points of a project when it is time for the live presentation. It can be frustrating for the solution developers, who may have well-thought-out answers for various detailed aspects. As a result, clear communication is key to ensuring that the agency fully appreciates the merits of the proposed solution.

5. Conclusion

In this study, we examined the participation of Lemobs, an academic-based startup in the Brazilian govtech sector, in the CPSI public procurement process established by the *Marco Legal das Startups*. Through three cases, we analyzed the challenges encountered and the lessons learned as Lemobs proposed innovative solutions for three public agencies: the Tribunal de Contas da União (TCU), Correios, and Copasa. Each case provided insights into how startups emerging from academia can adapt their solutions to public-sector demands while navigating the complexities of government procurement processes. This research underscores the growing role of govtech companies in fostering digital transformation within public administration and highlights the strategic approaches required for startups to engage with government clients effectively.

From our findings, several key lessons emerged. First, predictability in project scope and costs is crucial in public procurement, as the lack of clear expectations can hinder competitiveness. Second, building strong teams and a credible reputation significantly enhances a startup's chances of success, as demonstrated by Lemobs' high ratings in CPSI calls due to its academic expertise, industry experience, and prior achievements. Third, balancing technological maturity with innovation is essential, startups must bridge the gap between their existing solutions and the specific needs of public agencies without compromising reliability. Additionally, positioning a product at the technological frontier is valuable, but only when the selected technologies genuinely address government challenges. Finally, effective communication is critical, particularly in CPSI processes that require video pitches and live presentations. A well-structured presentation ensures that evaluators fully understand the solution's value, preventing misinterpretation and strengthening the proposal's competitiveness.

These contributions are intended to support researchers who seek to transition into entrepreneurship and those who already have a product derived from their academic research and wish to engage with the public sector. A key limitation of this study is the limited discussion on how the specific adaptations of Sigelu were presented in each proposal, as word constraints prevented a deeper exploration of these details. Future research will incorporate feedback from CPSI evaluators, providing insights into how they perceive the main challenges faced by startups and identifying strategies that could enhance their competitiveness in public procurement calls under the *Marco Legal das Startups*.

Practical report, DOI: https://doi.org/10.59490/dgo.2025.1046

Abstract. This paper aimed to develop a solution using digital technological resources to overcome operational obstacles and improve efficiency in the process of developing and monitoring the Planning and Management Instruments of the Unified Health System (IGSUS). The IGSUS instruments include: the Municipal Health Plan (PMS), the Annual Health Programming (PAS), the Detailed Report of the Previous Quarter (RDQA), and the Annual Management Report (RAG). These instruments result from the collaboration of multiple stakeholders and are essential for organizing actions that address the health needs of the population. Reports from the team itself, corroborated by an initial mapping of the process, indicated that there was significant repetition of operational tasks and rework in the creation of data collection files, sending emails to technical areas, reviewing the information entered by respondents, consolidating spreadsheet files, and preparing the consolidated text file. The mapping and automation of the processes for developing and monitoring the IGSUS followed methodologies for project management, process management, and agile methods, focusing on a collaborative, governed approach inclined toward innovation and improvement in the delivery of public services. This work led to the establishment of standardized data collection forms, Python scripts that automated these tasks, and a platform for sharing spreadsheets, reducing the hours spent on these tasks and enabling better support

for the planning process with the technical areas of the Municipal Health Department of São Paulo.

Keywords. Digital Health; Public Sector; Digital Transformation; Innovation

1. Introduction

The planning function is one of the four administrative functions that make up the administrative process, along with organization, direction, and control, and its scope is to define objectives to be achieved, as well as the resources and tasks to accomplish them. Modern planning concepts go beyond the idea of planning as a mere projection based on past information and reflect the paradigm of complexity, in which multiple elements interrelate and transform, creating new scenarios. Therefore, planning that aims to be sensitive to these changes must be structured to consider the perspectives of the affected actors and the historical and social contexts in which they are embedded. According to Matus (1991), the proponent of the Situational Strategic Planning method, planning is a continuous action, adapted to circumstances, with specified analytical factors and that considers the asymmetries between the stakeholders. Thus, its use allows for a more dynamic understanding of the analyzed scenario and the limits of governance over the challenges it aims to address. This perspective proves most advantageous for planning health actions, because, as expressed by Giovanella, L., citing Testa (1989), health planning is directed toward social change and is designed as an action that seeks direct intervention in history.

According to Consolidation Ordinance GM/MS No. 01/17 (Ministério da Saúde da República Federativa do Brasil, 2017), which systematizes the planning guidelines of the SUS, planning is an individual responsibility of each of the three federative entities, to be developed continuously, articulated, and integrated (Art. 94, Item I). The Planning and Management Instruments of the SUS, known by the acronym IGSUS, consist of the Municipal Health Plan (PMS), the Annual Health Programming (PAS), the Detailed Report of the Previous Quarter (RDQA), and the Annual Management Report (RAS). These instruments relate to budgetary documents that compose governmental planning and must reflect the health needs of the population and the actions and resources required for its care. It is important to emphasize that these instruments are mandatory and continuous, and their timely delivery is a condition for intergovernmental transfers of resources. Decree No. 1,651 of 1995 (Presidência da República Federativa do Brasil, 1995) and Complementary Law No. 141 of 2012 (Presidência da República Federativa do Brasil, 2012) regulate audits and budget and financial accountability through SUS management instruments, as well as the temporal relationship between budget planning and the annual health program (PAS). Decree No. 7,508 of 2011 (Presidência da República Federativa do Brasil, 2011) explains the mandatory nature of health planning. Finally, Resolution No. 459 of 2012 (Conselho Nacional de Saúde, 2012) standardizes the structure of the Detailed Report for the Previous Quarter (RDQA). Respect for the rites established for the preparation and publication of the IGSUS is therefore of paramount importance for compliance and transparency in the implementation of public policies and is a requirement for the continued transfer of federal funds.

Within the São Paulo Municipal Health Department, the support for the planning process is within the responsibilities of the Planning Advisory Office (ASPLAN). The Planning Advisory Office of the São Paulo Municipal Health Department (SMS/SP) is a unit that provides direct assistance to the Municipal Health Secretary regarding strategic planning and the decision-making process. Among its responsibilities outlined in Article 16 of Municipal Decree No. 59,685 of 2020 (Prefeitura Municipal de São Paulo, 2020), Item III, the office is tasked with disseminating and developing planning, monitoring, and evaluation methodologies for processes, projects, and strategic programs to support SMS/SP management, coordinating related areas within the Executive Secretariats. In order to enhance this process, ASPLAN has integrated digital tools into its workflow, encouraging the team to train and propose solutions using these resources, particularly those stemming from accessible digital transformations

Many public and private health organizations are using digital technologies to enhance organizational performance and create innovative solutions to improve healthcare delivery, generating innovation in the form of new processes, tools, therapies, medical procedures, or innovative approaches to education, training, management, and procurement (World Health Organization, 2021; Stoumpos et al., 2023). The process of digital transformation and the adoption of innovative tools directly impact a wide range of work processes, especially the automation of routine and repetitive tasks. When considering this transformation within the public sector, Terlizzi (2021) notes that digitization as a tool contributes to achieving a more efficient government, which aligns with the view of Jonathan, G.M. (2020), who sees digital transformation as a value-adding element for citizens by reducing operational costs and increasing the productivity of the public sector.

The author also discusses the differing expectations regarding digital transformation, which can be divided into optimists who view it as a definitive improvement for all domains, pessimists who see it as compromising the decision-making process due to the simplifications it requires for data modeling, and those who view it with a balanced perspective, recognizing the importance of digital transformation but understanding that other necessary conditions, when combined, make it effective.

In relation to the public sector, the digital transformation presents challenges, such as 1) regulatory hurdles; 2) data integration issues; 3) ICT infrastructure gaps; 4) limited digital literacy; 5) bureaucratic culture; 6) ethical considerations with AI; and 7) privacy and security concerns (Latupeirissa et al., 2024). Adamczyk, W.B. (2020) points out that insufficient incorporation of innovations in automation within public sector planning can lag behind the private sector's productivity, resulting in direct and indirect impacts on the operations of agencies and facilities, generating inefficiency and low problem resolution for service users. Asgarkhani (2005) argues that such transformations are driven in the private sector by competition, with competitive needs setting higher service standards involving digital tools. This contrast highlights the urgency for the public sector to address structural and cultural barriers in order to keep pace with evolving service expectations. As pointed out by Jonathan, G.M. (2020), one of the main factors for the successful implementation of digital transformation in an institution is its organizational culture, since cultures that are flexible toward innovation influence leaders and employees to invest the necessary effort in related deliverables. In a broader context, Gkrimpizi, T. et al. (2023) consider that digital transformation goes beyond technological innovation itself and also encompasses cultural changes that ensure its operability and continuity.

Despite the challenges and barriers to radical and timely digital transformation, incremental changes that qualify processes and work, supported by the automation of certain tasks to overcome significant bottlenecks, remain feasible. This perspective is even more timely when considering the efficiency gains that such applications can bring to improving the quality of services for SUS-dependent health needs. This point is particularly relevant when considering the determinants and conditions influencing the increased demand for the system, such as population aging, increased informality in the labor market, and the prevalence of chronic diseases, with a high concentration of preventable deaths in the most vulnerable population segments. Therefore, promoting the development of strategies based on digital transformations in SUS is providing responses that can contribute to the qualification and efficiency of care for an increasingly growing and diverse demand.

From the perspective of incremental change, the Planning Advisory team (ASPLAN) of SMS/SP, responsible for monitoring more than 250 goals in the Municipal Health Plan, which involves 40 technical areas of the Department, developed an automation solution for handling spreadsheets containing information about these goals using Python scripts. Since standardizing and streamlining processes is an indispensable requirement for automating tasks, a BPM (Business Process Management) approach was adopted to map the processes to be automated. With the incorporation of this improvement into the workflow, it was possible to simplify data collection, processing, and monitoring of goal-related information, yielding gains in the available hours of the team, impacting overall productivity, and allowing the team to focus on enhancing analysis of goal achievement and action execution.

2. Methodology

The mapping and automation of the processes for the development and monitoring of IGSUS followed project management methodologies, process management, and agile methods, focusing on a collaborative, governed approach inclined towards innovation and improving the delivery of public services.

A project management methodology was used to increase commitment to objectives and results, integration between the involved areas, availability of information for decision-making, improve the quality of project results, optimize human and material resources, and minimize project risks and issues.

The practice of tailoring, which aims to adapt and customize processes, methods, tools, and project management practices to meet the specific needs of each project and organization, was utilized. Thus, the process management method used was a hybrid form of recommendations from the PMBOK Guide (Project Management Institute, 2017) and agile methodologies, aiming to offer the success guarantees that a management methodology can provide, aligning the company's desired objectives with the available resources and time. The following stages were then followed:

1. **Initiation:** where the project was defined and authorized. The Project Charter was proposed, and the

project team was defined.

2. **Planning:** the project's scope, schedule, and resources were defined, along with the project's work breakdown structure.
3. **Execution:** the project plan was executed.
4. **Monitoring and Control:** the project's progress and performance were monitored and controlled.
5. **Closure:** the project's stages were finalized and documented.

During the execution phase, the developed solutions followed agile methodology steps with prototyping and testing to define the final solution product. This choice was due to the fact that this type of methodology provides feedback from end-users in short iterations, allowing for the development of faster solutions, directed at process users, and with better quality.

The processes related to IGSUS were then mapped using process management methodology according to BPM (Business Process Management) standards. An adapted BPM cycle from the CMBOK 4.0 Guide (ABPMP International, 2020) was used, consisting of planning, analysis, design, implementation, and monitoring. As an initial step, project planning was carried out, reviewing objectives and teams, as well as providing documents related to the processes to be mapped. The objective was defined as the development of solutions that make the analyzed processes and process flows more efficient. Next, an analysis was conducted to identify and evaluate how the processes were occurring. Through meetings and interviews with the team involved, it was possible to identify the key elements of a business process: Supplier, Input, Process, Output, and Customer (SIPOC). Thus, activities, tasks, and their responsible parties, the stages to which each task was related, and the estimated time in hours of work for their completion could be differentiated. As a result of this stage, a flowchart of the initial state of the process (AS-IS) was developed following business process management notation (BPMN).

After completing this stage, the process analysis phase began, in which repetitive activities and tasks that generated rework were identified, listing the development of data collection forms – Excel spreadsheets – and the treatment of collected data as tasks to be developed for improvement solutions.

In the process design phase, after identifying the activities targeted for improvement, the development of solutions began, consisting of three phases: prototyping, which involved the creation of initial solutions, testing these solutions, and the actual development of those that best met the proposed objective. Optimizations and reorganization of stages were agreed upon, and automations of repetitive and routine tasks were proposed and developed. Thus, a new process design (TO-BE) that incorporated the solutions was validated.

The final stage was the implementation of the developed tools. For data collection, the use of standardized collection forms in Excel documents for each of the goals was proposed. Additionally, Python code routines were developed to automate the creation of the forms, processing of collected data, and generation of a Word document with the IGSUS goals information. The more than 250 forms required the addition of new fields, locking and unlocking of cells, and occasionally specific formulas and formatting. To support the Word document, a database was created with the information collected from the forms, a task that was also automated. To facilitate the sharing of forms and instructional information about the process, a web page was developed and implemented using Microsoft's SharePoint tool. Focal points from each area had permission to access only their forms, avoiding the step of sending emails to each area with their folders and preventing unauthorized access to the forms. Additionally, this tool enabled the centralization of the sharing of instructional information for technical areas.

After developing these solutions, the routines were migrated according to the defined schedule, and the solutions entered a continuous improvement cycle. During the application period of the redesigned stages, the time spent by the team on activities and the return time of the completed forms were monitored to be compared to the time identified for the AS-IS process.

3. Results

The mapping of the processes involved was done according to the BPM notation. First, the process was mapped as it was executed (AS IS). Then, in an effort to evaluate and agree jointly between the actors involved in the tasks, improvements and optimizations were defined in the flow of activities. After validating these

improvements, the version to be implemented was designed (TO BE). This standardization made it possible to automate repetitive and laborious tasks, implementing more efficient and rational flows.

To illustrate the improvements made, Appendix A and Appendix B show, respectively, the AS IS version and the TO BE version of the monitoring and publication of the annex to the RDQA. As you can see, the original flow involved 4 macro-steps and 5 activities that are labor-intensive and have potential for optimization. The TO BE version, on the other hand, consists of 3 macro-steps and 4 activities that present significant improvements and optimizations. This redesign therefore resulted in the exclusion of 5 labor-intensive and time-consuming activities, as can be seen in the figures below.

Based on the mapping of the involved processes, Python scripts were developed that enabled the automation of digital stages for editing tables in Excel, creating and updating a database, and generating Word documents. These scripts utilize libraries such as pandas and openpyxl for data analysis, and python-docx and docxcompose for document manipulation. Additionally, tkinter is used to create user-friendly interfaces for data input and message display.

These stages were part of actions aimed at consolidating data, adjusting the forms to be sent to technical areas, and producing the final Word document for the publication of the IGSUS. The automation process is divided into three main steps: preparation for data collection, monitoring and filling, and data consolidation for publication.

1. Preparation for Data Collection: Scripts create specific fields for information input, with data validation to ensure accuracy. They also manage cell locking and unlocking to facilitate standard field filling.
2. Monitoring and Filling: A daily script monitors the completion of specific fields, updating a control spreadsheet that tracks progress goal by goal.
3. Data Consolidation: Scripts generate an Excel database, which is then used to create formatted sheets with information and images for each goal, ready for final publication.

With a tool that provided a more intuitive interface for shared filling with technical areas, the speed of information collection allowed for timely actions to qualify the Planning Advisory team's support in goal monitoring. This included proposing activities for goal analysis and providing the necessary methodological support for this task.

The entire workflow for the creation of the instruments was compiled in SharePoint, a Microsoft platform that allows for the creation of collaborative portals and web interfaces. Beyond serving as a documentation space, compiling the workflow and forms on this platform aimed to provide a single address that facilitated sharing them for completion, avoiding the need to send attachments via email to all relevant areas within the SMS/SP. This strategy also had the advantage of indirectly training the actors involved in the planning instruments on the new workflow and tools used. It is estimated that over 100 employees involved in monitoring goals were exposed to the developed content, and their work was impacted by this action.

The automation of the processes resulted in an annual gain of 1,240 hours related to form production, plus an additional 60 hours for sending customized emails per area, totaling a 1,300-hour saving for the team. This result pertains to the time saved from the work of two team members. In addition to efficiency gains, this reduction in time spent on repetitive tasks has allowed for a greater focus on improving the planning of actions and the analysis of results in the IGSUS, promoting reflection on the part of the actors who implement public policies to improve their results. In this way, process mapping and the automation of tasks have been configured as a relevant innovation in the context of public health policy management, contributing to qualitative gains in its execution and thus generating social value that translates into the improvement of actions and services offered to citizens.

The table below summarizes the deliverables from the automation project promoted by the Planning Advisory team of SMS/SP:

Tab. 1 - Main deliverables of the project.

Deliverables

1	New tool for registering information and monitoring IGSUS goals
2	Document with mapping of the new process
3	Python codes documented on GitHub
4	Gain of 1,300 technical hours annually
5	Training of over 100 professionals in the use of the new form
6	Platform with work flows and form sharing

4. Final Considerations

This initiative represented a successful case of digital transformation applied to a key process, where solutions using automation for routine and repetitive tasks impacted the overall reduction in time to complete the filling of the SUS Management Instruments. It enabled better qualification of analysis and monitoring processes and contributed to the creation of an intuitive, secure, and agile interface for data collection with technical areas. The qualification and development of the team during the process also stands out, as it incorporated new knowledge and skills into their technical repertoire. The increased efficiency derived from these improvements allowed the team's efforts to focus on enhancing the planning of stakeholders from the territory and technical areas within SMS, contributing to the greater efficiency, effectiveness, and impact of policies, as well as reducing health inequities.

This experience marked the initial step towards the automation of tasks that are beneficial to both the administration and the workers directly involved, adding value to the management and planning process. However, efforts are still required to disseminate the competencies involved, document, and standardize processes to institutionalize the benefits and improvements achieved. In this regard, additional efforts are being made to deepen mapping actions, optimization, and continuous improvement in the IGSUS processes, aiming to expand and sustain the benefits obtained.

Acknowledgement

- **Funding or Grant**: This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.
- **Data/Software Access Statement:** The data involved in this study consisted of goal-related data exchanged between departments during the traditional work process (monitoring goal progress). Data automation and processing were performed using Microsoft Excel, Microsoft Word, and VS Code (version 1.86) running Python (version 3.13), along with relevant Python packages.
- **Contributor Statement:**

  - Ilka Corrêa De Meo: Conceived the study and methodology. Supervised the development of scripts and the use of technologies. Wrote and reviewed the article. Contributed ideas for process improvement.

  - André Luiz dos Santos Teixeira: Catalogued references. Led the writing and review of the work.

  - Bianca Tomi Rocha Suda: Conceived the study and methodology. Contributed ideas for process improvement and validated the results.

  - Bruno Martinelli: Conceived the study and methodology. Participated in the development of automated steps. Reviewed the article and contributed ideas for process improvement.

  - Felipe Barbugian Borges da Cunha: Developed automated steps (scripts, SharePoint construction). Contributed ideas for process improvement.

  - Felipe Ribeiro Pereira: Developed automated steps (scripts). Assisted in process mapping. Wrote and reviewed the article. Reviewed flowcharts.

  - Fernanda Braz Tobias de Aguiar: Supervised the study. Contributed ideas for process

improvement and work conduction. Validated the results.

- Gianlucca Vergian Dalenogare: Reformulated process mapping. Wrote and reviewed the article. Developed flowcharts.
- Karina Teixeira Silva: Supported the construction and maintenance of SharePoint. Reviewed information and contributed ideas for process improvement.
- Luiz Gustavo Machado Cruz: Contributed ideas for process improvement. Validated scripts.
- Miriam Carvalho de Moraes Lavado: Supervised the study. Contributed ideas for process improvement and work conduction. Validated the results.
- Sandra Fernandes Maciel dos Santos: Supported the construction and maintenance of SharePoint. Reviewed information and contributed ideas for process improvement.
- Suellen Decario Di Benedetto: Conceived the study and methodology. Contributed ideas for process improvement and validated the results.
- Estevão Nicolau Rabbi dos Santos: Supervised the study. Contributed ideas for work conduction and validated the results.

- **Use of AI:** During the preparation of this work, the authors used ChatGPT (OpenAI) and Copilot (Microsoft) to support the development of Python code for data processing, edit text documents, and create system interfaces. Additionally, AI was utilized to assist in reviewing and improving the clarity, structure, and academic tone of the English text. After using this tool, the authors critically reviewed, edited, and validated all content, and take full responsibility for the final version of the publication.
- **Conflict of Interest:** There is no conflict of interest.

Abstract. The exponential growth of data and the advancement of computational tools have made Data Science (DS) an essential discipline for addressing complex societal challenges. In the public sector, Evidence-Based Public Policies (EBPP) leverage data-driven insights to enhance governance transparency, efficiency, and effectiveness. However, the integration of Data Science into policymaking presents challenges, including data quality, interdisciplinary collaboration, and institutional resistance. This paper introduces BEPP-DS, a structured methodology for developing EBPP using DS principles, emphasizing transparency, reproducibility, and scalability. The methodology is informed by real-world applications such as Big Data Social and Big Data Fortaleza, which illustrate how data-driven strategies improve policy design, implementation, and monitoring. BEPP-DS defines a structured framework, from problem identification to policy evaluation, ensuring data-driven decision-making in governance. The methodology provides a replicable model for governments seeking to harness Data Science in policy formulation. Future work includes expanding AI-driven analytics and strengthening citizen engagement in data governance.

1. Introduction

The exponential growth of data and developments in computational tools made Data Science (DS) a key field to tackle multidimensional societal challenges (Silva et al., 2022). Helping to derive actionable insights from data, DS has established itself as a vital force in many fields, such as medicine, education, and urban administration (Santos et al., 2023). Lately, applications of DS in governance have been exemplary, especially in the framing and implementation of Evidence-Based Public Policies (EBPP) (Anderson et al., 2005).

There is an increasing need for governments worldwide to make policies effective, equitable, and more transparent, with full involvement of relevant stakeholders (Saltelli et al., 2020). Evidence-based approaches allow

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

the systematic use of data within policy-making to ensure decisions are evidence-based, as opposed to intuition or tradition. However, for developing DS into public policy-making, there are related challenges –issues of data availability and quality, an interdisciplinary way of collaboration, and ethical, systematic methodologies guiding how knowledge is extracted within the government institutions' peculiarities (MacArthur et al., 2022).

Such is the demand for data-driven solutions in Brazil, whose socio-economic setting has also entrenched regional disparities. Despite all challenges, there is an emerging consensus on the need to structure and formalize DS use in government to work toward more effective public policies ultimately. This work describes a methodology for constructing EBPP using DS based on principles of transparency and non-discrimination.

Given this context, the question that guides this research is: how to structure a replicable methodology for building evidence-based public policies, using Data Science principles, that is applicable in different governmental contexts and capable of promoting more informed and effective decisions?

This paper describes the methodology that profited from the lessons learned while implementing large-scale data platforms such as Big Data Social (Sucupira Furtado et al., 2023a) and Big Data Fortaleza (Batista et al., 2024). Both examples give evidence of the potential of Data Science for developing governance that is efficient in processes, reproducible in decisions, and scalable in policies.

The rest of the paper is organized as follows: Section 2 gives an overview of the theoretical underpinning of Evidence-Based Public Policies and Data Science, showing their meeting point in governance. Section 3 reviews the related methodologies and pinpoints the literature gaps. Section 4 describes the proposed methodology, core components, and activities in depth. Section 5 demonstrates how the methodology works in real applications and discusses its impact. Finally, Sections 6, 7 and 8 discuss lessons learned and future opportunities, especially integrating Artificial Intelligence into data-driven policy-making.

2. Background

This section provides the basics necessary to understand the conjunction of Evidence-based Public Policies and Data Science, considering e-government. Understanding these domains allows us to comprehend better the opportunities and challenges of leveraging data science into governance practices, particularly in a context such as Brazil.

2.1. Evidence-based Public Policies

Evidence-based Public Policies are strategies and interventions designed and implemented based on empirical data and scientific research (Anderson et al., 2005). This approach ensures that rigorous evidence, rather than intuition or tradition, is the primary determinant of whether a policy is effective, efficient, and equitable. It is based on the central premise that structured methodologies that critically appraise and synthesize sound data substantially aid public decision-making and thus enable governments to handle societal challenges systematically and transparently.

EBPP adoption is rapidly expanding as the data and analytical tools base improve. Globally, the call for governments to account for their actions and deliver increased public service has grown. However, embedding evidence in policy faces several challenges: problems related to the quality of the data, resistance at the institutional level, and requirements for collaboration across disciplines. These hurdles notwithstanding, with increased calls for transparency and accountability, EBPP has become an indispensable framework for modern governance.

2.2. Data Science For Governments

Data Science (DS) is an interdisciplinary field that deals with methods and processes for extracting meaningful insights from data, combining statistical analysis, computational techniques, and domain expertise (Van Der Aalst and van der Aalst, 2016). It is pivotal in addressing complex societal challenges; it offers tools and methodologies to help uncover patterns, predict outcomes, and support decision-making processes.

The data science life cycle consists of five phases: data collection, cleaning, analysis, interpretation, and dissemination (Rahul and Banyal, 2020). Data collection involves aggregating information from diverse sources, while preprocessing ensures the data is clean and structured. In the analysis phase, analytical techniques like machine learning and statistical modeling are applied to derive actionable insights. These insights are then interpreted in the context of the problem domain and disseminated to stakeholders to inform decisions. This iterative cycle allows continuous improvement and adaptation, particularly suited for dynamic environments like governance.

2.3. e-Government in Brazil

e-Government is the use of digital technologies to improve the delivery of government services, enhance citizen engagement, and streamline administrative processes (Silcock, 2001). In Brazil, e-Government initiatives represent a unique opportunity to reduce persistent regional disparities and enhance public sector efficiency (Musafir, 2018). With more than 200 million people and a growing internet penetration rate, Brazil has the potential to use digital platforms to expand access to public services and enhance transparency.

However, adopting e-Government in Brazil is still dogged by various factors: deficiencies in rural digital infrastructure, socioeconomic disparities, and bureaucratic resistance. Nevertheless, projects like "Big Data Fortaleza" (Batista et al., 2024) and "Big Data Social"(Sucupira Furtado et al., 2023a) represent the transformational use of data science integrated into governance. These projects show how data-driven strategies could improve decision-making, resource allocation, and citizen outcomes.

3. Related Works

This section presents the related works studied to understand models and their respective results presented by Evidence-Based Public Policies and Data Science. Understanding these works allows us to better understand the challenges of leveraging data science in governance practices, especially in social contexts present in Brazil.

(Sucupira Furtado et al., 2023b) demonstrated how Ceará's digital transformation integrated technological innovation into public policy cycles to address social challenges and promote sustainable development. Tools like big data platforms and mobile apps enabled data-driven policymaking, improving efficiency, transparency, and responsiveness. Collaboration among public, academic, and private sectors (e.g., the IRIS Lab) enhanced institutional capacity and policy legitimacy. Focus on vulnerable populations aligned with SDGs, reducing inequalities through targeted interventions.

(Pereira et al., 2021) highlighted the role of standardized information structures in creating efficient and accessible policies. Interoperability between government systems improved evidence-based decision-making and digital inclusion by simplifying access to services. Standardized taxonomies enabled better policy monitoring and evaluation, ensuring adaptive and inclusive governance.

(Furtado et al., 2023) presented the importance of integrating data and advanced analytics to support the creation of more effective and targeted public policies. By consolidating information on social vulnerabilities, such as income, housing, and nutrition, the system made it possible to identify populations at greatest risk and prioritize government actions in a well-founded manner. This approach demonstrates how digital tools can strengthen the diagnosis of social problems, offering an empirical basis for the formulation of policies that are more aligned with the real needs of the population. A central feature of this work is its ability to personalize public policy recommendations based on detailed analyses of specific conditions. Through interactive dashboards, public managers can access solutions adapted to meet particular demands, such as the provision of financial aid, housing policies, or access to government programs to support society. This personalization reflects a more human and strategic approach to policymaking, by focusing on practical results and immediate impacts for the most vulnerable populations, maximizing the efficiency and social impact of government interventions.

(Schröer et al., 2021) presents CRISP-DM (Cross-Industry Standard Process for Data Mining) highlighting its relevance as a methodological framework capable of guiding the creation of evidence-based public policies. Divided into six phases – business understanding, data understanding, data preparation, modeling, evaluation,

and implementation –, this model offers a systematic approach to analyze large volumes of data, transform information into useful knowledge, and translate analytical insights into concrete actions. This methodology has a strong potential for application in the public sector, where data analysis can improve the formulation of policies aimed at complex social problems. The initial phase of business understanding is essential to align the data analysis objectives with public policy priorities. It allows managers to identify critical issues, such as social inequality or low coverage of health services, and define clear goals for interventions. By establishing these connections between data and objectives, the model enables the creation of more strategic policies aligned with the real needs of the population. This approach highlights how structuring data in analytical projects can improve the diagnosis of problems and direct resources to areas of greatest impact. The data preparation and modeling phases are equally important to the policymaking process, as they ensure the quality and usability of the analyzed data. By consolidating information from different sources, such as government databases or sectoral statistics, CRISP-DM helps to create a comprehensive overview of the challenges faced by society. In addition, the analytical models developed at this stage allow for scenario simulations and predictions of the effects of policies before their implementation, reducing uncertainty and optimizing expected results. This is especially relevant in contexts such as health, education and public safety, where well-planned interventions can generate significant transformations.

The analysis of the presented studies reveals a convergence around the strategic use of digital technologies and structured methodologies to strengthen the process of creating and implementing public policies. However, they also highlight significant gaps that need to be addressed to ensure a comprehensive and sustainable implementation. These studies underscore both the central role of technology in modernizing public governance and the challenges associated with inter-institutional integration, data privacy, continuous monitoring, and social participation.

The use of structured frameworks demonstrates the importance of well-defined analytical processes to guide data-driven decision-making. This approach allows for the identification of critical problems, the definition of clear goals, and the evaluation of the potential impact of policies before their implementation. However, inter-institutional integration, necessary to consolidate data and promote a holistic view of social demands, still faces challenges such as standardizing information and defining responsibilities among government agencies. Overcoming these challenges is crucial to maximize the effectiveness of public interventions.

Furthermore, the application of digital transformation in specific contexts reinforces the need to align technology and governance with strategic planning that prioritizes inclusion, sustainability, and data privacy protection. However, the studies leave open questions about how to ensure the financial and operational sustainability of these solutions and how to balance the use of data with guarantees of security and ethical treatment. They also highlight gaps in post-implementation monitoring. Time is needed to assess the long-term impacts of these strategies derived from public policies. These studies emphasize that achieving modern and sustainable public governance requires the integration of technology, ethics, inter-institutional collaboration, and citizen participation. This integration is essential to ensure efficiency, equity, and significant social impact.

4. BEEP-DS

Given our experience in government Big Data projects, it was possible to observe and extract good practices to compose a methodology for Building Evidence-Based Public Policies from Data Science (BEEP-DS). The construction of the BEPP-DS methodology followed a set of guiding requirements, derived from the analysis of real cases and the limitations observed in previous projects. The main requirements include: (i) clarity and traceability of decisions; (ii) minimization of rework and data reprocessing; (iii) integration of different professional profiles with defined roles; (iv) feasibility of replication in different institutional contexts; and (v) support for impact assessment. Based on these requirements, it was possible to design the workflow represented in Figure 1.

Based on the experiences of the Federal University of Ceará and the resources provided by the Fundo Nacional de Desenvolvimento da Educação (FNDE), the data product creation process is structured into six main roles: the requester, the data scientist, the business analyst, the data engineer, the developer, and the data manager.

The requester is the FNDE representative responsible for submitting a data product request. They present a strategic question already approved by FNDE, meaning that the business need has been previously analyzed

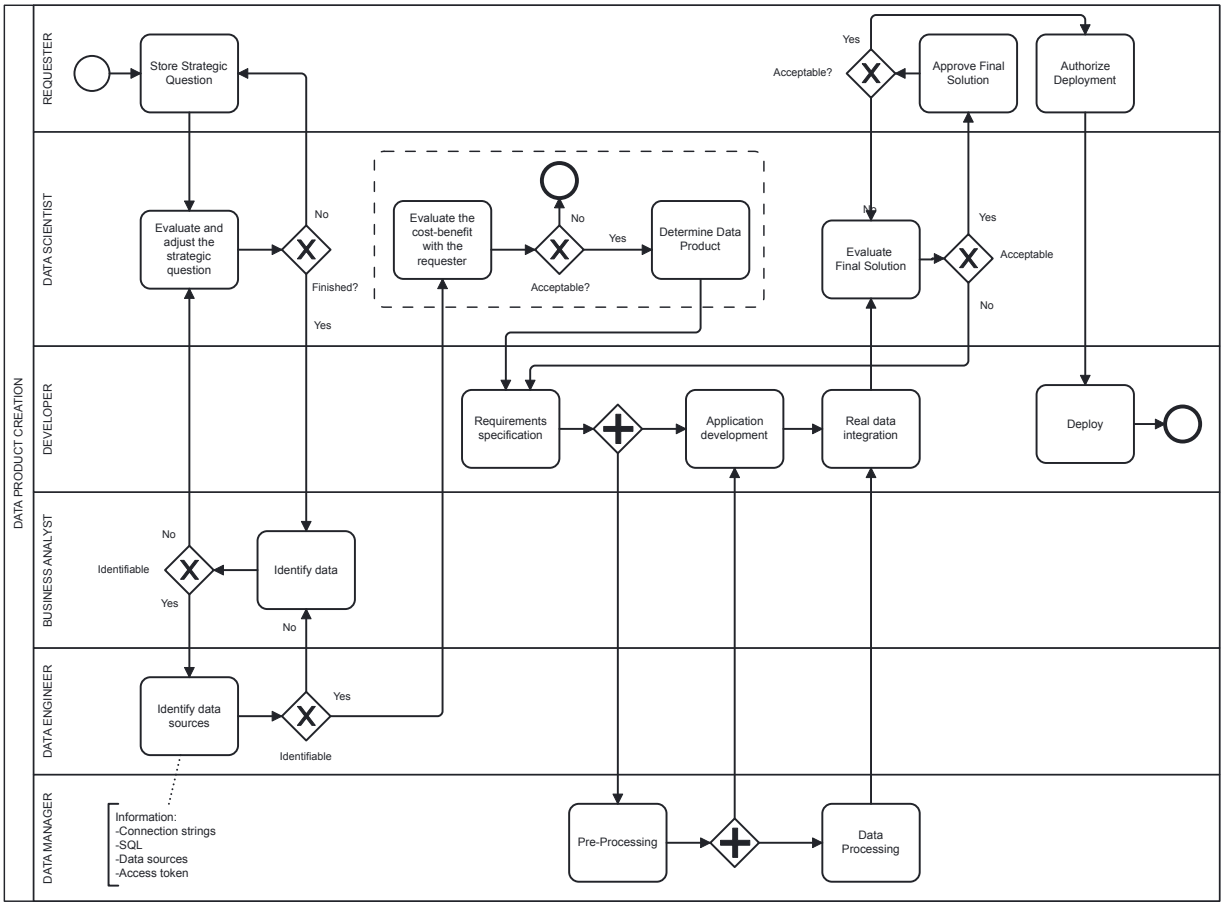

Fig. 1 – BPM Diagram for data product creation.

before the process has been started. Consequently, the submitted question would be structured and ready to be addressed.

The data scientist, in charge of the next step, is an information technology professional experienced in data analysis. Their role is to assess whether the strategic question meets essential criteria such as objectivity, well-defined scope, and feasibility within a reasonable timeframe. If necessary, the data scientist collaborates with the requester to refine the question. The data scientist is also supposed to accompany the whole data product creation process, trying to keep the efforts aligned with the goals of the requester. Once the question is sufficiently clear and viable, it is passed on to the business analyst. At this point, the process aligns with Business Understanding in CRISP-DM (Figure 2), where the objectives are identified, and the success criteria are established. Although the analysis of predictions is carried out by the data scientist, it will be clear that decisions about the development of data products for public policies require a broader vision. The technique envisaged, although essential, may not fully capture the social or strategic value of an initiative. Therefore, it is proposed that this stage evolve into a collegiate assessment, also involving experts from the business area and representatives of public management, allowing for the consideration of not only computational or technical effort aspects, but also the potential impact of the policy to be strengthened — for example, in terms of urgency, population coverage or mitigation of social risks.

The business analyst identifies data sources needed to address the strategic question, leveraging institutional knowledge. If data is unavailable or costly, they return the request with feedback; otherwise, they forward it (with documentation) to the data engineer. This aligns with CRISP-DM's Data Understanding phase. The data engineer handles technical infrastructure (connection strings, queries, access tokens). If obstacles arise (e.g., external data ownership), they escalate to the analyst and data scientist. Successfully sourced data is documented, mirroring CRISP-DM's Data Preparation.

The data scientist then evaluates feasibility (strategic fit, technical viability, cost-benefit) with the requester. If

Fig. 2 – Phases of the CRISP-DM Process Model for Data Mining

approved, they jointly define the product (dashboard, chart, etc.), initiating development (Modeling in CRISP-DM). The developer builds the product using a sample dataset (provided by the data manager), while the manager prepares the final dataset. The data scientist validates the product with real data, requesting adjustments if needed (Evaluation phase).

Finally, the requester reviews the product. If approved, the team deploys it, and the data manager catalogs it for use (Deployment in CRISP-DM). Rejection triggers reevaluation by the data scientist.

5. Usage Scenarios

This section describes two projects in which we obtained the necessary experiences to propose the method discussed in this paper. Big Data Social and Big Data Fortaleza are platforms built to help public managers make decisions based on analytical data. Although created in different scenarios, both faced challenges, such as the lack of a data culture in government sectors and the absence of processes to ensure the continuity of the platforms based on the management of the construction of new analytics.

5.1. Big Data Social

Big Data Social platform is a centralized hub for consolidating, managing, and analyzing diverse government databases related to low-income families enrolled in the “Mais Infância” welfare program. By integrating multiple sources, the system improves governance by generating key indicators and highlighting the social policies that directly benefit these families. These households are a priority for state agencies, as they often face significant socioeconomic hardships, predominantly living in rural areas and including one child under six.

To build the database, a state-led survey was conducted, gathering data from more than 150,000 families on topics such as food security, health, child welfare, housing conditions, income, and education. The Big Data Social platform not only stores this vast dataset but also provides advanced tools for data analysis, including analytics, data mining, and interactive dashboards. The platform maps the geographic locations of these families, providing decision-makers with valuable insights into how current policies impact families’ quality of life.

The execution of this project gave us experience with the challenges inherent in constructing evidence-based public policies. Although several data science processes can be applied to address such challenges, the lessons learned in this type of project are valuable for avoiding future mistakes and optimizing the results achieved.

5.2. Big Data Fortaleza

The Big Data Fortaleza platform was designed to create a robust data ecosystem that supports evidence-based public policy formulation, implementation, and monitoring. By centralizing and processing large volumes of

data from diverse governmental and institutional sources, the platform enables in-depth analysis and pattern recognition, optimizing public management. Its methodology is grounded in Data Science principles tailored for the public sector, with a strong emphasis on the BEPP-DS framework.

Aligned with e-Government initiatives and international data-driven policy standards, the platform adopts a modular approach encompassing data collection, preprocessing, exploratory analysis, predictive modeling, and interactive visualization. Machine learning and artificial intelligence enhance its capabilities, allowing for scenario forecasting and strategic recommendations that improve resource allocation and impact assessment. Built with interoperability and data governance best practices, the platform facilitates seamless integration across agencies, preventing data silos and promoting collaboration.

Validation across key public administration areas—such as urban mobility, health, education, and security—demonstrated the platform's effectiveness in integrating and cross-referencing previously fragmented databases, offering a comprehensive view of urban and social challenges. However, implementation faced hurdles, including institutional resistance to data technologies, the need for technical upskilling among public managers, and constraints in data quality and availability. To overcome these challenges, a participatory approach was adopted, engaging stakeholders and fostering a data-driven governance culture. The application of BEPP-DS proved instrumental in standardizing processes for extracting actionable insights from heterogeneous data sources, ensuring reliable and replicable outcomes.

The platform's deployment significantly enhanced municipal analytical capabilities, leading to optimized resource allocation, reduced administrative redundancies, and stronger policy monitoring and evaluation mechanisms. Interactive dashboards and automated reports improved data accessibility for both public managers and civil society, while increased transparency allowed citizens to track government actions more closely, promoting accountability. These advancements reinforced the shift toward responsive, data-informed governance.

The insights derived from Big Data Fortaleza contributed to refining the BEPP-DS methodology, establishing best practices for data science in public policy. The project highlighted the importance of robust data governance, including standardized processes, clear institutional responsibilities, and continuous data validation. As the methodology evolved, the platform incorporated advanced predictive models and expanded interoperability with national and international databases. Equally critical was the emphasis on continuous training for public officials, ensuring effective tool utilization to drive tangible societal benefits.

Looking ahead, Big Data Fortaleza aims to broaden its impact by leveraging open data and artificial intelligence to refine public policy formulation on a national scale, further cementing its role as a catalyst for data-driven governance.

6. Discussion

The BEPP-DS methodology was designed to address gaps observed in applying traditional data science frameworks to public policy contexts. While CRISP-DM is widely recognized for its six-phase structure—from business understanding to deployment—its direct application in government settings can be challenging due to insufficient emphasis on public-sector specifics, such as institutional complexity and the need for transparency and accountability. In comparison, BEPP-DS adapts and expands CRISP-DM principles by incorporating stages tailored to public-sector realities. For instance, while CRISP-DM focuses on business understanding, BEPP-DS emphasizes strategic questions aligned with political and social priorities. Additionally, BEPP-DS introduces a data governance framework addressing privacy, ethics, and responsible data use—aspects often overlooked in more generalized frameworks.

Although it has been applied in projects like Big Data Social and Big Data Fortaleza, a systematic evaluation of its effectiveness and adaptability across different government contexts is still needed. This includes further case studies, comparative analyses with other methodologies, and performance metrics to demonstrate its benefits and limitations. Moreover, implementing BEPP-DS requires significant institutional maturity and technical capacity. Public organizations with less developed structures may struggle with full adoption. Therefore, adaptations and ongoing support are crucial to ensure long-term effectiveness and sustainability.

BEPP-DS represents progress in integrating data science into public policy, offering a more contextualized and

sensitive approach to public-sector needs. However, its consolidation as a standard methodology will depend on further validation, adaptations to diverse institutional realities, and strengthening the technical capabilities of involved organizations.

7. Lessons Learned

Based on the BEPP-DS and the usage scenarios described in section 5, it was possible to systematize a set of lessons learned. This section discusses these lessons using the following structure: Each lesson has a title, a description of the context, the challenge faced, and the actions taken to overcome it.

Identifying the Real Problems of Each Institution: Understanding the unique challenges institutions face is crucial to implementing data-driven solutions effectively. In many cases, institutions can not clearly understand their operational hurdles, leading to poorly defined goals and misallocated resources. To address this, it is recommended that in-depth diagnostic assessments be conducted before initiating any project. These assessments should focus on understanding institutional workflows, key performance indicators, and stakeholder expectations.

Collaboratively Constructing Strategic Questions to Be Addressed: One of the most significant challenges in evidence-based policy-making is defining actionable and strategic questions. These questions must be relevant, measurable, and aligned with the institution's goals. A collaborative approach involving all stakeholders, including policymakers, data scientists, and end-users, ensures that the questions address real needs. Facilitation workshops and iterative refinement processes are recommended to align these diverse perspectives.

Establishing a Pilot to Validate the Methodology Quickly: Large-scale projects often face risks associated with untested methodologies. Pilots serve as controlled environments to test assumptions, refine processes, and gather feedback. By implementing a pilot phase, organizations can identify potential bottlenecks or risks. It is advised to select a small, representative sample for the pilot to maximize its relevance and scalability.

Systematizing the Recording of New Strategic Questions: In dynamic environments, new challenges and opportunities continuously emerge. Without a systematic approach, these new strategic needs might go unnoticed or be poorly documented. Implementing a structured repository or a formal process for capturing and reviewing new strategic questions ensures that the organization can adapt its policies and strategies effectively over time.

Creating Automated Flows to Keep Data Products Updated: Data products often lose relevance if not updated regularly. Many institutions rely on manual processes, which are prone to delays and errors. Automating data Extraction, Transformation, and Loading (ETL) processes ensures that data products remain current and accurate. Institutions should invest in robust automation tools and ensure adequate training for their technical teams.

Promoting a Data Culture Within Institutions: Adopting data-driven methodologies requires more than technical tools; it demands a cultural shift. Many public institutions encounter resistance to change due to their lack of familiarity with data practices. Building a data culture involves continuous education, transparent communication, and promoting data-driven decision-making at all organizational levels.

Establishing Standards for System Integration: Fragmented systems often lead to inefficiencies and missed opportunities for holistic insights. Integration challenges are particularly acute in multi-agency environments where data interoperability is essential. Developing and enforcing standards for system integration can address these challenges. Such standards should include data formats, APIs, and security protocols to ensure seamless collaboration.

Defining Data Architectures Independent of Business Domains: Rigid architectures tied to specific business domains often limit scalability and adaptability. Designing modular and domain-agnostic data architectures enables institutions to reuse data and infrastructure for various applications. This approach facilitates integration with external systems and future-proofing against evolving organizational needs.

8. Final Remarks

The BEPP-DS methodology introduced in this paper integrates Data Science into creating Evidence-Based Public Policies, focusing on transparency, scalability, and efficiency. Drawing from real-world initiatives like Big Data Social and Big Data Fortaleza, the methodology tackles the distinct challenges of implementing data-driven solutions within the public sector. It provides a structured framework that guides every stage of developing data products—from identifying key strategic questions to delivering actionable insights—helping improve decision-making in governance.

The study's findings underscore the importance of collaborative problem definition, systematic testing through pilot projects, and embedding data-driven practices within institutions. Applying the BEPP-DS methodology demonstrated its effectiveness in overcoming common challenges public organizations face, such as fragmented data, limited data culture, and a lack of automated processes. It also enabled policymakers to prioritize and implement targeted interventions, promoting evidence-based solutions to address critical societal issues.

Future work should aim to enhance the BEPP-DS methodology by incorporating Artificial Intelligence and Machine Learning for predictive analytics and real-time decision-making. Another valuable direction is developing approaches to increase citizen participation, enabling stakeholders to contribute to data collection, validation, and policy evaluation. Additionally, efforts must address ethical and privacy concerns to ensure that data-driven governance adheres to fairness, accountability, and inclusive principles.

Abstract. The rapid evolution of digital governance necessitates strategic planning to ensure efficiency, transparency, and adaptability in public service delivery. This paper presents the development of the Strategic and Master Plan for Information and Communication Technology (PEDTIC) at the Tocantins State Information Technology Agency (ATI/TO), a pivotal initiative aimed at strengthening digital transformation efforts in Tocantins, Brazil. The PEDTIC was built upon three foundational diagnostic assessments: the Governance of ICT, the Strategic IT Plan (PDTI), and the ABEP-TIC Index evaluation. These diagnostics provided a comprehensive analysis of ATI/TO's digital service capabilities, governance structures, and alignment with state objectives. The methodological approach combined situational assessments, regulatory reviews, management interviews, and benchmarking against national best practices. The findings highlighted gaps in IT governance, data integration, and digital service effectiveness. By aligning ATI/TO's strategic vision with the broader objectives of the Tocantins government, the PEDTIC establishes a framework that prioritizes structured governance, risk management, and the enhancement of public digital services. This study discusses the lessons learned from the diagnostic phase, emphasizing the importance of clear communication, cross-department collaboration, and proactive risk management in digital transformation. The PEDTIC provides a structured action plan with clearly defined objectives, performance indicators, and accountability mechanisms to ensure continuous improvement and adaptation. The results of this initiative have already led to a significant improvement in ATI/TO's ranking in the ABEP-TIC Index, demonstrating tangible progress in digital governance. Additionally, this paper explores the implications of ATI/TO's transformation towards a more strategic operational model, shifting from purely technical functions to a leadership role in state digital governance. The conclusions drawn highlight the critical need for structured digital strategies, ongoing capacity-building initiatives, and stakeholder engagement to sustain long-term advancements in public digital services. The PEDTIC serves as a case study for other government institutions aiming to implement structured and scalable digital transformation initiatives.

Keywords. Digital Governance, IT Strategic Planning, Government Digital Transformation, Public Sector Innovation, ICT Governance, PEDTIC, ABEP-TIC Index.

1. Introduction

In the face of rapid technological advancements, the public sector must undergo significant digital transformation to meet the evolving expectations of citizens. This transformation is critical for embracing public and digital governance (Kitsios et al., 2023), where efficiency, transparency, and accessibility are paramount. The Tocantins State Information Technology Agency (ATI/TO) plays a crucial role in this transformation within the state of Tocantins, Brazil. The agency's efforts culminated in the development of the Strategic and Master Plan for Information and Communication Technology (PEDTIC), which serves as a comprehensive framework to guide the agency's digital initiatives.

The foundation for the PEDTIC was established through three diagnostic documents: the Governance of ICT, the Strategic IT Plan (PDTI), and the assessment of the ABEP-TIC Index. These documents provided a detailed analysis of ATI/TO's current state regarding digital transformation, IT governance, and alignment with the state's strategic objectives. The diagnostics involved a thorough review of existing regulations, interviews with management, and benchmarking against best practices from other states, highlighting both the strengths and areas needing improvement in the agency's digital service delivery.

The project aimed to identify the needs, challenges, and opportunities for ATI/TO, ultimately leading to the creation of a robust action plan to enhance its digital capabilities. The results from the diagnostic assessments revealed critical gaps in service delivery, integration of digital solutions, and data governance practices, which are essential for enhancing public service efficiency. Furthermore, by analysing the agency's performance against the ABEP-TIC Index, the diagnostics pinpointed specific areas for growth and improvement.

The lessons learned from this comprehensive diagnostic process are invaluable, providing insights into effective strategies for navigating the complexities of digital transformation in the public sector. The PEDTIC outlines clear actions, goals, and responsibilities, positioning ATI/TO to adapt and thrive in an increasingly digital landscape.

This introduction frames the importance of digital transformation in public governance, sets the context for the challenges faced by ATI/TO, and underscores the significance of the PEDTIC as a strategic response to these challenges. The subsequent sections will delve into the specific methodologies employed in the diagnostics, the findings that informed the PEDTIC, and the actionable strategies that will guide ATI/TO in achieving its digital transformation goals.

2. Context

In this section, we outline the methodology that was employed to assess the Tocantins State Information Technology Agency (ATI/TO) and develop the Strategic and Master Plan for Information and Communication Technology (PEDTIC).

The approach consisted of four key steps presented in the following four sections: the first (Section 3.1) focuses on a situational assessment of digital service delivery at ATI/TO, highlighting strengths, weaknesses, and areas for improvement. The second (Section 3.2) evaluates the existing IT governance practices, emphasizing the need for enhanced frameworks to align IT strategies with the state's broader objectives. Section 3.1 benchmarks ATI/TO against best practices from other states and organizations, providing insights into successful digital transformation strategies. Finally, Section 3.4 details the development of the PEDTIC, which presents a comprehensive action plan with defined goals and responsibilities aimed at guiding ATI/TO in its digital transformation efforts. Together, these sections provide a cohesive view of the main assessment processes and the strategic planning necessary for effective public sector digital transformation.

The methodology and findings presented in the subsequent sections align closely with the seven dimensions of ICT readiness assessment proposed in Alghamdi et. al. (2011), providing a structured approach to evaluating and enhancing ATI/TO's digital transformation efforts. In this paper, the authors define organizational requirements that are necessary for the adoption of e-government to resolve the delay of ICT readiness in public sector organizations in developing countries.

The situational assessment of digital service delivery (Section 3.1) corresponds to the user access and ICT infrastructure dimensions, as it evaluates the agency's ability to deliver accessible and efficient digital services while identifying gaps in technological capabilities. The assessment of IT governance practices (Section 3.2) addresses the e-government organizational ICT strategy and business process and information systems dimensions, emphasizing the need for alignment between IT strategies and state objectives, as well as the importance of process reengineering and interdepartmental collaboration. The benchmarking against best practices (Section 3.3) reflects the e-government program dimension, ensuring that ATI/TO adopts proven strategies for digital transformation. Finally, the development of the PEDTIC (Section 3.4) integrates all seven dimensions by providing a strategic roadmap that encompasses ICT architecture, human resources, and risk

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

management, in a holistic approach to achieving organizational ICT readiness.

3. Approach

In this section, we outline the methodology that was employed to assess the Tocantins State Information Technology Agency (ATI/TO) and develop the Strategic and Master Plan for Information and Communication Technology (PEDTIC).

The approach consisted of four key steps presented in the following four sections: the first (Section 3.1) focuses on a situational assessment of digital service delivery at ATI/TO, highlighting strengths, weaknesses, and areas for improvement. The second (Section 3.2) evaluates the existing IT governance practices, emphasizing the need for enhanced frameworks to align IT strategies with the state's broader objectives. Section 3.1 benchmarks ATI/TO against best practices from other states and organizations, providing insights into successful digital transformation strategies. Finally, Section 3.4 details the development of the PEDTIC, which presents a comprehensive action plan with defined goals and responsibilities aimed at guiding ATI/TO in its digital transformation efforts. Together, these sections provide a cohesive view of the main assessment processes and the strategic planning necessary for effective public sector digital transformation.

The methodology and findings presented in the subsequent sections align closely with the seven dimensions of ICT readiness assessment proposed in Alghamdi et. al. (2011), providing a structured approach to evaluating and enhancing ATI/TO's digital transformation efforts. In this paper, the authors define organizational requirements that are necessary for the adoption of e-government to resolve the delay of ICT readiness in public sector organizations in developing countries.

The situational assessment of digital service delivery (Section 3.1) corresponds to the user access and ICT infrastructure dimensions, as it evaluates the agency's ability to deliver accessible and efficient digital services while identifying gaps in technological capabilities. The assessment of IT governance practices (Section 3.2) addresses the e-government organizational ICT strategy and business process and information systems dimensions, emphasizing the need for alignment between IT strategies and state objectives, as well as the importance of process reengineering and interdepartmental collaboration. The benchmarking against best practices (Section 3.3) reflects the e-government program dimension, ensuring that ATI/TO adopts proven strategies for digital transformation. Finally, the development of the PEDTIC (Section 3.4) integrates all seven dimensions by providing a strategic roadmap that encompasses ICT architecture, human resources, and risk management, in a holistic approach to achieving organizational ICT readiness.

3.1 Diagnosis - Situational Assessment of Digital Service Delivery at ATI/TO

The Situational Assessment of Digital Service Delivery at ATI/TO (in Portuguese: "Diagnóstico Situacional sobre Índice ABEP-TIC na ATI/TO") evaluates the current state of digital services offered by the Tocantins State Information Technology Agency (ATI/TO) as assessed by the ABEP-TIC Index (https://abep-tic.org.br/pesquisa-indice-abep-tic/). This diagnostic, applicable to all Brazilian states, focuses on the agency's capabilities in delivering digital public services and highlights key strengths and weaknesses in its operations.

Structured around the ABEP-TIC Index methodology, which consists of 35 criteria divided into three dimensions—Digital Service Offering Capabilities, Digital Service Delivery, and Regulatory Framework for Modernization—this assessment identified the effectiveness and efficiency of services provided. Following improvement actions between annual assessments, Tocantins State improved its ranking from 19th in 2023 to 9th in 2024.

Key findings indicate significant gaps in the implementation of digital services, which hinder the agency's ability to meet growing citizen demands for accessible public services. The assessment also underscores the need for better integration among various digital platforms to enhance user experience.

This assessment was important for aligning ATI/TO's strategies with the state's digital transformation objectives, serving as a foundational document for developing targeted strategies to enhance the agency's performance and service quality.

3.2 Diagnosis - Situational Assessment for the Development of the PEDTIC at ATI/TO

The Situational Assessment for the Development of the PEDTIC at ATI/TO (in Portuguese: "Diagnóstico Situacional para Elaboração do PDTIC da ATI/TO") analyzed current IT practices and governance frameworks within the agency. This assessment identified strengths, weaknesses, and opportunities, including benchmarking against other states to adopt successful strategies.

The evaluation emphasized the alignment of ATI/TO's IT practices with state objectives and the need for a cohesive

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

technology management approach. Key insights reveal that while a foundation for IT governance exists, improvements are necessary in communication and collaboration among departments, as silos limit information sharing and efficiency. Enhancing interdepartmental communication can facilitate a more integrated approach to service delivery and ensure that all teams are aligned with the agency's strategic objectives.

The assessment also highlighted the need for a structured framework for performance measurement and accountability, recommending the implementation of robust Key Performance Indicators (KPIs) for better tracking and decision-making. Ongoing training and capacity-building initiatives are essential for staff to adapt to rapidly changing technologies. Establishing a continuous professional development program may empower employees, enhance their competencies, and therefore improve the agency's ability to respond to the demands of digital transformation.

This assessment goes directly into the need for the development of the PEDTIC, providing a framework for actionable strategies to strengthen governance and enhance the agency's effectiveness in supporting digital transformation objectives. An Action Plan was formulated to address identified improvements, serving as a roadmap for necessary changes in digital service delivery and IT governance. Each objective within the plan is accompanied by specific actions, timelines, and assigned responsibilities to ensure accountability and facilitate effective progress tracking.

3.3 Diagnosis - Situational Assessment for IT Governance and Digital Government Strategy at ATI/TO

The Situational Assessment for IT Governance and Digital Government Strategy at ATI/TO (in Portuguese: "Diagnóstico Situacional para Governança de TI e a Estratégia de Governo Digital da ATI/TO") analyzed the current IT governance practices and strategic framework for digital government within the agency. This assessment identified strengths, weaknesses, and opportunities related to governance and alignment with broader digital transformation objectives.

The evaluation highlighted the importance of a robust governance structure to support digital initiatives. It examined current governance mechanisms, decision-making processes, and policies promoting transparency and efficiency. Key findings indicate that while progress has been made, improvements are needed in defining roles and enhancing stakeholder collaboration, which complies with the previous two Diagnostics.

The assessment also emphasized the need for a comprehensive risk management approach and compliance with regulations. Establishing a structured risk management framework will help ATI/TO proactively address challenges, ensuring alignment with state and federal guidelines. Fostering a culture of innovation and continuous improvement is also determinant for success, with ongoing training enhancing staff adaptability and skills.

This assessment serves as an important input for developing a cohesive IT governance framework and digital government strategy. It offered actionable insights and recommendations to strengthen governance practices and align digital initiatives with state objectives.

3.4 PEDTIC Development

The Strategic and Master Plan for Information and Communication Technology (PEDTIC) at ATI/TO is a framework that synthesizes the insights gained from the three situational assessments conducted. These diagnostics have highlighted the agency's strengths, weaknesses, and opportunities in the realms of digital service delivery, IT governance, and digital government strategy. By leveraging the findings from these assessments, the PEDTIC aims to create a comprehensive roadmap that aligns with the strategic objectives of the state and enhances the effectiveness of digital public services.

Creating a PEDTIC, as opposed to a traditional PDTI (Plano Diretor de Tecnologia da Informação), was chosen for several reasons. Firstly, the PEDTIC emphasizes a strategic approach that integrates both the operational and strategic dimensions of ICT, ensuring that technology initiatives are closely aligned with the overall goals of the organization and the needs of citizens. A comprehensive strategic plan like the PEDTIC facilitates a more proactive approach to technology management, enabling organizations to effectively anticipate future challenges and opportunities. Secondly, the PEDTIC encompasses a broader scope, addressing not only the technical aspects of IT governance but also the organizational, cultural, and societal dimensions of digital transformation. This holistic perspective highlights the importance of understanding the interplay between technology, people, and processes within the context of public service delivery.

ATI/TO PEDTIC is organized into sections, each designed to provide a comprehensive understanding of the agency's strategic direction and initiatives.

Strategic Diagnosis: It provides a comprehensive analysis of the current state of the Tocantins State Information

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Technology Agency (ATI/TO). This analysis includes a SWOT analysis, generated based on the three previous Diagnostics, allowing the agency to understand its strategic positioning. The diagnosis reveals critical areas needing improvement, such as the integration of digital services and communication between departments. Additionally, it identifies strategic objectives that ATI/TO should pursue and offers practical recommendations to strengthen governance and enhance the delivery of digital services to citizens.

Strategic References: It establishes the guidelines that will direct ATI/TO in its initiatives and objectives. This section defines the agency's mission, which is to modernize public services through information technology, and its vision, which describes its aspiration to become a leader in digital governance. Furthermore, it presents the core values that will guide the agency's operations, such as transparency and innovation. The framework also includes strategic guidelines to ensure that all decisions and actions of ATI/TO are aligned with its mission and vision, promoting a collaborative and results-oriented work environment.

Strategic Objectives: It outlines the key goals that ATI/TO aims to achieve as part of its strategic planning. These objectives were designed to enhance the agency's capacity to deliver effective digital services and improve overall governance. Each objective is aligned with the findings from the situational assessments and emphasizes critical areas such as digital service modernization, data security, and stakeholder engagement. The section provides a clear framework for prioritizing initiatives that will drive the agency's digital transformation efforts, ensuring that all actions taken are focused on meeting the needs of citizens and enhancing public service delivery. We used the Balanced Scorecard methodology, but we adapted for public organizations.

Action Plan, Goals, and Responsibilities: It details the specific initiatives and actions that ATI/TO will undertake to achieve its strategic objectives. This section outlines measurable goals for each initiative, providing timelines and assigning responsibilities to ensure accountability (see an example in Figure 1). It emphasizes the importance of cross-departmental collaboration and sets forth a roadmap for implementing changes that will enhance digital service delivery and governance practices. By clearly defining actions, timelines, and responsible parties, this section ensures that the agency can effectively track progress and make data-driven decisions to adapt its strategies as needed, ultimately improving the quality of services offered to the citizens of Tocantins.

6.2.3. Systems Integration

KEY OUTCOME

- Make 100% of services available in the interoperability solution within 4 years..

FORMULA FOR CALCULATING THE KEY OUTCOME

- (Quantity of services available in the interoperability solution) / (Quantity of services that can be interoperated) * 100

SOURCE OF INFORMATION

- It is necessary to inventory the number of services that can be interoperated.

STRATEGIC ACTION	RESPONSIBLE	GOALS			
		Year 1	Year 2	Year 3	Year o 4
Update the inventory of government systems	Directorate of Training and System Implementation	80%	20%	-	-
Define eligible systems and information domain areas for integration	Directorate of Training and System Implementation	50%	30%	20%	-
Conduct a survey of interoperability requirements	Directorate of Information Systems	30%	70%	-	-
Implement the interoperability solution	Directorate of Information Systems	10%	30%	30%	30%

Fig. 1 - BSC Internal Processes - Systems Integration.

Risk Management Plan: It outlines the strategies and processes that ATI/TO will implement to identify, assess, and mitigate potential risks associated with its digital initiatives and operations. It begins by identifying various types of risks, including operational, technical, and compliance-related risks, and assesses their potential impact and likelihood of occurrence (see Figure 2 and Figure 3). It emphasizes the importance of establishing a structured risk management framework that enables continuous monitoring and evaluation of risks. The plan includes specific mitigation strategies for each identified risk, detailing the actions that will be taken to minimize their

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

impact. Additionally, it assigns responsibilities for risk management tasks to appropriate personnel within the agency, ensuring accountability and effective oversight. By implementing this Risk Management Plan, ATI/TO aims to foster a culture of risk awareness and resilience, enhancing its ability to achieve its strategic objectives and deliver high-quality public services to citizens.

Risk Probability and Impact Matrix		IMPACT			
		Very High	High	Medium	Low
PROBABILITY	Possível	***HIGH RISK*** - Occurrence of a large-scale cyber attack that results in the interruption of systems and services	**MODERATE RISK** - Inadequate or insufficient technological infrastructure - Ineffective strategic planning	***MODERATE RISK*** - Acquisitions or procurements not completed in a timely manner	***LOW RISK*** - Ineffectiveness in communication with other areas and other agencies
	Improvável	**MODERATE RISK** - Unavailability of services due to the use of outdated technology	***MODERATE RISK***	***LOW RISK***	***LOW RISK***

Fig. 2 - Risk matrix.

7.2.8 Risk: Occurrence of a large-scale cyber attack that results in the interruption of systems and services

Risk Probability: Possible

Risk Impact: Very High

Mitigation Plan:

- Acquisition and procurement of security equipment and services
- Conducting penetration tests periodically
- Raising awareness among staff in the use of the corporate environment

Fig. 3 - Risk Description.

Monitoring and Evaluation Plan: It outlines the framework that ATI/TO will use to assess the effectiveness and impact of its initiatives and strategies outlined in the PEDTIC. This plan is important for ensuring that the agency remains accountable and can adapt its actions based on performance data and feedback. It establishes clear metrics and key performance indicators (KPIs) that will be used to evaluate progress toward achieving the strategic objectives. It details the processes for regular monitoring, including the frequency of evaluations and the methods that will be employed to collect data. It emphasizes the importance of involving stakeholders in the evaluation process to gather diverse perspectives and insights. Additionally, the plan outlines how the findings from monitoring activities will be communicated to relevant parties, ensuring transparency and fostering a culture of continuous improvement.

By implementing this Monitoring and Evaluation Plan, ATI/TO aims to create a dynamic feedback loop that informs decision-making, enhances operational effectiveness, and ultimately improves the quality of digital services provided to the citizens of Tocantins. This proactive approach allows the agency to make necessary adjustments to its strategies in response to changing needs and circumstances, ensuring that it remains aligned with its mission and objectives.

4. Results and Lessons Learned

The initiatives developed under the PEDTIC framework have significantly increased visibility regarding the necessary demands within the agency, fostering a deeper understanding among all stakeholders involved. By providing a clear and organized path forward, the PEDTIC has laid the groundwork for transitioning ATI/TO from operational tasks to a more strategic focus. This shift is fundamental for discussing the transformation of ATI/TO into a public enterprise, which is expected to enhance the dynamism and efficiency in executing necessary actions

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

and initiatives. Furthermore, positioning itself strategically allows ATI/TO to be perceived differently within the State, among peer institutions, and in relation to the State Government. These early results demonstrate the potential for more streamlined processes and improved governance, setting the stage for future advancements in digital service delivery.

Additionally, by aligning its initiatives with themes related to Digital Transformation, by including challenges and opportunities in the public sector, ATI/TO is strategically positioned to foster future participation as a key entity in the long-term, medium-term, and short-term Government Plans. This alignment not only enhances the agency's relevance but also ensures that it plays a critical role in shaping policies and initiatives that drive technological advancement and improve public service delivery.

In approaching the seven dimensions proposed by Alghamdi et al. (2011), the methodology for assessing ATI/TO and developing the PEDTIC was designed to address both technical and human factors. The "e-government organizational ICT strategy" was evaluated through the situational assessments, which identified gaps in IT governance and the need for alignment with state objectives, leading to the formulation of a cohesive strategic framework in the PEDTIC. "User access" was analyzed in the ABEP-TIC Index assessment, which highlighted the need for better integration of digital platforms to enhance service delivery and user experience. The "e-government program" dimension was addressed by benchmarking ATI/TO against best practices from other states, ensuring that the agency's initiatives align with successful digital transformation strategies. "ICT architecture" was considered through the evaluation of existing IT infrastructure and the recommendation of scalable, interoperable solutions in the PEDTIC. "Business process and information systems" were examined in the situational assessments, which emphasized the need for process reengineering and improved interdepartmental collaboration. "ICT infrastructure" was a focal point in the PEDTIC, with specific recommendations for enhancing hardware, software, and connectivity to support digital services. Finally, the "human resources" dimension was addressed through the identification of training needs and capacity-building initiatives to ensure that staff are equipped to support the agency's digital transformation efforts.

Although the implementation of the PEDTIC is still in progress, some important lessons have already emerged. First, the importance of clear communication and collaboration among departments has been underscored, as breaking down silos is essential for fostering a cohesive working environment. Establishing regular interdepartmental meetings and communication channels will be vital in maintaining this collaborative spirit moving forward. Second, the need for adaptability has become increasingly evident. As ATI/TO navigates the complexities of digital transformation, remaining flexible and responsive to new challenges will be essential. Continuous training and capacity-building initiatives for staff will be necessary to equip employees with the skills needed to embrace these changes effectively.

Lastly, engaging stakeholders, including citizens and other governmental entities, has proven determinant for the success of digital initiatives. Actively seeking feedback and involving stakeholders in the decision-making process will enhance the relevance and effectiveness of the services provided.

5. Conclusion

The implementation of the PEDTIC framework represents a significant step forward for ATI/TO in its journey towards enhanced digital transformation and IT strategic governance. The early outcomes have demonstrated the agency's ability to increase visibility regarding necessary demands, foster collaboration among stakeholders, and establish a clear path for transitioning from operational tasks to a more strategic focus.

There is a clear necessity to implement the recommendations outlined in the diagnostics, which emphasize the development and application of a comprehensive digital government strategy, improvement in the ABEP-TIC Index results, and the effective execution of the PEDTIC. By addressing these key aspects, ATI/TO aims not only to rectify existing gaps but also to establish a resilient and agile framework capable of responding to future challenges in the digital landscape.

As ATI/TO positions itself as a key player in the public sector, aligning its initiatives with themes of Digital Transformation will not only enhance its relevance but also enable it to participate actively in shaping future Government Plans. The insights gained from this process underscore the importance of clear communication, adaptability, and stakeholder engagement, which are essential for navigating the complexities of digital advancement.

Moving forward, ATI/TO is well-equipped to leverage these lessons learned to foster continuous improvement in its service delivery and governance practices. By maintaining a proactive approach and embracing the opportunities presented by digital transformation, ATI/TO can significantly enhance its contributions to the State of Tocantins, ultimately benefiting its citizens and ensuring a more efficient and effective public service. With this vision and political openness, PEDTIC has been approved in its totality and its implementation is programmed to

Abstract. Digital governance is a central concern in global efforts to achieve the Sustainable Development Goals (SDGs). The United Nations (UN) emphasizes the potential of digital technologies and technological partnerships to address global challenges, while governments struggle to develop technology governance policies at a pace that keeps up with technological advancements. Problem: despite growing recognition of digital technologies and technological partnerships as key enablers of sustainable development, there is limited understanding of how they could be more effectively leveraged by governmental and non-governmental organizations to advance the SDGs. Approach: This study examines how the UN envisions the role of digital technologies and technological partnerships in advancing the SDGs and analyses these findings through the lens of Social Innovation Ecosystems (SIEs). Methods: A qualitative document analysis was conducted on six official UN documents (2022–2024) addressing digital technologies and technological partnerships in the SDGs context. Thematic and reflexive analysis was applied with iterative coding. Main results: Findings highlight priority issues such as AI regulation for child protection, ethical and inclusive AI governance, counterterrorism, and efforts to reduce digital inequality. Four thematic categories were generated, and analysis also reveals a dual focus: centralized governance and stringent regulation of emerging technologies — particularly AI — alongside a call for international cooperation, ecosystem-like partnerships, public digital goods, and open models. Conclusions: Some UN priorities present tensions, as strict governance structures may hinder the agility required for open collaboration, and vice versa. SIEs approach may offer a potential balance, enabling governments, corporations, academia, and civil society to co-create solutions, share resources, and scale social innovations while ensuring technological development and adoption aligns with human rights, digital equity, and the SDGs.

Short case practical report, DOI: https://doi.org/10.59490/dgo.2025.1004

1. Introduction

On September 22, 2024, during the United Nations Summit of the Future, global leaders endorsed the Pact for the Future — a comprehensive agreement emphasizing digital governance as critical to tackling global challenges. A core element of this pact, the Global Digital Compact, underscores the strategic role of technology in fostering international cooperation and represents a commitment to digital governance and equitable, ethical digital development that benefits the whole society. The Pact recognizes science, technology, and innovation as key drivers of progress toward the Sustainable Development Goals (SDGs), stressing the need for cross-sector

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

partnerships to shape an inclusive, equitable, and sustainable future (United Nations, 2024). High innovation performance is essential for solving complex social problems and accelerating sustainable development (Lu & Wang, 2024). Social Innovation Ecosystems (SIEs) offer a promising model for organizing multi-actor collaboration (Ho & Yoon, 2022; Bucio-Mendoza & Solis-Navarrete, 2024). Digital technologies serve as enablers of innovation (Chueri et al., 2020; Soni et al., 2021; Ho & Yoon, 2022; Hu, Phillips & Wu, 2024), helping organizations scale solutions effectively. Given resource constraints across sectors, technological partnerships between governments, businesses, academia, and civil society are essential for knowledge sharing and resource mobilization (Parthasarathy, Dey & Gupta, 2021; Pinheiro, Chueri & Santos, 2021; Slitine, 2024). SIEs offer a structured yet adaptable environment well-suited to this collaborative approach (Lyulyoy et al., 2024).

Although digital technologies and partnerships are increasingly seen as essential to sustainable development, their effective use by public and private organizations to advance the SDGs remains underexplored. In November 2024, we conducted a systematic mapping study (Albuquerque & Siqueira, 2025) to examine the use of digital technologies in SIEs and compare them to the UN's technological priorities. Few studies offered detailed empirical insights, and most indicated low adoption, reinforcing the need to better understand how to design, integrate, and scale digital solutions in SIEs. Building on these findings, this study investigates how the UN approaches digital technologies and partnerships within the SDG context, exploring the alignment between governance, innovation strategies, and social impact. Such understanding may offer strategic guidance to strengthen cross-sector collaboration and ensure that technological progress supports global sustainable development.

The general objective is to investigate the UN's approach to the use of digital technologies and the formation of governmental and non-governmental technological partnerships to advance the SDGs. The specific objectives are:

- Identify UN's documents that address digital technologies or technological partnerships in SDGs context;
- Extract and analyze excerpts from these documents that mention the development, adoption, and/or use of digital technologies and/or technological partnerships;
- Characterize the UN's approach to digital technologies and technological partnerships;
- Identify priority and/or sensitive topics for the development, adoption, and/or use of digital technologies and/or for technological partnership articulation in the SDGs context;
- Analize the results in light of the Social Innovation Ecosystems approach.

To achieve the proposed objectives, the research questions (RQs) presented in Table 1 were defined.

Tab. 1 – Research questions.

ID	Question	Topic
RQ1	What is the UN's approach to the development, adoption, and/or use of digital technologies in the SDGs context?	The UN's approach to digital technologies in the SDGs context
RQ2	What is the UN's approach to governmental and/or non-governmental technological partnerships in the SDGs context?	The UN's approach to technological partnerships in the SDGs context
RQ3	What topics are presented as priority and/or sensitive issues for accelerating progress toward the SDGs?	Priority and sensitive topics

No studies were found that directly address the topics proposed in the RQs. However, some works explore indirectly related topics. For example, Chueri et al. (2020) conducted an in-depth study on real social innovation ecosystems in Brazil, examining digital platforms for coordination and collaboration, addressing economic and social aspects, though without explicit reference to the SDGs. Chaudhuri et al. (2024) investigated the role of Industry 4.0 technologies in fostering data-driven organizational culture and improving performance and innovation. However, their focus lies on competitive advantage in traditional organizations rather than social innovation. Wamba et al. (2021) conducted a literature review on artificial intelligence (AI) for social goals, exploring how AI research can support technology-driven social change and the creation of a "good AI society." Still, their scope is limited to AI, excluding partnerships or other technologies. These studies offer valuable insights but do not address the specific gap targeted in this research.

1.1 Conceptual foundations

The SDGs comprise 17 objectives outlined in the 2030 Agenda (United Nations, 2015), a plan of action adopted by the UN in 2015 as a universal call to eradicate poverty, protect the planet, and ensure peace and prosperity for all by 2030. Their implementation is driven by a Global Partnership for Sustainable Development, emphasizing solidarity and prioritizing the needs of the most vulnerable, with the engagement of all countries, stakeholders, and individuals. The interconnected and integrated nature of the SDGs is essential for achieving the Agenda's goals. According to the UN, fulfilling the SDGs requires effective use of technology and strong national innovation

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

capacities. This involves enhancing technological capabilities in developing countries and coordinating actors engaged in social innovation (United Nations, 2024). The United Nations Trade and Development (UNCTAD), the UN's focal point for Science, Technology, and Innovation (STI), aims to boost STI capacities in developing countries and support their integration into national development strategies. This helps countries leverage STI for progress, job creation, and sustainable development (United Nations Economic and Social Council, 2024; United Nations Trade and Development, 2023). UNCTAD emphasizes the potential of frontier technologies — emerging technologies with high impact and growth potential that benefit from digitalization and connectivity. While these technologies can accelerate sustainable development, they also pose risks such as rising inequality, job displacement, and ethical concerns (United Nations Trade and Development, 2023). UNCTAD's reports recommend actions to maximize benefits and mitigate risks, and stress the importance of international cooperation to treat such technologies as global public goods. Its latest Innovation and Technology Report (United Nations Trade and Development, 2023) highlights 17 frontier technologies essential for achieving the SDGs, including eight digital ones: AI, internet of things (IoT), big data, blockchain, 5G, 3D printing, robotics, and drones. UNCTAD notes that many of these are still largely inaccessible in developing regions, reinforcing its mission to strengthen their technological capacities (United Nations, 2024).

Social innovation could be defined as a novel process or solution that addresses a social issue more effectively, efficiently, sustainably, or equitably than existing alternatives, delivering value primarily to society rather than individuals (Phills Jr. et al., 2008; Beckman et al., 2023). The concept of Social Innovation Ecosystems (SIEs) captures the dynamics of such innovations through various ecosystem configurations. Typically, definitions describe the creation and diffusion of social innovations as distributed, co-produced processes. These ecosystems, formed by networks of actors, are vital for supporting innovative social initiatives and fostering new societal relationships. Pel et al. (2019) propose a relational framework with three empowerment dimensions in SIEs: local embedding, referring to rootedness in specific regions; translocal connectivity, the linking of diverse contexts to amplify impact; and discursive resonance, the legitimization of concepts through shared narratives that grant political and scientific authority. These dimensions operate at various intensities and scales, addressing both local and broader needs, and promoting more integrated and effective social innovation.

Besides this introduction section, this paper is organized as follows: Section 2 presents the research methods; Section 3 presents the results; Section 4 presents the discussion; and Section 5 presents the conclusion with final considerations.

2. Research Methods

This study adopts document analysis, a method suitable for accessing data that would otherwise be difficult or impossible to obtain. It involves extracting and analyzing data from various types of documents, including books, journals, institutional reports and photographs (Morgan, 2022). According to Morgan's (2022) classification, the approach here is qualitative, aiming to interpret how the UN, as an institutional actor, frames the role of technologies and partnerships in advancing the SDGs. It is also descriptive, as it focuses on identifying explicit meanings in the documents, rather than latent ones.

2.1 Document Selection Strategy

The analyzed documents were official UN documents, in English, issued by the General Assembly and select technical or advisory bodies, explicitly addressing digital technologies or technological partnerships for advancing the SDGs. Documents were retrieved from the official UN's website (https://www.un.org). Document selection, data collection and extraction were conducted in November and December 2024. Inclusion criteria prioritized relevance to this study—specifically, documents discussing the development, adoption, and/or use of digital technologies or the establishment of technology partnerships within the SDG context. Eligible document types included treaties, agreements, guidelines, reports, roadmaps, and statements, as well as resolutions or cover letters related to the selected documents (when available). Only documents published from 2015 onward—the launch year of the 2030 Agenda—were considered, with the most recent versions selected. Exclusion criteria ruled out opinion or news articles, documents that were not explicitly directed at the study's scope, drafts, and redundant materials (e.g., executive summaries of already selected full documents).

2.2 Search Strategy

The search followed a navigational browsing approach on the official UN's website, starting from the Global Digital Compact webpage (Table 2). Documents were skimmed to assess potential relevance. An iterative snowballing technique was applied—if a selected document cited another that met the criteria, it was reviewed for inclusion. Additional sections of the website were also explored. Final selections were drawn from the webpages listed in Table 2.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Tab. 2 – United Nations webpages where documents were selected.

Webpage	Link
Global Digital Compact	https://www.un.org/en/summit-of-the-future/global-digital-compact
HLAB on Artificial Intelligence	https://www.un.org/ai-advisory-body
Roadmap for Digital Cooperation	https://www.un.org/en/content/digital-cooperation-roadmap

Based on the reading of these documents, additional documents were selected using the 'snowball' search method. After another round of inclusion and exclusion criteria, the final list of documents was defined (Table 3).

Tab. 3 - Final list of selected documents.

Document title (and citation)	Document type
Implementing the Secretary-General's Roadmap for Digital Cooperation (Office of the Secretary-General, 2022)	Non-binding roadmap
Declaration on Future Generations (United Nations, 2024, pp. 52-56)	Non-binding political declaration
Governing AI for Humanity: final report (United Nations AI Advisory Board, 2024).	Report
Global Digital Compact (United Nations, 2024, pp. 37-51)	Non-binding agreement
Letter from the President of the General Assembly (United Nations General Assembly, 2024)	Cover letter
The Pact for the Future (United Nations, 2024, pp. 1-36)	Non-binding agreement

2.3 Data Collection and Extraction

Documents were downloaded in PDF format from the official UN website and stored in a public cloud folder. Data were manually extracted by reading and identifying excerpts explicitly related to the research questions. These excerpts were compiled into spreadsheets with the fields shown in Table 4. As this is a qualitative study, the analysis phase required revisiting the data to extract additional excerpts that could refine, support, or challenge researchers' insights.

Tab. 4 – Spreadsheet fields for the data extraction stage.

Field name	Field description
ID_doc	Document identifier, defined as an abbreviation of the document title.
Document_title	Original title of the document.
Year	Publication year.
Initial_page	Page number where the extracted excerpt begins.
ID_excerpt	Unique code identifying the excerpt.
Excerpt	Selected excerpt, presented as a direct quotation.

2.4 Data Analysis

The analysis began by consolidating the data from the previous step (subsection 2.3) into a single spreadsheet, with additional fields shown in Table 5.

Tab. 5 – Additional spreadsheet fields for data coding and analysis stages.

Field name	Field description
Keywords	Words or expressions identified in the excerpts that were relevant for the research questions.
Coding_cycle_1	Descriptive codes assigned to each excerpt.
Coding_cycle_2	Thematic categories grouping the first-cycle codes.

Data analysis followed a reflexive thematic approach (Morgan, 2022), allowing the coding process to evolve iteratively with the researcher's interpretation. This method supports uncovering "unexpected meanings rather

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

than summarize the data" (p. 73). Procedures were based on the strategies outlined by Miles, Huberman, and Saldaña (2014). In the first coding cycle, descriptive codes were applied; in the second, these were grouped into thematic categories (Table 5). When needed, multiple codes were assigned to a single excerpt to better address the research questions.

3. Results

A total of 145 excerpts were extracted, coded, and organized into thematic categories. These categories were initially based on the RQs and refined during analysis. Four final categories are presented in Table 6.

Tab. 6 – Thematic categories (after the second cycle of coding).

Category name	Category description
Digital technologies	Excerpts addressing digital technologies to advancing the SDGs.
Technological Partnerships	Excerpts addressing cross-sector collaboration to advancing the SDGs through digital technologies.
Global Cooperation	Excerpts addressing international cooperation by UN member states to advancing the SDGs through digital technologies.
Global Governance	Excerpts addressing the role of the UN in global governance of digital technologies.

Figure 1 shows the number of excerpts grouped into each thematic category after the second cycle of coding, and the following subsections present responses to each research question.

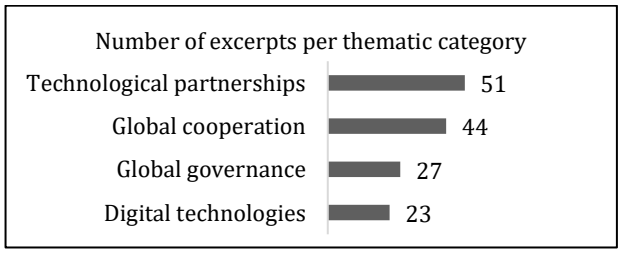

Fig. 1 - Number of excerpts per thematic category.

3.1 RQ1: The UN's approach to digital technologies in the SDGs context

To address this question, excerpts under "Digital Technologies" and "Global Governance" categories were analysed. The UN emphasizes digital technologies as transformative and accelerative tools for achieving the SDGs, stressing the need to reduce digital divides to ensure "no one is left behind." Key themes include digital inclusion, capacity building, data security, ethical AI governance, and human rights. Emerging technologies like AI are seen as essential for tackling global challenges, while unequal access is repeatedly cited as a major barrier. Governance of AI — whether globally centralized or regionally localized — is highlighted as critical to ensuring human rights and global well-being. Several excerpts warn of the risks of AI misuse, including terrorism, criminal use, psychosocial harm to children and youth, gendered digital inequality, and the dangers of unregulated technologies.

3.2 RQ2: The UN's approach to technological partnerships in the SDGs context

To explore this question, excerpts under "Global Cooperation" and "Partnerships" were analyzed. The UN advocates for digital cooperation through cross-sectoral, intergovernmental, and international partnerships. These are seen as essential to addressing complex challenges, guiding technological development, and maximizing benefits. Emphasis is placed on agility, adaptability, and collaborative ecosystems that enable knowledge and resource sharing. International cooperation is promoted as key to strengthening technological capacities and ensuring equitable access, especially for vulnerable populations. Two distinct contexts emerged in the data: a) Technological Partnerships, which involves multisector collaboration (governments, private sector, academia, civil society) to innovate and implement digital solutions tailored to community needs, usually in local or regional level (e.g., education, health, infrastructure); and Global Cooperation, which refers to international intergovernmental coordination in addressing transnational challenges (e.g., cybersecurity, poverty, terrorism). This cooperation is essential for policy alignment, capacity building, and collective responses to global threats. The UN positions this collaboration as a cornerstone of digital security and global stability in an unequal yet interconnected world.

3.3 RQ3: Priority and sensitive topics

To address this question, keywords across all thematic categories were analyzed to identify priority and/or sensitive topics. In the "Digital technologies" category, priorities include digital inequality, innovation, digital

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

inclusion, and the responsible AI use. In "Global Cooperation", digital and resource inequality between countries — particularly those in the Global South, Africa, island nations, and landlocked countries — stands out. In "Technological Partnerships", key issues include the lack of governance, discrepancies in regulations and insufficient technological capabilities. In "Global Governance", the risks associated with the improper use of AI and other emerging technologies were prioritized. Sensitive topics include AI regulation for child protection, with concerns about its effects on mental health, attachment, and cognitive development. Ethical and inclusive AI governance is seen as essential to ensuring equitable and ethical outcomes. Gender digital inequality is also addressed, with initiatives focused on empowering women. A strong emphasis is placed on safeguarding vulnerable groups and ensuring inclusive technological progress. Other sensitive themes include counterterrorism, preventing digital crimes, and reducing digital violence — all identified as urgent challenges requiring effective governance and international cooperation to uphold human rights and global security.

4. Discussion

The data analysis provides a broad view of how the UN approaches digital technologies and partnerships in the context of the SDGs, emphasizing global and local articulation across governmental and non-governmental sectors, responsible, inclusive, and ethical innovation, the defense and promotion of human rights, the reduction of inequalities, attention to vulnerable and marginalized groups, and centralized global governance. Table 7 summarizes the key findings, articulating the RQs and the thematic categories that emerged through the analysis. A distinguishing feature of this set of documents, compared to older UN reports, is that Global Digital Compact, Declaration on Future Generations, and Pact for the Future bring the perspectives of the Global South — particularly Latin America and Sub-Saharan Africa — to the center of the discussion, highlighting their goals, challenges, and interests. The approach reflects a strategy that combines centralization through global governance with the flexibility of partnerships among member states and regional partnerships involving various sectors of society. It also demonstrates a concern for avoiding the cultural imposition of world superpowers values at the expense of the Global South. The UN adopts a strong centralized governance approach, promoting the idea of a robust global governance system that transcends borders and ensures universal standards for the development and use of digital technologies. This global approach is prioritized over regional or local governance models to ensure consistency and effectiveness in technological policies worldwide. Global governance is seen as fundamental for establishing ethical guidelines, protecting human rights, and ensuring that the benefits of digital technologies are distributed equitably and responsibly, preventing asymmetries and exclusions.

Tab. 7 – Summary of key findings.

Research Question	Thematic Categories	Highlighted Topics
RQ1: The UN's approach to digital technologies in the SDGs context	Digital Technologies	Digital inequality; digital inclusion; technological innovation; AI accelerating SDGs; responsible AI use.
	Global Governance	Global coordinated AI governance; inclusive and ethical use of AI and other emerging technologies; human rights protection; children's safety.
RQ2: The UN's approach to technological partnerships in the SDGs context	Technological Partnerships	Local innovation; regional innovation; cross-sector collaboration; digital infrastructure; solutions tailored to community needs; scaling and replicating solutions.
	Global Cooperation	State-led international collaboration to global digital threats; capacity building; resource sharing; cybersecurity; counterterrorism; policy alignment.
RQ3: Priority and sensitive topics	All categories	Gender inequality; children's safety; digital violence; disparities in digital governance across nations and the lack of global digital governance; Global South, Africa, island, and landlocked nations inclusion.

However, some delicate issues stand out. The documents present several challenges that require agile solutions. Yet, many of the recommendations and guidelines rely on global decisions and actions (e.g., AI governance). But what happens in the absence of consensus? Assembly-based decisions can be slow, potentially reducing the agility needed to address urgent challenges. On the other hand, if decisions are made by a small group of member states, how well will these decisions reflect the needs of other countries? The same concern applies to large technology corporations that dominate the development of emerging technologies. Without digital regulation, their power becomes disproportionate, potentially exacerbating digital injustice and inequality. But how should such regulations be structured? Local and regional regulations can be more agile and better suited to specific contextual issues. Yet, power imbalances and injustices related to technology regulation could persist. This tension between the "global" and the "local" permeates the discussion of the most delicate issues, as seen across the analyzed documents.

Regarding the articulation between technological partnerships and Social Innovation Ecosystems (SIEs) in the context of the SDGs: technological partnerships play a fundamental role in promoting social innovation. Collaboration between different sectors — such as governments, NGOs, businesses, and academia — is essential for creating innovative solutions to complex social problems in more effective, efficient, and sustainable ways. These partnerships mobilize resources, knowledge, and technologies, fostering environments conducive to the co-production of social innovations. In the context of SIEs, technological partnerships can support the local adoption of innovations, enabling region-specific initiatives that address local needs while allowing the sharing of critical resources with partners who may otherwise lack access. Furthermore, these partnerships promote translocal connectivity, linking different regions and contexts to amplify the impact of social innovations and encourage the exchange of knowledge and experiences among diverse communities. Discursive resonance — another dimension of SIEs — can also be strengthened through these partnerships, as they can facilitate the collective process of legitimizing innovative concepts, thereby granting them political and scientific authority. Through collaboration, the actors involved in technological partnerships can shape a discourse that supports and legitimizes innovative practices, facilitating the acceptance and adoption of new social solutions. These partnerships can be key components of SIEs, providing the infrastructure needed to develop integrated solutions for complex social challenges. This is particularly significant given that the adoption of technological resources still appears low in many SIEs, even in Global North countries (Ventorini & Siqueira, 2025). SIEs, in turn, offer a favorable environment for this collaboration, as they promote co-creation of solutions, knowledge exchange, and mutual learning between stakeholders. These partnerships are not limited to purely technical innovation. They also involve a commitment to digital inclusion, digital equality, human rights, governance and data security — all of which are fundamental to ensure the ethical and responsible use of technologies. The analysis revealed that, to address global challenges and promote sustainability, technological innovation must be accompanied by regulatory frameworks aligned with human rights and sustainable development goals. Technological partnerships can help implement such regulations locally while facilitating the exchange of best practices across countries and regions. By promoting international cooperation, technological partnerships not only support local adaptation of innovations but also help ensure that the benefits of technological progress are equitably distributed — reducing digital inequality, which remains a significant obstacle to achieving the SDGs. Moreover, technological partnerships within SIEs have strong potential for fostering translocal connectivity. The UN highlights the importance of global cooperation, particularly in areas such as cybersecurity and digital crime prevention. By encouraging collaboration between countries, these partnerships build networks that transcend borders and connect local ecosystems, allowing solutions developed in one region to be adapted and successfully applied in others. This is particularly relevant for initiatives involving emerging technologies like AI, which, as the UN points out, have a transformative impact on key areas of sustainable development — including health, education, and infrastructure. Translocal connectivity is essential for optimizing the impact of these innovations and ensuring that the solutions developed are meaningful and accessible across diverse cultural and economic contexts. Finally, the creation of a collective discourse that legitimizes social innovations — another central component of SIEs — can also be reinforced through technological partnerships. The analysis shows that AI and other emerging technologies often have the potential to generate profound psychosocial impacts, especially on vulnerable populations such as children and women. The ethical governance of these technologies, particularly regarding human rights, is a major concern for the UN. By bringing together different stakeholders, technological partnerships can help construct a shared discourse that legitimizes innovative practices and supports the inclusive adaptation and implementation of these technologies. This collective discourse, underpinned by robust global governance, can serve as a means for the acceptance and dissemination of innovative solutions — while ensuring that these solutions are inclusive and do not reinforce existing inequalities.

5. Conclusions

This study aimed to contribute to the understanding of the UN's approaches to digital technologies and technological partnerships within the context of the SDGs. It also aimed to analyze the data through the lens of SIEs approach. The document analysis revealed that the UN adopts a strong centralizing stance, emphasizing the need for global governance in the management of digital technologies, particularly AI, while seeking to promote inclusion and empowerment of the most vulnerable countries, especially in the Global South. Technological partnerships — both global and local — are seen as essential instruments for fostering social innovation, enabling cross-sector collaboration, including governmental and non-governmental institutions, to maximize the societal impact of digital solutions. The analysis also highlighted the importance of global cooperation in addressing challenges such as digital crimes, terrorism, and online violence — sensitive topics in UN guidelines. The articulation between governmental and non-governmental actors at global and local levels is regarded as a key driver for integrated and sustainable technological responses to complex social problems. However, the analysis identified tensions among UN priorities. Strict governance structures may limit the agility and flexibility required for open collaboration — and vice versa. The study suggests that the SIEs approach is particularly suitable in this context, as it provides a structured, agile, and flexible environment where governments, enterprises, academia, civil society, and other actors could collaborate to co-create solutions, share resources, and scale social innovations across different regions while enabling progressive levels of governance. Promoting strong partnerships, providing funding, and fostering technological development within SIEs may help ensure that governmental and non-

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

governmental institutions work together in a way where the rapid pace of technological advances aligns with human rights, digital equity and broader sustainable development goals.

For future research, it is recommended to include in document analysis the UN's evaluation and monitoring reports on the digital economy of one or more countries. Published periodically by UNCTAD, these reports present data on countries' technological capabilities, inclusive digitalization strategies, and other criteria monitored by the UN. It is also important to note that, on January 1st, 2025, the Office of the Secretary-General's Envoy on Technology transitioned to the United Nations Office for Digital and Emerging Technologies (ODET), leading to significant updates on the sector's website. Therefore, another suggestion for future studies is to incorporate the new resources and documents now accessible on the updated ODET website (https://www.un.org/digital-emerging-technologies/), which were not available at the time of this research.

Drivers and Barriers in Libya's E-Government Implementation - A Case Study.

Amged B. Shwehdy [a]

[a] Affiliation: Independent researcher, Libya, email address: a.shwehdy@outlook.com, ORCID number: 0009-0006-4273-2498.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 26 May 2025

Abstract. This study aims to identify and analyse the key drivers and barriers influencing the implementation of e-government initiatives in Libya's public sector, a developing country with a post-conflict context. Employing a combined theoretical framework based on TOE framework and UTAUT, this research adopts a mixed-methods approach. Semi-structured interviews with digital ecosystem multi-stakeholders, were conducted alongside closed-ended surveys. The findings reveal that e-government implementation in Libya is shaped by technological, organizational, and environmental factors, as well as user acceptance dimensions. The study underscores the importance of addressing structural and institutional challenges through a centralized, strategic approach to enable successful digital transformation. Recommendations include enhancing digital infrastructure, fostering public-private partnerships, improving digital literacy, and reforming public sector policies. The insights gained are not only applicable to Libya but also offer valuable lessons for other nations facing similar challenges in digital transformation.

Keywords. Drivers and Barriers, E-Government, Public Sector, Libya, TOE Framework, UTAUT.
Practical report, DOI: https://doi.org/10.59490/dgo.2025.1043

1. Introduction

Digital transformation is reshaping governance globally, enabling streamlined public services, enhanced transparency, and greater citizen engagement (Mergel et al., 2019). The adoption of e-government varies considerably due to socioeconomic, infrastructural, and governance disparities among countries (EGDI, 2023; Samuel et al., 2020). Developing nations particularly face challenges like limited ICT infrastructure, financial constraints, and governance weaknesses (Bwalya & Healy, 2010; Heeks, 2002).

Libya represents a pertinent case for investigating e-government implementation due to its complex post-conflict context. Despite substantial nominal GDP, literacy rates, and high mobile penetration (World Bank, 2022; GSMA, 2022), Libya struggles with public sector inefficiencies and corruption, ranking poorly in global governance indicators (CPI, 2023; EGDI, 2023). Political instability further complicates digital transformation efforts.

This study aims to identify key drivers and barriers influencing Libya's e-government implementation, suggesting actionable strategies for overcoming challenges. Specifically, it addresses:

- What are the key drivers for e-government implementation in Libya?
- What are the key barriers and challenges to e-government implementation in Libya?
- How can these barriers and challenges be addressed to facilitate successful implementation?

The study focuses exclusively on Libya's public administration sector and employs a mixed-methods approach to

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

analyze qualitative and quantitative data. Semi-structured interviews with stakeholders, surveys of public sector employees and citizens, and policy document reviews form the basis of the analysis. By employing thematic and statistical methods, the research aims to contribute to a nuanced understanding of e-government implementation in Libya and its broader implications for digital transformation in developing contexts.

2. Literature Review

2.1 Foundations of E-Government and Digital Transformation

E-government leverages ICT to improve public service efficiency, transparency, and citizen-government interactions (Musa et al., 2019; Malodia et al., 2021). Adoption rates vary globally due to economic disparities, infrastructural capabilities, and governance quality, highlighting barriers like political resistance, limited stakeholder involvement, and inadequate ICT infrastructure (Abied, 2017; Alsaeh, 2020; Al-Rawahna et al., 2019).

Digital transformation addresses these barriers through citizen-centric services, knowledge management, and institutional reform, improving accountability and public sector competence (Mergel et al., 2019; Alvarenga et al., 2020; Al Yami & Ajmal, 2019). The institutionalization of ICT through clear policies and norms significantly enhances public sector effectiveness, as demonstrated internationally (Manda, 2021; Di Giulio & Vecchi, 2023).

Key technologies driving e-government include social media, blockchain, and cloud computing, which improve communication, accountability, and efficiency (Tapscott & Tapscott, 2016; Al-Ruithe et al., 2018). E-government is further accelerated by increasing digital literacy and mobile technology adoption, aligning with societal behavioral shifts and user expectations (Mensah et al., 2022; Tang et al., 2021; Gounopoulos et al., 2020). Additionally, it serves as a strategic tool for reducing corruption through minimized human intervention (Khan et al., 2021; Adjei-Bamfo et al., 2019).

Despite these benefits, developing countries often encounter significant implementation hurdles including insufficient funding, limited expertise, employee resistance, political interference, and outdated governance frameworks (Dhonju & Shakya, 2019; Filgueiras et al., 2019; Cinar et al., 2019). Successful cases, such as Namibia's public access points for e-government, highlight inclusive strategies as critical for overcoming these barriers (Nengomasha & Shuumbili, 2022).

2.2 Libya's Public Sector and Digital Landscape

Libya's public sector reflects a rentier state model, with oil revenues constituting 90% of national income (CBL, 2022). Approximately 80% of the labor force works in civil service, and public sector wages account for over a third of government expenditures (World Bank, 2015; LAB, 2020). This dependency on oil has fostered inefficiencies, nepotism, and corruption in recruitment and administrative practices, undermining the sector's effectiveness (Vandewalle, 2012; Transparency International, 2023).

Historical efforts to reform the public sector, including workforce reductions and incentives for private sector growth, faced resistance from entrenched informal institutions and public employees (World Bank, 2015). Post-2011, political instability and economic challenges have further strained the public sector. Informal actors, such as tribal leaders and militias, exert significant influence, complicating governance and exacerbating inefficiencies (Tantoush, 2022).

To contextualize the broader theoretical and regional insights, it is critical to examine Libya's unique public sector dynamics, digital infrastructure, and past e-government efforts, all of which shape the country's current opportunities and persistent challenges in digital transformation. Libya's digital infrastructure remains underdeveloped, with limited rural connectivity and outdated telecommunications policies (USAID DECA, 2022). The Libyan Post Telecommunications & Information Technology Company (LPTIC) monopolizes the telecommunications sector, overseeing fiber networks and mobile operators, while regulatory functions are managed by the General Authority for Communication and Informatics (World Bank, 2015). Political instability has impeded infrastructure investments, resulting in $1 billion in damages to telecom facilities since 2011 (OECD, 2016).

Despite these challenges, Libya boasts high mobile penetration (169.6%) but low internet penetration (21%) and modest internet speeds (Ookla, 2023). Digital literacy remains low, with many citizens relying on social media rather than broader digital platforms (USAID DECA, 2022). Recent government initiatives, including the formation of the National Committee for Digital Transformation in 2022, aim to address these gaps and advance digital governance (Government of National Unity 394, 2022)

While Libya's digital infrastructure remains underdeveloped, recent initiatives signal a renewed interest in leveraging technology for governance. These infrastructural realities directly impact the implementation and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

sustainability of e-government programs across the country.

E-government initiatives in Libya date back to the early 2000s but have faced significant setbacks due to political instability. Early efforts, such as the 2013 eLibya initiative, sought to modernize public services through ICT but were suspended following the 2014 conflict (Wynn et al., 2021). Subsequent projects, including the Ejraat Portal for administrative services, have demonstrated potential but remain limited in scope (Ministry of Economy and Trade, 2020).

The establishment of the National Committee for Digital Transformation in 2022 marked a renewed effort to develop a comprehensive digital strategy. This strategy emphasizes regulatory reform, capacity building, infrastructure development, and citizen participation, with a target for implementation by 2030 (GIA, 2022). However, progress has been slow, and Libya continues to rank poorly on global indices such as the UN E-Government Development Index (EGDI), where it placed 169th in 2022 (EGDI, 2023).

Although several e-government initiatives have been launched in Libya, their progress has been uneven and often hindered by systemic issues. A closer look at these challenges — alongside emerging opportunities — reveals the complex landscape in which digital transformation efforts are unfolding. Libya's e-government initiatives face numerous challenges, including inadequate infrastructure, low digital literacy, and entrenched corruption (Ahmed et al., 2013). Resistance to change within the public sector and a lack of trust in government institutions further complicate adoption (Forti, 2019). However, opportunities exist to leverage ICT for improving governance and service delivery, particularly by addressing systemic inefficiencies and fostering citizen engagement.

2.3 Synthesis and Research Gap

Libya's unique socio-political context and underdeveloped digital infrastructure significantly impede e-government adoption. Nonetheless, its youthful population, international support, and emerging strategies offer opportunities for progress. This research addresses existing gaps by analysing Libya's digital transformation potential comprehensively, offering insights applicable to other developing nations.

3. Methodology

3.1 Frameworks Applied

This study adopts a combined theoretical framework integrating the Technology-Organization-Environment (TOE) and Unified Theory of Acceptance and Use of Technology (UTAUT) models to provide a comprehensive understanding of e-government implementation in Libya. The TOE framework, developed by Tornatzky and Fleischer (1990), focuses on how technological, organizational, and environmental contexts influence adoption at the institutional level. In contrast, the UTAUT model (Venkatesh et al., 2003) centers on user-level acceptance factors, including performance expectancy, effort expectancy, social influence, and facilitating conditions. By combining these frameworks, the study captures both macro-level institutional drivers/barriers and micro-level user perceptions, which is particularly important in post-conflict contexts like Libya where fragmented institutions and varying user readiness coexist. This integrative approach is supported by prior research (e.g., Lee & Lee, 2014; Bouteraa, 2024), which highlights the value of combining TOE and UTAUT to gain deeper insights into complex adoption environments.

3.2 Data Collection and Analysis

A mixed-methods approach was employed to gather comprehensive data. The qualitative component involved semi-structured interviews with 23 key informants, including government officials, public sector employees, private sector representatives, and ICT experts. Interviewees were identified using a snowball sampling technique, where each participant recommended additional experts to be consulted. After conducting over 20 interviews, thematic saturation was reached, as responses became repetitive, and no new informants were suggested. This confirmed the adequacy of the sample for capturing a well-rounded understanding of the topic. The quantitative component consisted of a survey administered to 419 respondents, including citizens and public sector employees. The survey featured closed-ended questions to measure perceptions of e-government initiatives and assess the impact of technological, organizational, and environmental factors. The sample size exceeded the minimum threshold required for descriptive and inferential statistical analysis, ensuring robustness and representativeness within the scope of the study.

Qualitative data from the interviews were analyzed using thematic analysis to identify recurring patterns and underlying narratives. This approach allowed for the extraction of key themes related to the drivers and barriers of e-government implementation. Quantitative data from the survey were analyzed using descriptive and inferential statistical techniques, including regression and correlation analyses. These methods helped identify

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

relationships between variables and assess the significance of technological, organizational, and environmental factors in shaping e-government adoption.

3.3 Ethical Considerations

Ethical approval was obtained before data collection, ensuring compliance with guidelines for research involving human participants and data privacy and anonymity.

3.4 Validity

To ensure data validity, both the interview questions and the survey questionnaire were developed based on the combined model of the TOE and UTAUT and reviewed by experts in the field. Moreover, a pilot test was conducted to ensure the clarity and relevance of the questions. The survey and interview guides are available upon request for research transparency.

4. Findings

This chapter presents the main findings from the mixed-method data collection process, divided into quantitative and qualitative sections. The analysis highlights the interconnected themes and correlations between the two methods.

4.1 Quantitative Analysis

Survey respondents evaluated Libya's ICT infrastructure as moderately adequate for e-government implementation. However, gaps in technological compatibility and innovation were noted, particularly regarding system interoperability and reliability. Despite these challenges, respondents expressed confidence in their ability to use ICT and adapt to digital services. This aligns with expert observations, which highlight the need for targeted infrastructure upgrades to meet future demands.

Leadership, organizational culture, resource availability, and readiness emerged as critical organizational factors influencing e-government initiatives. Survey respondents rated leadership effectiveness as low, citing a lack of strategic direction and inconsistent promotion of e-government projects. Resource availability was also identified as moderate, reflecting a misalignment between institutional needs and allocated budgets. These findings echo expert concerns about fragmented strategies and limited leadership competencies within public institutions.

Political instability was highlighted as the most significant environmental barrier, with 77% of respondents identifying it as a major hindrance to e-government adoption. Additionally, only 48% of respondents were aware of existing legal frameworks supporting e-government, underscoring the need for regulatory reforms and increased public awareness.

Survey participants overwhelmingly agreed on the benefits of e-government, particularly in enhancing efficiency, transparency, and communication between citizens and the government. However, effort expectancy scores revealed challenges related to user accessibility and system design, with respondents citing issues such as non-user-friendly interfaces and limited alignment with users' technical expertise.

Respondents noted moderate social influence from peers and superiors in encouraging e-government adoption, suggesting that societal norms and workplace environments play a role, albeit not a decisive one, in shaping attitudes toward digital services.

Facilitating conditions, including training, technical support, and resource availability, were rated as low. This reinforces expert views on the lack of capacity-building initiatives and support mechanisms necessary for successful e-government implementation.

Key barriers identified by respondents include leadership quality, institutional structure, and lack of strategic management, with financial resources deemed less critical. Conversely, drivers such as reducing corruption, increasing transparency, and improving service quality ranked highest, reflecting public demand for accountability and efficiency.

4.2 Qualitative Analysis

Experts emphasized the administrative complexities hindering e-government adoption, including overlapping mandates, a lack of procedural guides, and weak leadership. Political conflict and the absence of legislative

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

oversight exacerbate these issues, creating a fragmented and inefficient public sector.

Experts acknowledged the potential of Libya's extensive fibre optic network but noted significant disruptions due to armed conflict, regulatory constraints, and unreliable power supplies. The government's monopoly over telecommunications infrastructure was identified as a key obstacle, limiting private sector participation and innovation.

A critical shortage of qualified IT personnel in the public sector, coupled with insufficient capacity-building initiatives, was highlighted. Experts also pointed to cultural resistance among employees and decision-makers as a barrier to adopting digital technologies. High reliance on individual initiatives further undermines institutional progress.

Experts observed a high level of digital literacy among Libya's young population but noted gaps in decision-makers' understanding of technology. Citizen trust in digital services remains low due to prior negative experiences, emphasizing the need for reliable, user-centric solutions and robust public communication strategies.

Both experts and survey respondents noted the limited availability and reliability of digital government services. Successful initiatives, such as the Marriage Facilitation Fund, demonstrate the potential for effective e-government when backed by strategic planning, private sector partnerships, and integration with existing systems.

Experts identified the private sector as a critical partner for e-government implementation, particularly in providing infrastructure and hardware. However, regulatory barriers, lack of trust, and limited investment opportunities hinder private sector involvement.

Political instability and weak leadership were identified as major obstacles to e-government initiatives. Experts emphasized the importance of consistent leadership and strategic vision, noting that fragmented governance and frequent leadership changes undermine project continuity.

Outdated and inconsistent legal frameworks were cited as significant barriers to digital transformation. Experts highlighted the absence of laws recognizing electronic transactions and digital identities, as well as regulatory gaps that discourage private sector participation.

Corruption within the public sector presents a dual challenge, both obstructing digital transformation efforts and potentially being mitigated by increased transparency through e-government. Experts advocated for a multi-stakeholder approach to address these issues.

International organizations have played a significant role in supporting Libya's digital transformation efforts. However, the lack of a unified national strategy has resulted in fragmented initiatives, reducing their overall impact.

Based on the experts, the drivers and motives of implementing e-government initiatives in Libya vary from one institution to another and from leadership to another. However, the political aspect and agenda were presented heavily when the experts analysed the current government efforts in this field. Moreover, the understanding is that e-government may increase the citizens' trust, help decentralise government services, and unify the country, especially with current circumstances, by providing the same services to all of Libya, wherever they are. Facilitating those services to the citizens is also one of the motives, where some institutions have issues with long waiting lines and queues. Other institutions are interested in increasing transparency and accountability and fighting bureaucracy and corruption.

4.3 Finding Summary

Both qualitative and quantitative analyses highlighted political instability, inadequate infrastructure, leadership deficits, and regulatory challenges as critical barriers. Despite these obstacles, there is strong consensus on e-government's potential to improve transparency, accountability, and service delivery through targeted reforms, capacity building, and strategic collaboration.

5. Discussion and Recommendations

Administrative challenges, such as rigid hierarchies and lack of procedural guidance, significantly hinder e-government implementation in Libya. Promoting a digital culture, adopting standardized procedures, and fostering innovative leadership are essential to overcoming these barriers. Overlapping institutional mandates create inefficiencies and resource conflicts. A centralized authority should coordinate e-government efforts, ensuring strategic alignment and resource efficiency. Political instability impacts policy continuity and trust. A long-term

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

digital transformation strategy, supported by robust public-private partnerships and transparent civil society oversight, can mitigate these effects and foster resilience. Outdated legal frameworks must be urgently updated to support digital governance, including digital transactions and data privacy. Interim policies and international collaboration can bridge current legislative gaps. Corruption undermines both project procurement and public confidence. Implementing transparent procurement processes and digital accountability tools, alongside civil society monitoring, can enhance integrity and public trust. The shortage of qualified IT personnel requires targeted capacity-building and change management initiatives. International partnerships can supplement immediate expertise needs while developing local capabilities. Enhancing citizen engagement and digital literacy through user-centric digital services and public awareness campaigns is critical. Services should be accessible, reliable, and responsive to encourage widespread adoption. Finally, public-private partnerships and international collaborations are vital. These partnerships should prioritize knowledge transfer and equitable implementation, supporting Libya's long-term digital infrastructure growth.

6. Conclusion

This research provides a focused analysis of the multifaceted factors influencing e-government implementation in Libya. Using the TOE and UTAUT frameworks, it highlights how institutional structures, leadership, political stability, and citizen engagement shape digital transformation efforts. Key barriers identified include overlapping institutional mandates, lack of procedural guidance, public sector inefficiencies, political instability, poor strategic planning, and outdated legal frameworks. Addressing these requires the establishment of a centralized agency with executive support to ensure coherence and effective resource allocation. Leadership is a crucial enabler. Visionary leaders must define strategic direction, foster collaboration, and ensure sustained commitment. This effort must be reinforced by a legal framework that supports electronic transactions, privacy, and digital identity. Upgrading ICT infrastructure and developing human capital are essential. While Libya has foundational infrastructure, expanding coverage and ensuring interoperability are priorities. Capacity-building initiatives are also vital to address the digital skills gap. Combating corruption and fostering public trust are equally critical. Transparent procurement systems, digital accountability tools, and civil society oversight can help build legitimacy and trust in e-government initiatives. Furthermore, public-private partnerships and international collaborations are necessary to provide technical expertise, stimulate innovation, and support capacity development. E-government can contribute to national unity and decentralization by offering equitable access to services across regions. Though Libya's socio-political complexity poses challenges, this study provides actionable insights. Future research should explore the long-term impact of these initiatives and the role of emerging technologies like AI and blockchain. Ultimately, the findings serve as a roadmap for advancing inclusive, accountable, and effective digital governance in Libya and similarly fragile contexts.

From Trust Antecedents to Trust Frameworks: Co-Creating Multi-Actor Agreements for Data Sharing

Louise van der Peet [a*], *Nitesh* Bharosa[a], *Marijn* Janssen[a]

[a]Faculty of Technology, Policy, and Management, Delft University of Technology, Delft, the Netherlands, l.vanderpeet@tudelft.nl, 0009-0008-5022-4279.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 23 May 2025

Abstract. Companies and public agencies who are looking to improve their services can benefit from more data sharing. However, due to regulations and security concerns, data sharing between individuals, businesses and public agencies is complicated. There are many variables to consider in a multi-actor environment where actors with various roles and incentives look for legal and technical certainty. Public and private organizations increasingly acknowledge the need for multi-organizational agreements on data sharing standards. This results in the rise of trust frameworks to guide efforts towards trustworthy data sharing in an interorganizational setting. However, academic literature on trust frameworks is scarce, and we lack a systematic understanding of the factors that constitute trust in a multi-actor data sharing environment. The objective of this paper is to provide a systematic understanding of the antecedents of trust playing a role in trust frameworks. A two-stage approach is followed, starting with a systematic review of antecedents, followed by an empirical inquiry as verification. Our findings indicate a wide range of antecedents -including technological and organizational antecedents - can be considered.

Keywords. Trust frameworks, Multi-actor data sharing, GovTech, Digital infrastructures, Trust antecedents, Data sharing collaboration, Transformative innovations
Research paper, DOI: https://doi.org/10.59490/dgo.2025.1029

1. Introduction

Organizations increasingly recognize the value of sharing data across organizations and sectors to unlock new insights, optimize operations, and create public value (Dawes, 1996). When it comes to public service delivery and private service delivery, organizations seek to provide more personalized and proactive services, requiring more up front data from citizens or clients (Scholta et al., 2019). However, multi-actor data sharing is complex due to increased regulations on data, privacy requirements, heightened security risks, and diverse stakeholder interests. For instance, the General Data Protection Regulation (GDPR) poses strict requirements for personal data collection and processing in Europe. The revised eIDAS regulation (for "electronic IDentification, Authentication and trust Services") adds strict rules for identification, authentication, authorization, data exchange and archiving. And the NIS2 directive requires European organizations to enhance their cybersecurity capabilities, while introducing risk management measures and reporting requirements to entities from more sectors and setting up rules for cooperation, information sharing, supervision, and enforcement of cybersecurity measures. Accumulated, getting data from persons and organizations in a manner that is compliant to such regulations is not easy. There are even more complexities in multi-actor environments, where diverse stakeholders—ranging from individual citizens and private companies to governmental agencies—must balance various roles, cost structures, installed base, incentives, and legal obligations in data sharing decisions. In a sector or networked setting without a hierarchically dominant standard setter, actors looking to avoid costly 1-1 solutions or proprietary standards, must collaborate and agree on open standards that are compliant and scalable.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Trust frameworks seem to be an emerging solution for arranging information-sharing in multi-actor ecosystems. While much has been done on trust and trustworthiness, there is little academic grounding for the construct of trust frameworks in the context of multi-actor data sharing. "Trust" is frequently mentioned as foundational for successful data sharing: trust in responsible data handling, trust in regulatory compliance, and trust in the broader ecosystem of partners, etc. Trust can be both the input for collaboration, as well as the outcome of collaboration. Trust signals certainty, for instance regarding technology investment decisions by public and private organizations. Lack of trust can impede innovation and digital transformations that rely on multi-actor data sharing (Bharosa, 2022). Yet which factors determine trust are not known.

This paper seeks to address this gap by defining and categorizing the antecedents of trust in trust frameworks. The main research question is: *what are the antecedents of trust in multi-actor data sharing?*

We should distinguish between trust and trustworthiness. Although the two are used interchangeably, they have different meanings (Greenwood and Van Buren III, 2010). Trust is situational and exists on the trustor's side when they assess trustworthiness of the trustee (Sekhon et al., 2014). Trustworthiness is based on the characteristics of the trustee that lead the trustor to believe that the trustee will act in their best interest (Greenwood and Van Buren III, 2010). The articles included in the literature review often mean trustworthiness when they mention trust. However, it can be argued that antecedents for trust - factors leading to trust from the trustor - are the same as trustworthiness factors from the trustee. Therefore, and because previous literature refers to trust antecedents, we use trust rather than trustworthiness.

This paper proceeds as follows. Section 2 outlines the research approach. Section 3 presents the results of the systematic review of the literature: a long list of antecedents of trust. Section 4 outlines the empirical verification of the antecedents found in literature. Section 5 provides a discussion of the findings, comparing the literature with practice. Finally, Section 6 concludes this paper and provides recommendations for research and policy-making.

2. Research approach

The paper aims to provide a systematic understanding of the antecedents of trust in trust frameworks. A two-stage approach is followed, starting with a systematic review, followed by an empirical inquiry on antecedents. We found a large number of antecedents in the literature; therefore, explorative empirical research was needed to verify the list of antecedents. The central unit of analysis are the antecedents of trust, organized into categories.

First, we performed a systematic literature review to identify a long-list of trust antecedents from related topics of trust frameworks. We used the PRISMA method (Page et al., 2021) for systematic review of the literature to exclude papers from the search. The search query is discussed in section 3. The resulting long-list presented in Appendix A can be used as a starting point and refined in subsequent research. The goal of this paper is to find antecedents of trust for trust frameworks, but there is a limited amount of research that is about trust frameworks (van der Peet et al., 2024), therefore we investigated trust antecedents for related topics like interorganizational data sharing, information systems, and standardization.

Second, we wanted to explore the antecedents of trust in practice. Therefore, we organized an expert workshop to identify trust antecedents and ultimately verify those discovered in the literature. This workshop took place at a government practitioner's conference in October 2024 in the Netherlands. The workshop was around 45 minutes long. In total, 88 unique respondents participated in the workshop. 88% of the participants had direct experience working with one or more trust frameworks in practice. The first part of the workshop contained introductory questions on the concept of trust frameworks and the second part questioned the antecedents of trust, which were discussed in a large group setting. The antecedents were collected on Slido, an online platform for data collection. The participants contributed by adding trust antecedents in free form.

We used the results from the workshop to verify the long-list of antecedents derived from the literature. This is done by verifying subcategories that emerge from the literature, and adding antecedents mentioned in the workshop that were not found in literature. In this manner, we verify the subcategories for trust antecedents of trust frameworks, and extend the long-list.

2.1. Complexity of trust in multi-actor data sharing

In a multi-actor setting, data sharing becomes inherently more complex due to the involvement of multiple organizations, each with its own objectives, processes, standards, installed base and requirements for data processing and sharing. In such ecosystems, data sharing components (e.g. data specifications, definitions, APIs, exchange patterns, security policies, processing requirements etc) are never in sync. There is a continuous need for further development, harmonization and standardization due to changing regulations, business models, values chains, partners and security requirements. Moreover, as new technologies such as digital identities, cloud systems, wallets, distributed ledgers, sensors, IOT and artificial intelligence mature and enter the board room, new data sharing requirements and architectures emerge. That is why data sharing infrastructures are dynamic and always in transition to a new state. The varying interests and starting points complicate harmonization and standardization efforts. Some standards may cost some actors more than others, and at the same time benefit some actors more than others. The potential cost and benefits of standardization for data sharing is unevenly distributed in the ecosystem (e.g. Bharosa et al., 2015). Consequently, getting actors to collaborate requires a majority to trust that the future data sharing infrastructure is in their best interest and will benefit all of them on the long run, even though it will cost time, money and collective action on the short run. In a multi-actor ecosystem, it is very difficult to know, let alone trust each individual in the ecosystem. This means we have to move from trusting the human, to trusting the infrastructure, creating trustworthy systems. For this, data sharing collaborators can make agreements to ensure the trustworthiness of the system. In practice, these types of agreements are often described within a trust framework. A trust framework, as described by ARF, is "a legally enforceable set of operational and technical rules and agreements that govern a multi-party system designed for conducting specific types of transactions among a community of participants and bound by a common set of requirements." (eIDAS Expert Group, 2023).

The complexity of making these agreements highlights the need to understand trust antecedents for creating trustworthy multi-actor data sharing systems. Identifying and addressing these antecedents helps build confidence among participants, reduces uncertainty, and ensures collaboration in a diverse, multi-actor setting. By designing a framework around these factors of trust, a trustworthy system for multi-actor data sharing can emerge.

3. Literature review on trust antecedents

Although there is limited research about trust related to trust frameworks, there is a large amount of literature on trust antecedents in various settings. To find those applicable in trust frameworks, we performed a literature review that searches for trust in both organizational and technological contexts, specifically: trust in data sharing, interorganizational and cross-domain trust, trust in information systems and technology, trust in standardization, legal trust, operational trust, trust in governance and trust in collaboration. Consumer-centric terms like "social media" and "commerce" were excluded to maintain focus on trust frameworks. A Scopus 'title-keyword-abstract' search for these keywords, excluding social media, commerce, human-robot interaction, the sharing economy related papers, results to the following:

> TITLE-ABS-KEY (("antecedent of*" W/1 trust) OR "trust antecedent" OR "trust factor" OR "trust variable" OR (("antecedent of*" W/1 trustworthiness) OR "trustworthiness antecedent" OR "trustworthiness factor" OR "trustworthiness variable") AND TITLE-ABS-KEY ("data sharing" OR "interorganizational" OR "cross-domain" OR "information systems" OR "technology" OR "standardization" OR "legal" OR "operational" OR "governance" OR "collaboration") AND NOT TITLE-ABS-KEY ("social media" OR "social networking" OR "social network" OR "human-" OR "consumer" OR "customer" OR "commerce" OR "buyer" OR "technology acceptance model" OR "sharing economy")

The query was run in December 2024 and reveals 266 academic papers.

We used the PRISMA method (Page et al., 2021) for systematic literature reviews to exclude papers from the search. After excluding papers that do not identify trust antecedents, or that are not specific to the scope there are 45 papers left. A large amount of noise in the results came from the term trust factor, which is often used to describe a the result of a calculation to determine the trustworthiness of an actor or technical component in a digital environment (e.g. Chen et al., 2023, Wang et al., 2023, Al Shahrani et al., 2024). We systematically reviewed each included paper and extracted all reported trust antecedents, enabling comparison and

Subcategory	Description	Examples of Trust Antecedents
Organizational trustworthiness	Factors used to judge if an organization is credible, competent, and reliable	Reputation, Certifications, Demonstrated reliability, Partner's competence, Perceived similarity
Calculative trust	Rational assessment of costs, benefits, and feasibility in a partnership	Perceived feasibility, Benefit, Adoption by partners, Successful precedents
Transparency	Openness and clarity of communication, processes, and information sharing	Operational and procedural transparency, Open communication, Timely exchange of information, Pricing transparency
Institution-based trust	Formal rules, structures, and legal frameworks	Regulations, Contracts, Structural assurance, Procedural fairness, Consensus mechanisms
Relational trust	Trust arising from interpersonal bonds, goodwill, and shared values over time	Shared values, Commitment/loyalty, Benevolence, Predictability/consistency, Honesty/integrity
Mutuality	Equal distribution of roles, responsibilities, and influence	Equality in decision-making, Collaborative problem-solving, Balance of control, Mutual dependence
Intra-organizational competence	Internal capacity and support	Quality of governance, Organizational/technical support, Stable organizational structure, Power relations
Trust initiator	Roles or actions within the organization that spark or promote trust	Leadership engagement, Organizational encouragement, Recommendation
Data governance	Policies and processes ensuring data security, privacy, and reliability	Security, Regulatory compliance, Confidentiality, Data integrity, Data auditability
Knowledge (Tech)	Stakeholder skill, familiarity, and acceptance of technology	Satisfaction with existing system, Experience with the tech, Perceived usefulness, Positive user skill perception
Ability (Tech)	Technical system's performance, reliability, and user-friendliness	Availability, Usability, Network reliability, Privacy, Simplicity, Speed
Technical components	Specific tools or features that facilitate trust in technology	Smart contracts, Electronic documents, Audit and verification mechanisms

Tab. 1 – Subcategories of trust antecedents for trust frameworks, verified subcategories in italics

categorization of the extracted concepts. All extracted trust antecedents were categorized by grouping into thematically related categories and subcategories. The antecedents can be divided into two main categories: organizational trust and trust in technology. For both of these categories, the defined subcategories and trust antecedents can be found respectively in Appendix A. In total we find 118 trust antecedents, divided into 12 subcategories. The subcategories are defined in Table 1.

Collecting and classifying the trust antecedents mentioned in the literature gave us a starting point for understanding how trust is formed and maintained in multi-actor data-sharing settings like trust frameworks. Our classification into categories and subcategories shows that existing research covers a wide range of areas—such as technology, interorganizational relationships, and internal organizational factors—but does not directly address the context of trust frameworks. This gap highlights the need to study how these trust antecedents apply, or may need to be adapted, for trust frameworks specifically.

3.1. Examples of antecedents in practice

To illustrate the practical use of the identified antecedents, we investigate the paper 'Steering the adoption of Standard Business Reporting for cross domain information exchange' by Bharosa et al., 2018, which outlines adoption of the SBR trust framework.

Standard Business Reporting (SBR) is a government-led initiative that aims to standardize the way businesses

Trust category	Trust antecedent	Implementation in SBR
Transparency	Operational and procedural transparency	Open governance, clearly defined procedures
	Timely exchange of relevant information	Expert working group where knowledge is shared as much as possible
Institutional	Regulations	Mandate by public organizations
	Contract	Covenant to adopt SBR
	Consensus mechanism	Decision-making bodies
	Support structure	Direct feedback when parties encounter problems
Mutuality	Clarity of roles and responsibilities	Governance with Board, Platform and Expert groups
	Equality in decision-making and resource sharing	All parties have a say
Data governance	Data accuracy / authenticity	Standardized data formats, business rules
Technical ability	interoperability	Generic and shared exchange infrastructure
	Simplicity	Technically simple syntax and interface
	Compatibility	Reuse technical components as much as possible

Tab. 2 – Examples of how trust antecedents are implemented in Standard Business Reporting based on Bharosa et al., 2018

report information to public agencies. It was designed to reduce administrative burdens on businesses by enabling Qualified Information Exchange (QIE), achieved through a set of standards and a shared technical infrastructure.

The study highlights how various steering instruments were used to positively influence adoption. These strategies map well to the trust antecedents discussed in our framework. For example, transparency is reinforced through open governance structures and expert working groups that facilitate knowledge sharing; institutional trust is built through formal agreements; mutuality is reflected in the inclusive governance model, where all stakeholders, public agencies, businesses, intermediaries, and software providers, have a voice; data governance is strengthened through the use of business rules that ensure accuracy and authenticity; and technical trust is fostered through interoperability and simplicity. More examples of the antecedents in SBR can be found in table 2.

As highlighted in prior work the SBR case, where standardization was advanced through a deliberate combination of engineering and learning approaches (Bharosa et al., 2011), trust similarly emerges not from a single mechanism but from the intentional design, iterative learning, and adaptation of technical, institutional, and relational practices. This case serves as a practical demonstration of how trust antecedents can be implemented in a complex, multi-stakeholder setting.

4. Empirical verification: five additional antecedents

As the literature review focused on concepts related to trust, rather than trust frameworks specifically, we conducted a workshop with practitioners experienced in government-related trust frameworks. This allows us to verify the applicability and completeness of the literature-derived antecedents in a real-world setting. The participants were asked to come up with antecedents for trust in collaborative trust frameworks in free-form. In Table 1, the subcategories in italics were verified during the workshop. Furthermore, there were five antecedents mentioned in the workshop that did not appear in the literature, namely the following:

1. Oversight: Supervision, inspection and enforcement to ensure compliance, accountability, and alignment with agreed-upon standards or goals. This transparency reduces uncertainty and risk of hidden opportunistic behavior, reassuring parties that if something goes wrong, it will be detected and corrected.

2. Shared responsibility: The partners collectively bear the obligations, decision-making authority, and consequences of an initiative or process. Shared responsibility aligns incentives among partners, reducing suspicion of opportunism and creating trust.
3. Inclusion: The practice of actively involving diverse stakeholders—regardless of background, status, or perspective—in decision-making, processes, or benefits. The more people believe their voices influence outcomes and that processes are fair to all, the stronger the foundation for trust.
4. Trust services: An electronic service normally provided for remuneration that ensure the reliability, security, and legal validity of electronic transactions, as mentioned in eIDAS article 3 (European Parliament and the Council of the European Union, n.d.). This technical and legal assurance removes much of the guesswork and fear of fraud, making parties feel safer to interact or do business online.
5. Design: The purposeful planning and creation of processes, or systems optimize experiences, and align with overarching objectives. A well designed system makes expectations clear, minimizes errors, and prioritizes user needs, creating more confidence in the system or organization.

Given that the participants are all related to government agencies, the emphasis on oversight and shared responsibility may reflect public-sector norms of accountability and transparency, which might not be as pronounced in purely private-sector collaborations. Similarly, some of the trust frameworks that participants were involved in are related to digital identity, explaining why trust services related to eIDAS and digital identity were mentioned.

These findings underscore the importance of situational factors—like regulatory oversight and digital identity requirements—in shaping trust frameworks. Overall, the workshop validated most of our literature-derived subcategories and revealed additional considerations unique to governmental and regulated environments.

5. Discussion

The findings from our literature review and workshop show that there are many different trust antecedents potentially relevant to designing a trust framework. While this variety captures the complexity of trust, it also creates what we call 'trust design overload.' Practitioners aiming to design trust frameworks can quickly become overwhelmed by the extensive list of potential factors to consider.

This overload is further complicated by the fact that some trust antecedents are context-dependent. For instance, public-sector environments tend to emphasize formal oversight and regulated trust services, whereas private-sector collaborations may focus more on financial incentives or calculative trust. Similarly, small or medium-sized organizations might weigh resource availability and ease of implementation more heavily than larger entities with more capacity.

One way to address trust design overload is through prioritization. Practitioners can evaluate which trust antecedents are most relevant, deciding how to balance the need for different forms of trust. Nonetheless, prioritization demands overview of trust antecedents and insights in various design options and consequences. A potential solution for prioritization is tooling that can help practitioners navigate these choices.

This raises the question of whether a trust framework can be deliberately designed or whether it must grow organically through collaboration and trial and error—a question largely shaped by one's epistemological outlook. In this study, we adopt a positivistic stance by identifying and verifying antecedents for trust. Rather than viewing trust solely as an organic outcome, we treat it as a construct that can be systematically measured and deliberately shaped through specific interventions. However, the degree to which each antecedent is "designable" varies: for example, perceived similarity is contextual and not easily engineered, whereas certifications can be straightforwardly designed and implemented.

6. Conclusion and recommendations

6.1. Conclusion

The main goal of this paper is to contribute to an understanding of trust frameworks, specifically to provide a systematic understanding of antecedents of trust in trust frameworks. By systematically reviewing the literature and validating our findings with expert practitioners, we fill a gap in existing research on trust frameworks. The defined set of trust antecedents specifically addresses multi-actor data-sharing contexts.

In section 3, we create a long-list of antecedents of trust in trust frameworks through a systematic literature review. This results in 118 antecedents, which can be divided in 12 subcategories, and 2 categories. The practical relevance of these antecedents is illustrated through the case of Standard Business Reporting (SBR), highlighting that trust does not emerge only from implementing predefined mechanisms, but from the deliberate design combined with learning and continuous adaptation of technical, institutional, and relational practices.

We verified these antecedents with 88 trust framework practitioners in a workshop. Of the twelve subcategories in our original framework, nine were discussed in detail: 1. Organizational trustworthiness (e.g., reputation, certifications), 2. Calculative trust (e.g., perceived feasibility, successful precedents), 3. Transparency (e.g., open communication, timely exchange of information), 4. Institution-based trust (e.g., regulations, contracts), 5. Relational trust (e.g., shared values, benevolence), 6. Mutuality (e.g., equality in decision making, mutual dependence), 7. Data Governance (e.g., security, regulatory compliance), 8. Knowledge of technology (e.g., experience, perceived usefulness), and 9. Ability in technology (e.g., availability, usability). Practitioners also identified five additional antecedents not found in the literature: Oversight, Shared Responsibility, Inclusion, Trust Services, and Design.

By summing these antecedents and clarifying their relevance to multi actor collaborations, our study fills a research gap in the field of trust frameworks. Specifically, it provides an empirically validated set of trust antecedents that practitioners and researchers can use to develop, refine, and implement trust frameworks in diverse data sharing scenarios.

6.2. Limitations and Recommendations

We acknowledge several limitations. First, due to the scarcity of academic research on trust frameworks, our literature review focused on related areas. While this approach enabled the generation of a broad list of antecedents, it may have overlooked unique factors specific to trust frameworks. Second, the focus on Dutch public sector might limit the generalizability of the findings to private sector collaborations or other national contexts. Third, the use of free-text input through an online platform allowed for an open exploration of ideas, yet it may have resulted in less structured and consistent data, potentially missing subtle or implicit antecedents.

Public private organizations seeking to share data in a trustworthy way can use the insights from this study to inform collaborative data sharing agreements. By systematically incorporating the trust antecedents identified here, data sharing initiatives can better address legal and technical uncertainties, leading to more secure and trustworthy multi actor collaborations. However, implementing too many trust measures at once risks creating 'trust design overload,' emphasizing the need for further research on how to prioritize and balance these antecedents.

From a theoretical standpoint, we recommend three directions of research. First, tools or decision support systems are needed to simplify the design and implementation of trust frameworks, guiding organizations in selecting the most relevant antecedents without overcomplicating their agreements. Second, a further foundation for advancing or refining trust theory in multi-actor data sharing contexts can be developed. Third, research should expand the scope by examining diverse countries, industries, and settings to validate and deepen our understanding of trust antecedents in multi actor collaborations.

Abstract. Digital transformation is a consolidated topic on government agendas and the use of AI-Artificial Intelligence in this context is increasingly expanding. However, efforts are needed to ensure that the digital transformation of public services no longer creates a channel for social exclusion. A key component in this sense is the use of clear language in products and information for access to digital public services. The main objective of this work is to describe the experience report of the construction of an Artificial Intelligence-AI, called LiS, with the purpose of improving the quality of the contents of service letters to users, from bodies of a subnational entity in Brazil. We will present the stages of developing the LiS, to review the contents of service letters to users, using plain language writing techniques. The combination of an automatic review, using LiS and a manual step, in the process of preparing and reviewing service letters for users, presented significant results in the services, which had their contents reviewed in this process. This gain was observed from the analysis of the results of evaluations of the content of services accessed by citizens. Another significant result presented was the reduction in review time for service letters. The use of the AI tool balanced with a human review stage, in the context of building and reviewing service letters for users, demonstrates efficiency in this process. Additionally, this combination reflects an approach to increase inclusion in citizen access to public services.

Keywords. Digital transformation, plain language, Artificial Intelligence, Inclusivity
Short case practical report, DOI: https://doi.org/10.59490/dgo.2025.1003

1. Introduction

Digital transformation is a reality in the business models of government entities both at the federal level and also in the states and municipalities of a federation. Governments have expanded the use of information and communication technologies to improve services delivered to citizens, reduce operational costs, increase transparency, support decision-making, as well as increase citizen engagement in government policies. This process of digital transformation has a lot of complexity involved, and this advancement of technologies and the development of digital public services is often not fully inclusive, UN (2024). Digital transformation is not just about technologies and innovations. It requires, among other things, well-defined strategies to promote initiatives so that this process does not create new layers of inequality. As presented by the UN (2022), the new face of inequality is digital and digital government can be a driver to equalize this phenomenon. Therefore, in the context of public organizations, it is necessary to encourage initiatives to combine the effective use of new technologies, in order to minimize factors that lead to exclusion. Inclusion, from the conception of projects, must be prioritized in relation to digital by standard, UN (2024).

One of the aspects identified as a facilitator in this context is the use of plain language in the Government's communication with society. The objective of this work is to report the case of building an Artificial Intelligence-AI tool, called LiS, for use in the process of building and updating service letters for users. This article is organized as follows: in Section 2, a basic set of concepts and work related to the article, in Section 3, the stages of building the tool are described with the main results presented. Finally, Section 4 presents conclusions.

2. Concepts and related works

2.1 User services letters

Brazilian federal law, 13,460 of June 2017, Brazil (2017), known as the code for the defense of the rights of users of public services, is an instrument created with the aim of expanding the capacity of public entities to meet social demands, simplifying the lives of citizens. Applicable to all public bodies and entities, at different levels of the federation, the law determines, among other things, the preparation of user service letters. The user services letter is an instrument that aims to inform users about the services offered by public bodies and entities, the forms of access and quality commitments.

The regulations determine that each service described in the user service letters must provide clear and precise information regarding how the user can access the service. The minimum information that must be included is: requirements, documents necessary to obtain the service, forms and information necessary to access the service, main steps for carrying out the service, forecast of the maximum period for providing the service, places and ways for the user to present any statement about the provision of the service. Once prepared, user service letters must be updated periodically with permanent dissemination and publication on the body or entity's website. The user services charter is also cited as one of the essential components for the digital provision of services. Brazil (2021).

2.1 Plain language in the public sector

The concept of plain language according to the International Plain Language Federation (2024), defines that a communication is in plain language if the words, structure and design to which the readers are addressed, allows this audience to easily find the information they need, understand what you found and use the information for your purpose. The focus is on the reader of the content, so that they can understand a document written in plain language on the first reading. In this sense, it is necessary to understand what the reader wants to know, what information they need and thus achieve their goals PLAIN (2024) .

In the context of Brazilian public organizations, the use of plain language has initiatives that are growing more and more. From a regulatory perspective, Federal Law 13,460 of June 2017, Brazil (2017), which in the chapter on basic rights and duties of users, estabLiShes among its guidelines the use of plain and understandable language, avoiding the use of acronyms, jargon and foreign language. In a subnational approach, the Municipal Plain Language Program of the City of São Paulo, estabLiShed based on Decree 59,067 of 2019, São Paulo (2019), and state Law No. 18,246 of December 1, 2022, which estabLiShes the language policy plain, in the State of Ceará, Ceará (2022), are examples of regulatory initiatives. Work carried out in innovation laboratories such as LAB 11. São Paulo City Hall Government Innovation Laboratory, Lab11 (2022) and the Innovation and Data Laboratory, Iris (2023), are other examples of initiatives to encourage the use of plain language in the context of Brazilian public organizations.

In addition to the examples cited and in the direction of making the use of plain language more effective in all communication with citizens, in public administration bodies and entities in Brazil, bill no. 6,256 of 2019 is being processed in the Brazilian Senate, which estabLiShes the National Plain Language Policy in bodies and entities of direct and indirect public administration of all federative entities, Brazil (2019).

Considering the importance of the topic and the need to promote the theme of plain language, at a subnational level in Brazil, the Brazilian Association of State and Public Entities of Information and Communication Technology, ABEP-TIC (2024) included in its Supply Index Digital Public Services of State and District Governments 2024, a dimension that evaluated the use of Plain Language in the description of public services presented on the Service Portals of Brazilian States, seeking to verify the engagement of federative units in better service to citizens. In the same direction of boosting the use of plain language, ABEP-TIC (2022) prepared the Guide for Using Simple Language for Presenting Services.

In the context of this work, we will use plain language techniques to prepare the texts presenting the services contained in the service letters to users, described in the previous section.

2.2 Artificial Intelligence - AI

Artificial Intelligence, although currently in evidence, is not a new concept. Since the beginnings of AI, researchers such as Russell and Norvig (2021) highlight that the evolution of intelligent systems has occurred through different approaches, from rule-based systems to deep neural networks. The recent advancement of generative AIs, especially those developed by OpenAI, has popularized the use of language models based on neural networks through accessible interfaces and simple prompts. GPT (Generative Pre-trained Transformer) is a notable example of this technology, supported by the Transformer architecture, which takes advantage of attention

Copyright ©2025 by the authors. This conference paper is publiShed under a CC-BY-4.0 license

mechanisms to understand the relationship between words in large text sequences in a parallel and contextualized way.

The Transformer architecture revolutionized natural language processing (NLP) by allowing the model to process and generate text while simultaneously considering multiple contexts within the same sentence or paragraph. Through the self-attention mechanism, the model is able to "weigh" different parts of the input text, understanding long-distance relationships between terms that, in other approaches, would be disconnected (Vaswani et al., 2017). As described by Sejnowski (2018), this advance in PLN enabled the creation of more robust and versatile models, allowing for diverse applications, from virtual assistants to automatic diagnoses.

The development and application of a GPT model can be divided into three main steps. In the first of them, pre-training, the model is trained with a large amount of textual data collected from different sources on the internet, which allows it to acquire knowledge of grammar, linguistic structures and general information about the world, although it is not yet targeted at a specific task. The ability to predict the next word in any context allows the model to build a solid foundation of linguistic understanding (Brown et al., 2020).

Next, the fine-tuning stage takes place, in which the GPT undergoes an adaptation focused on more specific tasks, such as translation, summarization or, in the case of this work, the review and generation of User Service Letters . This tuning is performed with smaller, specialized datasets that contain examples and instructions specific to the target task. According to Kai-Fu Lee (2018), this step is crucial to ensure that AI models are adaptable to different contexts and can meet the specific requirements of sectors such as health, education and public administration.

Finally, for organizational or government tasks, there is often a third step focused on personalized training and ongoing validation, in which the model is tested in controlled scenarios and receives constant feedback from experts. These adjustments are made through "prompt engineering", which consists of adding or modifying instructions to correct inconsistent output. It is also at this stage that, for example, a good practice guide is recorded, documenting recommendations and recurring corrections to guide the safe and effective use of the model.

3. Case description

3.1 Context

State law No. 16,420 of September 17, 2018, of the state of Pernambuco, Brazil, Pernambuco (2018), determined, among other matters, the obligation of public entities in the State, to prepare their User Service Letters, in accordance with the guidelines of Federal Law 13,460 of June 2017, Brazil (2017). The Pernambuco State Administration Secretariat was the government body with the responsibility of defining the methodology for pubLiShing the Services Letters to Users services on the State services portal, for citizens to access. Tab 1 shows the evolution of the number of services pubLiShed on the portal over the years, starting from the launch in August 2018.

Tab. 1 - Number of public services, pubLiShed on the services portal

Year	Number of services
2018	639
2019	725
2020	950
2021	1.003
2022	1.026
2023	1.065
2024	693

Despite the increase in the number of services pubLiShed on the services portal over the years, originating from service letters to users, some problems were identified when analyzing the content of the services, two of which are main: i. pubLiShed services, which were not public services for the citizen and ii. the quality of the texts presented difficulties in understanding from the citizens' perspective.

Copyright ©2025 by the authors. This conference paper is pubLiShed under a CC-BY-4.0 license

Based on the identification of these main problems, some actions were defined, including: i. adjustment to the methodology for preparing user service letters, with greater emphasis on the use of Plain Language; ii. definition of clearer criteria for distinguishing "what is and what is not a public service for user service letters", with contextualized examples; iii. implement a routine for updating public agents responsible for preparing service letters for users, based on monthly courses.

In parallel to these actions, in 2024 the development of Artificial Intelligence - AI began to support the team in the process of reviewing service letters for users.

3.2 Implementation of LiS

The success of using GPT models strongly depends on an iterative training and validation cycle. In particular, for public bodies, aspects such as clarity, coherence, use of civil language and legal compliance are fundamental. Adjusting the GPT for a government context requires additional care, such as ensuring data curation that excludes biases and misinformation, in order to protect the institutional image and ensure the correct provision of services; promote transparency and explainability, as AI models can generate convincing but incorrect content, which makes continuous training and validation by experts essential; maintain a constant concern with ethics and security, observing principles of data protection and non-discrimination, as well as ensuring human reviews that validate the content; in addition to enabling customization and scalability, allowing, upon mastering the task, the model to be applied on a large scale, such as reviewing hundreds of services in a few weeks, significantly optimizing efficiency in the public sector.

During LiS's initial training and learning phase, the creation and review of the first 20 services most accessed by the population were monitored by a multidisciplinary team that sought to identify flaws and possible adjustment needs in real time. Whenever inconsistencies or errors occurred in the generation of content, they were corrected through *prompt engineering*—either by reinforcing instructions from pre-training or by introducing new guidelines.

To consolidate learning, the most recurrent failures were recorded in a guide on good practices for using LiS, with direct instructions on how to overcome them when preparing prompts. Still in the controlled testing stage, LiS reviewed another 100 service descriptions, which subsequently underwent human validation to check for any remaining inconsistencies. In less than two weeks, the AI had already reviewed more than 300 service letters from 13 agencies of the Government of Pernambuco, demonstrating scalability potential and contributing to speeding up the process of producing official documents in simple language.

3.3 Results

The combination of using LiS with a manual review stage of service texts was initially implemented in a set of the 20 services most accessed by the population, starting in November 2024. To monitor citizen satisfaction regarding service texts, the service portal has a content evaluation, where citizens can leave their opinion on whether the content of the service they accessed was useful to them, marking "yes", positive evaluation, or "no", otherwise, evaluation negative. Tables 2, 3 and 4 show the evolution of this content assessment of the three services most accessed by the population throughout 2024, respectively: "Obtain 1st copy Identity Card service", "Obtain 2st copy Identity Card service", and "Get a Job Vacancy".

It is important to note that the review of services with the LiS was made available together with a new version of the service portal, which brought changes to the tool's design, and this update was publicized in the press and social media. To consider this situation, when analyzing the results, we included the following information in the tables: "% of positive evaluations", proportion of positive evaluations in relation to the total number of evaluations and "number of accesses" to the service by citizens on the portal.

Tab. 2 - Evolution of content assessment - Obtain 1st copy Identity Card service

Month	It was useful	It wasn't useful	% positive	number of access
January	401	46	89,71	189.772
February	218	28	88,62	119.715
Mach	243	38	86,48	137.289
April	400	87	82,14	208.387
May	296	43	87,32	160.142
June	209	39	84,27	119.093
July	276	55	83,38	173.846
August	238	42	85,00	152.571
September	225	54	80,65	147.233
October	147	38	79,46	147.328
November	2.709	127	95,52	900.429
December	1.418	39	97,32	681.263

Tab. 3 - Evolution of content assessment - Obtain 2st copy Identity Card service

Month	It was useful	It wasn't useful	% positive	number of access
January	522	59	89,85	389.962
February	304	34	89,94	278.047
Mach	421	65	86,63	327.077
April	507	76	86,96	405.755
May	322	48	87,03	352.398
June	290	40	87,88	271.081
July	421	64	86,80	349.857
August	332	47	87,60	336.063
September	205	32	86,50	304.907
October	198	41	82,85	321.610
November	5.740	306	94,94	2.359.464
December	3.217	168	95,04	1.777.558

Copyright ©2025 by the authors. This conference paper is pubLiShed under a CC-BY-4.0 license

Tab. 4 - Evolution of content assessment. Get job vacancy service

Month	It was useful	It wasn't useful	% positive	number of access
January	56	12	82,35	20.782
February	29	5	85,29	14.569
Mach	17	5	77,27	14.673
April	50	9	84,75	19.129
May	55	8	87,30	20.502
June	33	7	82,50	16.407
July	37	6	86,05	21.969
August	40	4	90,91	20.741
September	32	4	88,89	17.209
October	31	7	81,58	19.173
November	67	16	80,72	39.660
December	100	6	94,34	29.033

It is possible to identify, when analyzing the tables, a significant evolution in the evaluation of content by citizens, in the first two months (November and December) of using LiS in reviewing texts, with a human conference stage, in the two main services, Tab 2 and Tab 3. The increase in the number of accesses to both services in the same period can be seen as a reason for the launch of the new portal, and the publicity actions in the press, as mentioned previously. Even with this situation, of launching the new portal, at the same time of using LiS in reviewing texts, the percentage above 90% of positive evaluations, not identified in the months prior to November, and remaining high in the second month, December, is an indicator of success in reviewing the texts.

According to Tab 4, it is possible to identify in the month of November, the second lowest percentage of positive evaluations, 80.72%, of the service in the year 2024. However, in December, it presented the highest percentage 94.34%, similar to the same month's percentages for Tab 2 and Tab 3 services, above 94%.

Another aspect in this process of reviewing the contents of service letters to users is the time spent reviewing the service texts by the team. Before implementing LiS, a revised service with human interaction took an average of 30 minutes. Using LiS, a service reviewed with LiS lasts, on average, 3 seconds, with a human review taking an average of two minutes.

4. Conclusion

The objective of this work was to present an experience report on the construction of an Artificial Intelligence-AI, called LiS, to support the process of reviewing the contents of service letters to users, based on Plain Language guidelines, in order to improve citizen understanding when accessing public services. To this end, we present the main problems in the preparation of user service letters identified over six years, and the stages in the development of LiS. Following the implementation of the user services letters reviewed by LiS, in November 2024, it was possible to perceive a relevant set of significant results that demonstrate an improvement in the usefulness of texts for citizens, detected from the analysis of content evaluations. Another relevant result for the process was the reduction in time spent by teams reviewing the contents of user service letters.

The experience with LiS illustrates the potential of generative AIs like GPT to modernize the writing and review of official documents. The process, which includes pre-training, fine-tuning and constant validation, allows the technology to be gradually improved for the public services context, ensuring clarity, reliability and adherence to legal standards. The use of GPT models has proven to be a valuable tool for public management, as it optimizes time, standardizes processes and contributes to improving communication between government and citizens. The key to success, however, lies in the training phase and the active participation of multidisciplinary teams, which guarantee alignment between knowledge of the model and the real demands of communication, transparency and accessibility of public administration.

Copyright ©2025 by the authors. This conference paper is pubLiShed under a CC-BY-4.0 license

It is important to highlight that, despite the initial satisfactory results, for the first services in the first two months of monitoring, it is necessary to continue monitoring for a longer period, as well as expanding the evaluation to other services, including identifying services that do not present good evaluations. of content by citizens, so that it is possible to identify possible adjustments to the LiS.

Among the contributions that this case provided is the protocol of intent, signed between the State Government and the Federal Government, through the Ministry of Management and Innovation, to estabLiSh a cooperative or partnership link in the use of the solution. MGI (2024).

Finally, this work is just an effort within a theme of growing relevance in digital transformation in governments, which is understanding that language is a key component in human interaction and a way to reinforce inclusion in digital services and government initiatives.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 26 May 2025

Abstract. Digital Transformation in public services requires a comprehensive understanding of the value creation to improve services and government operations. Designing digital public services is challenging, but Service Design methods can help achieve services that align with democratic values like accessibility, reliability, and a positive user experience. This article reports on the collaborative design of a mobile app for a regulatory agency in Brazil, using co-creation, co-design, and co-production methods through two workshop cycles. The first cycle, based on Lean Inception principles, defined the Minimum Viable Product (MVP), while the second cycle, utilizing Design Sprint techniques, refined and tested the MVP with citizens. Feedback from users and public servants is also shared, emphasizing the importance of involving citizens and government employees in developing public service solutions.

Keywords. Digital Public Services, Collaborative Design, Lean Inception, Design Sprint, User Testing, Prototyping.
Practical report, DOI: https://doi.org/10.59490/dgo.2025.1044

1. Introduction

Digital transformation has reached the public sector, with government agencies aiming to harness its benefits. Successful initiatives highlight the importance of designing a great citizen experience (Mergel et al., 2019b). Approaches like co-creation, co-design, and co-production have been used to engage stakeholders and citizens in the digitization of public services (Figueiredo et al., 2024; Scupola & Mergel, 2022).

According to Luna et al., 2024, citizens perceive the value of digital public services when they are accessible, reliable, user-friendly, intuitive, and provide clear instructions, complete information, and easy tracking of requests. Meeting these expectations is challenging and requires integrating user-centered approaches into the software development process (Szabó & Hercegfi, 2023).

In this paper we show the experience of a Brazilian regulatory agency in the health sector in designing a digital public service centered on the citizens, with special focus on elderly users. The service aims to provide simple and straightforward access to relevant information for citizens, while also enabling them to file complaints about the regulated entities that they believe are violating sector regulations. This dual functionality ensures both accessibility and accountability, promoting the proper functioning of the health sector.

Two workshop cycles were held with public servants and included citizen participation in the final stages. The first, in October 2023, used an adapted Lean Inception to define a Minimum Viable Product (MVP). The second, in March 2024, applied Design Sprint techniques to enhance the MVP by designing and testing a prototype with citizens.

The report is organized as follows: Section 2 outlines the collaborative design context and motivation within the government agency. Section 3 describes the methods used for the design process. Section 4 discusses the challenges faced and their impact. Section 6 presents the results and outcomes. Section 7 shares lessons learned, and Section 8 concludes with key findings and future work directions.

2. Context and Motivation

Digital Transformation in Public Services requires holistic efforts to understand the value creation process when using technology to provide services for citizens (Mergel et al., 2019a). Co-design and Co-production can both help in collaboratively understanding viable value propositions and designing better government services (Osborne et al., 2016, 2022; Strokosch & Osborne, 2020).

The experience we report in this paper is an example of collaborative design where a government agency from the health sector in Brazil is working to enhance an existing service. At present, the service is primarily provided via a toll-free 0800 number, ensuring that citizens can access assistance without incurring any costs.

In 2020, the agency received around 270,000 information requests and 150,000 complaints, with a resolution rate of over 90%. However, the service is mainly human-operated and conducted by telephone. Citizens can also access the service through the agency's website or mobile app, but many report difficulties navigating the website, citing confusing language and complex navigation. The existing mobile app is also criticized for poor usability, as one agency employee remarked, "If we, who are from the agency, have difficulties accessing the app, imagine the user who doesn't have much knowledge?"

To improve service delivery to citizens, the agency partnered with LabQ Gov.br[1]—a government lab focused on experimenting and redesigning digital public services. In collaboration with the authors' lab, they applied UX, Citizen Experience, and Service Design methods to identify opportunities for improvement and innovation in federal government services.

The project's goal for the agency was to develop an application for citizens using health services, offering personalized information to improve their understanding of available services and empower them to make informed decisions about health plan options in Brazil.

3. Approaches and Methods

The collaborative design initiative employed activities from both Lean Inception and Design Spring approaches, detailed in the following subsections.

3.1. Lean Inception

Lean Inception (LI) is a collaborative method supported by principles from Lean Startup and Design Thinking (Caroli, 2018). LI proposes that the participants work together to comprehend and elaborate the MVP. LI works with an incremental iterative logic, where small parts of the product (MVPs) are gradually added to the whole in order to test hypothesis (Caroli, 2018).

LI method is usually conducted through a week and follows eight activities: 1. Product Vision; 2. Scoping; 3. Personas; 4. User Journeys; 5. Brainstorming of Features; 6. Analysis of Features Values; 7. Sequencing Features; and 8. Canvas MVP. (Ferreira et al., 2021).

The initial activities of the workshop seek to align the participants about the context and define the goals of the product or service (Lobão et al., 2023). First, the Product Vision helps to structure the product's focus and what is the strategy, ultimately defining the essence and the values the company wishes to pass to the user. Then, at the Scoping moment, the product is defined by characteristics of what it is/is not and what it does/does not do; and by the objectives. At the end of these activities, the team is much more aligned towards the goals of the product/service (Caroli, 2018).

[1]https://www.gov.br/governodigital/pt-br/estrategias-e-governanca-digital/transformacao-digital/central-de-qualidade/labq

At the following moment, Personas and User Journeys are established, which moves the focus from business strategy to the user perspective. This phase allows the team to create empathy and understand the pains and necessities of costumers. While personas represent a realistic vision of roles and goals of users, a user journey specifies tasks the system must execute to help them (Caroli, 2018; Ferreira et al., 2021; Lobão et al., 2023).

After that, the Brainstorming of Features tries to answer the questions: "*What must the project have to resolve the user's necessities? What features must the product have to fulfill it's goals?*" (Caroli, 2018). These features are evaluated in the Analysis of Features by their level of effort, business value, user experience (UX) and developer's confidence to implement. This classification helps prioritize the features (Caroli, 2018).

With the level of complexity and business and UX values defined, the team is able to conceive the Feature Sequencer. In this step, the MVP is finally stipulated from combining enough features to validate a hypothesis. Ultimately, the Canvas MVP is generated by all the information gathered in the workshop (Caroli, 2018).

3.2. Design Sprint

Google Design Sprint (DS) is a collaborative design strategy based on Design Thinking and Agile methodologies. Design Sprint offers a five-day long structured process that focuses on not planning much ahead and failing rapidly, so the team can learn at every iteration (Knapp et al., 2016; Lárusdóttir et al., 2023).

Usually, the five stages of the process are divided in five days: (a) Map; (b) Sketch; (c) Decide; (d) Prototype; and (e) Test. The input of the DS methodology is a Challenge, and by the end of the process the output generated is what is Learned, the knowledge assembled. By the end of the DS sessions, the solution is set, anchored on the knowledge, strategy and ideas of the team, and the product or service can go on to the next phase, implementation (Lárusdóttir et al., 2023).

On Monday, the team maps the service and how the costumer interacts with it. Then, by the end of the day, a target problem for the workshop is chosen within what was mapped. Tuesday begins with a consultation of existing ideas using the Lightning Demos technique, consisting of three-minute presentations by each member about their favorite known solutions; then, each participant create their own sketch of the solution, a storyboard of three steps.

Wednesday starts with deciding which solutions resulted from Tuesday are more aligned with the goal, using a voting system. Then, the teams builds a more detailed storyboard of the system to help creating the prototype on the next day. On Thursday, the focus is building a high-fidelity prototype, so that by Friday it is used to test with real users. The users are invited to be interviewed, they are contextualized, shown the prototype, given tasks to achieve using the product and lastly asked some questions such as what they liked most/least or what worked for them (Knapp et al., 2016).

4. Challenges Encountered

While LI and DS approaches have reached success in industry, their use offers some challenges when applied to improve digital public services.

Both approaches, LI and DS, require a full five-day week for a team to complete the activities. A key challenge in applying these methods in a government context is securing a team of civil servants who can dedicate such a substantial amount of time exclusively to the project. Typically, the most knowledgeable individuals in the agencies are the least likely to participate in these activities. This difficulty led us to gather as much information as possible about the service and focus on the activities that were deemed essential, aiming to extract the maximum value from the approaches for the project. We also used on-line forms to collect information from the workshop participants after the session when necessary.

Another issue impacting the project was the large number of stakeholders appointed to participate and contribute. On the first day of the initial cycle, 19 civil servants from various areas were present. While the diversity of areas is an important factor for innovation, it also presents challenge in working effectively to achieve the initiative's goals. While planning the workshops, we adopted a strategy of dividing the participants into two groups to work on the activities. Subsequently, we consolidated the results into one single outcome.

Fig. 1 – Original Lean Inception Agenda (adapted from Caroli, 2018) and Adapted Lean Inception Agenda (from authors). Gray cells indicate removed activities and orange cell indicate the added activity.

Additionally, the participants were spread across multiple locations in the country, making it difficult to assemble everyone in one place. Consequently, a restriction for the initiative was that it had to be conducted remotely with all participants attending virtually through a conferencing tool. For promoting the active contribution of the participants in the activities we used Miro[2], an online collaborative whiteboard platform designed for team collaboration.

5. Solutions and Strategies

The challenges described in the previous section conflict with the recommendations from the LI and DS approaches. This section outlines the solutions and strategies we used to adapt these approaches to conduct the project in light of the challenges faced.

5.1. Lean Inception Adaptations

Figure 1 presents both the original and adapted agendas of LI, where the gray cells indicate removed activities and orange cell indicate the added activity. The original LI agenda spans a full five-day week, while our proposed agenda was condensed into three full afternoons. Most of the LI activities were retained, albeit with shortened execution times.

In this case, we also utilized an online questionnaire to gather specific data that could not be obtained during the workshops. As a result, participants were required to make an an additional effort outside the workshop.

Two original activities were removed: the Tech, UX & Business Review, and the Sequencer. These activities are structured methods for performing feature prioritization. Due to time constraints, we conducted the prioritization in a more informal manner, like using the voting feature of the Miro board tool.

Originally, LI starts with the Product Vision, but a new activity, the Problem Statement, was introduced at the very beginning of the workshop. Given that this project involved a large team of civil servants from different areas from the agency, each with distinct perspectives on the problem, it was decided that including activities to get a consensus on the problem would be definitive in converging towards a solution within a shortened time-box (Ferreira et al., 2021). As in Ferreira et al., 2021, we noticed that by starting with a scope defined we could reduce the time spent in the Product Vision activity and have a more oriented discussion.

[2]https://miro.com

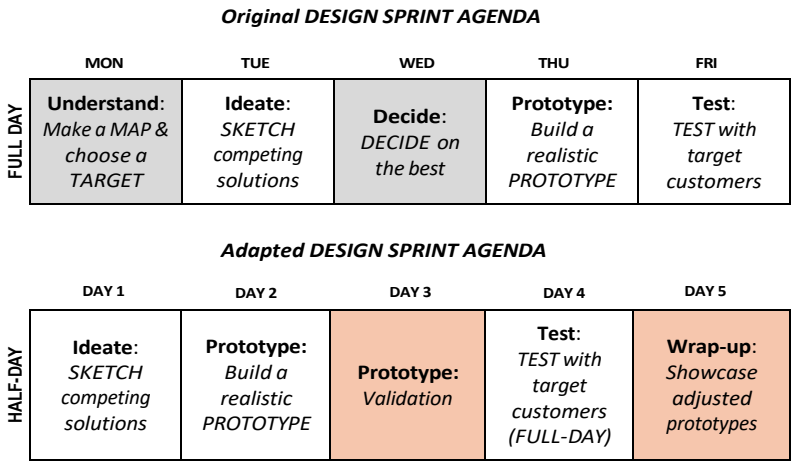

Fig. 2 – Original Design Sprint Agenda (adapted from Knapp et al., 2016) and Adapted Design Sprint Agenda (from authors). Gray cells indicate removed activities and orange cells indicate the added activity.

To manage the large number of individuals attending the workshops, some activities were executed in two steps. In first step, the group was divided into two breakout rooms within the conferencing tool to discuss the matter in smaller teams. Afterward, the entire group reconvened, and a representative from each breakout room briefly presented their group's conclusions. These conclusions were then consolidated into one shared result.

When dividing the groups, care was taken to compose the room with individuals from different areas whenever possible. One member of the facilitation team supported each group during discussions.

5.2. Design Sprint Adaptations

Similar to Pelinson and Campese, 2023, in a public service context of digital transformation, DS was adapted to be conducted remotely and with participants that included civil servants.

Figure 2 presents both the original and adapted agendas of DS. Gray cells indicate removed activities and orange cells indicate the added activity. The original DS agenda spans a full five-day week, while our proposed agenda took four full afternoons and one full day for the testing with users.

Since the user journeys and features were previously defined in Cycle 1, the Understand activities from Monday and the Decide activities from Wednesday were not necessary. The remaining days of the original DS agenda were used to sketch ideas for the MVP features, build and test the prototypes.

The agency required the development of high-fidelity prototypes. Therefore, two designers collaborated with the agency team to deliver these prototypes, using Figma[3], a web-based design tool used for interface design, user experience (UX) design, and collaborative design projects. This decision necessitated adding one additional meeting for prototype validation before the user test, as well as a final activity to present the adjusted prototypes after the user testing.

Due to the workshops being run remotely, a hybrid solution was planned to conduct the test the new solution with the citizens. The tests were conducted at one of the agency's service center. After a citizen was attended to as usual, they were invited by the civil servant to participate in the tests for the new solution. The facilitators conducted the test in a separate room. The workshop participants, who were located in other cities, observed the testing sessions through the conferencing tool from two perspectives: (1) they could see the and hear the user through the camera and microphone, and (2) they could see the user navigating the prototype through the screen sharing feature on the mobile phone used for testing. While observing, the sprint participants were asked to take notes on the perceptions of the user for each screen or features analyzed.

6. Conduction of the Workshops

The workshops were planned and facilitated by three of the authors, with the support of LabQ.

The first cycle of workshops, based on the LI method, was conducted in October 2023 and produced the MVP for the app. Initially, two afternoons were planned for the complete execution of a Lean Inception (Caroli, 2018) workshop to establish the initial parameters for constructing a Minimum Viable Product (MVP) of a mobile app. The MVP aimed to synthesize a unified vision from the collaboration between various stakeholders of the agency.

At the beginning of 2024, the public agency realized that they needed a prototype to pitch the project and allocate the budget for its development. Consequently, a second cycle of DS workshops were conducted in March 2024 to prototype and test the solution with citizens prior to the initiation of the software development project.

6.1. Cycle 1 - LI Workshop

LI workshops can be very beneficial, as they enable the development of experienceable products with minimal effort, enabling customers and users to early validate the product without the need for further development (Zimmermann et al., 2021).

The goal of the LI workshop conducted was to establish parameters for developing the app's MVP by consolidating a shared vision through the involvement of stakeholders from various areas related to the service. In this first cycle 19 stakeholders from various areas were involved.

The first day of the LI workshop started with gaining a better understanding of the citizens' problem when using the agency services. A set of insights was collected to identify the users' issues and needs. Using Miro boards, they gathered and consolidated these insights into a single, clear problem statement: "The user encounters difficulties in easily and quickly accessing their health plan data, available useful services, and general information about their rights".

In the second part of the workshop, the product vision was developed, in order to decide what would be the initial focus of the solution and the positioning strategy. First, the participants were divided into two groups. Each group created a Miro board describing their shared product vision, which contained information regarding which types of users would be using the app, their problems and the description of the app. Later, both product visions were consolidated into one clear product vision.

Additionally, an activity was held to ease the development of a clear definition of the product. In this step, the participants defined the product by what it is and it isn't, and what it does and it doesn't. Also, this activity promotes the creation of a more precise and aligned vision for the strategic decisions regarding the product, including what the product does, what it doesn't do yet and what it will never do.

On the second day of the workshop, the goal was to establish proto-personas that would later be used to identify features and user journeys. Personas are used to represent a user of the system, its behavior, goals and motives (Blomkvist, 2002).

In this regard, the participants created two different personas, one representing a user who already has a healthcare plan and the other representing a user who is interested in acquiring one. Both personas had a profile with personal information, a description of their behavior and habits, problems and frustrations, and needs and goals.

With the personas in mind, a brainstorming section was conducted to identify the essential features of the app. In addition, the participants built user journeys based on the personas they had previously created.

On the third day, an important discussion was held regarding the prioritization of personas created on the previous day. The participants decided to focus on one persona, the one who represents the user who already has a healthcare plan. Based on this persona, the user journey was consolidated and associated with the features previously gathered.

Throughout the three days of the workshop, we gathered the essential information to develop an MVP Canvas, including an MVP proposal, personas, user's journey and features. Also, through a form shared asynchronously with the participants, we collected the expected results and metrics to validate the business hypothesis.

The expected outcomes for the MVP canvas include: aiding in the procurement planning to develop the app for this public service in a minimal amount of time. Also, improve the current app, as there is a larger scope to be dealt with. Finally, the app should be user-friendly, easy to use, and different from what users have available today. It should also have to evolve to be considered as a reference in the healthcare plan field.

Moreover, the metrics gathered to complete the MVP canvas include increasing app downloads, user numbers, and access compared to the current app history, They also include boosting consumer support channel access relative to other channels, expanding available services, and increasing this service's consultations and searches on the Rol database. Additionally, there is improving user satisfaction, enhancing existing services through digitization, improvement of the satisfaction survey results for the app support channels, and enhancing the app image in society.

6.2. Cycle 2 - Prototyping Workshop

The second cycle lasted for 5 days, using the Design Sprint strategy. The goal was to create a storyboard with wireframes, develop high-fidelity prototypes, and test them with users.

On the first day, the agenda focused on developing two storyboard proposals for the app. The session began with an overview of the MVP proposal and a discussion of the metrics gathered in the first cycle. Participants took notes on their observations and highlighted key points they considered important.

Next, participants were divided into two groups to conduct the Crazy 8s activity, aimed at generating innovative ideas. Using a piece of paper folded three times, each participant reviewed their notes, selected one or more ideas to explore, and created quick one-minute sketches. They experimented with different shapes, structures, content, and other elements, either iterating on a single idea eight times, sketching two different ideas four times each, or varying their approach as needed.

Furthermore, participants developed a storyboard illustrating the user journey, drawing inspiration from the ideas generated in the Crazy 8s activity. The storyboard highlighted key moments where users might face difficulties, ensuring those areas were addressed with greater precision. By the end of the day, each group had drafted a low-fidelity prototype, putting the selected ideas into practice.

On the second day, each group presented the storyboard created on the previous day. The best ideas were then consolidated into a single storyboard. Following this, the groups began developing the high-fidelity prototype, which the designers refined between workshop sessions.

On the third day, the designers presented the high-fidelity prototype, which was validated by the DS participants with minor adjustments.

On the fourth day, user testing was conducted to validate the prototype. The evaluation involved observing different user profiles, including four public agents from the office and four citizens interacting with the prototype. The interviews took place in the government agency responsible for the service. To begin, users were asked introductory questions to better understand their background, such as: 'What brought you here today?', 'Have you tried other means of communication?', and 'Is this your first time seeking this service?'.

Users were then introduced to the prototype and encouraged to verbalize their thoughts following the *think-aloud technique* (Knapp et al., 2016). Observations focused on how they navigated the home screen and their initial impressions. Next, the interviewer asked users to perform specific tasks with the prototype, simulating real interactions with the service.

While users tested the prototype, the DS team observed the sessions remotely via a conferencing tool, taking notes on user perceptions for each feature of the solution using a Miro board. To organize and visualize the collected feedback, a structured board was created with sections corresponding to different areas of the app interface, such as the home screen and healthcare plan information.

Feedback from various users was recorded systematically: positive comments were noted on green post-its, negative feedback on red post-its, and neutral observations on yellow post-its. This structured approach enabled a thorough analysis of user experiences and areas for improvement.

On the fifth day, the DS team reconvened to discuss the user testing results and finalize adjustments to the prototype.

By applying a set of techniques from the Design Sprint approach, we successfully achieved the goal of this cycle: developing a high-fidelity prototype for this government service that is user-friendly, simple, and easy to use.

Overall, participants considered the app prototype a significant advancement for the public service provided by the agency. It streamlines and accelerates service delivery, eliminating the need for users to visit the agency in person. Several users highlighted the time they previously spent traveling to the agency for tasks that could now be completed online through the application.

Additionally, the application would improve communication between citizens and agents. One agent noted that contacting citizens is often challenging, as many do not respond to emails. Addressing complaints via phone or email can also be time-consuming, making effective communication difficult. Furthermore, obtaining necessary documents from users is often problematic, as they frequently delay or fail to send the required materials. The agent believes the app will streamline communication by making it more direct and centralized, helping users better understand requests and respond promptly.

During the user testing observation, one participant praised the team's approach, particularly highlighting their demonstration of empathy. She emphasized that listening carefully to users' needs is crucial. While recognizing that the app is not a complete solution, she noted that it can significantly enhance human interaction. Additionally, she pointed out that optimizing the scheduling system is an area that requires improvement, as users still want to maintain dialogue with real people.

7. Reflections and Lessons Learned

7.1. MVP and Roadmap

The time constraints for involving civil servants in LI and DS workshops led us to streamline these approaches by removing some activities. Specifically for the LI, the removal of the Tech, UX & Business Review, prevented us from and the Sequencer activities required prioritizing personas, journeys, and features throughout the process. Originally, the removed activities are intended to help prioritize the features to be implemented in the MVP, while the other (non-prioritized) features are organized in a Roadmap.

We observed that some participants tend to get anxious about the scope of the MVP when they have to leave behind part of the ideas that are discussed during the workshop. We believe that the lack of a roadmap that includes the non-prioritized feature contributed to this concern. Treating the non-prioritized ideas more formally may help address this issue. An intermediary solution between the informal prioritization and the removed activities might provide a balanced solution.

7.2. Prototypes Quality Level

The public agency required the delivery of a high-fidelity prototype to pitch the project internally within the organization. As a result, we decided to involve designers and work with high-fidelity prototypes starting from the third day of the Design Sprint. This decision required more effort than initially planned, causing the creation and adjustment of prototypes to take more time than anticipated.

While the DS approach recommends that prototypes should be realistic, it emphasizes the need to find a "Goldilocks" level of quality (Knapp et al., 2016). The prototype's quality cannot be too low, as users might not perceive it as a real product, but it also cannot be too high, making it impossible to deliver in time for the user testing session the next day.

Achieving the "Goldilocks" quality level for prototypes is challenging. The use of Figma was invaluable in creating a realistic prototype that simulates the design patterns of digital public services used by the Brazilian government. However, adhering closely to these design patterns required the team to put in extra hours to prepare the prototypes for the user testing session.

In hindsight, we might consider omitting the design pattern and working with a simpler prototype until all necessary adjustments are made. The high-fidelity prototype could then be delivered at the end of the process.

7.3. Value of User Testing Session

The final stage of testing the solution with citizens and civil servants working at the service center proved highly effective in identifying opportunities to improve the user experience with the service and enhance the functionalities selected for the MVP.

The User Testing session provided the workshop participants with an opportunity to understand the value perceived by citizens when using the proposed app. During the session, civil servants were able to clearly observe how citizens interact with the digitized service, the language they use (which sometimes contrasts with the internal jargon of the agency), the difficulties in navigating between screens and potential areas for improvement. They also identified which information should be highlighted for a better user experience. Therefore, this practice is recommended to be adopted whenever possible before developing new features for the application.

Additionally, the agency's DS team found that engaging with users extends beyond the scope of the solution prototype. The context surrounding the user testing sessions offers valuable insights and learning opportunities for enhancing public service offerings to citizens.

8. Conclusion

In this experience report, we reflect on how collaborative design can enhance the user experience of digital public services. A mobile application solution was designed through two cycles of workshops, adapting both Lean Inception and Design Sprint approaches.

While the Lean Innovation and Design Sprint approaches have proven successful in industry, applying them to improve digital public services presents unique challenges. Both methods require a full week of dedicated participation, but securing such a commitment from civil servants is difficult, especially from the most knowledgeable individuals. Adaptations were made to address the challenges encountered when applying these methods in the public services context. We focused on essential activities and used online forms to gather additional input. Another challenge - managing a large, diverse group of stakeholders from different areas - was mitigated by splitting participants into smaller groups and consolidating their results.

This approach enabled effective collaboration, even with civil servants who had limited availability. The project outcomes were praised by the government agency as an exemplary process for innovation in digital public service design. Involving citizens in user testing sessions was particularly noted as a valuable opportunity to improve public services.

Reflections on the workshops execution provided insights into practices that can be refined for the future collaborative design projects in the government.

Abstract. This study presents the development and validation of a breast cancer patient journey as a real-world demonstration of how public-private collaboration can address digital government challenges while advancing Industry 4.0 and Government 4.0/5.0 paradigms. Using Curitiba, Brazil, as a pilot city, the initiative highlights how technologies, standards, and governance frameworks can foster social cohesion and reduce health inequalities by improving breast cancer care. By leveraging AI-driven tools, participatory governance, and data interoperability, the project aligns population health goals with economic efficiency, ensuring accessible and high-quality care. The results demonstrate the potential of collaborative digital health strategies to enhance public health equity and inform scalable governance models for broader applications across sectors. This research offers a replicable framework for advancing digital transformation in health systems, focusing on preventive and cost-effective interventions to promote resilient and inclusive health ecosystems.

Keywords. Pilot Project, Breast Cancer Journey, Ecosystem Governance, Triple Helix, KPI´s

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 15 May 2025
Practical report, DOI: https://doi.org/10.59490/dgo.2025.923

1. Introduction

According to the World Health Organization (WHO) no one should face breast cancer alone. Breast cancer is the most common cancer globally, with approximately 2.3 million new cases annually. It remains a leading cause of morbidity and mortality worldwide, necessitating a comprehensive approach that integrates public, private, and civil society stakeholders working together to reduce this burden (WHO, 2025),

In the United States, approximately one in eight women will be diagnosed with breast cancer during their lifetime. Only this country estimated that 310,720 women and 2,800 men will receive a diagnosis of invasive breast cancer, but the approach for early detection and treatment have significantly improved survival rates, especially when the disease is caught in its earliest stages. According to Cancer

Statistics (2025), female breast cancer mortality peaked in 1989, and recent studies reveal likely declines in breast cancer mortality and stable prevalence of mammography as primarily diagnostic research (SIEGEL et al, 2025, Breast cancer facts & stats., 2019)

In Brazil, breast cancer primarily affects women over 50 and is the leading cause of cancer-related deaths among women. Men represent a smaller group, accounting for about 1% of cases. The National Cancer Institute (INCA) highlights the growing need for improved systems to address these disparities (INCA, 2024).

Curitiba, a Brazilian city, has pioneered a patient-centric pilot project aimed at aligning digital transformation with social impact goals. By fostering partnerships across the public and private sectors, the initiative tackles health system fragmentation and promotes interoperability, guided by Value-Based Health Care principles.

This collaboration involves the municipality, patient organizations, and a pharmaceutical company working with experts and academic researchers to create an innovative solution for breast cancer care. Focused on leveraging digital tools and preventive strategies, this initiative drives transformation in healthcare, reducing inequalities and improving population health. The Curitiba pilot demonstrates how collaboration and technology can catalyze impactful change, offering a model for broader replication.

2. Materials and Methods

The focus of this initiative on the digital journey of breast cancer patients in Curitiba, Paraná, Brazil was based on the Triple Helix model, which emphasizes collaboration between government, industry and academia and served as a basis for using consolidated WHO standards to improve and implement a data exchange platform and promote interoperability.

This study adopts a single-case design, since context-rich field research enhances practical usefulness, so the study aims to generate insights considering real-world impact. By focusing on Curitiba's pilot, the study captures complex dynamics often missed in broader, decontextualized approaches. This practice allows the identification of leading-edge practices, which, once understood and explained, can inform the adaptation and replication of similar initiatives in comparable settings (Merchant, 2012).

Based on principles of triple helix model, the project's innovation addresses systemic inefficiencies and promotes equity through the initiative, highlighting the transformative potential of collaborative digital health strategies through resource-directing indicators, such as increasing screening coverage by 35% in underserved areas, with AI tools identifying high-risk cases for immediate follow-up.

Table 1 below presents the context found and the actions taken. In this context, the municipality and its patient organizations and a pharmaceutical company that funded the project funded experts and academic researchers who contributed to the design of an innovative solution.

Table 1: Approach and Actions Taken

Journey	Detection and Screening	Diagnosis	Therapeutic Planning	Treatment Delivery	Education, Follow-Up and Survivorship
Context	Low screening rates in underserved areas due to fragmentation in service delivery.	Delays in confirming diagnoses due to bottlenecks in laboratory processing.	Limited integration of patient data across systems led to fragmented treatment plans.	Inconsistent reporting of adverse events and treatment outcomes.	Gaps in long-term patient monitoring post-treatment.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Actions	Collaborative efforts between municipal health departments, NGOs, and technology providers launched mobile mammography units equipped with AI-based imaging tools. Data was integrated into the municipal e-SUS APS platform and analyzed to prioritize follow-ups.	Public-private partnerships established expedited diagnostic workflows using centralized databases and automated case triage in the Federal Breast Cancer systems	Multisectoral tumor boards utilize interoperable platforms adhering to standards to co-design personalized treatment pathways. Patients were actively involved through digital consultation tools.	Deployment of patient-reported outcome (PRO) systems and real-time monitoring apps allowed seamless integration with federal health registries	A coordinated follow-up program, supported by local community organizations, offered education and support through interactive platforms. Data from wearable devices were incorporated into municipal health dashboards.

3. Results

The initiative is projected to deliver significant advancements in breast cancer care by integrating digital health solutions. Analysis of the current and desired patient journeys shows that leveraging AI-enabled management tools to prioritize high-risk cases can increase screening coverage in underserved areas by 35%. These tools also enhance equity by focusing resources on populations with limited access to healthcare.

Adherence to best practices for early detection and intervention is expected to significantly reduce the average time to diagnosis, enabling earlier interventions. Patient satisfaction and adherence to treatment plans are targeted to improve by 20%, leading to more timely initiation of therapy. Enhanced monitoring systems, including real-time tracking of treatment outcomes, are anticipated to reduce emergency admissions caused by adverse events, further improving care efficiency and equity.

For example, AI-supported workflows can address diagnostic delays by streamlining processes, shortening the time to diagnosis, and promoting adherence to treatment plans through education and digital engagement. This approach is expected to yield a 20% improvement in therapy initiation within recommended timeframes. Additionally, strengthened adherence to follow-up care, supported by interoperable data systems, can lead to measurable gains in five-year survival rates, showcasing the transformative potential of collaborative digital health strategies.

To strengthen the evaluation's rigor, considered KPIs were aligned with internationally recognized frameworks, such as ICHOM, and validated through iterative consultations with local experts, public health managers, and patient organizations. Data sources included municipal health records, e-SUS APS, and patient-reported outcomes integrated via interoperable platforms.

By linking these outcomes to Key Performance Indicators (KPIs)—such as expanded screening coverage, reduced diagnostic delays, and improved treatment adherence—the project highlights the role of digital governance in promoting equitable healthcare systems and addressing disparities in access and outcomes, as detailed in Table 2.

Table 2: KPI´s and expected results

Phase	Detection and Screening	Diagnosis	Therapeutic Planning	Treatment Delivery	Education, Follow-Up and Survivorship
KPI´s	Screening coverage increased by 35% in targeted areas, with high-risk cases flagged for immediate follow-up.	Measuring of time frame average time to diagnosis reduced days, improving early-stage detection rates/ according to best practices	Improving patient satisfaction and adherence to treatment plans, with a 20% increase in therapy initiation within recommended timeframes.	Enhancing tracking of therapy effectiveness and reduced emergency admissions related to adverse events.	Improving adherence to follow-up care, with a measurable increase in five-year survival rates.

The collaboration between the Curitiba municipality, patient organizations, a pharmaceutical company, and academic experts to redesign breast cancer care exemplifies how accurate data collection serves as the cornerstone for implementing affordable, actionable KPIs and metrics in public health systems. By prioritizing precision in data capture, integration, and analysis, this initiative demonstrates how Brazil's fragmented healthcare ecosystem can evolve into a cohesive, patient-centered model while addressing systemic inequities. The points listed below explain its transformative potential:

---

1. Data Accuracy as the Foundation for Affordable KPIs

Accurate data collection ensures that KPIs are reliable, relevant, and cost-effective. In Brazil's decentralized system, inconsistencies in tracking patient outcomes across municipal, state, and federal platforms often lead to inefficiencies. For example:

Municipal-level data (e.g., screening rates, follow-up adherence) must align with state-level data (e.g., access to mammography, chemotherapy quotas) and federal databases (e.g., mortality rates, funding allocations).

By standardizing metrics using global frameworks like ICHOM, the project ensures that KPIs reflect outcomes prioritized by patients (e.g., survival rates, quality of life, care continuity) rather than purely administrative targets.

This alignment reduces duplication, minimizes manual data reconciliation costs, and enables governments to allocate resources based on evidence-driven priorities, a critical step for affordability in resource-constrained settings.

---

2. Interoperability and Real-Time Insights

The project's integration of open standards for interoperability bridges siloed systems, allowing seamless data exchange across care levels. For instance:

- A patient's diagnostic data from a municipal clinic can instantly inform state-level treatment authorization, while federal systems monitor population-level trends.
- AI-driven analytics process real-time data to identify bottlenecks (e.g., delays in biopsy results) or disparities (e.g., low screening rates in rural areas), enabling proactive interventions.
- By automating data flows, the system reduces administrative overhead and ensures KPIs (e.g., time-to-treatment, patient satisfaction) are updated dynamically, avoiding the costs of retrospective audits.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

3. Patient-Centered Outcomes and Equity

Adopting ICHOM's framework shifts focus from volume-based metrics (e.g., number of screenings) to value-based outcomes (e.g., reduced recurrence rates, psychosocial support access). Accurate patient-reported data ensures metrics reflect lived experiences, such as:

- Financial toxicity (e.g., out-of-pocket costs for low-income patients).
- Geographic barriers to care (e.g., travel times to oncology centers).
- Cultural factors influencing treatment adherence.

These insights allow policymakers to design targeted, equitable interventions, such as subsidized transportation for rural patients or telehealth follow-ups—strategies that maximize impact per dollar spent.

4. Scalability and Cost-Effective Governance

The Curitiba pilot leverages modular, open-source technologies to create a replicable model. For example: AI algorithms trained on local data can predict demand for therapies, optimizing procurement and reducing waste and federated learning allows hospitals to share insights without compromising patient privacy, lowering R&D costs for new treatments. This approach avoids proprietary system lock-in, ensuring scalability to other regions or disease areas (e.g., diabetes, prenatal care) at minimal marginal cost.

5. Reducing Financial Risks Through Predictive Analytics

Accurate historical and real-time data enables predictive modeling to anticipate budget impacts. For instance:

- Early detection rates correlate with lower long-term costs; investing in screening KPIs today reduces late-stage treatment expenses tomorrow.
- AI identifies high-risk populations for preventive campaigns, curbing avoidable hospitalizations.

By linking KPIs to financial sustainability, the system aligns clinical goals with fiscal responsibility, a key tenet of Government 4.0/5.0.

6. Strengthening Social Cohesion via Transparency

Public trust in healthcare systems erodes when data is opaque or perceived as biased. This Project fosters transparency by:

Sharing de-identified outcome data with patient organizations, ensuring accountability. Using dashboards to visualize progress on KPIs (e.g., reduced mortality disparities across socioeconomic groups). Such transparency builds collective ownership among stakeholders, reinforcing social cohesion and incentivizing sustained collaboration.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

While the study emphasizes the positive outcomes of the Curitiba pilot, it also recognizes critical challenges inherent to digital health transformation. These include data privacy concerns in cross-institutional exchanges, regulatory fragmentation across government levels, and high initial implementation costs for infrastructure and training. Addressing these barriers required strict adherence to national data protection laws (LGPD), phased deployment strategies, and strong stakeholder alignment—factors essential for scalability and sustainability.

4. Conclusions

In this context, the municipality, patient organizations, and a pharmaceutical company collaborated with experts and academic researchers to develop an innovative solution. This partnership, focused on the breast cancer care line, exemplifies how digital governance can foster social cohesion and reduce health disparities by implementing preventive, cost-effective, and patient-centered processes aimed at improving population health.

In Brazil, navigating the breast cancer care journey requires seamless integration between municipal, state, and federal systems. Municipal systems manage initial tracking and follow-up data, state platforms regulate access to specialized exams and treatments, and federal databases store centralized information for monitoring and financing. The Curitiba pilot project establishes a new paradigm for interoperability, bridging these levels of care and spheres of government to create a cohesive, patient-centered healthcare model.

This initiative is the first in Brazil to combine global standards with the ICHOM (International Consortium for Health Outcomes Measurement) framework for patient-centered breast cancer care. By focusing on outcomes that matter most to patients, the project highlights the importance of collaborative efforts among health professionals, specialists, and patients. The adoption of these standardized measures represents a global commitment to improving quality of care, enhancing the quality of life for patients, and driving advancements in breast cancer treatment (ICHOM, 2025).

To achieve these goals, the project integrates open standards for interoperability, enabling real-time information exchange across municipal, state, and federal levels. Leveraging AI and global benchmarks, it establishes a replicable, sustainable model for digital governance in healthcare, with the potential to be scaled to other lines of care and regions.

The results highlight the transformative potential of digital health strategies under the Government 4.0/5.0 paradigm. By aligning technological innovation with social and economic goals, the framework uses AI-driven indicators to minimize financial impacts while keeping the patient at the center of the process. This approach underscores how digital governance can build equitable, efficient, and resilient healthcare systems, fostering social cohesion and reducing disparities across diverse populations.

The Curitiba initiative could prove that accurate data collection is not a technical afterthought but a strategic enabler of affordable, equitable healthcare. By harmonizing global standards with local realities, Brazil can transform its public health systems into agile, patient-centered networks. The project's success hinges on three pillars:

1. Interoperability to unify fragmented systems.
2. Outcome-focused metrics to prioritize value over volume.
3. AI-driven governance to minimize costs and maximize impact.

As this model scales, it offers a roadmap for low- and middle-income countries to leverage digital innovation as a tool for equity—proving that precision in data collection is inseparable from progress in population health.

Abstract. Governments are increasingly adopting AI to improve public services as part of smart city development, and hybrid intelligence plays an essential role in this developmental process. This panel, emphasizing stakeholder perspectives, explores the opportunities and challenges of adopting hybrid intelligence for smart city development. We include three papers and six authors for the panel. The first paper investigates how smart city initiatives facilitated through citizen-government participation platforms differ in terms of stakeholder groups, types of participation, and technology employed. The second paper examines how the municipal city, Hsinchu City Government, utilizes intersection fisheye camera images to analyze traffic flow and their related stakeholders' views on such adoption. The last study examines data-driven public services by combining the strengths of human experiences and artificial intelligence. This paper discusses studies utilizing open data, big data, or linked data to support informed decision-making through an inclusive process and inter-governmental collaboration and innovation transfer, as shown in the second paper. The panel will also reserve time for the audience to join the discussions and share their related research in applying hybrid intelligence for smart city development.
Keywords. AI, hybrid intelligence, digital twin, big data, smart city.
Panel, DOI: https://doi.org/10.59490/dgo.2025.928

1. Theme and Goals

Increasingly, governments are adopting AI to improve public services and increase automation processes as part of the smart city development. Liu, Tang, and Collard (2025) show that hybrid intelligence plays an essential role in smart city development through a review of over 10,000 articles (e.g., Kitchin, 2014; Anttiroiko et al., 2014; Gil-Garcia et al., 2015; Gil-Garcia et al., 2016; Meijer & Bolívar, 2016; Elazhary, 2019; Kumar et al., 2020). Liu et al. (2025) show that existing literature focuses on technological and engagement components for designing hybrid intelligence in smart city development. For instance, Elazhary (2019) shows that TransWiseway utilizes sensors and cloud computing to improve safety and efficiency. TransWiseway is a smart transportation system, also known as Web of Wisdom Things, developed by Intel technologies by utilizing crowd information and accumulating user experiences for decisions (Elazhary, 2019).

Besides technological advancements in analyzing massive crowd information and behaviors, Liu et al. (2025) point out the essential aspect of engagement in adopting AI, developing hybrid intelligence, and keeping the crowd informed regarding how their information is utilized or actively engages the crowd for AI development. For

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

instance, Gil-Garcia, Zhang, and Puron-Cid (2016) introduce the concept of "smartness" in government, identifying fourteen key components: "integration, innovation, evidence-based decision-making, citizen-centricity, sustainability, creativity, effectiveness, efficiency, equality, entrepreneurialism, citizen engagement, openness, resiliency, and technology savviness" (p.525). Developing a smart city should include these steps to foster collaboration and citizen participation (Gil-Garcia et al., 2016). Also, the government should involve citizens as co-producers in policy development and service implementation (Liu, 2021). Often, governments adopt strategies for open data sharing, data-driven services (Nikiforova et al., 2023), and guidelines tapping into crowd information (Liu et al., 2025). For instance, Nikiforova et al. (2023) highlight the importance of stakeholders' aspects in the high-value dataset literature.

This panel, emphasizing stakeholder perspectives, explores the opportunities and challenges of adopting hybrid intelligence for smart city development. We include three papers and six authors for the panel. The first paper investigates how smart city initiatives facilitated through citizen-government participation platforms differ in terms of stakeholder groups, types of participation, and technology employed. The second paper examines how the municipal city, Hsinchu City Government, utilizes intersection fisheye camera images to analyze traffic flow and their related stakeholders' views on such adoption. The last study examines data-driven public services by combining the strengths of human experiences and artificial intelligence. This paper investigates studies utilizing open data, big data, or linked data to support informed decision-making through inclusive process (Ciesielska et al., 2022) and inter-governmental collaboration and innovation transfer (Ciesielska et al., 2021). The panel will also reserve time for the audience to join the discussions and share their related research in applying hybrid intelligence for smart city development.

2. Panel Content

2.1 Hybrid Intelligence for Smart City Development: Stakeholders Perspective

Increasingly, governments adopt various stakeholders in smart city development (Gil-Garcia et al., 2016). With the rise of AI technology, incorporating crowds into the development and implementation process has become essential (Liu, 2017a; Liu, 2021). Liu, Guo, and Chen (2023) reveal an interesting case where the government adopts a living lab concept, allowing various stakeholders to experiment with emerging technologies before scaling up or adopted by the governments. That study provides online smart city proposals and achieves data from the Taipei City Government. Digital technology can replace the government in its dominant position (Linders, 2012, 451). Musiatowicz-Podbial (2024) mentioned that successful collaboration among stakeholders requires certain upfront conditions of common platform establishment, introduction of government incentives and inducements, and the perceiving the mutual benefits of collaboration among stakeholders. Municipal governments could develop platforms for stakeholder participation in smart city development (Liu et al., 2023) and citizen participation in public service provisions (Liu, Chao, & Chen, 2024). This study builds on the platform framework and stakeholder analysis to further investigate how smart city initiatives facilitated through citizen-government participation platforms differ, in terms of collaborating parties, the role of technology in enhancing collaboration and the results of collaboration measured both as direct outputs and longer-term outcomes. Our study conducts a systematic review of the social partners and state collaboration in smart city development. Building on existing literature, our paper proposes a stakeholder analytical framework to understand interactions characteristics. Using an archived dataset, our paper shows that most citizen-initiated projects could not be sustained or implemented due to lacking capital or resources. Successful projects build solid relationships with different governmental units and private enterprises. Based on our findings, governments could provide monetary resources as seed funds and should also offer networking opportunities for selected projects to sustain.

2.2 Fisheye Camera Images for Traffic Flow Detection in Hsinchu City

Although digital twins have become a standard technology in smart city development—particularly in traffic flow monitoring—establishing a comprehensive digital twin system across an entire city requires careful consideration of financial resources, technical capabilities, and privacy concerns. This challenge is especially pressing for cities with limited budgets, which must find cost-effective ways to achieve similar outcomes. This case study highlights the smart transportation initiative led by the Hsinchu City Government. Hsinchu City and Hsinchu County form a major hub of Taiwan's high-tech industry, with clusters of chip manufacturing facilities such as TSMC. During peak commuting hours, traffic congestion is a significant issue. To address this, the Hsinchu City Government utilized fisheye cameras installed at intersections to analyze traffic flow—yielding promising results. In this initiative, the Hsinchu City Police Department provided the traffic video footage, while the National Center for High-Performance Computing and National Yang Ming Chiao Tung University conducted the data analysis. This collaborative effort exemplifies a successful public-private partnership, underpinned by secure data-sharing practices among various data holders. It also reflects the formation of a data ecosystem between government and academic institutions. A traffic flow model was established using 40 fisheye cameras at intersections, enabling intelligent traffic management and control.

2.3 Enabling Data-Driven Public Services and Governance through Hybrid Intelligence

Increasingly, governments adopt strategies for open data sharing, data-driven services (Nikiforova et al., 2023), and guidelines tapping into crowd information (Liu et al., 2025). However, data-driven services and governance face challenges, including awareness of data input (Liu et al., 2025), misinformation (Lorenz-Spreen et al., 2020), and representation (Liu, 2017a). Liu et al. (2025) reveal two types of conditions for data inputs in the designs of hybrid intelligence, including conscious crowd and unconscious crowd. The conscious crowd actively provides information and data by acknowledging how the data is used and for what purposes (Liu et al., 2025). On the other hand, the unconscious crowd might not fully realize how their data is analyzed (Liu et al., 2025). Valentino et al. (2020) show that the public might not be aware of the documentation of their behaviors by the sensing technologies. This talk discusses the transformation of high-value datasets (Nikiforova et al., 2023; Ciesielska et al., 2021; Ciesielska et al., 2022) for public services and governance by utilizing artificial intelligence, crowd intelligence, and hybrid intelligence.

3. Significances to the Attendees

The panel is designed for international academic scholars across different disciplines, government officials, policymakers, practitioners, and other industry leaders interested in engaging diverse stakeholders to address the impacts and challenges of AI or HI adoption in the public sector. The discussion will provide both theoretical constructs and practical suggestions for designing inclusive and effective AI and CI in public governance.

4. Panel Structure

Tab. 1 – Panel Program.

Session	Duration	Theme	Presenter
Introduction	5 min.		Chair
1st Presentation	20 min.	Hybrid Intelligence for Smart City Development: Stakeholders Perspective	Grażyna Musiatowicz-Podbiał;
2nd Presentation	20 min.	Fisheye Camera Images for Traffic Flow Detection in Hsinchu City	Hsien-Lee Tseng; Ko Wei-Jan
3rd Presentation	20 min.	Enabling Data-Driven Public Services and Governance through Hybrid Intelligence	Helen K. Liu
Discussions	20 min.	Q&A	Open to the audience
Closing	5 min.		Chair

5. Panalists

Helen K. Liu: Professor in the Department of Political Science and Director of the NTU Center for Collective Intelligence, National Taiwan University (NTU). Her research develops crowdsourcing platform design principles for the public sector to engage citizens. Her research interests are crowdsourcing, online engagement, collaborative governance, e-governance, and inter-organizational networks. She serves as a conference co-chair of the dg.o

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

conference 2024. She also serves on the *Government Information Quarterly* and *Public Administration* editorial board.

Grażyna Musiatowicz-Podbiał: Assistant Professor at Department of Informatics in Management, Faculty of Management and Economics, Gdańsk University of Technology, Poland. Her research includes applied information technology, IT strategies, digital transformation, economic, digital business, digital government, and digital platforms. She served as a conference co-chair of the dg.o conference 2023.

Hsien-Lee Tseng is an Associate Professor at the Department of Public Administration and Management at the National University of Tainan, Taiwan, specializing in e-governance, data governance, and public policy. He is also a research fellow at the Taiwan E-Governance (TEG) Research Center. His recent research focuses on digital rights and principles, and AI application in public sectors.

Wei-Jan Ko is a PhD candidate at National Yang Ming Chiao Tung University and currently serves as a researcher at Center of Research Acquisition, National Institute of Cyber Security, Taiwan. His expertise lies in information security, data governance, and digital policy.

Magdalena Ciesielska: Assistant professor at the Department of Informatics in Management, Faculty of Management and Economics, Gdańsk University of Technology, Poland. Her research includes e-government, smart city, and sustainability.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 27 June 2025

Abstract. Nonmediated Governance (nm-Gov) refers to a visionary state of a society in which members of the society steer their government through Liquid Democracy. This for now purely theoretical concept assumes that every citizen is represented in a digital form, that all assets of the society are represented digitally, as well as that rules that govern the community are digital. This paper summarizes nm-Gov and Liquid Democracy and describes a diagraming technique used to model use-cases to better understand how data in nm-Gov can be translated to concrete governance action. Deeper exploration of nm-Gov through modeling further use-cases with this diagraming technique is the theme of the Beyond Bureaucracy workshop at the dg.o 2025 in Porto Alegre, Brazil.

Keywords. Liquid democracy, self-governance, nonmediated governance
Panel, DOI: https://doi.org/10.59490/dgo.2025.1052

1. Introduction

Impulsive administrative behavior has early become the hallmark of the Trump II administration in the USA, causing ripples all around the world. By April 2025 their executive orders regarding themes such as *diversity, inclusion, equity, and inclusion* (DEI) programs (EO 14151, 14173, 14190, etc.), birthright citizenship (EO 14160), foreign aid programs (EO 14169), public administration workforce (EO 14210, 14238), or tariffs (EO 14245, 14257, 14259, 14266), have substantially affected the legal, economic, and social fates of many US-American inhabitants, citizens, and voters. The swiftness and character of the actions brings up two important aspects of modern democracies: the aspect of buyer's remorse in relation to a continued democratic support of a government administration by its voters (Curtice, 2018; Krieger, 2025), as well as the question of the ability of traditional institutions of democracies to enforce the *rule of law* where governments result to *nonacquiescence* (Matthew, 2019). An indication for an ongoing conflict between the branches of government in the USA is the outcry by popular media outlets on the legal challenges faced by the Trump II administration regarding their executive orders. But other Western nations are also facing similar conflicts. Thus, the *International Criminal Court's* (ICC) issuance of an arrest warrant against the prime minister of Israel and his minister of defense put ICC member states in a position where defiance of the ICC was considered openly (Diekjobst, 2025; Sabel, 2024).

More direct democracy has been argued as a remedy against newly elected governments getting off the democratic leash (Kogan, 2016). A special kind of direct democracy is *Liquid Democracy* (Paulin, 2014, 2020; Valsangiacomo, 2021), a way of democratic representation in which individuals revocably delegate their political *trust* to other members of a community and vote on matters of common concern by the power of their received delegated *trust*. Liquid Democracy (LD) considers also delegated trust as a form of semi-active political participation and thus, it can maximize the number of members of a society that back political decisions. As such, LD is considered the most democratic way for a community to arrive at common decisions (Blum & Zuber, 2016; Valsangiacomo, 2025). The

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

defining characteristic of LD is the ability of an individual to revoke their trust delegation at any time (hence "liquid"). This characteristic can serve as a mechanism for a community to implement policies that can *erode* and eventually *vanish* once the community is no longer backing them by a sufficiently high intensity of support.

The practicability of LD remains a subject of active debate amongst scholars (Butterworth & Booth, 2023; Caragiannis & Micha, 2019; Valsangiacomo, 2025; Valsangiacomo & Zuber, 2025). Scholars who argue in favor point out at the superior democratic properties of this model, while scholars who argue against it bring forward fears of utter chaos stemming from a high frequency in changes to laws, citizens overburdened with too much choice, and a lack of institutional checks and balances if LD was to be used as a tool for passing laws and public policies. One way or another, LD remains a concept with different possible implementations with not enough empirical observations from real-world experiments (Paulin, 2019a, Section 3.5-"Apropos: the Pirates & co.", 2020).

Liquid Democracy can only be implemented by digital systems that rely on *informated* (Paulin, 2018) relations between members of a community; *informated* means that the identities of individuals are described as digital data that resides in cyberspace. One way of implementing LD has been described by Paulin (2014, 2019e): to apply it in such a way that the action of agents and agencies, which collectively make up government, can be steered by controlling access to informated resources such as public funds (use of money for concrete undertakings), societal ranks and roles (who can call themselves "head of state" in relation to other nations, who has the trust to adjudicate conflicts, etc.), and the eligibilities that come with such ranks or roles in a society (who has access to state secrets, to the nation's bullion vault, to weapons systems, etc.). Such use of LD for *steering* the agents and agencies of a state is quite different from using LD for gathering a public's opinion on a policy issue that would merely *instruct* agencies to behave in a certain way. This approach is called *Nonmediated Governance* and examples on how this could work out are provided in chapter 10 of the book *Smart City Governance* (Paulin, 2019d).

The objective of this paper is twofold: (1) to outline *Nonmediated Governance* (nm-Gov) as a visionary concept, and (2) to describe a toolset to plan and model scenarios for nm-Gov. The rest of this paper is structured as follows: Section 2 presents nm-Gov in terms of a vision. Section 3 presents nm-Gov scenarios to illustrate the concept and a toolset for modeling nm-Gov scenarios that shall be used to further explore nm-Gov scenarios as part of the Beyond Bureaucracy workshop at the dg.o 2025.

2. Nonmediated Governance

The term *Nonmediated Governance* – nm-Gov (Paulin, 2019d), refers to a visionary state of a society in which members of the society steer their government through Liquid Democracy – LD. In nm-Gov, LD is not used as a tool to form public policy, but as a tool to *steer* (by assigning / revoking) societal roles of individuals, budgets of projects, and access to *resources* such as information, data, or systems. This concept is *visionary*, as it can be imagined only as a hypothetical state and has not been directly implemented in modern states. To implement it, a society / state would need to assure that all citizens' identities, as well as *resources* of such society were represented in form of digital data that can be accessible from within cyberspace.

As of today, such interaction between *identities* and *resources* in cyberspace already exists: e-mail providers, e-banking systems, cloud storage, as well as cyber-physical systems (systems that can be steered from within cyberspace as part of the *Internet of Things* paradigm (Kopetz & Steiner, 2022)) are nothing but systems that provide *informated* resources of some kind, and govern who can access these resources under what conditions (cf. van Steen & Tanenbaum, 2023). Representing individuals and their properties in cyberspace is easily doable by state-of-art technology, and so is representing resources such as money, information, or systems. Controlling access to such *informated* identities, properties, and resources can easily be done (Paulin, 2019b) and is well established in online services and "smart" products that are connected to the Internet for purposes of control and maintenance, such as cars, farming machinery, household appliances, drones, etc.

Modern states however did not do the leap into cyberspace in a way that would leverage this potential just yet. The focus of states is on e-government, which is about *digitalizing* processes that have been designed and implemented before the digital age (Bovens & Zouridis, 2002; Paulin, 2019b, 2019a). The outcome of (digitalized at best) government processes are typically certificates of some kind – birth certificates, marriage certificates, high school and university diplomas, building permits, etc. Some government bodies issue and accept *informated* certificates (Austria, for example provides the app "eAusweise", which provides one's driving license, car registration certificate, and personal ID in form of a dynamically generated QR code), but they remain *certificates* even so. The objective of such certificate is to manifest that its holder has a given set of characteristics (e.g. has graduated high school, is married, or has been deemed fit to operate a vehicle). These characteristics can have a meaning under specific circumstances: some jobs might require a university diploma, alimony and inheritance rights will depend on whether one has been married, and authorities might punish one for starting construction without a building permit.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

In contrast, whenever we check e-mails, transact money via e-banking, or access cloud files, we do not present certificates that would demonstrate our *eligibilities* within these digital systems. Obviously, it would be counterintuitive to do so, but one might still ask: why not? The reason is, that digital systems have built-in mechanisms that govern the access to resources based on the *identity* of the accessor. These *resources* are *objects* such as folders, files (also e-mails are files!), records (e.g. bank transactions), and user accounts, as well as *properties* of these objects, which define their characteristics. Even the rules by which access to the *resources* of a digital system is governed, are *resources* of the digital system, and hence, can be inspected and modified if one has the required *eligibilities* to do so.

Resources in a digital system are nothing but digital *data* that can be created, read, modified, and deleted. Changes to this data can change the way a system behaves and can change who can access what resources under which conditions. This paradigm could be – in theory at least, applied to govern entire states. This would require each citizen's identity to be represented as digital data within a system, as well as all resources of the state, such as funds, information, or access to technical systems that can be controlled from within cyberspace. Such system could be either a monolithic program, or a distributed system consisting of many connected systems as is the World Wide Web (Berners-Lee et al., 1992). By accessing the data stored in such system one could *determine* at any time the role, the rank, and the *eligibilities* of a person in a given context. By modifying this data, one would shape one's own or other people's role / rank / eligibilities.

If also the rules governing access to this data would be stored in the same way as other data in that system, then an interesting possibility would arise: a society could change these rules by means of LD, thus organically morphing the rules under which the society operates. The rules by which the liquid democratic decision making would operate in such society – i.e., what is needed for a decision to be binding, can be represented in this way as well. Such self-altering system is technically possible, as has been demonstrated by Paulin (2015, 2019c), who used relational databases and the SQL language to show how such digital rules can be accessed and changed by means of Liquid Democracy.

3. Modeling rules for nm-Gov: Constellation-Based Reasoning

In nm-Gov, *eligibilities* are derived ad-hoc from data know to the system without human mediation in creating, accessing or manipulating this data. Parts of this data would be *assertions* by officials and professionals on conditions such as one's knowledge level on a certain matter, physical health, or judgments in criminal or civil proceedings. Other data would be provided during vital events (birth, marriage, death), education, employment, etc. By interacting with this data, one might be able to conduct things like:

- Registering the birth of another person. *Conditions*: 1) one is registered as a professional with a role that allows for a creation of such data; 2) the person to be registered has not yet been registered already.
- Give one's newborn a name. *Conditions*: 1) one is a parent of the newborn; 2) the person to be given a name has no name yet.
- Authorize a payment to a company to build a new park in the city. *Conditions:* 1) one has the backing of the required number of community members in the LD network; 2) there is enough money on the community's account.
- Impose tariffs by implementing a rule according to which if one wants to pay money to a company that is on a long list of foreign companies, they first must have paid 25% of that sum to the community. *Conditions:* 1) one has the backing of the required number of community members in the LD network to change the rules.
- Claim one's monthly salary. *Conditions:* 1) one is on a list of people entitled to a salary.
- Remove somebody from the list of people entitled to a salary. *Conditions:* 1) one is on a list of people entitled to change data in the list of people entitled to a salary.
- Claim one's monthly payment of unemployment allowance. *Conditions*: 1) one is not making active contributions to the unemployment insurance; 2) one has been paying unemployment insurance contributions for six months before claiming the allowance; 3) one has not been claiming unemployment allowance for six months already.

Above conditions can be thought differently and for sure would differ by jurisdiction and time. They serve to illustrate the relation between one's intended action and conditions that need to be fulfilled so one has the *eligibility* to conduct the desired action. One's eligibility derives from a *constellation* of data know to the nm-Gov system – data such as whether one exists, is on the payroll of some public agency, has been contributing to unemployment insurance, has the backing of a community to change its rules, etc.

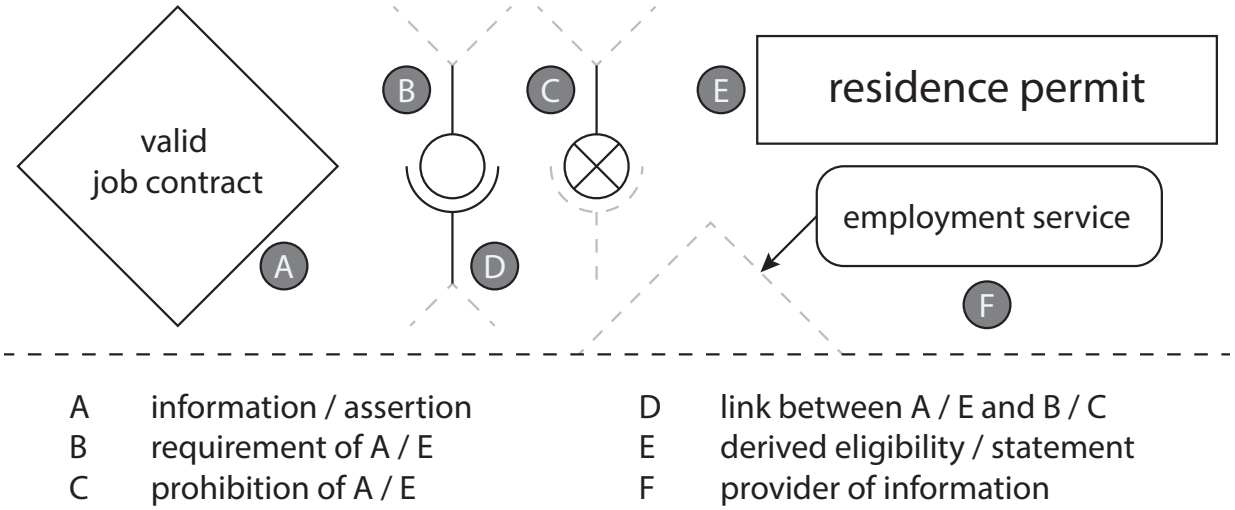

Fig. 1 - Elements for depicting constellation-based-reasoning (CBR) by means of a diagram.

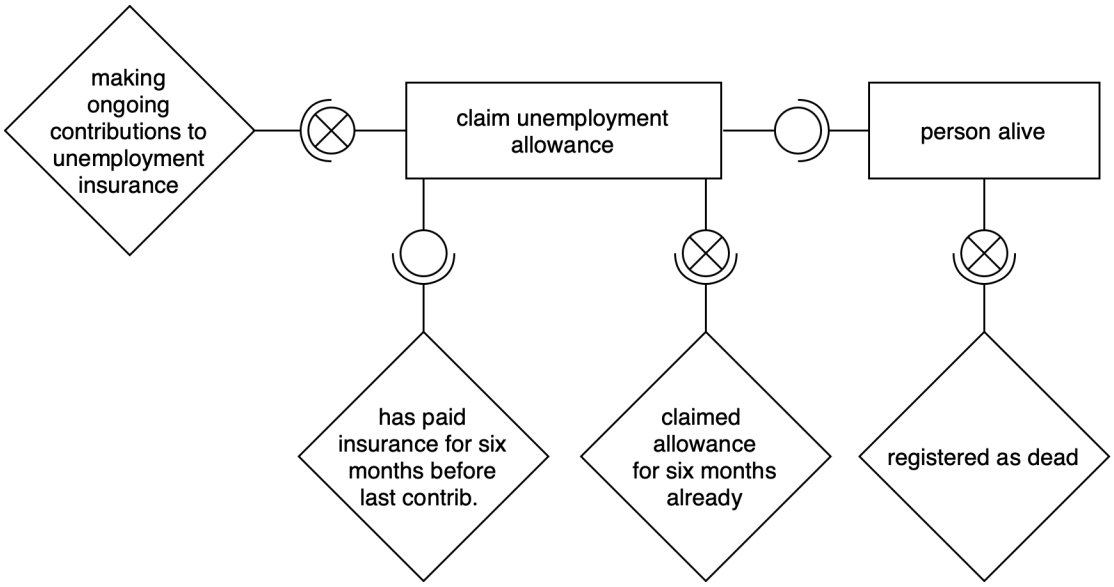

Fig. 2 - CBR diagram depicting the constellation of data required so that one can obtain their monthly unemployment allowance payment

To model and communicate such constellations of preconditions visually, a diagramming technique has been devised (Paulin, 2019d, Section 9.3), as shown in Fig. 1.: Element *A* is used to express data known to the nm-Gov registry; element *E* stands for the eligibility one desires; *B*, [C], and [D] are connectors, whereby [B] indicates that the assertion from the connected [A]-element must be existing and / or true, while [C] indicates that the data / assertion from the connected [A]-element must either not exist, or not be true. Element [F] is used to indicate who can provide the data / assertion. An implementation of this toolset for Draw.io is available on GitHub (Paulin, 2025).

Fig. 2 shows how the CBR diagram can be used to model a claim for monthly unemployment allowance payments.

Further use-cases of nm-Gov reasoning were modelled by this technique as part of the Beyond Bureaucracy workshop at the dg.o 2025. The first part of the workshop aimed at creating a deeper understanding of nm-Gov and LD. The diagramming technique as described here was introduced to the participants using the Draw.io implementation. Finally, workshop participants selected complex scenarios to be modelled and discussed with regards to their real-world implications.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 19 May 2025

Abstract. The panel aims to explore the role of meaningful connectivity in digital government theory and practice, identify existing gaps, and propose future research directions. The meaningful connectivity perspective, which transcends binary Internet access metrics, is generally defined by the presence of infrastructure, affordability, and digital skills—dimensions considered crucial for ensuring that low-income and vulnerable populations can effectively use digital public services. The panel discussion will also showcase practical case studies of meaningful connectivity measurement in Brazil, Chile, the Dominican Republic, and Uruguay, using the methodology developed by the Regional Center for Studies on the Development of the Information Society (Cetic.br), a UNESCO Category II center located in Brazil. By engaging experts and researchers in digital government, the panel intends to provide valuable insights for academics, policymakers, and practitioners aiming to enhance the adoption of digital public services and bridge digital divides.

Keywords. Meaningful connectivity, digital government, digital services uptake.
Panel, **DOI**: https://doi.org/10.59490/dgo.2025.927

1. Theme and Objectives

The theme of the panel "Digital Government and meaningful connectivity: Opportunities and challenges for theory and practice" is related to the uptake of digital government and meaningful connectivity. It focuses on examining the role of meaningful connectivity in the theory and practice of digital government. The meaningful connectivity concept extends beyond mere Internet access, incorporating more dimensions such as infrastructure, affordability, and digital skills to ensure that digital technologies can effectively benefit all, especially vulnerable and underserved populations (Castello, 2024; Macaya, 2024). In this sense, the panel seeks to explore how meaningful connectivity can affect access to digital public services and promote the uptake of digital government.

The panel's objectives are threefold. First, it aims to debate the possibilities of integrating meaningful connectivity into digital government theory and practice, focusing on the population's access to digital public services. Second, it seeks to propose future research directions that can address existing gaps in understanding the relationship between meaningful connectivity and digital government. Third, the panel will present practical case studies of

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

meaningful connectivity measurement in Latin American and Caribbean countries, including Brazil, Chile, the Dominican Republic, and Uruguay, showcasing methodologies and insights derived from these experiences.

Through these discussions, the panel intends to promote a debate about the role of meaningful connectivity perspective as a framework for addressing digital inequalities and ensuring that digital public services are accessible and inclusive. The practical cases seek to highlight innovative approaches and methodological frameworks, such as those developed by the Regional Center for Studies on the Development of the Information Society (Cetic.br), offering actionable insights for policymakers, researchers, and practitioners. By connecting theoretical debates with real-world contexts, the panel aims to provide a comprehensive perspective on the opportunities and challenges of integrating meaningful connectivity into digital government initiatives and frameworks.

2. Digital government questions and issues addressed by the panel

The panel explores the gaps in literature and practice concerning the uptake of digital government services, particularly through the lens of meaningful connectivity and its intersection with digital government from an equity perspective. Meaningful connectivity has gained prominence in recent international reports and conferences, such as the ones proposed by the International Telecommunication Union (ITU) (ITU, 2022), the Alliance for Affordable Internet (A4AI) (A4AI, n.d.), the United Nations (UN) Digital Global Compact (UN, 2024), and the discussions held during Brazil's 2024 G20 Presidency (G20, 2024).

Meaningful connectivity is understood as a threshold of connectivity quality encompassing multiple dimensions, such as infrastructure, affordability, and digital skills, rather than a binary measure of access (Alliance for Affordable Internet (A4AI), n.d.). It is proposed to be measured at the individual level, providing a granular understanding that population-wide indicators fail to capture. This construct underscores that merely having Internet access does not equate to meaningful access, especially when considering digital government services (Macaya, 2024). This is crucial for ensuring that low-income and vulnerable populations, who typically experience lower levels of connectivity, can effectively benefit from digital technologies (Belánger & Carter, 2009; Helbig et al., 2009).

The shift towards meaningful connectivity has significant implications for digital government research, policy, and practice. Despite its relevance in addressing digital inequalities, studies of meaningful connectivity through a digital government lens remain limited. Furthermore, comprehensive governmental policies addressing meaningful connectivity are still in early development. In this context, Cetic.br, a Category II UNESCO center and a department of the Brazilian Network Information Center (NIC.br) located in Brazil, developed a methodological framework for measuring meaningful connectivity based on data from its annual ICT Households survey (NIC.br, 2024). This nationally representative probabilistic study, conducted since 2005, identifies the adoption and ownership of information and communication technologies (ICT) among individuals 10 years old or older in Brazil (NIC.br, n.d.). Cetic.br´s methodological model for measuring meaningful connectivity is also being applied in Latin American and Caribbean countries, such as Chile, the Dominican Republic, and Uruguay, with plans for implementation in seven African countries, among other nations. Based on this context, the panel aims to highlight the opportunities and challenges of implementing the meaningful connectivity framework in digital government research and practice by addressing the following questions:

- What are the key dimensions and indicators of meaningful connectivity, and how do they impact the uptake of digital government services?
    - Exploring the relationship between meaningful connectivity and digital government service adoption.
    - Examining the implications of meaningful connectivity dimensions, such as infrastructure, affordability, and digital skills.
- How can meaningful connectivity be effectively measured and operationalized in diverse contexts, particularly in Latin America countries?
    - Discussing the methodological approaches and challenges in measuring meaningful connectivity.
    - Presenting case studies from Brazil, Chile, the Dominican Republic, and Uruguay.
- What policy recommendations can be derived from a meaningful connectivity approach to improve digital government services theory and practice?
    - Proposing actionable policies and scientific strategies to enhance meaningful connectivity frameworks in both literature and practice.
    - Identifying best practices and lessons learned from countries, especially Latin American initiatives.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

By addressing these questions, the panelists hope to foster a deeper understanding of meaningful connectivity's role in digital government and inspire future research and practical applications to enhance the adoption of digital public services, and bridge digital divides.

3. Benefits of discussed topics for attendees and research

Conference attendees will have the opportunity to explore the intersection of digital government and meaningful connectivity, including current debates and identifying gaps in both literature and practice. Additionally, they will be introduced to the methodology developed by Cetic.br for measuring meaningful connectivity and its results in Latin American and Caribbean countries.

The panel aligns with the conference theme "Digital government fostering social cohesion for reducing inequalities", as panelists seek to discuss strategies to enhance meaningful connectivity in the context of digital inequalities and its policy implications for ensuring equitable access to online public services. It also fits with both conference tracks 8 (Digital Government for Stronger Society) and 23 (Dialogues about Latin America).

4. Format

The panel is structured as an interactive session. The planned format is a plenary with short presentations from each expert and Q&A from the audience. The schedule is presented below:

• Session Introduction (Session moderator – up to 10 minutes)

• Short presentations from panelists (up to 10 minutes per panelist)

• Q&A from audience and moderator

• Closing comments and session summary (moderator and panelists)

3. Panel composition

The moderator is Manuella Maia Ribeiro, ICT Research Projects Coordinator from Cetic.br (Brazil). She is a digital government and public administration specialist coordinating the Brazilian ICT Electronic Government survey since 2013. She holds a PhD and Master's degree in Public Administration and Government from the Getulio Vargas Foundation (Brazil), a bachelor's degree in public policy management from the University of São Paulo (Brazil), and Law from the Mackenzie Presbyterian University (Brazil). She is a visiting expert at the United Nations University Operating Unit on Policy-Driven Electronic Governance (UNU-EGOV).

Professor Maria Alexandra Cunha, from Fundação Getulio Vargas (Brazil), brings her extensive background in digital government, ICT governance, and smart cities. Her work focuses on how governments can leverage technology to enhance public service delivery, reduce inequalities, and foster inclusive digital transformation. At FGV, she also leads the IT and Government area in the Center for Public Administration and Government (CEAPG).

The panel also features Professor Elsa Estevez, Universidad Nacional del Sur (Argentina). She is an internationally recognized researcher in digital government. She has consulted for governments, taught public managers and policymakers, and organized events about digital government in over 30, mostly developing countries. Her research interests cover structuring the information technology function in government, the digital transformation of government-citizen relationships, and the impact of such transformation on nations' and cities' capacity to pursue sustainable development. She has a PhD in Computer Science from Universidad Nacional del Sur.

The panellists include J. Ramon Gil-Garcia. Gil-Garcia is a professor at the University at Albany, SUNY, and Director of the Center for Technology in Government (CTG). His research focuses on digital government, inter-organizational collaboration, and digital inclusion. He has published extensively on smart cities, AI in public administration, and data-driven decision-making. With his experience, Professor Gil-Garcia has contributed to discussions on technology's role in public sector transformation.

Together, the panellists and the moderation will provide a multifaceted perspective on the role of meaningful connectivity in digital government, drawing from their extensive research and practical experience in many countries. Their contributions aim to bridge gaps in theory and practice, offering actionable insights for advancing inclusive and effective digital government.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 27 June 2025

Abstract. The proposed panel discusses the responsible application of artificial intelligence (AI) in the public sector, focusing on governance and the mitigation of inequalities inherent in risk, implementation, and structuring. AI presents unparalleled opportunities for enhancing efficiency and quality in public services. However, it is imperative to adopt a responsible approach to prevent exacerbating technical and social inequalities. This work examines best practices for governance in AI systems, transparency mechanisms, and inclusivity frameworks, ensuring that AI contributes to equitable and inclusive societal development.

Keywords: Artificial Intelligence, Public Sector, Governance, Inequalities, Accountability.
Panel, DOI: https://doi.org/10.59490/dgo.2025.1051

1. Introduction

The advent of artificial intelligence has profoundly transformed both public and private sectors, necessitating the establishment of robust governance structures to ensure ethical and responsible technology deployment. As public sector activities inherently aim to promote the common good, transparency, and quality in service delivery, AI systems can play a pivotal role in delivering efficient and timely services. However, disparities in access to technology across regions, coupled with the absence of well-defined governance mechanisms for developing and implementing AI, make it essential to deliberate on this subject.

The application of AI in public services introduces opportunities for modernization and efficiency, yet without adequate measures, it risks amplifying existing inequalities. Therefore, the establishment of governance structures not only aims at implementing transparent and ethical AI but also ensures equitable access to technology, thereby fostering a development model that aligns with societal objectives. This text explores the dimensions of AI governance in the public sector, emphasizing governance frameworks, mitigation of inequalities, transparency, and ethical accountability.

2. Governance in AI for the Public Sector

Governance of AI systems in the public domain has emerged as a key focus in recent debates. The ambivalence of AI—its ability to drive efficiency while exposing structural vulnerabilities—requires building frameworks of laws, norms, and policies that ensure responsible technology deployment.

Floridi (2013) aptly noted that the “infosphere” shaped by technological innovations influences societal realities and

policymaking. For the public sector, responsible AI governance involves addressing ethical, transparent, inclusive, and just dimensions. Key pillars include:

2.1 AI Governance: a) Regulation and Public Policies: Developing legal frameworks and policies that prioritize the rights of citizens, guaranteeing the safe and accountable use of AI systems; b) Ethics Committees and Oversight Bodies: Establishing committees to monitor and ensure compliance with ethical standards in AI use within the public sector.

2.2 Mitigation of Inequalities: a) AI for Public Services: Enhancing access and efficiency in health, education, and social welfare using AI-driven solutions in underserved a´reas; b) Impact Assessment Tools: Implementing AI systems to identify inequities and propose tailored interventions for effective policy outcomes.

2.3 ***Transparency and Accountability***: a) Algorithmic Explainability: Enabling citizens to understand how algorithmic decisions impact them, ensuring confidence in the system; b) Responsibility Frameworks: Clearly defining accountabilities and implementing mechanisms for addressing misuse of AI systems in public service delivery.

3. Challenges of Ethical AI in Governance

Artificial Intelligence, when implemented without adequate governance measures, risks amplifying societal inequalities. Historical biases present in training datasets can reinforce discriminatory practices. Additionally, disproportionate access to resources and AI technologies can further isolate marginalized groups. To address these challenges, the following measures are proposed:

3.1 ***Correction of Algorithmic Biases***: Identifying and mitigating biases in datasets ensures fair and equitable decision-making processes.

3.2 ***Equal Accessibility*****:** Policies promoting equitable access to AI-driven services must ensure inclusivity across racial, gender, socio-economic, and geographic diversities.

3.3 ***Social Inclusion***: AI solutions must proactively address marginalization, leveraging innovative techniques to promote empowerment and community development.

4. The Role of Governance Frameworks

Governance frameworks are integral to embedding ethical practices in AI deployment. Public sector governance includes two key dimensions:

4.1 Governance of People: Training public officials on AI use, ethical protocols, and decision- making processes to ensure effective implementation of AI systems.

4.2 Governance of Processes: Establishing standards for AI system development, operational guidelines, data integrity protocols, and societal impact evaluations. FLORIDI (2018) emphasized that socially responsible AI outcomes depend on balancing benefits against potential harm. While adherence to the law provides minimum compliance, ethical and impactful governance frameworks drive maximum societal benefits.

5. Socio-Technological Implications and Inequality Mitigation

Governance frameworks must integrate mechanisms to manage socio-technological implications. Unchecked AI deployment risks reinforcing inequalities. Algorithmic systems relying on historic datasets often replicate societal biases and exclusions. Effective mitigation strategies include: a) Scrutinizing and correcting biases in algorithmic training; b)Ensuring equal access to optimized and AI-enhanced public services; c)Promoting inclusive social advancements by designing solutions tailored to marginalized communities.

Moreover, enforcing stringent oversight mechanisms guarantees transparency in algorithmic processes and achieves accountability in service delivery. The OECD highlights technology governance as crucial to safeguarding shared values, protecting human rights, and building resilient societies. Governance structures must adapt to the socio-technological landscape to maintain their relevance and efficiency.

6. International Perspectives on AI Regulation

Globally, approaches to AI regulation vary significantly. The European Union's comprehensive AI Act

emphasizes risk mitigation but has faced criticism for restricting innovation. In contrast, the United Kingdom shifted towards prioritizing technological advancement in 2025. Similarly, the United States revised its stance by adopting innovation-centric policies under the Trump administration, eliminating pre-market AI safety protocols and emphasizing economic growth.

The divergence in international regulatory models presents both challenges and opportunities for Brazil. As a developing nation reliant on imported hardware and limited technological resources, Brazil must adopt a balanced regulatory framework that fosters innovation while safeguarding against risks. Collaborative efforts, leveraging global frameworks and addressing localized priorities, can propel Brazil toward effective and inclusive AI governance.

7. Methodology

This study employs bibliographic research under a hypothetical-deductive method, analyzing international frameworks and adapting them to public sector needs in Brazil. This methodology ensures alignment with global standards while addressing unique national challenges, building a customized governance model.

Concluding Remarks

The application of AI in the public sector demands responsible governance and practices that prioritize equity and mitigate inequalities. Governance structures must emphasize inclusivity, transparency, and accountability, ensuring AI benefits are fairly distributed while safeguarding citizens' rights. By fostering multistakeholder participation—uniting public authorities, private sectors, and civil society—Brazil can create a governance model that balances efficiency, justice, and ethical responsibility. This commitment to sustainable AI development is vital for advancing toward a more equitable and resilient society.

Abstract. The visualization of judicial statistics is a new form of judicial openness in the era of big data, which is of great significance for the public to understand judicial dynamics and maintain judicial fairness. The study finds that neither the Supreme Court of China nor the U.S. Supreme Court provides a dashboard of judicial statistics, but the frequency of data updates in the United States is quarterly, and in China, it is updated in the form of annual reports. Among the court web portals of 35 provinces (including Hong Kong, Macao, and Taiwan) in China, only 3 courts provide visualization of judicial statistics. Among the 51 state court web portals in the United States, 18 courts conduct visualization of judicial statistics. For dg.o attendees, this research offers unique insights into how the two countries approach the challenge of making judicial data accessible and understandable to the public.

Keywords. Judicial statistics; Judicial visualization; Judicial comparison between China and the United States; Judicial openness.
Poster, DOI: https://doi.org/10.59490/dgo.2025.929

1. From judicial openness to visualization of judicial statistics

As Louis Brandeis said, "Sunlight is said to be the best of disinfectants; electric light the most efficient policeman". In modern society, judicial openness brings transparency to the system. [1]Transparency is a crucial element in the judiciary to promote citizen confidence in courts and ensure fair case administration by court staff.[2] From a perspective of common sense, visualization facilitates users to intuitively understand the content of the data, and make vertical and horizontal comparisons to enhance the transparency and the efficiency of the judicial system. Marković and Gostojić think the set of statistics included in judicial visualization should at least include the results of court decisions, case registrations, archived document records, and statistics.[3]It is known from the relevant literature that the Israeli Supreme Court database is one of the few public multi-user datasets focusing on courts and judges and is very rich in judicial statistics[4]. Besides, Germany[5], the United Kingdom[6], the Netherlands[7], France[8], Switzerland[9] and Spain[10] have created dashboards for the visualization of judicial statistics.

Judicial dashboards[11] in the United States and China might keep up with this trend. In this paper, we investigate in detail the current situation of visualization of judicial statistics on the web portals of China's supreme court and provincial courts and those of the U.S. federal supreme court and state court portals, analyzing in depth the specific differences between the two countries. Then, we put forward suggestions for enhancing the level of visualization in the two countries.

As can be seen from inquiries into the laws of the two countries, both the United States and China have laws and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

regulations at the central level that require the disclosure of judicial statistics at all levels of the courts, with the specific requirement that they be disclosed on an annual basis. In China, *the Opinions on Further Deepening Judicial Disclosure* proposes the disclosure of judicial statistics in the form of a bulletin, and in the United States, the *Disclosure of Electronic Records* provision requires government agencies to make better use of electronic processing to request information.

2. Current Status and Problems of Visualizing Judicial Statistics in China and the U.S.

The research process was as follows: in the first step, the three researchers divided their work and queried the data dashboards on the websites of the central and local courts according to a uniform standard; in the second step, a senior researcher reviewed all the data; and in the third step, the data were updated.

2.1 Overview of the central-level judicial dashboard in China and the U.S.

According to the research, China's Supreme People's Court portal makes judicial statistics public in the form of an annual report but does not provide a visual interactive function, while the website of the United States federal courts provides quarterly updated case data.

2.2 Overview of the Provincial and State-level Judicial Dashboard in China and the U.S.

Below, we compare the visualization of Chinese and U.S. court statistics through the eight most typical aspects when evaluating dashboards. Specific data are presented in Tables 1 & 2.

(1) Whether data are province-wide (state-wide) integrated

The integration of judicial statistics enables the data of courts at all levels to be displayed through a unified platform, which not only facilitates the search of judicial data by various groups of people but also accelerates horizontal comparison.

(2) Data are displayed with several dashboards

Provincial courts in China mostly use a single dashboard on the portal, while U.S. state courts mostly use a combination of multiple dashboards. The more dashboards of judicial statistics, the more detailed classification standard of the data, and the easier it is for all kinds of people to retrieve the data. However, the overly cumbersome classification standard of judicial statistics increases the difficulty of the statistical work.

(3) Whether the data comes from the local self-construction

In the author's view, the unified construction of the judicial statistics platform gives full play to the central court's function of leadership for local courts, while reducing the burden of local courts on the construction of statistical platforms, and helps to unify statistical standards to achieve comparative analysis. However, the statistical platform built by the local courts may be more flexible and innovative.

(4) Whether the data are from a single department

The advantage of multisectoral statistics over single-sector statistics is that the statistical process tends to be characterized by "objectivity, comprehensiveness, and mutual supervision". It is important to restrain the power of single-sector openness of judicial statistics, increasing the credibility of the whole system.

(5) Update Frequency

The Update frequency in China's provincial courts is significantly lower than the one in the U.S. state courts. The higher the update frequency, the more it can reflect the "dynamic" character of local judicial statistics. High-frequency updates of judicial statistical data can enhance judicial transparency and strengthen judicial authority.

(6) Lowest Court Level

The judicial data of each judge in the lowest court can be displayed to the public. The authors believe that each citizen can not only feel the importance of the local judicial system while the judge is coping with cases but also better realize justice for the people when the judicial statistics open towards the level of individual judges.

(7) Case Status

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Among provincial courts in both China and the U.S., there are differences between the divisions of case status. The classification of case statuses in judicial statistics should be tailored specifically to each country and align with the legal and judicial background of the country.

(8) Availability of Before-and-After Comparison of Data

Only one court in China (Zhejiang Province[5]) has time comparisons of judicial statistics. The provision of the comparisons of judicial statistics is conducive to the understanding of the public in the operating trends of the judicial system. It also facilitates the analysis of data compiled by professionals and makes it easier for judicial management to formulate scientific and reasonable countermeasures.

3. Suggestions for visualization of judicial statistics

Three recommendations for Chinese courts are as follows:(1) Legislating regulations on the openness of judicial statistics and establishing a standardized platform for the visualization of judicial statistics nationally. (2) Establishing a sound mechanism for disclosure upon request in the judicial system.

Three recommendations for U.S. courts are as follows: (1) Promoting the construction of visualization dashboards to popularize them nationwide. (2) Constructing a common standard for judicial data disclosure to facilitate public comparisons.

4. Conclusion

The visualization of statistical data in the courts is a new form of disclosure in the era of big data. It plays a crucial role in helping the public understand the court's operations and upholding justice. Currently, disparities exist between Chinese provincial courts and American state-level courts in terms of statistical data visualization. These differences are primarily manifested in the quantity of data dashboards, the frequency of data updates, the number of case classifications, and the case statuses presented. Both countries still have a long journey ahead in building effective dashboards for their courts.

ARGOS: A Human-in-the-Loop ML System for Legal Aid Classification in Espírito Santo

Eduardo Pacheco[a]

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 19 May 2025

Abstract. We present the modeling of an AI system named ARGOS to classify free legal aid requests in the Court of Justice of Espírito Santo (TJES). The model replicates the decision-making pattern of a judge from the 6th Civil Court of Vila Velha, developed within Challenge 16 of PitchGovES by Atlas.IA, promoted by the State Management Laboratory of Espírito Santo (Lab.ges). The challenge proposed an automated solution to assess applicants' eligibility by cross-referencing multiple data sources to support judicial decisions. The approach consists of three key components: (i) a machine learning model for classifying requests, (ii) an information retrieval engine to support the model, and (iii) an explainability mechanism to justify decisions. A global model for TJES was initially considered but discarded due to legal and technical constraints. Instead, a judge-specific model was developed to align with the principle of Judicial Independence in Decision-Making. Model development began with analysing past judicial decisions, classifying requests as granted or denied. A significant challenge was data imbalance, as requests were not evenly distributed across classes. To address this, balancing techniques and feature selection methods were applied. Various machine learning algorithms, including decision trees and deep learning models, were tested. The final model balanced accuracy and interpretability, ensuring magistrates could understand the factors influencing decisions. The second component involved creating an information retrieval engine to supplement applicant data. Given that free legal aid assessment relies on financial capacity, the tool gathered external data. However, access to government databases was restricted, so alternative sources were used, including public income records, social assistance histories, and judicial metadata. The solution comprises four modules: applicant data capture, a dashboard, a decision interface with model training, and a recommendation system. The initial implementation achieved 81.3% balanced accuracy, surpassing the 70% target, demonstrating potential for broader judicial adoption.

Keywords. Machine Learning, Legal Decisions
Poster, DOI: https://doi.org/10.59490/dgo.2025.930

1. Introduction

The right to free legal aid is fundamental for ensuring equal access to justice, particularly for economically disadvantaged individuals. In Brazil, courts face a growing demand for legal aid requests, requiring judges to evaluate the financial conditions of applicants while maintaining efficiency and fairness. TJES is no exception, and optimizing the analysis of these requests has become a pressing issue.

To address this challenge, the PitchGovES initiative, led by the Lab.ges, launched Challenge 16, which called for innovative solutions to improve the evaluation of free legal aid requests. The core question posed was: How can access to justice be facilitated through a model that assesses whether a request should be granted, cross-referencing multiple data sources to justify its decision? The winning proposal, developed by ATLAS.IA, aimed to build an AI-powered system to support judicial decision-making in this context.

Our project ARGOS, selected as the winner of the challenge, proposed the development of an AI-powered system with Human-in-the-Loop approach capable of classifying legal aid petitions as “granted” or “denied” to facilitate decision-making in current cases based on historical judicial behavior. The system integrates a

[a] Data Scientist at Atlas.IA (www.atlasia.tech) , São Paulo, Brazil. edu@atlasia.tech. ORCID: https://orcid.org/0009-0007-9887-9189
Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

machine learning model trained on judicial decisions, an information retrieval engine to augment petitioner data, and a layer of explainability to ensure transparency and accountability. Rather than proposing a global model for the entire judiciary, we chose to replicate the decision-making logic of an individual judge from the 6th Civil Court of Vila Velha based on the rationale that each judge requires a personalized model. This design respects judicial independence, keep the judge at the center of the decision-making process aligning with legal and institutional principles while delivering practical benefits. The proposed system adheres to the guidelines for Trustworthy AI developed by the European Commission (2019), which emphasize human agency, transparency, and accountability. In line with these principles, our approach embeds a Human-in-the-Loop model that ensures judicial autonomy is maintained, while enhancing the quality and consistency of decision-making. As Bekkerman (2021) argues, HITL approaches are essential when deploying ML systems in high-stakes domains such as healthcare, finance, or law, enabling oversight and fostering trust in automated tools.

1.1 Project Scope and Objectives

We propose automating judicial decisions by replicating the individual decision patterns of each judge. This can increase efficiency in judicial services and allow judges to dedicate more time to analyzing the merits of each case. This can be addressed by a machine learning model that learns the judge's decision-making patterns and optimize public resource allocation, generating benefits for society as a whole. It is possible to avoid wasting scarce resources—such as judicial time—on tasks that could be automated. It is also possible to enhance the data available by data enrichment from external sources that either corroborate or contradict the petitioner's claims, enabling more informed decision-making. The proposed system was structured around two main components: 1. **machine learning model** trained to classify legal aid requests as granted or denied, based on historical judicial decisions. 2. An **information retrieval engine** that collects external data to supplement the analysis. This system must also enhance **explainability** and enforce transparency to help users to justify the decisions.

A key challenge in designing the system was determining whether a global model for the entire court could be developed. However, legal and technical constraints led to the decision to focus on modeling the decision-making patterns of a single judge. This approach aligns with the principle of Judicial Independence in Decision-Making, ensuring that each magistrate retains autonomy in their rulings. Judges typically rely on the information provided in the initial petition to evaluate a legal aid request. However, applicants may omit or misrepresent financial details, leading to potential inaccuracies in judicial decisions. The project aimed to expand the data sources available to judges, supplementing the petition with external financial and social data. An information retrieval engine was developed to collect relevant data, including: 1. Public salary records of federal and state executive branch employees 2. Social assistance histories, such as Bolsa Familia and Emergency Aid 3. Metadata from previous legal proceedings, including records from the Public Defender's Office. Despite efforts to access government databases, legal and technical barriers restricted direct integration with certain financial records, such as tax returns and property registries. As a result, alternative web-crawling techniques and APIs were utilized to gather publicly available data. The developed solution, ARGOS, integrates multiple components into a comprehensive decision-support system. The platform consists of four key modules: 1. Data Capture – Extracts structured information from the initial petition and external sources. 2. Dashboard – Consolidates relevant data into a user-friendly interface for judicial review. 3. Decision Interface – Enables judges to classify requests and fine-tune the AI model. 4. Recommendation System – Provides AI-generated predictions to streamline decision-making.

2 Data

At the final stage, the data from all collected sources was combined and processed to represent a legal aid request, stored in the "request" table with the following fields:

Field	Description
Total income	Sum of the applicant's declared income and external sources
Has income	Boolean indicating whether the applicant has a registered income
Has public defender	Indicates whether the applicant has been assisted by a public defender
Has social vulnerability	Self explanatory
Has debt	Self explanatory
Total Debt	Total amount of debt recorded for the applicant
Has expenses	Boolean flag indicating if the applicant has reported expenses
Has assets	Boolean flag showing if the applicant has registered assets
Total assets	Sum of the applicant's registered assets and external sources

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Occupation	The applicant's employment status or job category
Decision	Target variable, indicating whether the request was granted or denied.

Tab. 1 – Features and target label of the machine learning model

2.1 Exploratory Data Analysis

Income distribution showed a predominance of low-income petitioners, consistent with the target demographic of public legal aid policies. However, cross-variable analysis raised inconsistencies: while most applicants declared minimal income, some reported high levels of expenses or debts that seemed disproportionate. Histograms of total debt and total expense distributions highlighted this gap. While most petitioners reported low or zero debt, many also reported unusually high expenses. This discrepancy suggested either incomplete or inaccurate self-reporting, reinforcing the need for external data verification.

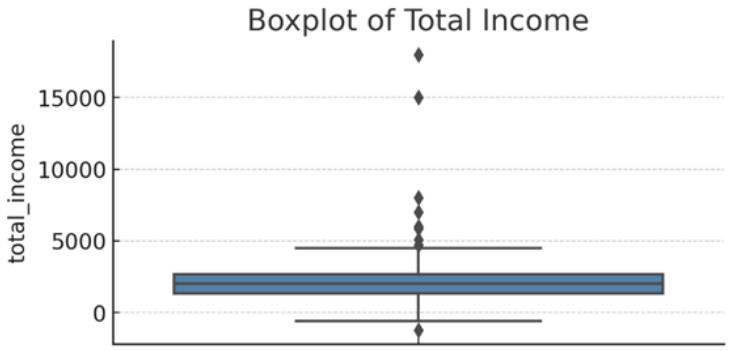

Fig. 1 - Total Income

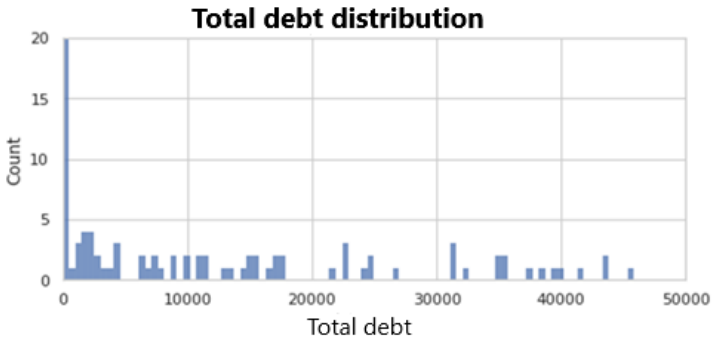

Fig. 2 - Total Debt

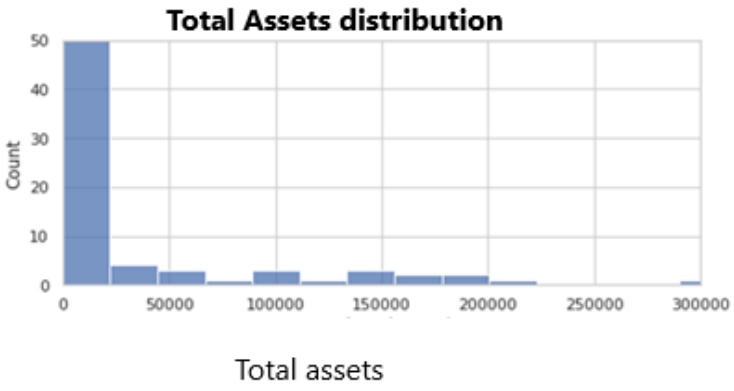

Fig. 3 - Total Assets

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

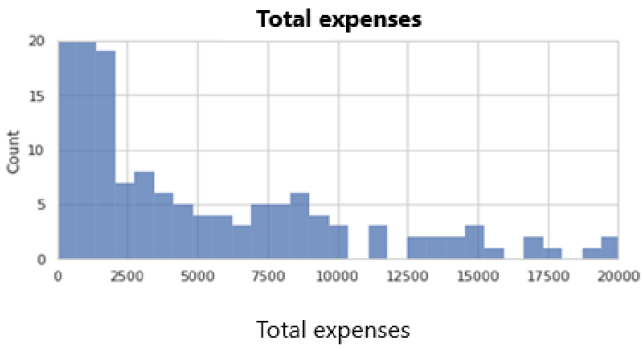

Fig. 4 - Total Expenses

Similarly, the distribution of total assets confirmed that most applicants owned few or no significant properties or financial holdings, yet there were outliers. These insights informed the feature selection process and pointed to the potential benefit of integrating external databases to validate self-declared information.

3 Modeling Approach

The modeling strategy followed a structured pipeline: 1. **Baseline Creation** – A dummy classifier always predicting the majority class ("granted") was used as a lower performance bound 2. **Preliminary Models** – Linear models such as logistic regression (Hosmer, Lemeshow, & Sturdivant, 2013), support vector machines (Cortes & Vapnik, 1995), and K-nearest neighbors (Altman, 1992) were tested to assess model fitness. 3. **Decision Tree Models** – Given their explainability, several decision tree-based (Quinlan, 1986) models were trained and fine-tuned via grid search 4. **Ensemble Models** – Random forests (Breiman, 2001) were evaluated to identify whether ensemble techniques (Breiman, 1996) improved predictive power 5. **Evaluation** – Models were evaluated using accuracy, balanced accuracy, and AUC under 10-fold cross-validation and hold-out test sets. The final training set comprised 85% of the dataset, with the remaining 15% held out for testing. Stratification ensured that class balance was preserved in both partitions.

4. Model Performance

The baseline dummy classifier achieved 63% accuracy and 50% balanced accuracy—highlighting the challenge posed by class imbalance. Logistic regression improved upon this with 71.7% test accuracy and 75.2% balanced accuracy. Support vector machines and KNN performed comparably, though KNN was more computationally intensive. Decision trees emerged as the most promising model class due to their transparency. A tree optimized via grid search (with max depth = 9 and min samples per leaf = 8) achieved 73.3% test accuracy and 77.9% balanced accuracy. Feature importance analysis revealed that income, unemployment status, and educational attainment were significant predictors.

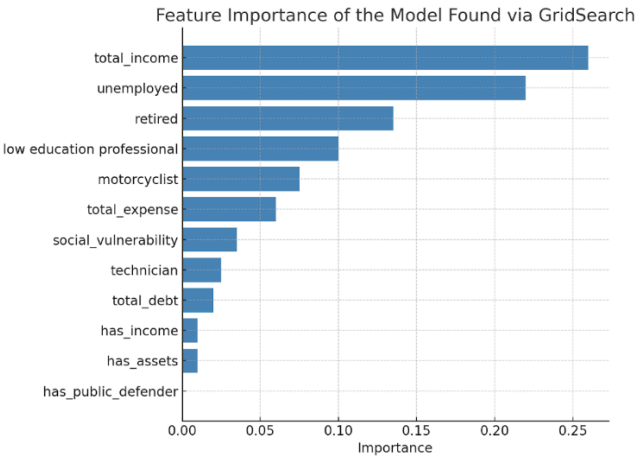

Fig. 5 - Feature importances of Decision Tree model

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Random forests slightly outperformed decision trees in certain metrics and exhibited superior performance in low false-positive regions of the ROC space. However, decision trees were favored for high true-positive rates and greater interpretability. The model's ability to identify denial cases improved markedly over the baseline.

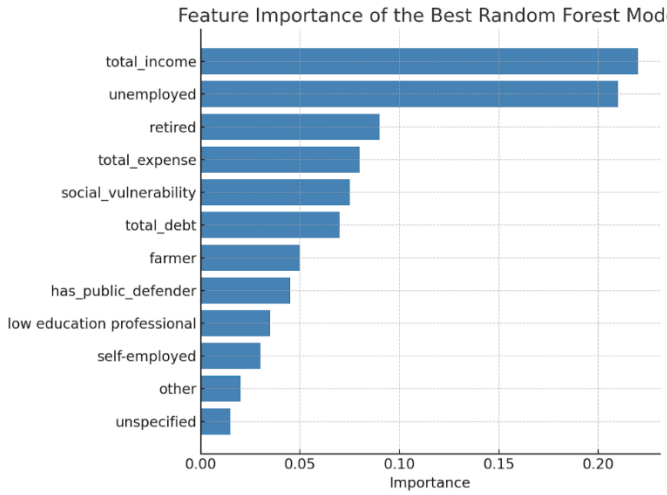

Fig. 6 - Feature importances of Random Forest model

After training all candidate models we then compared the top-performing models. The following picture shows the results.

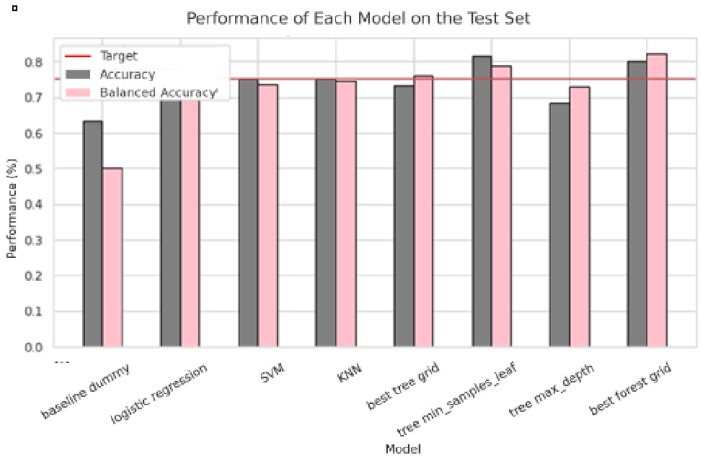

Fig 7 - Comparison of best models

ROC curves confirmed these findings, with decision trees and random forests significantly outperforming KNN.

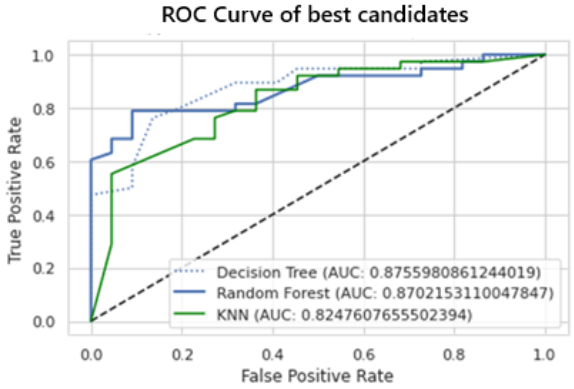

Fig 8 – ROC and AUC of best candidates

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Confusion matrices indicated that the decision tree was more conservative (favoring grants), while random forests were more effective in denying non-eligible requests.

5. Discussion

Across all evaluation metrics, decision tree and random forest models emerged as the best-performing options. Decision tree model achieved the highest balanced accuracy and was better suited for legal contexts where minimizing false negatives (wrongly denying aid) is paramount. Model performance on the test set was summarized as follows: **Decision Tree**: 81.66% acc, 78.82% balanced acc; **Random Forest**: 80% acc, 82,29% balanced acc. Slightly higher performance in low-FPR zones, better at correctly denying aid. These results confirmed the validity of the proposed approach and its potential applicability to other judges or courts.

6. Next Steps and Policy Considerations

From a technical standpoint, the system could be improved through the use of ensemble methods such as Boosting or Stacking. However, these enhancements must be weighed against the loss of interpretability. We argue that explainability can be preserved through global feature importance analysis and counterfactual explanation tools. SHAP-IQ (Fumagalli et al., 2023) methods must be explored to better-grounded explainability. Another major frontier for improvement lies in feature quality. The inclusion of more granular asset data—such as vehicle ownership and real estate—would provide stronger predictive signals. As these features were underrepresented in the current dataset, they had limited influence on model performance. Access to such data is legally possible and technically feasible via integration with existing government platforms. On the systems side, user interfaces could be optimized based on feature relevance. We also propose the development of a *decision draft generator*—a system that automatically prepares preliminary judicial decisions for review—thus saving time while maintaining final control with human judges.

7. Conclusion

This project demonstrates the feasibility and utility of modeling judicial behavior through machine learning, with direct application to legal aid classification in the Brazilian judiciary. By combining historical decision analysis, external data retrieval, and interpretability techniques, the ARGOS system provides a powerful tool for increasing efficiency and transparency in legal decision-making. More broadly, the experience highlights how AI can respect legal autonomy while delivering practical benefits to public administration. The approach taken here—replicating an individual judge's logic, rather than imposing a top-down standard—offers a scalable, ethically sound model for digital governance. As courts worldwide face growing caseloads and limited resources, systems like this one represent a compelling frontier for responsible and human-centered AI in the public sector.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 19May 2025

Abstract. Smart Sustainable Cities (SSCs) integrate technology, governance, and sustainability to address urban challenges and improve citizens' quality of life. However, the understanding of SSCs varies depending on local contexts and stakeholders' perspectives and is often technocentric. This study presents preliminary findings on how local authorities in Porto Alegre (POA), Brazil, understand smart sustainable cities, analysing their perceptions and interpretations of this evolving urban model. This study addresses the following research question: What does "smart sustainable city" mean to local authorities in Porto Alegre? Using a qualitative approach, fifteen interviews with key officials from different city departments provide preliminary insights into how SSCs are framed beyond technological advancements illustrating examples of initiatives that contribute to Porto Alegre's transition towards an SSC. While technology plays a role, local authorities emphasise inclusive governance, innovation, data-driven decision-making, education, collaboration, citizen-centricity, and integration as central to their vision of a smart sustainable city.

Keywords. Smart city, smart sustainable city, urban innovation.
Poster, DOI: https://doi.org/10.59490/dgo.2025.935

1. Introduction

Smart Sustainable Cities (SSCs) is a prominent concept in urban development, aiming to leverage technology and data to improve residents' quality of life, promote economic growth, and ensure social development and environmental sustainability (Bibri & Krogstie, 2017; Höjer & Wangel, 2015; Pereira & de Azambuja, 2021). Even though many authors have sought to conceptualize the smart (sustainable) city concept, it remains it still lack a single definition (Albino et al., 2015; Dameri, 2013; Kummitha & Crutzen, 2017; Yeh, 2017).

This paper presents the preliminary findings of a case study from Latin America—Porto Alegre—using primary data collected through fifteen in-depth interviews. The aim of this study is to understand the perception of local authorities in Porto Alegre on smart sustainable cities and to identify key initiatives and projects. This study addresses the following research question: **What does "smart sustainable city" mean to local authorities in Porto Alegre?**

Local authorities are at the forefront of urban governance, responsible for planning, resource allocation, and service delivery, directly impacting the lives of citizens. Therefore, understanding their perceptions regarding SSCs is important for the successful implementation and adaptation of smart and sustainable cities. Their insights can help identify key initiatives, challenges, opportunities, and best practices, ensuring that technological advancements align with community needs and policy objectives.

2. Research Methods

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

This study adopts a qualitative approach, utilizing the case study method. This approach was chosen because it is particularly effective for exploring contemporary phenomena and aims to offer a comprehensive and detailed description of a case (Yin, 2018).

2.1 Case Selection: Porto Alegre

Porto Alegre, the capital of Rio Grande do Sul, Brazil's southernmost state, boasts a rich history and a vibrant contemporary profile. While its founding dates to 1769, the official establishment is celebrated on March 26, 1772. Home to approximately 1.5 million people, it ranks as the twelfth most populous city in Brazil, with its metropolitan area encompassing a substantial 4.5 million residents. The selection of Porto Alegre as a case study is justified by the need to explore smart sustainable cities in developing countries and by the city's distinctive socio-economic and cultural characteristics. Moreover, Porto Alegre nurtures a thriving innovation ecosystem counting with renowned universities that contribute to a dynamic pool of young talent. Two major technology parks, Zenit and TECNOPUC, exemplify the commitment to innovation with TECNOPUC recognized as one of the nation's leading incubators for technological advancement. A recent report announced the city as the second most competitive capital in Brazil (Pacto Alegre, 2025). These attributes position Porto Alegre as a compelling example for studying the challenges and opportunities associated with implementing smart city frameworks in comparable contexts.

2.2 Data Collection and Analysis

The data collection of this study happened from 2022 to 2024. The first round of interviews was conducted in 2022 and additional ones in 2023 and 2024. In total, 15 interviews have been conducted in Porto Alegre, eleven in person and four online via video call. The interviews were guided following a semi-structured interview protocol. The topics included in the protocol have been selected based on the SSC drivers and barriers identified through a previous study (Azambuja, 2021). Each interview lasted between 60 and 90 minutes. All interviews were transcribed for analysis, and interviewees were assigned unique codes (INT#1–INT#15) to maintain confidentiality.

3. Preliminary Findings

3.1 Smart Sustainable Cities: Perspectives of Local Authorities

The following table presents the perspectives of local authorities in Porto Alegre on what constitutes a 'smart sustainable city' and key characteristics.

Tab. 1 Perspectives of local authorities on SSC

Perspectives on Smart Sustainable Cities	Key Characteristics	Interviewee
"… is one that can use data to identify and address issues, with agencies working together rather than in silos."	Integrated, Collaborative, Data-driven	INT#1
"… bring citizens into a place of collaboration, not just reacting to individual problems, but contributing to the city as a whole."	Citizen-centric, Collaborative	INT#2
"Coordinates public policies to manage the collective intelligence of the city, enabling people to enter a virtuous cycle of production, sharing, and well-being."	Collective intelligence, Collaborative, Citizen-centric	INT#3
“Needs to be coordinated and connected, with a clear understanding of its resources and capabilities before implementing new technologies.”	Strategic planning, Connectivity	INT#4
"It's more of a journey than a destination. Smarter cities are those that are constantly improving and becoming more sustainable."	Sustainable, Continuous improvement	INT#5
"A city that uses data, technology, and relationships to truly solve people's problems when they occur."	Citizen-centric, Data-driven, Collaborative	INT#7
"A smart city has integrated databases accessible to citizens, with easy connections, and is extremely simple for everyone to use, regardless of their level of knowledge."	Accessibility, Integrated, Inclusive	INT#8
“It starts with education and connectivity. We need to connect with citizens and understand their needs and expectations."	Education, Connectivity, Citizen-centric	INT#9
"... it should use all the tools and technology to analyse, formulate, quantify, control, and monitor the impacts of its actions."	Citizen-centric, Data-driven, technologically advanced	INT#10

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

"A smart city is a city where freedoms are respected, and the main element is the citizen, not the public authority."	Citizen-centric, Individual freedom	INT#11
"A smart city is a planned city... with continuity of planning. It uses technology to provide digital services and is less bureaucratic."	Continuous Improvement, Less bureaucracy	INT#12
"A smart city is a collaborative city... where we can exchange resources and knowledge with other cities."	Collaborative, Knowledge sharing	INT#13
"A smart city is a city that has the citizen at the centre of everything... with initiatives in health, safety, and education."	Citizen-centric	INT#14
"The first thing that comes to my mind is digital inclusion... A smart and sustainable city is one that thinks about digital inclusion."	Inclusion, Citizen-centric	INT#15

As seen, most of the interviewees mentioned the importance of a citizen-centric approach for the success of smart sustainable cities. According to the results, citizen needs are crucial for the planning of actions. Another important finding is the strong link of SSC development the of education. As mentioned by one interviewee "cities cannot be smart without smart people, because ultimately, it needs people". Furthermore, smart people are the ones able to create a "virtuous cycle of production", which is crucial for a sustainable development.

3.2 Key Initiatives contributing to Porto Alegre's transition

Porto Alegre have been developing several initiatives ranging from technology-driven solutions to community-centred projects. Table 2 outlines a summary of initiatives mentioned by the interviewees.

Tab. 2 Key Projects and Initiatives in Porto Alegre

Initiative/Project	Category	Short Description	Evidence
100% Digital Licensing	Urban Planning	Online platform for urban licensing, streamlining processes and reducing bureaucracy.	INT#7
156 and Central do Cidadão	Citizen Services, EGOV	Integrated platform for citizen service requests and information.	INT#1, INT#2, INT#3, INT#9, INT#10
Carta de Serviços (Service catalog)	Citizen Services, EGOV	Online list of all services provided by the city, with details and instructions.	INT#1
Cidades Educadoras (Educating Cities)	Education, Inclusion	International network of cities promoting education and citizen engagement.	INT#2, INT#3, INT#5
CEIC	Public Safety, Mobility	Using smart cameras for public safety and traffic control.	INT#7, INT#8
Concession of Parks and Green Spaces	Living	Ensuring maintenance and investment in parks and green spaces.	INT#8
Luz do Saber	Environment	Project using solar energy in schools.	INT#4
Open Data Portal, ObservaPOA	EGOV	Platform that makes public data available for consultation and download.	INT#2, INT#5, INT#8, INT#10
AI Optimization of Public Services	AI and Efficiency	Using AI to optimize resource allocation and improve service efficiency.	INT#8
Pacto Alegre	Economy, Education, Living	Platform for collaboration between government, universities, and businesses to promote innovation.	INT#3, INT#4, INT#5, INT#6, INT#8
Sala do Empreendedor (Entrepreneur's Room)	Economy	One-stop shop for entrepreneurs to access information and services.	INT#11, INT#15
Smart Cities Hub	AI, Urban Services, EGOV	Collaborative hub for developing and implementing AI solutions for smart cities.	INT#13, INT#14
Smart Urban Services	Urban Services	Using technology to optimize garbage collection, public lighting, and road maintenance.	INT#8

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Strategic Project Management System	Strategic Planning, EGOV	System for managing and monitoring the city's strategic projects.	INT#10
Telemedicine and Digital Health	Health	Using technology to improve healthcare access and efficiency.	INT#3, INT#5, INT#9, INT#10, INT#15
Territórios Inovadores (Innovative Territories)	Innovation and Entrepreneurship	Promoting innovation and entrepreneurship in different neighbourhoods.	INT#13
Urban Revitalization Projects	Environment, Economy	Revitalising the Historic Centre and Quarto Distrito to attract investment and improve quality of life.	INT#8, INT#11
WI-FI extension	Inclusion	Providing free Wi-Fi in vulnerable areas to promote digital inclusion.	INT#13

Among the most notable initiatives mentioned by the interviewees is the Pacto Alegre, a collaborative framework that fosters innovation and entrepreneurship by promoting collaboration between universities, companies, and the government. INT#5 highlights the importance of Pacto Alegre as a "platform for coordinating various actions," driving economic development and creating a "future-oriented" perspective. This initiative was inspired by various global examples being influenced by international experiences, particularly from cities like Barcelona, Medellín, and Israel, but was uniquely shaped by Porto Alegre's local needs and experiences, explains INT#5. The Cidades Educadoras project is part of the Pacto Alegre and focuses on educating citizens about their rights and responsibilities in urban development, promoting civic engagement through various programs.

Other key initiative is the Central do Cidadão (156web and mobile app), which is an evolution of the 156 Fala Porto Alegre which enable citizens to report urban issues such as streetlights, waste collection, and road conditions. INT#1 explains that 156 "integrates different communication channels" and "forwards demands to the responsible secretariats," making public services more accessible and efficient. Moreover, Porto Alegre has been investing in smart urban services, implementing initiatives like intelligent garbage collection (not yet in all regions) and public lighting systems. INT#8 mentions these projects as examples of how technology can be used to improve efficiency and resource management in urban services.

Urban revitalization projects like the revitalization of the Historic Centre and Quarto Distrito were also mentioned as capable of promoting economic development. INT#8 emphasizes the importance of urban revitalization for attracting and retaining talent, stating that "talents are attracted by these interesting places". Moreover, the city also counts with mobility related efforts to improve public transit systems, including smart traffic management and app-based ticketing solutions and a huge Integrated Centre of Command (CEIC). CEIC is a facility that integrates various municipal departments to monitor and manage city services. In recent years, the CEIC has expanded its capabilities by installing interactive security totems to enhance public safety.

4. Preliminary Conclusions and Future Work

This research, based on interviews with 15 key representatives from various municipal departments in Porto Alegre, has provided valuable preliminary insights into the perceptions of local authorities regarding smart sustainable cities (SSCs) within the specific context of a city in the Global South. The preliminary analysis the interviews, revealed a diverse range of definitions and key characteristics associated with SSCs, laying the groundwork for a more comprehensive understanding.

For Porto Alegre's authorities, a smart sustainable city is fundamentally citizen-centric, prioritising residents' needs, well-being, and active participation. Additionally, authorities recognise education and engagement as critical components, ensuring that citizens are informed, empowered, and involved in shaping urban development. Several initiatives illustrate Porto Alegre's commitment to this vision. Platforms such as the 156 Service and Central do Cidadão improve citizen access to information and municipal services. Pacto Alegre fosters cross-sector collaboration to drive innovation, while Cidades Educadoras promotes civic engagement through education. Urban revitalisation projects enhance public spaces for community use, and digital inclusion programmes work to bridge the digital divide. However, despite these advancements, significant challenges persist, which are going to be discussed in a future work.

In terms of contributions, this paper presents examples of key initiatives currently in place in Porto Alegre that, according to local authorities, are contributing to the city's development towards becoming a smarter and more sustainable one. Future studies could explore one of the key initiatives presented in Table 2 in greater depth to

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

investigate implementation challenges and successful practices. Further research is also encouraged to analyse public perceptions of the city's initiatives and projects, as well as to evaluate their tangible impact on citizens' lives.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 22 May 2025

Abstract. Evidence-based policy-making in public procurement depends on high-quality data. This case study evaluates 14 months (Nov 2023–Jan 2025) of procurement records from the EU's Tenders Electronic Daily (TED) to assess the reliability of this key data source. Our analysis uncovers significant anomalies in data accuracy and governance, raising concerns about the integrity of procurement processes and the policies built on them. We highlight the urgent need for improved data governance to support transparency, accountability, and innovation-driven procurement.

Keywords. e-procurement data, government data, data governance, public procurement.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1019

1. Introduction

Public procurement plays a key role in policy-making by directing demand that can drive innovation among suppliers (Amann and Essig, 2015; Bleda and Chicot, 2020). Effective and fair procurement depends on accurate assumptions about market structures and behavior, which require systematic analysis of reliable data. Open Government Data (OGD) from e-procurement portals provides a valuable basis for such analysis, offering insights into supplier participation, market dynamics, and procurement trends. Although OGD can improve transparency and efficiency, concerns about data quality may limit its usefulness (Zuiderwijk and Janssen, 2014). This study addresses the following research question: "How good is the data quality of data provided by e-procurement portals?" We analyze public procurement data from a European OGD platform, focusing on tender awards and contract notices. The aim is to assess data quality and inform evidence-based policy-making. Our findings point to the need for more consistent data maintenance, including clear standards and controls for publishing procurement data.

2. Relevant Theory & Literature

The intersection of OGD and e-procurement has attracted significant scholarly attention (Attard et al., 2015; Zhenbin et al., 2020. OGD involves the proactive release of government-held data to promote transparency, innovation, and accountability (Charalabidis et al., 2016). While its benefits are well documented — political, economic, and operational improvements (Janssen et al., 2012) — research also highlights its risks, including privacy issues, misinterpretation, and inequalities (Zuiderwijk and Janssen, 2014).
Integrating OGD with e-procurement systems can improve efficiency and reduce corruption. Adoption, however, depends on technical, organizational, and policy factors Wang and Lo, 2016). Yet, without high data

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

quality, such integration may fail to deliver set goals.
Data quality remains a central concern in OGD, with dimensions such as accuracy, completeness, consistency, timeliness, and accessibility frequently cited (Batini and Scannapieco, 2016; Heinrich et al., 2017).

3. Data and Methodology

This study combines procurement data from the TED portal and firm-level data from Moody's Orbis, covering November 2023 to January 2025. Historical exchange rates from the UN Treasury were used to standardize contract values. The TED dataset includes 1.7 million contract and award notices, of which 939,165 are unique. Winner information is available in 259,487 notices, identifying 496,445 winners (209,464 unique). Orbis provides validation and geographic details for 471,303 entities. CPV codes classify 82.1% of notices, but only 27.6% disclose winner data. Value reporting is concentrated, with 93.9% of tenders falling between €4,544 and €63,379,652. Data was retrieved via the TED Search API in JSON format.

4. Results

The dataset exhibits major anomalies in total value (Fig. 1, Fig. 2). To address these, we excluded contracts with non-positive values and conducted comparisons between the full dataset and a filtered subset limited to the interquartile range (IQR).

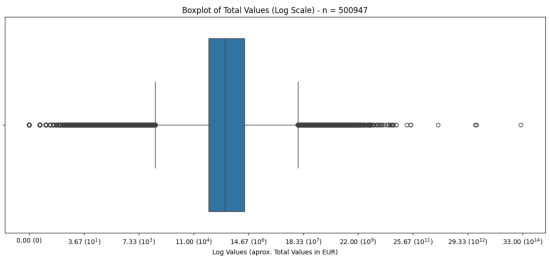

Fig. 1 – Boxplot of log scaled total values

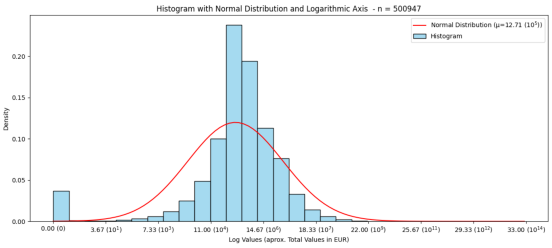

Fig. 2 – Log-transformed distribution of contract values

In the unfiltered dataset (a1, $n = 859{,}929$), Germany accounted for 19.98% of tender lots, followed by Poland (12.34%) and France (11.92%). Eastern Europe, including Poland, the Czech Republic, Romania, and Bulgaria, contributed 26.99%. After filtering out zero-value entries (a2, $n = 491{,}763$), Germany's share dropped to 9.29%, with only 45,675 of its 171,807 lots reporting a valid value. This highlights major gaps in the German data. We then compared total market volume before and after value filtering. Without restrictions (b1), the total reached €215.97 trillion, which is clearly inflated. According to the European Commission, public procurement comprises about 14% of EU GDP. Based on 2024 AMECO data (€14,122.3 billion at constant prices), this would suggest a procurement market of around €1,977.12 billion (€2,533.52 billion at current prices). Filtering to €4,544–€63,379,652 (b2) yields a revised volume of €1,256.46 billion, more aligned with expectations. Figures 1 and 2 show a right-skewed distribution with extreme outliers. Filtering changes the composition significantly. Germany's tender share drops by over 10 percentage points, and similar effects are seen in other indicators. German companies appeared as winners in 19.17% of contracts overall, but this fell to 10.92% after filtering. The average value of lots won by German firms or consortia including them was €2.51 million, dropping to €1.62 million after cleaning. These figures reflect inconsistencies due to both participation and poor data quality.

We analyzed 771,016 contracts with CPV codes across three scenarios: all classified contracts, those with positive values, and those within the filtered value range. In all cases, Division 45 (Construction Work) was dominant. The second most frequent category changed from Division 33 (Medical Equipment) in Scenario 1 to Division 71 (Engineering Services) in Scenarios 2 and 3. These shifts reflect the effect of data cleaning on sectoral distribution.

Of the 939,165 unique notices, 168,149 lacked CPV codes, indicating substantial classification gaps in the dataset.

Tab. 1 – Distribution of tender lots per CPV-Code

CPV-Division Code	Scenario 1	Scenario 2	Scenario 3
45	18.19%	7.62%	6.95%
71	10.41%	5.04%	4.77%
33	10.30%	6.76%	6.36%
90	5.95%	3.25%	3.11%
79	5.08%	3.17%	2.93%
34	4.82%	2.66%	2.54%
72	4.65%	2.96%	2.79%
50	4.43%	2.78%	2.67%
30	2.52%	1.56%	1.44%
9	2.35%	1.48%	1.36%

5. Discussion & Conclusion

A key issue is the lack of benchmarks to validate total contract values. Without a ground truth, anomalies such as zero or extremely high amounts (e.g., €1 billion) are hard to interpret, raising concerns about accuracy and intent. Our comparisons showed that outliers distort results and can lead to misleading conclusions. Missing, false, or extreme values weaken data integrity and may mask actual spending or signal fraud. Transparency requires data quality, not just quantity. TED data reveals flaws in inconsistent metadata. Better governance, oversight, and institutional capacity are needed. High-quality data is essential for accountability, policymaking, and public trust. In conclusion, TED data quality is poor. Frequent missing values and outliers limit its value for analyzing procurement and undermine the credibility of e-procurement initiatives.

Abstract. This study investigates how co-creation is being institutionalized in public service delivery in Poland and Ukraine, focusing on six domains of citizen involvement: legislative frameworks, digital platforms, public consultations, civic monitoring, local initiatives, and civic education. These neighboring countries, connected through shared regional initiatives but shaped by differing political, administrative, and civic trajectories, offer a compelling basis for comparative analysis. While both have made strides in adopting participatory practices, Poland tends to follow a more structured, policy-aligned approach, whereas Ukraine exhibits dynamic, bottom-up developments driven by ongoing decentralization reforms. Our findings indicate that co-creation is becoming more systematically integrated into governance structures, although institutionalization remains uneven across domains and administrative levels. Key challenges include institutional fragmentation, limited translation of public input into policy outcomes, and underdeveloped interdisciplinary competencies, particularly in light of digital transformation and the growing role of AI. The paper concludes with practical recommendations for strengthening co-creation ecosystems in both countries.

Keywords. Public sector, co-creation, public services, institutionalization.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1017

1. Introduction

In recent years, co-creation has emerged as a key principle in the modernization of public service delivery, aligned with broader trends in digital transformation and democratic governance (Edelmann & Mureddu, 2023). Both Poland and Ukraine have made notable advances in digital public services and citizen engagement, supported by national strategies and cross-border initiatives such as Interreg NEXT Poland–Ukraine (*Interreg NEXT Poland – Ukraine 2021-2027*, 2023). While existing literature highlights the benefits of co-creation (Mureddu & Osimo, 2020; Rodriguez Müller et al., 2021) there is limited comparative research on how different countries implement and embed participatory practices across governance domains. Poland and Ukraine offer a particularly relevant case for such an analysis: Poland as an EU member state aligning with European standards of participatory governance, and Ukraine as a country navigating decentralization, digital reform, and institutional change under complex political conditions. This study *aims* to compare the institutionalization of co-creation in Poland and Ukraine, focusing on six key domains of citizen involvement: legislative frameworks, digital platforms, public consultations, civic monitoring, local initiatives, and civic education. We apply a structured qualitative comparison *approach* based on official documents, public data, and civic programs to map and analyze institutional practices across both countries. This study *contributes* to the growing body of research on participatory public governance by providing a structured comparison of how co-creation is operationalized in Poland and Ukraine. It identifies both common patterns and country-specific differences across six domains of citizen involvement, offering insights into the extent and nature of institutionalization. It also offers practical recommendations for strengthening co-creation ecosystems and supporting more inclusive and sustainable public service delivery.

2. Comparative context

This section provides a comparative overview of the evolving digital public service landscape and mechanisms of citizen involvement in co-creation in Poland and Ukraine. It maps key policy frameworks, platforms, and practices across six domains, highlighting similarities, differences, and context-specific developments.

2.1 Digital transformation landscape

Poland and Ukraine have a strong history of digital cooperation, recently strengthened by the 2024 Memorandum of Cooperation in the Digital Sector, focusing on AI, cybersecurity, data protection, and internet infrastructure (Ministry of Digitalization, 2023). The Interreg NEXT Poland–Ukraine 2021–2027 program, co-funded by the EU, further supports joint innovation, startups, and digital solutions (*Interreg NEXT Poland – Ukraine 2021-2027*, 2023). Progress in digital transformation and co-created public services is reflected in the E-Government Development Index (EGDI) and E-Participation Index. In 2024, Ukraine scored 0.88 in EGDI and 1.0 in e-participation; Poland scored 0.86 and 0.75, respectively (*United Nations E-Government Knowledgebase*, 2023). While both countries have similar human capital levels (0.82 Ukraine, 0.83 Poland), Poland leads in telecommunications infrastructure (0.96 vs. 0.84), whereas Ukraine surpasses Poland in online service availability (0.98 vs. 0.80) (Ciepielewska-Kowalik, 2024a).

2.2 Co-creation of public services

Co-creation is increasingly recognized as a strategy to enhance the quality and efficiency of public services, while also fostering trust in government and strengthening democratic governance. In *Poland*, the concept of co-creation has gained momentum, particularly in the context of Europeanization and the shift toward knowledge-based governance (Szarek-Iwaniuk & Senetra, 2020; Ciepielewska-Kowalik, 2024b). In *Ukraine*, co-creation has evolved alongside decentralization reforms, with local authorities and citizens increasingly collaborating to address community needs (Khutkyy & Matveieva, 2024; Keudel & Huss, 2024). Table 1 presents a comparative overview of *citizen involvement mechanisms for public service co-creation* across six key domains in Poland and Ukraine: (1) *Legislative frameworks* – legal instruments and policies that guarantee citizens' rights to access information, participate in governance, and influence decision-making; (2) *Digital platforms* – government-run portals, apps, and tools that facilitate access to services and civic participation; (3) *Public consultations* – formal processes (hearings, online consultations, forums) through which citizens provide input on policies, projects, and laws; (4) *Civic monitoring* – citizen-led oversight of service quality and institutional performance via feedback tools, open data, and evaluation platforms; (5) *Local initiatives* – community-driven projects like participatory budgeting and local improvement plans supported by local authorities; (6) *Civic education* – programs that promote democratic awareness, participatory skills, and active citizenship..

Tab. 1 - Comparative overview of citizen involvement mechanisms for public service co-creation across six domains in Poland and Ukraine.

Domains	Mechanisms in Poland	Mechanisms in Ukraine
Legislative Frameworks	The Law "On Access to Public Information" (2001) (Poland, 2001) guarantees citizens the right to access information held by public institutions, as well as private entities performing public functions. PROO program (Poland, 2018) promotes the development of civil society, civic education, and volunteerism, aiming to enhance citizen participation in decision-making The Law on Participation in Local Self-Government (Poland, 1990) outlines principles of local governance and enables citizen involvement in local institutions.	The Law of Ukraine "On Citizens' Appeals" (1996) (Ukraine, 1996) allows citizens to submit suggestions, complaints, and proposals to public authorities. The Law of Ukraine "On Access to Public Information" (Ukraine, 2011), ensures citizens can access reliable information about government activities. The concept of e-government development in Ukraine (*Concept of the Development of E-Governance in Ukraine*, 2017) promotes transparency and digital access to public services in line with European standards.
Digital platforms	The mObywatel (*Portal MObywatel*, 2023) streamlines citizen-government interactions, with ~600,000 daily visits by early 2025. The mObywatel (*Mobile Application MObywatel*, 2023) provides digital access to personal documents and a wide range of public services. Gov.pl portal (*Polish Public Services Portal Gov.Pl*, 2023) offers centralized access to government services, including the dedicated platform for entrepreneurs (biznes.gov.pl) (*Portal for Entrepreneurs*, 2023).	The Diya portal (Ministry of Digital Transformation of Ukraine, 2023a) offers access to 130+ online public services, enhancing transparency and interaction, with 21 million users by January 2025. The Diya mobile app (Ministry of Digital Transformation of Ukraine, 2023b) allows mobile access to services and digital document storage, with over 10 million downloads by January 2025. The platforms "Public Budget" (DEM) (*Platform*

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

		"Public Budget" (DEM), 2023), State Geocadastre (*State Geocadastre*, 2023), Public Services Portal iGov (*Public Services Portal IGov*, 2023) etc., support service access and civic engagement
Public consultations	Local governments are required to engage citizens in decision-making through consultations, hearings, and working groups (*Order on the Principles of Conducting Public Consultations of Documents Developed in the Ministry of Labour and Social Policy*, 2014), (*Ministry of Family*, *Labor and Social Policy*, 2023)	Public hearings, discussions, and consultations incorporate citizens' views into local decision-making (Ukraine, 1997a), (*Public Hearings of the Kyiv City Council*, 2023).
Civic monitoring	Citizens contribute to service transparency and efficiency by monitoring administrative services via tools like the Public Services Monitoring System (*Public Services Monitoring System*, 2023) and E-Governance platforms Public Services Monitoring System (*E-Governance Platform*, 2023).	Civic monitoring, regulated by national law (Ukraine, 1997b), allows citizens to assess service quality and oversee local government performance.
Local initiatives	Mechanisms such as participatory budgeting enable citizens to propose and implement local projects in areas like infrastructure and public space (*What Is a Local Initiative?*, 2023).	Support mechanisms, including participatory budgeting, empower citizens to propose and implement local projects, with outcomes shared via local platforms and the (*Association of Ukrainian Cities*, 2023).
Civic education	The (*The ABCs of Civic Participation*, 2023) promotes engagement from basic awareness to active involvement, while programs like (*A Conscious Citizen Program, 2023*) support civic education and public influence.	Adult education programs—supported by international and local initiatives—equip citizens with practical knowledge on governance, budgeting, and participation tools, fostering civic capacity and democratic engagement (*Decentralization. International Support*, 2023) .

Our comparative analysis reveals that both Poland and Ukraine demonstrate growing commitments to co-creation as a strategy to enhance public service quality and strengthen democratic governance. Ukraine's Diya platform exemplifies large-scale digital integration, enabling streamlined access to over 130 services, while Poland's mObywatel and Gov.pl platforms reflect steady progress toward e-participation. Legal frameworks in both contexts promote transparency and participation, yet Poland shows more structured alignment with EU-supported civic programs. Public consultations and participatory budgeting processes are increasingly present in both countries, but their impact on actual decision-making warrants further scrutiny. Mechanisms for civic monitoring and support for local initiatives are present but unevenly developed, particularly at the local level. However, its institutionalization ranges from formalized resources to project-based initiatives. Together, these observations reflect both *common patterns* and *country-specific differences* across all six domains. These trends suggest that participatory approaches are *becoming more systematically integrated if unevenly institutionalized*, across governance structures, varying not only between countries but also across thematic domains and levels of implementation.

3. Discussion and conclusions

This study examines the institutionalization of co-creation in Poland and Ukraine by comparing mechanisms of citizen involvement in public service design and delivery. Drawing from a structured comparison across six key domains – legislative frameworks, digital platforms, public consultations, civic monitoring, local initiatives, and civic education – we highlight both convergences and contextual differences in the two countries' approaches. To advance the institutionalization of co-creation in Poland and Ukraine, several *recommendations* can be derived from the comparative analysis of existing mechanisms and practices identified in our study: *First*, participation must translate into real impact – public consultations and legislative *feedback tools* should more systematically inform policy and service improvements. *Second*, civic education should embed co-creation literacy not only in community initiatives but also in *academic and professional training*. *Third*, *inclusive* access to digital co-creation tools requires improved user experience and accessibility on platforms. This involves applying *user-centered design* principles and addressing the needs of underrepresented groups through simplified services and integrated digital skills training. *Fourth*, cross-border learning communities should be fostered to support knowledge exchange. Joint academic modules, civic hackathons, and institutional partnerships can leverage existing tools for comparative learning and innovation. *Finally*, our analysis also underscores the need to build *educational ecosystems* that support co-creation competencies, especially as public services become more digitized and AI-driven (Rizun et al., 2025). Beyond administrative literacy, co-creation now requires interdisciplinary capabilities in areas such as ethics, data governance, and responsible AI.

Abstract. For enhancing transparency and compliance with access to information laws, government portals provide information about investments, investing companies, and beneficiary sectors in creative economy. However, the dispersion and poor structuring of data on government investments in culture limit the understanding of the public value generated by these actions, both for public managers themselves and for society. Based on an empirical quantitative study with collected data frow digital portals of two Brazilian different subnational states, this article aims to discuss how government portals can structure their data on cultural investments in a way that translates its public value. As results, we propose directives for the structuring of culture data in government platforms that contemplates dimensions in a way thatsupports the perception of public value.

Keywords. Culture investments, electronic government, public value.
Poster, DOI: https://doi.org/10.59490/dgo.2025.934

1. Introduction

In Brazil, cultural support is structured within a complex legal framework that encompasses both federal and municipal levels, with mechanisms for tax incentives and accountability [1]. Through it, companies and individuals can allocate part of their Income Tax due to approved cultural projects in exchange for tax benefits. In accordance with Brazilian legislation, both the federal government and subnational states are required to promote transparency in public administration, which includes disclosing relevant information about cultural investments on their respective websites.

Although Brazilian legislation advocates for transparency and the availability of data regarding cultural investments, in practice, such information is not always integrated and structured appropriately on government websites. Furthermore, there is a notable absence of crucial information regarding the socioeconomic impact of cultural investments, which undermines society's perception of public value.

Seeking to address the theoretical gap—i.e. the compromised effectiveness of public value in government websites—this article presents an analytical study of two government portals from different subnational states in Brazil. The study aims to discuss how the cultural investment data available on these platforms can generate public value.

2. Theoretical background

Public value refers to the tangible and intangible benefits that government policies and services provide to society.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Therefore, creating public value is the primary responsibility of public managers, who must balance the needs and expectations of citizens with the available capacities and resources. E-government, in turn, is the use of information and communication technologies (ICTs) to transform government processes and services, increasing efficiency, accessibility, and transparency [2].

The perception of value in the creative economy is related to how individuals and companies interact with digital public services. For creative entrepreneurs, easy access to information, registration, and funding services is essential for decision-making. An efficient e-government not only reduces bureaucratic barriers but also improves user experience, increasing trust in public administration [18].

Therefore, e-government plays a crucial role in promoting the creative economy, providing the infrastructure and incentives needed for the development of this dynamic sector. Addressing the challenges of e-government implementation and investing in continuous innovation are essential steps to ensure that governments can create sustainable public value in an increasingly digitalized world [21]

3. Methodology

This study employs quantitative analysis of secondary data and documentary analysis to conduct a comparative study between the cities of Rio de Janeiro and Porto Alegre in the context of digital cultural data platforms. The research uses two main sources of data: Rio de Janeiro's "Carnival Data" reports (2022-2024), and documents from the Itaú Cultural Observatory. The main source of quantitative data is the so called Continuous National Household Sample Survey (PNADC), carried out by the Brazilian Institute of Geography and Statistics (IBGE).

The PNADC was chosen over the RAIS (Annual Social Information Report) due to its greater scope, since Around 55% of Brazilian workers in creative occupations do not have a formal work permit or are self-employed. The PNADC allows us to capture this informality, which is characteristic of the cultural sector. For this study, we used data for the period 2022-2024, focusing on the metropolitan regions of Rio de Janeiro and Porto Alegre.

Data processing involved multiple steps to ensure a comparative analysis between the two cities. Initially, after extracting the PNADC microdata, filtering was carried out to keep only the data for the capitals Rio de Janeiro and Porto Alegre for the period 2022-2024.

To operationalize this classification, three main categories of analysis were created:
1. Creative Employees in Creative Sectors - professionals who carry out creative activities in cultural/creative sectors
2. Non-Creative Employees in Creative Sectors - professionals in support roles in cultural/creative sectors
3. Creative Employees in Non-Creative Sectors - creative professionals working in traditional sectors

The creative sectors were identified using the National Classification of Economic Activities (CNAE 2.0), resulting in 10 sector groups: Fashion; Craft Activities; Publishing; Film, Music, Radio and TV; Information Technology; Architecture; Advertising; Design; Performing Arts and Visual Arts; Museums and Heritage.

4. Creative Labor Market: A Comparative Analysis Between Rio de Janeiro and Porto Alegre.

A comparative analysis between Rio de Janeiro and Porto Alegre reveals significant differences in both the structure of the creative labor market and the availability of sector-related data. While Rio de Janeiro has developed a digital platform specifically for monitoring the Carnival ("Carnaval de Dados"), Porto Alegre still lacks similar instruments for cultural data management and transparency [26][27][28].

Data from the Continuous PNAD (National Household Sample Survey) highlight significant structural differences between the two cities. Porto Alegre has a higher percentage of workers in creative occupations (10.72%) compared to Rio de Janeiro (9.94%). However, when analyzing the creative sector as a whole, Rio de Janeiro exhibits greater robustness, with 9.55% of workers, compared to 8.57% in Porto Alegre [22].

In terms of earnings, Rio de Janeiro presents higher values for professionals working simultaneously in creative occupations and sectors (R$ 6,317), whereas in Porto Alegre, this average is R$ 5,384. However, for creative occupations in non-creative sectors, Porto Alegre has a slightly higher average income (R$ 7,216 versus R$ 7,139

in Rio de Janeiro).

The most striking differences appear in the educational and racial profile of workers. In Porto Alegre, 80.94% of creative workers hold a higher education degree, a percentage that drops to 74.56% in Rio de Janeiro. The racial

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

composition also shows significant contrasts: while in Porto Alegre, 86.42% of workers are white and 13.58% are black/brown, in Rio de Janeiro, these proportions are 65.11% and 34.89%, respectively, indicating greater racial diversity in Rio's creative market.

Regarding Carnival, Rio de Janeiro exemplifies how structured data management can contribute to sectoral development. According to data from "Carnaval de Dados," the event mobilizes approximately 45,000 direct workers, including 20,000 in the Sambadrome, 18,400 municipal employees, and 10,000 licensed street vendors For 41% of these workers, Carnival represents their primary annual source of income, underscoring its economic significance [24][26][27][28].

Analyzing the structure of the cultural labor market in both cities is enriched when considering specific data from Rio de Janeiro's Carnival between 2022 and 2024. While PNAD data provide a general overview of the creative sector, Carnival data reveal how a specific cultural manifestation can significantly impact the local economy.

The profile of Carnival workers presents characteristics that differentiate it from the broader creative market. While the PNAD analysis shows high levels of formal education (74.56% with higher education in Rio) , the Carnival sector exhibits a more diversified and informal structure. The predominance of informal labor (42%) and service providers (29%) indicates a specific work dynamic within this cultural segment [26][27][28].

Carnival presents a significantly different racial profile compared to the broader creative market. While PNAD data indicate a predominance of white workers in the creative sector (65.11% in Rio), in Carnival, 67.6% of workers are black [26][27][28].

While the creative sector shows high levels of formal education (74.56% with higher education in Rio), the Carnival sector exposes significant labor precarity. The high percentage of black (67.6%) and young (51.3% under 36) workers, combined with the predominance of informal links (42%) and low wages (35.2% earning between 1 and 3 minimum wages, 33.3% earning up to 1 minimum wage), suggests patterns of labor precarization.

The employment structure analysis reveals that only 1% of Carnival workers hold formal employment contracts, while the vast majority fall into informal work and service provision. This seasonality, characteristic of the Carnival event, contributes to the economic instability of cultural sector workers. Despite high educational qualifications, these professionals rarely hold employer positions or establish stable employment relationships, perpetuating a cycle of precariousness in the cultural sector.

This scenario is particularly significant considering that 41% of these workers rely on Carnival as their primary annual income source [24] highlighting how the lack of cultural sector structuring can contribute to maintaining precarious labor conditions, even in large-scale economic events. This comparative analysis demonstrates how the availability of detailed data on a specific cultural manifestation (as in Rio de Janeiro) allows for a deeper understanding of its socioeconomic impact, reinforcing the importance of cultural data management and monitoring tools, which are currently absent in the Porto Alegre context.

5. Final Remarks

This study has explored the role of cultural observatories as digital platforms for public value generation in Brazil, particularly through a comparative analysis of the cities of Rio de Janeiro and Porto Alegre. By assessing the availability, structure, and impact of cultural investment data, we have highlighted the critical importance of well-structured digital governance mechanisms in fostering transparency, efficiency, and public engagement in the cultural sector.

One of the key contributions of this study is the identification of significant disparities in the structuring and accessibility of cultural investment data between the two cities. The presence of a structured data observatory in Rio de Janeiro, specifically for Carnival illustrates how digital platforms can enhance transparency, facilitate decision-making, and generate public value. The detailed employment and demographic data collected through the "Carnaval de Dados" initiative exemplify best practices that could be replicated in other cities to improve cultural policy management [26][27][28].

Data/Software Access Statement

The statistical software STATA was used to read and analyze the microdata from the PNADC (Pesquisa Nacional por Amostra de Domicílios Contínua - Continuous National Household Sample Survey).

Abstract. In the digital government era, the government must protect citizens' data from cyberattacks to gain public trust. This study aims to identify the type of cyberattack incidents in government organizations and the implementation strategies to prevent cyberattacks. In this study, we conduct the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) approach to answer our research questions. It performs a detailed analysis based on 50 peer-reviewed articles published in the conference proceedings and journals from January 2020 to December 2024. Those articles are retrieved from five databases: ACM Digital Library, Engineering Village, IEEE Xplore, the University at Albany Library, and Web of Science. The results revealed six types of cyberattacks in government organizations: malware, denial-of-service attacks, phishing attacks, false data injection, supply chain attacks, and advanced persistent threats. Furthermore, our review showed that four strategies have been implemented to prevent cyberattacks: 1) developing national cybersecurity strategies and frameworks, 2) building cyber defense capacity, 3) enhancing infrastructure resilience, and 4) education, training, and awareness. This study contributes to the field by providing different types of cyberattacks associated with government organizations and presenting a centralized and comprehensive analysis of research work in security, which is an excellent resource for other researchers in a similar field. Finally, this study also offers practical implications for government organizations, providing strategies to help them prevent cyberattacks.

Keywords. Cyberattack, cybersecurity, public sector, government organization.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1021

1. Introduction

It is undeniable that the use of information and communication technologies (ICTs) in government organizations has become essential as a part of the digital government and modern society. The digital government aims to expedite the administrative process in government organizations (Frandell & Feeney, 2022). Furthermore, ICT integration has become increasingly prevalent, but at the same time, it is also associated with cyber risks, including cyberattacks (Frandell & Feeney, 2022). The risk can be caused by the fact that, in the digital government, the government stores its data online or in the cloud. Cyberattacks have occurred globally in both the private and public sectors, including financial services, government administration, insurance, and other industries. The increase in cyberattack incidents has drawn the attention of many researchers to study cyberattacks in organizations.

The existing literature concentrates on the private sector due to prominent cases, including data breaches at big

companies such as Yahoo, Equifax, and Capital One (Khan et al., 2022). For example, Starbucks, a company with chain stores worldwide, experienced a ransomware attack that impacted 11,000 of its branches in North America, requiring employees to be scheduled manually (Watkins, 2024). However, there is scarce literature focusing on cyberattacks in government organizations. This study aims to shed light on various types of cyberattack incidents in government organizations and the strategies these organizations have implemented to prevent and address cyberattacks. Two research questions guided our study: (1) What type of cyberattacks occurred in government organizations? and (2) What strategies has the government employed to prevent cyberattacks? In order to answer these research questions, this study employed a Systematic Literature Review (SLR) approach. In particular, in this study, we apply the PRISMA approach to answer our research questions.

2. Research Design

The research design section is divided into two sub-sections: search strategies and review method. First, we describe the search strategies apply in this SLR, including the keywords used and the various sources of articles included in our search. Second, we elaborate on the steps involved in identifying the articles included in this study.

2.1 Search strategies

In our study, we include five databases for articles searches in our analysis: ACM Digital Library, Engineering Village, IEEE Xplore, the University at Albany Library, and Web of Science. In all our searches, we use the following search words: "cyber attack" OR "cyber-attack" OR "cyberattack" AND "public sector" OR "government".

2.2 Review method

In order to ensure the clarity, transparency, and quality of this systematic literature review, this study follows the SLR using the PRISMA approach to help us better understand the cyberattack types and strategies to prevent and mitigate those different attacks in government organizations (see Figure 1 below). Figure 1 below illustrates a flow diagram of the PRISMA approach, which outlines our method, divided into two main stages: identification and screening. Initially, we identified 785 articles that included the keywords. However, we excluded 735 articles because those do not meet the eligibility criteria. Finally, after reading the full text and checking the eligibility criteria, we included 50 articles for the review.

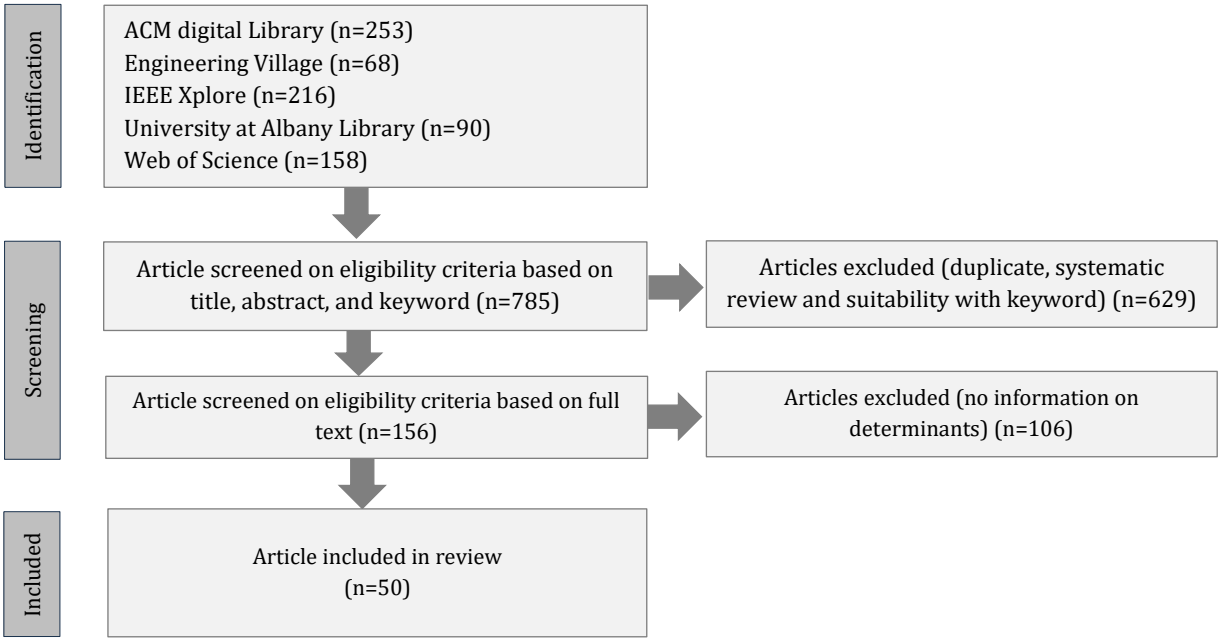

Fig. 1 – Flow diagram with PRISMA approach.

Table 1 below presents the characteristics of the included studies, which illustrate the selection of articles from five different database resources. Table 1 below shows the characteristics of the studies included in our review, including the number of articles retrieved from the database and selected for our review.

3. Findings and Discussion

3.1 Cyberattack types

Our study indicates that the three most common government cyberattacks are malware, denial of service (DoS) and denial-of-service (DDoS), and phishing. First, ransomware attacks disrupt operations or steal sensitive data, compromising grid reliability and security (Atkins, 2021; Avraam et al., 2023). Second, DoS and DDoS attacks cause significant disruption to the government system, including communication disruption, data breaches, and attacks on the cloud service (Byeon & Suh, 2020; Aljuaid & Alshamrani, 2024). Porter and Tan (2022) in their study discuss distributed DDoS attacks as the primary method used in the first cyberattack on Estonian government organizations in 2007, targeting parliaments, banks, and ministries. Third, phishing attacks are a common cyberattack technique that targets government organizations (Drummonds et al., 2022; Park et al., 2023). In addition to these three attacks, the literature also discusses more sophisticated threats, such as code injection attacks.

Our review reveals that government organizations were vulnerable to three other types of cyberattacks: False Data Injection (FDI), supply chain attacks, and advanced persistent threats (APTs). FDI presents crucial threats to High-Voltage Direct Current (HVDC) systems under an Exchange Frequency Containment Reserve control (Avraam et al., 2023; Ramadhan et al., 2023). Furthermore, supply chain attacks indirectly target third-party vendors to infiltrate government systems. For example, the 2020 SolarWinds hack exemplifies a supply chain attack within the Orion software updates of the Texas-based IT firm SolarWinds, and government organizations, including the Department of Homeland Security and Microsoft (Porter & Tan, 2022; Wang, 2021). Attackers compromised the software build system to insert malware into legitimate Orion updates, which were then unknowingly installed by thousands of governments and corporate users. Finally, APTs, also known as national cyber-attacks, target the government in any organization and are hard to detect (Atkins, 2022; Kumar et al., 2022).

3.2 Strategies to prevent and mitigate cyberattacks

We discover four key strategies commonly implemented by governments to prevent cyberattacks. First, government organizations develop a national cybersecurity strategy. The existing literature shows that the United Kingdom government established a national cybersecurity strategy to strengthen resilience at the organizational and national levels (Klumpes, 2023). The literature mentions that national cybersecurity is updated periodically in 2011, 2016, and 2022 (Klumpes, 2023). Additionally, Swedish government organizations implemented the ISO/IEC 27001 framework for compliance in government organizations, including municipalities and regions (Magnusson

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

et al., 2023). Furthermore, Japan has implemented strategies and measures to strengthen cybersecurity, covering legal, policy, and operational aspects, starting from an action plan in 2000, the national strategy on information security since 2006, and a cyber security strategy in 2013 (Ukhanova, 2022).

Second, government organizations build a strong cyber defense capacity, which includes establishing a cyber defense unit, command, and response (Porter & Tan, 2022) or cyber response (Mahima, 2021). For example, the Estonian government established the Estonian Defense League Cyber Unit, which united computer programmers from the private and public sectors. Additionally, in 2018, Estonia established a cyber command comprising 300 military and civilian professionals, including those from the private sector. Besides developing a defense cyber unit, government organizations' action to build a strong cyber defense is creating an emergency response team (Hossain et al., 2021; Riebe et al., 2021).

Third, government organizations have started to enhance cybersecurity infrastructure by developing resilient infrastructure and implementing a detection system (Ramadhan et al., 2023; Suresh & Madhavu, 2021). For example, using sensors and normalized correlation to detect anomalies in HVDC systems effectively identifies cyberattacks, such as measurement delay, missing data, and false data injection, as demonstrated through simulations in Jeju Island, South Korea (Ramadhan et al., 2023).

Fourth, education, training, and awareness programs are essential to foster a cybersecurity-aware workforce and informed public. Keshvadi (2023) suggested the importance of specialized cybersecurity education programs designed for non-technical staff based on the results of a research survey of senior cybersecurity leaders from public and private sectors in different countries, including Australia, Europe, and the United States.

4. Conclusion

Our review shows six cyberattacks that occurred in government organizations: malware, DoS and DDoS, phishing attack, FDI, supply chain attack, and APTs. In this study, the review shows prevention strategies for cyberattacks: developing national cybersecurity strategies and frameworks, building strong cyber defense capacity, enhancing the resilience of infrastructure, and providing education, training, and awareness. Our study reveals a notable lack of empirical study examining cyberattacks and strategies to prevent and mitigate them in government organizations.

This study has two main contributions to the field. First, this study contributes to the limited literature by proposing a specific type of cyberattack explicitly associated with government organizations. Second, this study presents a centralized and comprehensive analysis of research work in security, which will serve as an excellent resource for other researchers in a similar field. Limitation of our study focuses exclusively on two primary keywords: cyber-attack/cyber attack/cyberattack and public sector/government. In the future, we need to incorporate additional keywords into our searches, like cybersecurity and cyber resilience.

Abstract. School dropout is a multifaceted and persistent challenge with serious implications for public health, economic development, and social equity. In Brazil, where educational disparities remain deeply rooted in structural and contextual inequalities, addressing dropout requires more than tracking attendance, academic performance, or behavior. This study presents the development and implementation of a Relational Model (RM) aimed at identifying and mitigating school dropout risks through a comprehensive, data-informed approach. Central to this model is the Alternative Instrument for Assessing School Dropout Risk Factors (IAFREE-A), which evaluates 13 interrelated risk factors across five key dimensions: Student-School, Student-School Professionals, Student-Family, Student-Community, and Student-Student. These dimensions allow for a nuanced understanding of how relational dynamics and contextual conditions shape students' engagement with schooling. A pilot study was carried out in the state of Mato Grosso, involving 624 students across 10 public schools. Data collection was conducted through physical questionnaires, digitized using Optical Character Recognition (OCR) technology, and processed via an integrated digital platform. This platform generates individual and institutional dropout risk profiles by mapping protective and risk factors, providing actionable insights for educators, school administrators, and policymakers. Results highlighted critical concerns such as inadequate school infrastructure, perceptions of insecurity, and weak family-school connections, reinforcing the need for early, context-specific interventions. The findings demonstrate that school dropout is not an isolated event, but the outcome of complex relational, institutional, and structural factors. The RM and IAFREE-A offer an innovative and culturally sensitive framework for prevention, enabling tailored interventions that respond to students' lived realities. By fostering stronger connections among students, educators, families, and communities, this approach has the potential to reduce dropout rates and promote more equitable and supportive educational environments in Brazil and beyond.

1. Introduction

School dropout, defined as the cessation of school attendance without re-enrolment in the formal education system, is widely recognised as both a public health concern and an economic issue, with profound implications for unemployment, poverty, crime rates, and mental health (Wood et al., 2017; Vinas-Forcade et al., 2021). The phenomenon is driven by a complex interplay of individual, familial, school-related, and community factors, including poor academic performance, lack of motivation, emotional challenges, adverse socioeconomic conditions, and insufficient family support (Witte et al., 2013; Nelson et al., 2016). These factors collectively contribute to a multifaceted problem that requires a comprehensive and nuanced approach to address effectively. To tackle this issue, a Relational Model (RM) has been proposed, which integrates protective dimensions and early warning indicators for school dropout. This model employs an Alternative Instrument for Assessing School Dropout Risk Factors (IAFREE-A), comprising 13 risk factors categorised into five dimensions: Student-School, Student-School Professionals, Student-Family, Student-Community, and Student-Student (Vasconcelos et al., 2023). The model offers a holistic perspective on the interactions influencing dropout, moving beyond conventional metrics such as attendance, behaviour, and academic performance, which, while important, do not fully capture the relational and contextual dynamics that contribute to dropout (Kearney, 2021).

The Student-School dimension focuses on the relationship between the student and the school environment, including factors such as infrastructure, safety, and the availability of educational resources. Poor infrastructure, for example, can create an unwelcoming and unsafe environment, discouraging attendance and engagement. Schools with inadequate facilities, such as lack of proper classrooms, libraries, or even basic sanitation, can significantly impact students' willingness to attend and engage in learning (Churchill et al., 2021). Additionally, the perception of safety within the school environment plays a critical role. Students who feel unsafe due to bullying, violence, or lack of supervision are more likely to disengage and eventually drop out (Vinas-Forcade et al., 2021). The Student-School Professionals dimension examines the interactions between students and school staff, including teachers, administrators, and support personnel. Positive relationships with school professionals can foster a sense of belonging and support, while negative interactions can lead to disengagement and dropout (Uekawa et al., 2010; King & Garcia, 2016). Teachers who are empathetic, approachable, and supportive can create an environment where students feel valued and motivated to succeed. Conversely, a lack of communication or negative interactions with school staff can alienate students, making them feel disconnected from the educational process (Rogers & Feller, 2016).

The Student-Family dimension considers the role of family support in a student's educational journey. A lack of parental involvement or unstable family environments can significantly impact a student's ability to remain in school (Witte et al., 2013). Families facing financial difficulties may prioritise work over education, leading students to drop out to contribute to household income. Similarly, households with high levels of conflict, neglect, or abuse can create an environment where education is not prioritised or supported. On the other hand, families that actively engage in their children's education, by attending school meetings, helping with homework, or simply showing interest in their academic progress, can significantly enhance students' motivation and commitment to staying in school (Rogers & Feller, 2016). The Student-Community dimension explores the influence of the broader community, including socioeconomic conditions, access to extracurricular activities, and community attitudes towards education. In communities where education is undervalued or where economic opportunities are limited, students may see little incentive to remain in school (Churchill et al., 2021). Conversely, communities that prioritise education and provide resources such as after-school programmes, mentorship opportunities, and safe spaces for learning can create a supportive environment that encourages students to stay in school (Vinas-Forcade et al., 2021). Finally, the Student-Student dimension looks at peer relationships and the social dynamics within the school environment, which can either support or hinder a student's educational trajectory. Positive peer relationships can provide emotional support and motivation, while negative interactions, such as bullying or social exclusion, can lead to disengagement and dropout (Nelson et al., 2016).

2. Research methods

To test the effectiveness of this model, a pilot study was conducted in a Brazilian state in partnership with the local education secretaries, involving data collection from 624 students across 10 schools. Physical questionnaires were used, which were subsequently digitised using Optical Character Recognition (OCR) technology and processed on an integrated platform. This platform generates scores that map protective dimensions and dropout risk factors, enabling data-driven decision-making. The pilot results underscored the instrument's efficacy in the early identification of at-risk students, highlighting critical issues such as inadequate school infrastructure, the perception of schools as unsafe environments, and a lack of family support (Vasconcelos et al., 2023). These findings reinforce the necessity of considering contextual and relational factors in dropout prevention strategies, as traditional metrics alone are insufficient to capture the full scope of the problem (Wood et al., 2017; Kearney, 2021).

3. Results

The study concludes that school dropout should be understood as a multifactorial and relational process, shaped by a combination of structural, institutional, and subjective elements. Structural factors include socioeconomic conditions, access to resources, and community support, while institutional factors encompass school policies, teacher-student relationships, and the overall school climate (Fuentes, 2024). Subjective factors, on the other hand, involve individual experiences, perceptions, and emotional states, which can significantly influence a student's decision to leave school (Nelson et al., 2016). The concept of protecting educational trajectories, central to this study, extends beyond merely identifying imminent risks. Instead, it focuses on creating conditions that foster student retention and academic achievement. This approach is rooted in the understanding that enhancing positive interactions among the various stakeholders in the educational ecosystem can transform schools into environments of opportunity (Fuentes, 2024).

The Relational Model (RM) and the IAFREE-A instrument represent a significant advancement in the field of dropout prevention. By integrating multiple dimensions and focusing on relational dynamics, the model provides a more comprehensive framework for understanding and addressing the root causes of dropout (Vasconcelos et al., 2023). The pilot study demonstrated the practical applicability of this model, showing that it can effectively identify at-risk students and provide actionable insights for intervention. The integrated platform, which processes and visualises the data collected through the IAFREE-A instrument, plays a crucial role in this process. It allows educators, administrators, and policymakers to access detailed information about the factors contributing to dropout risk, enabling them to tailor interventions to the specific needs of their students and schools (Vasconcelos et al., 2023).

One of the key strengths of the model is its emphasis on early intervention. By identifying at-risk students before they disengage from school, educators can implement targeted support measures that address the underlying issues contributing to dropout. This proactive approach is far more effective than reactive measures, which often come too late to make a meaningful difference (Barfield et al., 2012). The pilot study highlighted several areas where early intervention could have a significant impact, including improving school infrastructure, fostering positive relationships between students and school staff, and increasing family involvement in education. These interventions, when implemented effectively, can create a supportive and engaging school environment that encourages students to stay in school and achieve their academic potential (Perusia & Cardini, 2021).

The study also underscores the importance of evidence-based public policies in addressing school dropout. By monitoring the long-term impact of interventions and continuously refining strategies based on data, policymakers can ensure that their efforts are effective and sustainable (Fuentes, 2024). The integrated platform developed as part of this research provides a valuable tool for this purpose, offering a detailed and accessible overview of dropout risk factors and protective dimensions. This platform can be used by a wide range of stakeholders, from school administrators to national policymakers, to inform their decision-making and prioritise resources where they are needed most (Vasconcelos et al., 2023).

In addition to its practical applications, the study makes a significant theoretical contribution to the field of education. By proposing a relational model that integrates multiple dimensions of dropout risk, it challenges traditional approaches that focus narrowly on academic performance and attendance (Kearney, 2021). This broader perspective aligns with contemporary research, which increasingly recognises the importance of relational and contextual factors in shaping educational outcomes (Wood et al., 2017). The study also highlights the need for culturally sensitive and context-specific approaches to dropout prevention, as the factors contributing to dropout can vary significantly across different regions and communities (Gutiérrez-de-Rozas et al., 2022).

The Relational Model (RM) and the IAFREE-A instrument are particularly relevant in the context of Brazil, where school dropout rates remain a persistent challenge. The country's diverse socioeconomic and cultural landscape requires tailored solutions that address the unique needs of different communities (Fuentes, 2024). The pilot study conducted in the federal state of Mato Grosso demonstrated the potential of this approach to make a meaningful impact in a Brazilian context. By identifying the specific factors contributing to dropout in this region, the study provides a foundation for developing targeted interventions that can be scaled up and adapted to other parts of the country (Vasconcelos et al., 2023).

4. Conclusion

In conclusion, the study presents a robust and innovative approach to addressing the complex issue of school dropout with some limitations as being a pilot study. By integrating multiple dimensions of dropout risk and focusing on relational dynamics, the Relational Model (RM) provides a comprehensive framework for understanding and addressing the root causes of dropout. The IAFREE-A instrument and the integrated platform offer practical tools for identifying at-risk students and implementing targeted interventions. The study demonstrated the effectiveness of this approach in a Brazilian context, highlighting its potential to make a

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

meaningful impact on dropout rates and educational outcomes. The study also underscores the importance of evidence-based public policies and the need for culturally sensitive, context-specific solutions. By continuing to refine and expand this approach, it is possible to create a more equitable and inclusive education system that supports all students in achieving their full potential.

Abstract. Countries differ in their capacity to develop and use digital technology – some build such capacity locally, others rely on foreign countries and corporations, and yet others do both. While sourcing arrangements may vary, the outcome is critical to countries' performance – their ability to pursue national goals and priorities. The paper explores the relationship between the countries' digital dependence and performance, relying on the calculation of the Spearman correlation coefficient between the Digital Dependence Index and the Online Service and E-Participation Indices, for 23 countries in 2020. The calculation established a small to moderate negative correlation between the variables, i.e. the better performance, the lower dependence, in line with theoretical assumptions, and identified cases that violate these assumptions.

Keywords. Digital technology, digital dependence, digital government, national performance
Poster, DOI: https://doi.org/10.59490/dgo.2025.936

1. Introduction

Governments around the world struggle to predict and manage the effect of digital transformation scaling up from the individual (citizens and businesses) to the system (economies and societies) level. System-level risks are particularly dangerous at the times of geopolitical tensions when the countries' capabilities to implement digital transformation is essential. For countries lacking indigeneous capabilities, it is a major risk.

In the international arena, countries' digital capabilities are represented by digital sovereignty, digital autonomy, and digital dependence. Digital sovereignty "encompasses the authority of a state to control data, infrastructure, and digital policies, ensuring that these elements reflect national laws and interests" (Bennett & Raine, 2020). Digital autonomy is "the ability of a state to shape its digital landscape, allowing for self-determination in technological adoption and policy formulation" (Mann & Wadhwa, 2019). Digital dependence is "the extent to which actors in a particular country have to rely on foreign-controlled digital technologies to perform digital activities" (Mayer & Lu, 2022a). Thus, digital sovereignty asserts the country's control over digital activities within its borders, while digital autonomy vs. dependence represents its independence vs. dependence on external entities in deciding over such activities. Stronger digital dependence weakens both sovereignty and autonomy.

Digital dependence also undermines national performance. According to Steward (1981), "technology imported from industrialized countries is often inappropriate" for developing countries, and lack of local capacity makes it more challenging to "adapt imported technology to local conditions". Fabayo (1996) contents that reliance on technology imports undermines African countries' indigenous technological development and contributes to their "distorted development or underdevelopment". Relying on import arrangements like the digital Silk Road might, in turn, entrap them "problematic digital dependence" (Seoane, 2022). Even countries like South Korea may experience "profound technological dependence" limiting their "autonomous economic growth" (Smith, 1993).

The country's performance also depends on the policy-implementation capacity of its public administration system and its digital counterpart – digital government. According to Srivastava (2007), there is a significant association between digital government and "administrative process efficiency" which in turn reduce "social divide". A

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

significant positive correlation is also present between e-government readiness and GDP (Saghafi et al., 2011) and between digital government maturity and government quality (Durkiewicz et al, 2018). How investing in digital government can produce value for countries is part of the digital government value chain (Durkiewicz et al., 2021). However, the relationship between digital dependence and digital government is largely unexplored.

To fill this gap, we explore if the relationship between the Digital Dependence Index (DDI) (Mayer & Lu, 2022a) and Online Service and E-Participation Index (United Nations, 2020) fulfils theoretical assumptions, i.e. lower dependence, higher performance. To this end, we calculate the Spearman correlation coefficients and identify countries that violate these assumptions, combining high dependency with high performance or low dependency with low performance. High or low designations represent indicator values below the first quartile or above the third quartile. The data reveals negative correlations but with several exceptions.

The paper is structured as follows. Section 2 introduces digital dependence and its measurement followed by research method in Section 3. Section 4 describes the results, followed by the discussion in Section 5 and conclusions – findings, limitations, and directions for future research – in Section 6.

2. Concept

Digital Dependence (DD) and related terms have a modest coverage in literature. On Scopus, "digital dependence" OR "digital autonomy" OR "digital sovereignty" yielded 487 results on 11 February 2025. DD is addressed from varied positions: resilience to the power of foreign corporations (Gaie & Langlois-Berthelot, 2024), troubling patterns of social behavior (Gonzales, 2024), threats to privacy and data integrity (Ilves & Osula, 2020), and geopolitical tensions (Budnitsky, 2022). Hu (2024) suggests that DD grow as a "side-effect" of foreign countries' development programs while technological sovereignty forces "difficult trade-off between taking advantage of the benefits of digital technologies and surrendering control" (Ilves & Osula, 2020).

DD is introduced in Mayer & Lu (2022a) which features "Digital Dependence Index" (DDI) that measures "the share of foreign suppliers in the total demand for certain digital technologies for each country" (Mayer & Lu, 2022b). DDI consists of hardware, software, and intellectual property subindices, ranging between 0 for countries that do not "use or consume any foreign-controlled or imported digital technologies" and 1 for countries that do not "have any domestic sources of supply for the needed digital technologies". The calculation of the index for 23 countries – G20 plus Estonia, Israel, Singapore, and Kenya in 2019 uncovered no country where "domestic digital technology is in a dominant position", one country – the USA where "domestic supply delivers majority of digital tech", two countries – China and South Korea where "global markets supply majority of digital tech", and the rest where "Foreign digital technology is in a dominant position". The latter concerns not only developing countries but also countries associated with technological advancement, like Japan, Singapore, or Australia.

3. Methods

The analysis targeted the countries' combined Digital Dependency (DD) and Digital Government (DG) performance. Two questions were formulated: 1) How does the DDI dataset appear when completed with the DG performance data? 2) Which country cases are characteristic given their performance in both areas? In particular, we look at four categories of countries with: high dependence and high performance, high dependence and low performance, low dependence and high performance, and low dependence and low performance.

To answer the first question, we built the dataset for 23 countries from the 2019 DDI study (Mayer & Lu, 2022b) including DDI's trade, infrastructure, and intellectual property subindices. The dataset was complemented with the 2020 E-Government Survey (United Nations, 2020) and its two indicators, i.e. Online Service Index (OSI) and E-Participation Index (EPI). Due to the varied distributions of data among countries, their ranks rather than index values were used. While the country selection in DDI is not a statistically-relevant sample, the Spearman rank correlation matrix was elaborated to support the supposed negative correlation between the levels of DD and DG.

To answer the second question, the 1st and 3rd quartiles for each indicator were calculated, and the countries with performance above the 3rd quartile were marked with "+" while those below the 1st quartile were marked with "-". A country was considered interesting if it belonged to either categories for any DD and DG indicators. The results were then analyzed with respect to the cases that represent (1) high dependence and high performance, or (2) low dependence and low performance. These cases were identified as possibly worth further exploration.

4. Findings

The Spearman correlation matrix between the DD and DG indicators in the created dataset is presented in Table 1. According to this, there is a small to moderate negative correlation between DD and DG, confirming the assumption that the better DG performance, the lower DD, and the other way round. We did not provide p-values since this is

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

not meant to be a statistically representative dataset: the data refers to a specific point and range of measurement.

Tab 1. Spearman rank correlation coefficient values between the 2019 Digital Dependency Index and its Trade, Infrastructure and Patents subindices vs. the 2020 Online Service Index and e-Participation Indices

	DDI	TRADE	INFRASTRUCTURE	PATENTS
OSI	-0.32	-0.39	-0.14	-0.34
EPI	-0.34	-0.35	-0.21	-0.38

Table 2 contains the dataset for 23 countries in the DD study (Mayer & Lu, 2022b). Each country's performance is described in thirteen columns. The first six contain the DDI ranks (DDI-2019) and its three subindices – trade (TRADE-2019), infrastructure (INFRASTRUCTURE-2019) and patents (PATENTS-2019), and two columns representing Online Service Index (OSI-2020) and e-Participation Index (EPI-2020). The following six columns indicate whether the previous indices' values are above the 3rd ("+") or below the 1st quartile ("-") of all values in that index. The final column indicates whether, following the logic of this research, a case is "interesting".

According to Table 2, there are three cases (Germany, Israel, Kenya) where either of the dependence indicators is very low at the same time as one of the digital government indicators. Also, there are cases – USA and Korea, with low dependence and high performance, and the other way round – Indonesia and Saudi Arabia.

Tab 2. Rank data for G20, Estonia, Israel, Singapore, and Kenya for the 2019 DDI and its Trade, Infrastructure and Patents subindices vs. the 2020 OSI and EPI, with particularly low (-) or high (+) values.

Fig. 1 visualizes how the data is scattered. Digital Dependence Index values are plotted against Digital Government performance (average of OSI and EPI). For readability, particular country points are labeled with respective ISO alpha-3 codes. Notice the distinct separateness of three countries, the United States, China, and Korea.

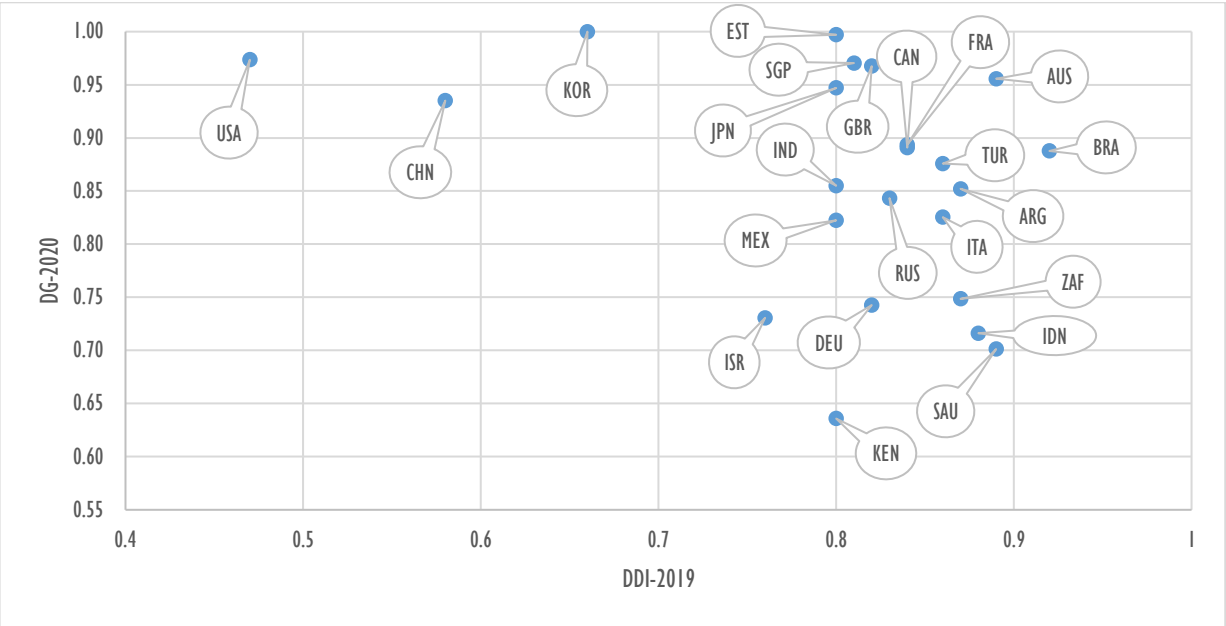

Fig. 1. DDI and DG performance data scatterplot with country labels.

5. Discussion

Today's global digital landscape is dominated by one or two countries, the second trying to catch up with the first (Mayer & Lu, 2022a). Most countries seem to surrender to this dichotomy despite the enormous impact of digital technologies on them. As noted, the most capable and committed countries "are keen to exploit their 'cyberpower'" employing "companies under their jurisdiction and control as their agents" (Ilves & Osula, 2020, p. 26).

This study pursued the ambition to start defining a new direction in DG studies: exploring the relationship between countries' DG and DD. To our knowledge, it is a pioneering effort of this kind. We brought conceptual recognition and theoretical soundness to this problem, revealed some discrepancies between DD and DG performance, and identified countries that need policy analysis. We learned that DD is a highly relevant and timely concept, beyond unequal distribution of economic power. However, conceptual clarification is first needed, starting with definitions of "sovereignty", "autonomy" and "dependence", and their digital counterparts, and how they affect governments and countries. Then, the concepts should be mapped to the elements of the national or international public policy.

6. Conclusions

This study was built upon the premise that "digital dependence" affects the countries' digital policies and their capacity to pursue national development. While terms like "digital sovereignty" or "digital autonomy" have already settled in the academic and policy discourse, "digital dependence" remains elusive. With this paper, we intend to address this gap and reveal some insights emerging from the official international data.

Since this study is based on (Mayer & Lu, 2022a), which itself is limited, our observations may not exactly reflect the global state of affairs, although we would be surprised if they are refuted by a more comprehensive study. We identified countries with problematic relationships between DD and DG but all need in-depth studies. Also, the theoretical constructs provided should lead to more sophisticated models, providing a nuanced analysis of DD.

We plan to further develop our insights into DD. A formal model is a work in progress. We also intend to enhance the DD concept aimed at spotting its causes, including the unprecedented power of global technology corporations.

Abstract: This study aims to analyze the challenges faced by local governments in the preservation and restoration of rural historical buildings in Peru, using the Caqui Hacienda in the Chancay Valley as a representative case. It is proposed that the rigidity of Peruvian regulations on cultural heritage, combined with the limited technical and budgetary capacity of local administrations, represents a significant obstacle to the recovery of these properties. Additionally, other barriers are identified, such as the weak implementation of digital governance, lack of institutional coordination, and limited availability of accessible digital platforms for citizens. Through an exploratory qualitative approach that combines historical analysis, regulatory review, field observation, and surveys of public works professionals, the study seeks to evaluate how the adoption of technological tools and the modernization of public policies could contribute to a more efficient, transparent, and sustainable management of cultural heritage. The expected results aim to provide evidence on the need for regulatory reforms and institutional strengthening and to propose the use of emerging technologies, such as artificial intelligence, in the monitoring and restoration processes of historical heritage in rural contexts.

Keywords: Digital governance, cultural heritage, historical buildings, transparency, restoration, public sector.
Poster, DOI: https://doi.org/10.59490/dgo.2025.938

1. Introduction

The preservation of rural historical buildings is closely linked to the effectiveness of digital governance in the management of cultural heritage. The implementation of digital tools can enhance transparency and efficiency in decision-making, particularly in public projects involving heritage conservation. However, in rural areas such as the Chancay Valley, the low level of digitalization in local government processes may hinder initiatives aimed at restoration and protection. Studies on e-government adoption indicate that insufficient digital infrastructure, budget constraints, and limited institutional capacity negatively affect the ability of public administration to effectively manage historical sites (Buyannemekh, Gil-Garcia, & Gascó-Hernández, 2023).

In this context, the role of artificial intelligence (AI) and digital monitoring systems could be explored as potential enablers to enhance heritage conservation efforts. AI-driven platforms have been successfully integrated into public works management, improving project oversight and reducing inefficiencies (Miranda-Hospinal et al., 2023). By leveraging AI and digital platforms, local governments in Peru could establish data-driven strategies to monitor and prioritize the restoration of historical sites. Nevertheless, achieving such advancements requires not only technological investment but also policy alignment and capacity-building programs to ensure effective governance in heritage preservation (Goos & Savona, 2024).

In the Chancay River Valley in Peru, there are several rural historical buildings that are abandoned and, as a result,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

undergoing deterioration. The Caqui country house or hacienda, located in the district of Aucallama, was selected as a representative example to analyze the reasons behind the lack of building's maintenance and to propose a research project to recover this historical structure. The property legal status is a critical issue that prevents intervention to recover and protect this cultural heritage. However, it is also considered that the level of digital governance implemented in the local administration could be a contributing factor to this situation.

The current state of the old historical constructions in the lower Chancay Valley is critical due to the lack of maintenance and attention they have received, as they represent the former model of production under the control of a landowner—a model in which, today, production is managed in some cases through a cooperative system and in others by individual farmers. In this territory, it is possible to find unique human settlements with emblematic cultural traditions and historical buildings that are undergoing deterioration and face latent extinction. Near the town of Caqui, the old landowner's country house, which still stands, is distinguished not only by its architecture but also by the artistic expression that can still be seen in the wall paintings and inside a small chapel.

The historical structure restoration of Caqui requires a detailed study of its original architecture, as well as the recovery of the paintings. As a reference, there is a replica of this building in Japan. It was built in a theme park called Little World, which features representative constructions from different parts of the world. The old Caqui farmhouse was selected as a typical Peruvian building, and the replica has dimensions similar to those of the original located in Caqui. The paintings were also reproduced; however, some of them are not exactly the same as those found in Caqui. Additionally, some of the furniture displayed in the theme park corresponds to the original furniture from the old Caqui farmhouse. Therefore, this replica is considered a potential model for reconstructing the original building.

The national government of Peru has given due importance to the implementation of digital government through a plan called the Digital Policy for Digital Transformation. Peru's e-government development index improved, reaching position 59 out of 193 evaluated economies. However, it is considered that differences still exist within the country, especially in small districts or localities where the level of digital government implementation remains low. Therefore, improving this implementation will primarily benefit citizens and will also support the management of other areas, such as the conservation of historical buildings.

2. The old Caqui Farmhouse

2.1 Construction Characteristics

The farmhouse analyzed in this study is in the village of Caqui, in the district of Aucallama, province of Lima, Peru. Figure 1 shows the location of Caqui on a Google map. The Caqui hacienda is situated on the left bank of the lower Chancay River valley, at an approximate altitude of 246 meters above sea level. It is built on a rocky outcrop that emerges from the geological formation known as La Bóveda Hill. The hacienda was managed by the Mujica family at the time of the Agrarian Reform implemented in 1968, which brought an end to the hacienda system and gave way to the cooperative system and, in some cases, the subdivision and distribution of land.

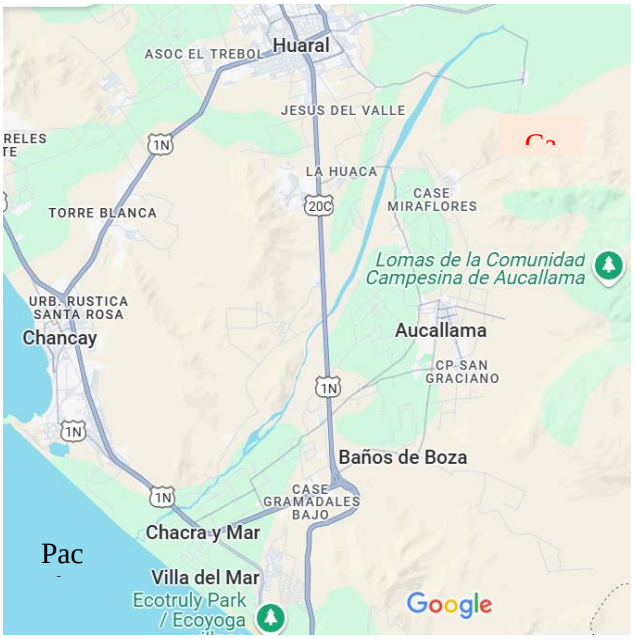

Fig. 1 – Location of Caqui (Google Map)

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The architectural typology of the Caqui hacienda building corresponds mainly to a domestic residence (kitchen, dining room, bathrooms, etc.), in which the spaces are arranged around a central courtyard that provides light and ventilation and allows for the independence of each area. The house, being intended to accommodate the landowner and his family during their visits, includes spaces that facilitate the management of the hacienda, such as offices and reception rooms. Accordingly, it features a vestibule, a main courtyard, an entrance atrium, and a chapel—spaces that possess special infrastructure and in which particular attention was given to design and decoration. Figure 2 shows the floor plan of the Caqui hacienda.

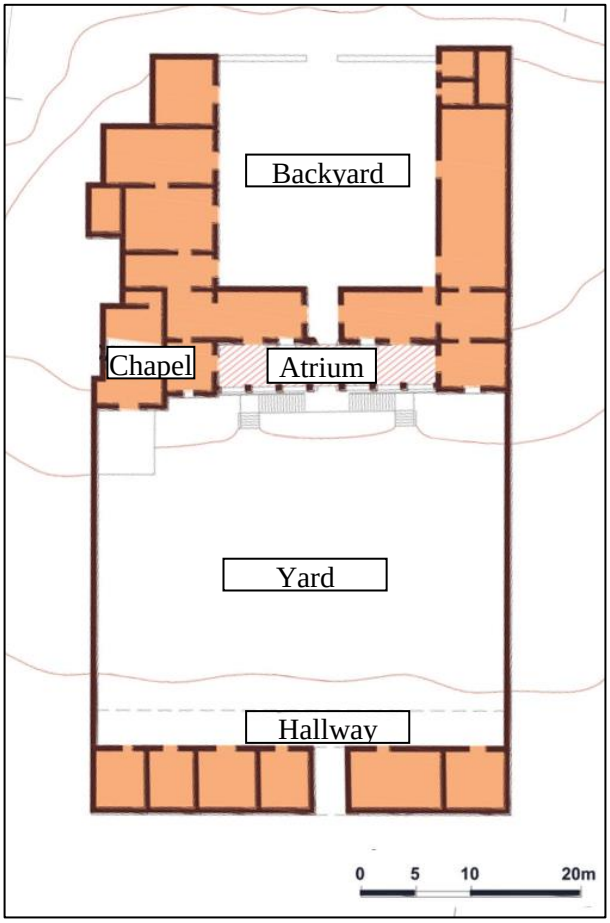

Fig. 2 – Plan view of the Caqui hacienda.

2.2 Comparison with the replica

A full-scale replica of the Caqui farmhouse can be found at the Little World theme park in Aichi Prefecture, Japan, as part of the World Buildings exhibition. This replica is considered a potential model for the reconstruction and restoration of the original Caqui farmhouse. Figures 3 to 6 below show a comparison of photographic details between the two buildings.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Fig. 3 – General view from hallway entrance (left replica, right Caqui farmhouse)

Fig. 4 – Detail of the exterior of Chapel (left replica, right Caqui farmhouse)

Fig. 5 – Detail inside the Chapel (left replica, right Caqui farmhouse)

Fig. 6 – Detail of the backyard (left replica, right Caqui farmhouse)

When comparing the replica with the current structure of the Caqui farmhouse, it can be observed the severe deterioration of both the building itself and the artwork on the walls, especially inside the chapel. It is therefore clear that the well-preserved replica can be used as a model to propose the repair and/or restoration of this historical structure.

3. The role of the local government

The building analyzed in this study is managed by the local municipal government of the Aucallama district. Figure 7 shows the municipal building. The district of Aucallama has an area of 717 km^2 and a population of 19,464 inhabitants (2017).

Fig. 7 – Municipal building of Aucallama district.

According to the government's website, digital governance has been implemented and users can access care and services online. In addition, information is available to ensure or verify governmental transparency. However, information about cultural heritage or historical buildings is more difficult to obtain. This information should be available not only to researchers or individuals interested in such buildings, but it could also help promote tourism in the area by showcasing not only recreational facilities but also the cultural aspects of the district. On the other hand, the development of proposals for the reconstruction or restoration of historical buildings can be carried out in collaboration with institutions such as universities, which engage in activities that include social outreach

4. Final comments and Future directions

This poster outlines insights into the role of digital government and AI governance in addressing institutional challenges within heritage restoration projects, specifically in rural contexts like the Caqui Hacienda case in Peru.

Firstly, it highlights the potential gap between national-level digital transformation initiatives and their practical implementation at the local government level. Although Peru's national digital transformation policies have significantly advanced, achieving noticeable global recognition, local disparities persist, particularly in rural areas. This disconnect exposes that digital government efforts should go beyond mere policy formulation, actively engaging in the capacitation and technological empowerment of local governments to warrant coherent and inclusive digital progress. Secondly, the research emphasizes that robust digital governance frameworks and AI-driven platforms can profoundly enhance heritage management processes. By integrating AI tools into public administration, local governments could foster decision-making transparency, enhance monitoring efficiency, and strengthen public participation and accountability in heritage preservation efforts. Moreover, this poster highlights the importance of regulatory flexibility and institutional collaboration as critical enabling factors for digital and AI governance in the heritage sector.

Future research should further explore the specific mechanisms through which digital governance and AI can be more effectively implemented at the grassroots level, suggesting models that can be replicated and adapted to various rural and resource-constrained settings globally. For this reason, future work will explore this phenomenon through empirical analysis, beginning with a survey (See Appendix A).

Appendix A

1. Perception of the current situation and the role of digital government

- **To what extent do you agree that digital government could improve the management and conservation of historical heritage?**
  (Scale from 1 to 7, where 1 is strongly disagree and 7 is strongly agree)
- **Do you believe that the use of digital technologies can help prevent the deterioration of historical heritage?**
  (Options: Yes / No / Not sure)

---

2. Institutional capacities and training

- **Do you consider it necessary for the Ministry of Culture to provide training to local governments on the use of digital technologies for managing and restoring historical heritage?**
  (Scale from 1 to 7, where 1 is strongly disagree and 7 is strongly agree)
- **What level of knowledge do you have regarding artificial intelligence (AI) and digital tools applied to heritage conservation?**
  (Options: Basic / Intermediate / Advanced / I have no knowledge)

---

3. Technical and operational barriers

- **What do you consider to be the main barriers to implementing technologies such as AI in the management and restoration of historical heritage? (Select all that apply)**
  - Lack of funding
  - Lack of training
  - Lack of digital infrastructure
  - Lack of clear regulations
  - Other: _____

---

4. Regulations and the deteriorated state of heritage

- **Do you consider that the current regulations in Peru for intervening in heritage properties are too rigid in relation to the technical, economic, and operational capacity of local governments?**
  (Scale from 1 to 7, where 1 is strongly disagree and 7 is strongly agree)
- **Do you believe that the lack of modernization in heritage regulations has contributed to the abandonment, deterioration, or inability to restore numerous heritage buildings in the country?**
  (Scale from 1 to 7, where 1 is strongly disagree and 7 is strongly agree)
- **Considering international experiences like that of Japan—where preserving the façade and updating the interior is allowed—do you believe it is necessary to rethink and modernize Peru's heritage regulations to enable more sustainable and contextual restoration practices?**
  (Scale from 1 to 7, where 1 is strongly disagree and 7 is strongly agree)
- **What aspects of the current regulations do you think should be modernized to allow for more efficient, sustainable, and feasible restoration of historical heritage? (Select at least 3 options)**

  - Excessive or costly technical requirements
  - Extensive bureaucratic procedures
  - Inefficient authorization processes
  - Lack of differentiated criteria based on the value or type of property
  - Lack of integration with digital government and urban planning regulations
  - Little consideration of the local economic context
  - Other: _____

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

5. Transparency and access to heritage information

- **Do you believe that the process by which a site is declared historical heritage is accessible and transparent?**
  (Options: Yes / No / Not sure)
- **Do you think citizens and local authorities should have open access to the protocols, criteria, and resolutions used to declare a site as historical heritage?**
  (Scale from 1 to 7, where 1 is strongly disagree and 7 is strongly agree)

---

6. Expectations and opportunities of digital government

- **What benefits do you expect from the adoption of digital government in the management of historical heritage? (Select at least 3 options)**

  - Mayor transparencia en la asignación de fondos
  - Greater transparency in the allocation of funds
  - Reduction of bureaucracy in permit processes
  - Better access to heritage information
  - Improved planning and monitoring of restoration projects
  - More informed citizen participation

- **How likely do you think it is that AI will be implemented in heritage management in the next five years?**
  (Escala de 1 a 7, donde 1 es totalmente en desacuerdo y 7 totalmente de acuerdo)

---

7. Key stakeholders and citizen participation

- **Who should lead the implementation of digital government in the protection of historical heritage? (Select at least 3 options)**

  - Ministerio de Cultura
  - Ministry of Culture
  - Local governments
  - Academic institutions
  - Technology companies
  - International organizations

- **Do you believe citizens should have access to digital platforms to check the status of heritage properties and report their deterioration?**
  (Options: Yes, absolutely / Yes, with restrictions / No / Not sure)

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 22 May 2025

Abstract. Government organizations initiate digital transformation by using online platforms to facilitate the dissemination of open government data (OGD) to the public. Despite the government's effort to increase citizens' willingness to participate in the OGD initiative, there is a possibility that citizens may encounter challenges accessing the OGD through open government data portals (OGDP). This study aims to assess the effectiveness of user interface (UI) and user experience (UX) design in Satu Data Indonesia (SDI), the Indonesian national OGDP. The research question guiding this study is "How does user experience influence willingness to use OGDP?" We follow a quantitative approach to gain an understanding of the OGDP usability and users' willingness to engage with the OGD. First, an experiment will examine participants' access to SDI portal. Second, a survey will investigate whether the participants are willing to use OGD based on their experience engaging with OGDP. This study will enhance our understanding of OGDP usability within the context of developing countries and evaluate whether user experience influences future usage willingness. Ultimately, the findings will benefit governmental entities in improving their OGDPs' usability and user experience.

Keywords. open government data, open government data portal, OGDP, UI/UX design, accessibility, usability.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1015

1. Introduction

Open government data (OGD) comprises two components: open data, which is characterized as data freely available for use, repurposing, and dissemination (Open Knowledge Foundation, 2012), and government data, which is defined as data generated by government organizations (Ubaldi, 2013). By providing access to government data, the government promotes and enacts a participatory and collaborative policy process (Soegiono, 2018). The OGD movement aims at increasing the availability and accessibility of government data, encouraging government organizations to publicly disseminate their data on open government data portals (OGDP). This movement was initiated in the United States in 2009, with the issuing of the Open Government Directive, mandating federal agencies to open government data for openness, participation, and collaboration (The White House, 2009). Later, it became a global trend among governmental entities. Using OGDPs illustrates the actualization of both open government initiatives and digitization for disseminating government data and information with technology (Sari et al., 2024).

Previous studies have discussed OGDP in different regions, including Asia (Saxena, 2019; Shao et al., 2021; Wang et al., 2023; Warraich & Rasool, 2023), Europe (de Juana-Espinosa & Luján-Mora, 2019; Kapoor et al., 2015), America (Begany et al., 2021; Oliveira et al., 2016; Paige & Freund, 2019), and combinations among different

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

regions (Máchová et al., 2018; Molodtsov & Nikiforova, 2024; Mutambik et al., 2021; Nikiforova, & McBride, 2021; Sheoran et al., 2023). However, few studies examining OGDP from the user interface (UI) and user experience (UX) design perspective in emerging countries. This study, focusing on Indonesia, addresses this literature gap by using a quantitative approach to answer the following research question, "How does user experience influence willingness to use OGDP?"

This study deepens the understanding of OGDP usability and users' challenges of OGDP access. Moreover, it enriches current literature on OGD in developing countries. Finally, the findings can guide government organizations to improve OGDP usability and ultimately increase the willingness to use OGD. This study is structured as follows: the following section provides a literature review, the third section describes the methods, and the last section discusses the conclusion and future work.

2. Literature Review

2.1 Usability and the adoption of OGDPs

OGD initiative is characterized by free government data access and use. This initiative has attracted many scholars' interest in the adoption, challenges, and impact of using it. The existing literature has addressed OGDP adoption and its association with usability. For example, Shao and colleagues (2021) shows that the perceived utility and ease of use deterine user's intention to use an OGDP. It indicates a willingness to engage with OGDPs when its use is beneficial and user-friendly. Similarly, Kapoor and colleagues (2015) shows that the less complicated an OGDP is to use, the easier it is to adopt, which can be assessed by the time required for searching OGD datasets. In short, the willingness to engage with OGDPs is positively associated with its benefits and user-friendliness.

2.2 Usability features of OGDPs

Previous studies discuss various OGDP usability features. First, numerous studies emphasize dataset access, including searching and filtering capabilities on OGDPs for dataset discoverability (Máchová et al., 2018; Oliveira et al., 2016). Additionally, when users cannot locate the needed OGD, OGDP must offer adequate assistance to contact government employees; otherwise, it may hinder OGDP usage. The government can enhance the assistance features, such as incorporating online functions (Wang et al., 2023). Second, readability is crucial. Indeed, as indicated by Warraich and Rasool's (2023) assessment of the Pakistan OGDP, poor readability impedes users' ability to read and comprehend OGDP content.

Third, visualization and analytic tools on OGDPs are necessary (Máchová et al., 2018; Mutambik et al., 2021; Saxena, 2019). Lastly, active interactions and communications with users and stakeholders are crucial since government's capacity to facilitate interactivity on OGDPs affects the ease of use (Sheoran et al., 2023). Users would use OGDPs when the government provides sufficient channels for interactions and gives feedback (Shao et al., 2021). Indeed, Nikiforova and McBride (2021) discovered that the most deficient OGDP usability characteristic includes lacking capabilities for interactions between OGD users and providers. Interactions can be strengthened by providing feedback forms features, including forums, contact forms, ratings and comments, and dataset requests (Mutambik et al., 2021). Various variables can measure OGDP interactivity, such as pageviews, number of sessions, and the duration of user interaction with the portal (Begany et al., 2021).

2.3 UTAUT model and the research framework

This study evaluates the usability of SDI (https://data.go.id/), the Indonesian national OGDP, and the factors of user experience influencing behavioral intentions to use OGDPs. The previous study indicated that behavioral intention to utilize technology may influence the use of OGD (Sari & Gascó-Hernández, 2024). Since the OGDP is considered an assisting technological platform, we employed the Unified Theory of Acceptance and Use of Technology (UTAUT) model to inform our research. In addition to four key determinants of UTAUT (effort expectancy, performance expectancy, social influence, and facilitating conditions), this study also examines moderating factors: gender, age, and education, which are defined as demographic characteristics of the participants (See Figure 1).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

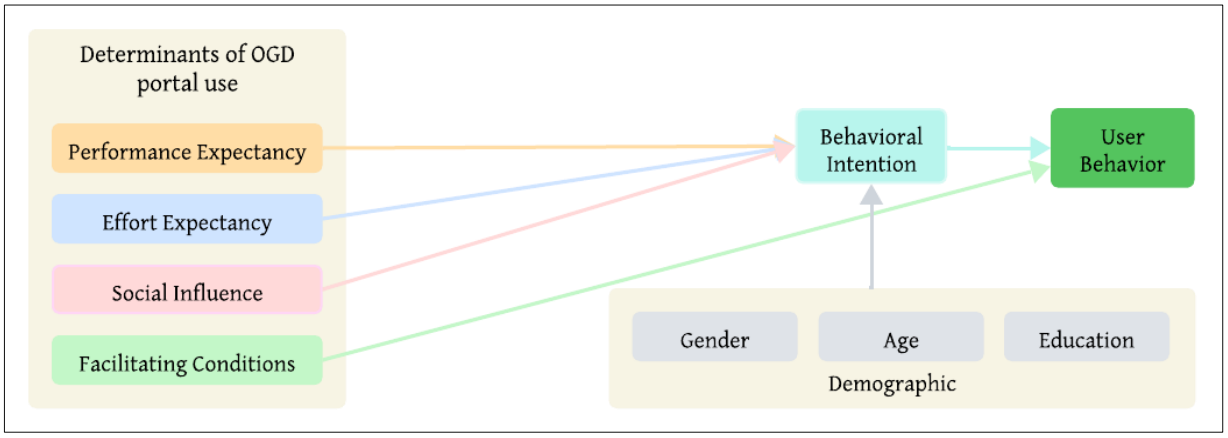

Fig. 1 – Research Framework extending the UTAUT model (Venkatesh et al., 2003)

3. Methods

3.1 Case study

The Indonesian government launched its OGD initiative in recent years. In June 2019, the President of Indonesia issued Presidential Regulation Number 39 of 2019 on Satu Data Indonesia, which requires all levels (national, provincial, and local) of Indonesian government organizations to release current, accurate, and accountable data through SDI. Since the launch of SDI portal in December 2022 (Iman, 2022), the new policy has trickled down to regional governments. Following the implementation of OGD initiatives at the national level, government organizations at various levels followed suit and launched their regional OGDPs (Sari, 2020).

3.2 Research Design

We employ two methodologies to address our research question (See Figure 2). First, a usability experiment requires the participants to follow the provided instructions and access SDI portal. Participants will play the researchers seeking OGD datasets across three provinces in Indonesia to support their research. One type of OGD users are students (Crusoe et al., 2019; Davies, 2010; Lassinantti et al., 2019; Talukder et al., 2019; Zainal et al., 2019). This study will recruit participants from graduate schools, as graduate students are more likely to possess the data literacy necessary for effective OGD use, aligning with the target population of this study. Participants will access the OGD datasets on SDI portal and answer questions in a session lasting for one hour.

After the experiment, a survey questionnaire will measure participants' willingness to use OGD based on their experiences with the portal. The survey consists of five sections, with 25 questions assessing participants' attitude to the statements with a 4-point Likert scale (strongly agree to strongly disagree). The performance expectancy inquiries assess whether utilizing OGDP assist with finding needed datasets. The effort expectancy questions evaluate the ease of use of SDI portal. The social influence section investigates whether social networks promote participants' use of OGDP. Finally, the facilitating conditions section investigates whether participants need the knowledge and guidance for utilizing SDI portal.

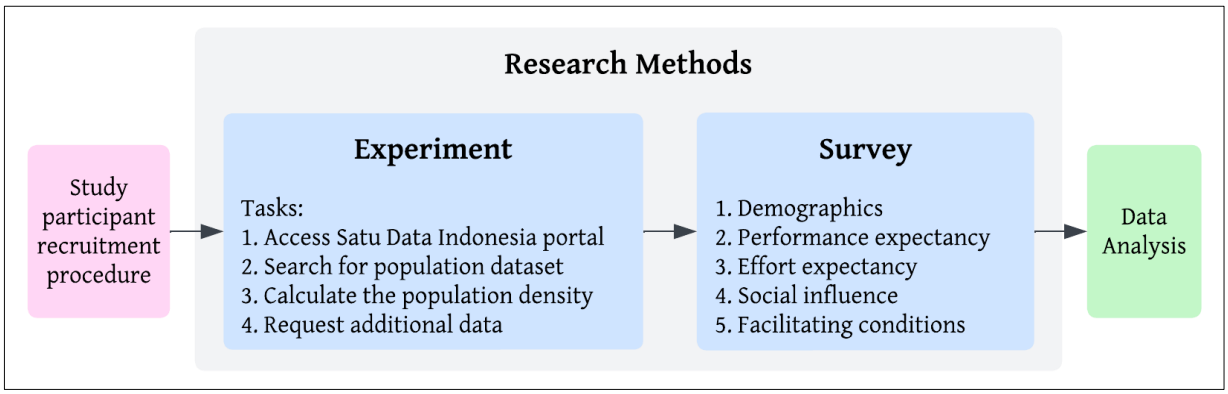

Fig. 2 – Procedure

4. Conclusion and future work

Limited OGD research analysed the situations in emerging countries when studying OGDP usability and the effect of user experience on the willingness to use OGDPs. This study addresses this gap by starting to focus on emerging countries with a case study on SDI portal. The OGDP usage experiment and the user experience survey in the subsequent phase seek to determine whether the experienced accessibility and usability influence future willingness to use OGDPs. Ultimately, the findings will provide empirical insights informing OGDP designing guidelines, enhancing OGDP UI/UX, thereby improving user experience and engagement, which boost the willingness of OGD use.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 25 July 2025

Abstract. This paper presents the Canvas of the Experiment, an innovative tool developed by the Innovation Laboratory of the Court of Justice of the State of Ceará (LabLuz) to structure, implement, and evaluate innovation within the Brazilian judiciary. By employing a data-driven approach, the Canvas aims to enhance efficiency, accessibility, and inclusion in judicial processes. The study describes the methodology, structure, and impact of the Canvas through various case studies, demonstrating its effectiveness in generating measurable results and promoting evidence-based decision-making. The results reveal the potential of the Canvas to transform innovative ideas into practical solutions, offering a valuable model for other public institutions.

Keywords. Data-driven Innovation, Evidence-based policy, Impact measurement, Legal Innovation Framework, Experiment Canvas.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1070

1. Introduction

The Brazilian judiciary faces persistent challenges in improving efficiency, ensuring accessibility, and fostering social inclusion. Traditional approaches often struggle to integrate data into decision-making, leading to inefficiencies and limited impact (Lunardi & Clementino, 2021). To address this vulnerability in public sector innovation, the Innovation Laboratory of the Judiciary of Ceará (LabLuz) developed the Canvas of the Experiment to tackle these issues. This tool provides a framework for designing, implementing, and evaluating innovative practices within the judicial system. It facilitates the creation of evidence-based solutions, ensuring that new initiatives are rigorously tested and validated before broader implementation. This article explores the Canvas's structure, methodological foundations, and the impact of its application.

2. The Experiment Canvas methodology and structure

The Brazilian judicial system requires a shift toward evidence-based approaches to overcome obstacles such as high rates of criminal recidivism, complex legal language, and operational inefficiencies. These challenges are further exacerbated by the low educational level of those interacting with the judicial system. The Canvas of the Experiment was designed to help overcome these barriers. It serves as a practical guide for innovation professionals to formulate clear objectives, develop actionable plans, and systematically test innovative solutions. By integrating data collection and analysis into the innovation process, the Canvas enables effective measurement and validation of new practices before their large-scale implementation.

All LabLuz initiatives are conducted experimentally, with well-defined planning and outcome indicators. Only after data collection and verification of the initiative's success is the knowledge generated in the laboratory transferred to operational teams, and the practice is scaled as an institutional project.

Thus, completing the Canvas is the initial and essential step in structuring the development of an experiment, ensuring that all participants understand their roles and project objectives.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Figure 1 – Experiment Canvas

The Canvas integrates principles of action research, Design Thinking, and strategic management to offer a pragmatic, data-oriented approach to innovation. Its methodology is rooted in the works of Kurt Lewin and William Foote Whyte, emphasizing the iterative and collaborative nature of the innovation process (Elden, 1992).

The framework is structured around the following key components:

1) **Strategic alignment**: ensures that innovative projects align with the judiciary's overall strategic objectives. This includes alignment with the judiciary's strategic map and international frameworks such as the UN's 2030 Agenda and the Sustainable Development Goals (SDGs).

2) **Objectives**: clearly defines tactical and operational goals, establishing measurable targets for the project. This step ensures that all parties share a unified vision of the project.

3) **Data-driven approach**: emphasizes the use of data to track innovation progress and evaluate its effectiveness. This includes identifying necessary data, defining collection methods, and assigning responsibilities for data collection.

4) **Hypothesis testing**: formulates a central hypothesis about the expected impact of the experiment, which is then rigorously tested using selected data.

5) **Iterative process**: Designed to be used iteratively, allowing continuous adjustments, refinements, and improvements.

The Canvas helps structure experiments by guiding teams through essential steps, including defining strategic alignment to ensure the experiment contributes to broader institutional objectives. Its use also promotes contextualization within larger frameworks such as the UN's 2030 Agenda. Additionally, the Canvas assists teams in defining data collection methods and specifying responsibilities.

Formulating a testable hypothesis, which the experiment seeks to validate or refute, is a guiding step throughout the innovation cycle. The Canvas aids in establishing methods for tracking progress and analyzing results to enable informed decision-making. Ultimately, it ensures the use of structured data collection methods and assignment of responsibilities, guaranteeing that data is collected reliably and ethically. This process fosters a culture of experimentation and evidence-based decision-making.

3. Case studies and impact

The effectiveness of the Canvas of the Experiment is demonstrated through several case studies conducted by LabLuz, such as reducing penal regressions.

A fundamental study focused on simplifying legal language used in communications with prisoners transitioning to a more lenient regime. Carmo & Sá (2024) show that using clear and accessible language alongside visual resources led to a **31.54% reduction in penal regressions due to negligence**, demonstrating how language

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

simplification directly impacts compliance and reintegration. The Canvas proves its value when, at the end of an experiment, the team can measure the prototype's impact in reality and compare it with the initial projection.

Another successful application of the Canvas was in Family Courts, where the use of plain language in summonses led to an increase in attendance at conciliation hearings. This initiative highlighted the importance of clear communication in increasing public engagement with the judiciary. Once again, at the end of the efforts, the impact was traceable.

Additionally, a chatbot is being used to provide information and support to victims of domestic violence, improving decision-making security regarding protective measures and reducing the demand for court officers (Vieira, 2020). Data already support the hypothesis of this experiment, highlighting the Canvas's versatility across various contexts.

LabLuz is also testing simplified communication strategies to facilitate understanding and compliance with protective orders by aggressors, aiming to reduce violations of urgent protective measures.

Another ongoing experiment seeks to test whether a language-based approach improves the effectiveness of search and seizure warrants in the jurisdiction of Boa Viagem, Ceará.

These cases illustrate how the Canvas facilitates the transition from innovative ideas to measurable and impactful results. The emphasis on data collection ensures that decisions are based on evidence rather than assumptions.

4. Conclusion

The Canvas of the Experiment represents a significant advancement in how the Brazilian judiciary approaches innovation. By providing a framework for developing, implementing, and evaluating new practices, it promotes a culture of evidence-based decision-making and continuous improvement. The Canvas facilitates the translation of innovative ideas into tangible results, leading to increased efficiency, accessibility, and inclusion within the judicial system. It offers a valuable model for public institutions seeking to adopt data-driven approaches to enhance their services and promote social impact.

The application of the Canvas of the Experiment has generated several significant findings:

1) Simplified legal language significantly improves comprehension among individuals interacting with the legal system, particularly those with lower educational levels (Mayer, 2021).

2) Visual resources enhance clarity and information retention, complementing simplified language and aiding in overcoming information absorption barriers.

3) A data-driven approach enables evidence-based decision-making, leading to more effective improvements in judicial policies and processes (Monte, 2023).

4) Structured experimentation provides a replicable methodology for other institutions, promoting systematic innovation in the public sector.

5) The use of the Canvas ensures that each solution is validated before wider application, promoting efficiency, accountability, and measurable impact.

These findings highlight the importance of integrating data and user-centered design into the public sector innovation process.

Ultimately, the Experiment Canvas serves as a replicable model for governments seeking to develop innovation strategies that are not just exploratory but empirically validated, results-driven, and deeply aligned with societal needs. By embedding data and evidence at the core of policy experimentation, public institutions can enhance trust, legitimacy, and effectiveness, paving the way for a more transparent, accountable, and responsive governance ecosystem.

Abstract. This paper aims to recognize content and trends with topics related to Digital Transformation (DT) in educational offers in Higher Education Institutions (HEI), in four EU countries: Austria, Italy, the Netherlands, and Poland. Research is based on benchmarking, recognizing keywords in courses and programmes offered by European universities. The main findings indicate that DT is an essential element of EU education curricula.. The second observation shows DT education as frequently located at the intersection between technology and society. The third finding demonstrates the growing inclusion of DT topics in non-technical disciplines. This research also has practical implications, as its findings on educational portfolios can be applied globally.

Keywords. digital transformation, HEI education, EU courses, digital skills development, digital competencies.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1054

1. Introduction

This template was set-up as a word document. The document is based on A4 size and contains a left and right margin of 24 mm, the top margin is 23.3 mm while the bottom margin is 19 mm.

Digital Transformation (DT) can be defined as a multidimensional transformation that results in new developments and redefines practices and relationships between various stakeholders, in the way they offer services and products (Zaoui and Souissi, 2020). In recent decades, the pressure on businesses and governments has increased, leading them to adopt these new ways of working (Kraus et al., 2021, Tangi et al., 2020) and therefore requires essential capacity building. It has been recognized that in Europe, more than 90% of professional roles require a basic level of digital knowledge. On the other hand, it was noticed that around 42% of Europeans still lack basic digital skills, including 37% of those in the workforce (EU 2022a). According to Cedefop (2022) 45% of adult workers acknowledge that they need new knowledge and skills to work with digital technologies. Developing digital skills becomes a top priority, ensuring that people are well-versed in digital skills, which in turn not only boosts the competitiveness of businesses but also empowers individuals to play an active role in shaping the digital future. The future demand for skills will drive increased digitalization, leading to task re-engineering with a strong focus on upskilling and reskilling, particularly in digital competencies. Bearing this in mind, the main research question is as follows: **RQ: What are the essential content elements of educational initiatives driving digital transformation capacity building by HEIs in Europe?**

This paper reveals the findings from state-of-the-art research on educational programmes related to DT available

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

at HEIs, in four EU Member States: Austria, Italy, the Netherlands and Poland, focused on common trends in the educational agenda for higher education.

2. Methodology

Benchmarking in European HEI's helps to determine learning and promotion strategies, improving the teaching process and curriculum development, to have a positive impact at the educational institution level (Nugroho and Jaqin, 2021). The educational processes are knowledge-oriented and knowledge-intensive (Godfrey and Godfrey, 1999) and therefore justify using a four step benchmark method as described by Spendolini (1992).

The first step of this process was an analysis of the courses and training programmes in four European countries on the topic of DT capacity building. The study focuses on four European countries: Austria, The Netherlands, Italy and Poland. The main activity performed was focused on web-based research in each country, targeting higher education initiatives in the field of DT. Besides course search, a snowballing technique was performed to deepen the information based on the initial findings.

The scope of this research was to find HEIs courses and programmes that would fit training or teaching knowledge and skills for DT in a variety of fields and took place between April and June 2023 and resulted in analysis of 148 courses/programmes.The mapping focused on understanding the main topics (content) offered, the length of programmes (duration), workload (ECTS), and the approach (delivery method) used. To enable subject analysis, each course has been assigned keywords describing its main content for better course differentiation, based on digital transformation characteristics found in n research articles (Phuong, et al,, 2023; Morakanyane, Grace, & O'Reilly, 2017; Morze & Strutynska, 2021).

The coding of courses and programmes has been done assigning a maximum of three keywords to each learning item. The major trends can be identified and deliver insights on DT education in Europe. After listing, analysing, and labelling the courses, a simple count was performed, identifying commonalities and repetitions. The most frequently mentioned keywords were indicated by researchers based on analysis of course topics and content. Independently of recurring in the first, second, or third keyword slot, using the repetition as proxy was a first attempt to formulate the trends.

3. Findings

The state-of-the-art overview has shown that digital transformation is a key element in HEI curricula. To answer the research question, the content of the courses was analysed without upfront selection criteria. The courses represent a wide range of potential training programmes, ranging from entry-level positions (employees) through middle managers to management staff. A total of 55 keywords were listed, and the courses were labelled according to the course description. Within the total of 148 courses identified, 25.7% explicitly mention DT in their programmes, indicating a trend towards creating a specific field in education.

A recurring topic, gaining momentum throughout these countries, is Artificial Intelligence (AI), which is emerging as a key aspect of DT, with several academic programmes dedicated exclusively to it. AI, Data Science, Digital Technology, Technology ethics and Regulation and Governance came next with 12.8% of occurrences (**Tab. 1**). The prominence of AI, data science, and digital ethics within HEI curricula aligns with the 2030 Digital Compass's (EU 2021) vision for a digitally skilled population and the digital transformation of businesses and public services.

Digital Business, Digital Leadership, Machine Learning (ML), Digital Innovation, IT infrastructure, Social Impact and Change management build the next group of keywords, slightly above 7% of occurrences. In this case, more humanities are included (management, social, business), expanding the understanding of digital transformation to its opportunities and consequences.

Tab. 1. Most frequently present focus area of courses (keyword occurring more than 10% of cases)

Keyword	Area	Occurrence	%
Digital Transformation	Economic aspects	38	25,70%
Artificial Intelligence (AI)	Technological aspects	19	12,80%
Data Science	Technological aspects	19	12,80%
Digital technology	Economic aspects	19	12,80%
Technology ethics	Managerial aspects	19	12,80%
Regulation and governance	Economic aspects	18	12,20%

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

While the EU's overarching DT agenda provides a unified framework, the specific educational responses vary significantly across member states. Each country exhibits unique educational focuses. A discernible trend emerges, emphasizing social impact as a pivotal aspect of digital transformation, highlighting its potential effects on society. These variations reflect the importance of a flexible and context-specific approach when addressing educational offerings.

4. Conclusions

Firstly, the most popular elements of DT curricula are AI, Data Science and Digital Engineering. In addition, emerging elements are: technology ethics, regulation and governance, and digital leadership. This suggests that technological aspects are currently balanced with business and management aspects.
The second observation is that several programmes are located at the intersection between technology and society. While in the past, technological advances were mainly studied in scientific academic programmes, today we increasingly see undergraduate and postgraduate programmes in social sciences, including courses on the impact of emerging technologies and digitalization in government, industries, markets, and society in general.
Additionally, observations revealed that EU's Digital Skills Agenda (EU 2020) is reflected in the wide array of DT programmes offered by HEIs at various educational levels. The interdisciplinary nature of these programmes, which span from technical to social sciences, ensures that digital skills are integrated across diverse fields, promoting accessible and inclusive digital education.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 10 July 2025

Abstract. Citizen Participation (CP) is essential for urban projects, traditionally done through face-to-face meetings. Information Technologies (IT) have introduced electronic participation (e-Participation), enhancing inclusivity and engagement. CPPs generate valuable data for decision-making, but processing large volumes of unstructured data is challenging. Traditional methods are inefficient. AI algorithms can improve data analysis, automate classification, detect patterns, and extract relevant information, reducing the workload for decision-makers. This research explores how AI can detect and classify patterns in CPP data, contributing to best practices in applying AI to government operations.

Keywords. Citizen participation, Artificial Intelligence models, Data analysis, Pattern detection, Semantic, spatial and temporal analysis.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1068

1. Introduction

Citizen Participation (CP) integrates citizens into decision-making for urban and community projects. Historically, CP was facilitated through face-to-face meetings, allowing stakeholders to share their perspectives. The advent of Information Technologies (IT) has introduced electronic participation (e-Participation), leveraging tools like blogs and social networks to enhance inclusivity and engagement. CPPs generate valuable data that must be meticulously analyzed to aid decision-making and improve service delivery (Marzouki et al., 2022b). However, processing large volumes of unstructured data is challenging. Traditional manual methods are inefficient and limit scalability. AI algorithms can automate the classification of citizen posts, detect patterns, and extract relevant information, reducing the workload for facilitators and edecision-makers (Bonsón et al., 2015; Marzouki et al., 2022a). This research explores how AI can enhance CPP data analysis, contributing to better decision-making and government service delivery. By leveraging AI, governments can gain deeper insights into citizens' needs and preferences, ensuring that actions are aligned with community demands (Burgess-Allen & Owen-Smith, 2010; Sanford & Rose, 2007).

2. Theoretical background

To integrate Artificial Intelligence (AI) into participatory platforms, we focus on the analysis of participation data derived from these platforms. At the core of this conceptualization, we propose a systemic approach in which the human aspect is represented by citizens, facilitators, and decision-makers. This model integrates

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

AI techniques for faster, more efficient, and responsive interactions to citizens' needs.
Key concepts include textual data analysis (TDA) and the semantic, spatial, and temporal contextualization of participation data. TDA examines textual data to extract meaningful patterns using natural language processing (NLP) techniques like Named Entity Recognition (NER) and text classification. AI models such as LDA, CNN, LSTM, and RBFN are considered for text classification. NER identifies key entities in text, classifying results into spatial, semantic, and temporal dimensions (Marrero et al., 2013).
The anticipated results aim to extract knowledge about citizens' living contexts, classify this knowledge into distinct patterns, and inform decision-makers. This approach promotes better decisions aligned with citizens' needs, generating valuable insights to refine policies, improve services, and foster stronger engagement between decision-makers and communities. Anchoring decisions in citizen-centered data strengthens trust and governance effectiveness.

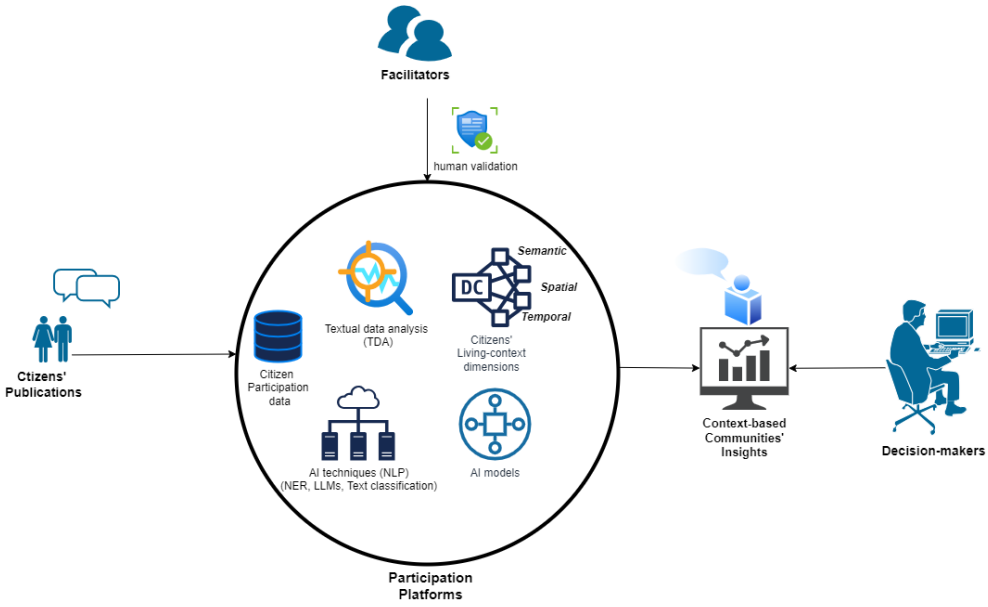

Fig. 1 – A conceptual model for AI models integration in citizens' living context identification in citizen participation data (authors main contribution)

2.1. Textual Data Analysis (TDA)

TDA systematically examines textual data to extract meaningful patterns, isnsights, or classifications using techniques like natural language processing (NLP), text mining, sentiment analysis, and topic modeling. In our study, TDA allows qualitative assessment and automatic classification of citizens' posts, reducing the workload for facilitators and improving decision-making (Feldman & Sanger, 2007; Mohit, 2014).

2.2. Semantic, Spatial, and Temporal Contextualization

After collecting citizens' opinions and feedback, data analysis and information extraction processes are necessary. Patterns capturing stakeholders' living contexts are classified into three dimensions (Marzouki et al., 2022a; Meersman, 1997):

1. **Semantic Dimension:** Represents the meaning of information provided by citizens, including issues, suggestions, lived experiences, metrics, governing entities, references, questions, compliments, links, tags, hashtags, and emoticons (Marzouki et al., 2022a).
2. **Spatial Dimension:** Addresses the question "Where," representing objects in geographical space, including internal and external spatial entities, similar organizations, hypothetical and approximated positions, cities, provinces, countries, hashtags, and location stamps (Lafrance et al., 2019; Marzouki et al., 2022a).
3. **Temporal Dimension:** Addresses the question "When," including past and future calendar expressions, deictic and anaphoric expressions, founded calendar expressions, and temporal hashtags (Lafrance et al., 2019; Marzouki et al., 2022a).

2.3. Named Entity Recognition (NER)

NER identifies and categorizes important names and proper nouns in text, enabling information extraction of Named Entities (NE) (Marrero et al., 2013). We will use pre-trained models due to their high accuracy:

1. **Spacy:** Utilizes deep learning for NLP, processing text from tokenization to annotation (Dasagrandhi, 2021; Partalidou et al., 2019).
2. **Stanford CoreNLP:** Java-based tool with feature extractors for named entities, using a sequence of annotations (Bondielli et al., 2018).
3. **OpenNLP:** Contains components for a complete NLP system, including sentence detection, tokenization, and parsing (Mohanan & Samuel, 2016).
4. **Gate:** Open-source tool with multilingual support, providing reusable processing resources for NLP tasks (Cunningham et al., 2014; Elsherif et al., 2019).
5. **NLTK:** Python library for NLP tasks, analyzing data programmatically (Siva Rama Rao et al., 2022).

This approach aims to extract knowledge about citizens' living contexts, classifying this knowledge into distinct patterns, and informing decision-makers in their decision-making processes. By anchoring decisions in citizen-centered data, this approach strengthens trust and the overall effectiveness of governance .

2.4. Large Language Models (LLMs)

LLMs are a category of deep learning models designed to understand and generate human language. These models are built on transformer architectures, which enable them to learn complex patterns in text data by processing input sequences in parallel and capturing long-range dependencies between words. LLMs are pre-trained on massive corpora of text and can be fine-tuned for specific tasks such as text classification, named entity recognition (NER), and text generation (Brown et al., 2020). Below, we discuss some of the most prominent LLMs: GPT-4, BERT, RoBERTa, DistilBERT, and T5.

1. **GPT-4 (Generative Pre-trained Transformer 4):** GPT-4 is a state-of-the-art generative language model developed by OpenAI. It has been trained on a vast corpus, which enables it to perform well on a wide range of natural language processing (NLP) tasks (Brown et al., 2020).
2. **BERT (Bidirectional Encoder Representations from Transformers):** BERT, developed by Google, is a transformer-based model designed to understand the contextual relationships between words in a sentence. It is primarily used for tasks like named entity recognition (NER), question answering, and sentence classification (Devlin et al., 2019).
3. **RoBERTa (A Robustly Optimized BERT Pretraining Approach):** RoBERTa is an optimized version of BERT developed by Facebook AI. The improvements result in better performance on a range of NLP tasks, particularly for tasks that require understanding the relationship between words within large text corpora (Liu et al., 2019)
4. **DistilBERT (Distilled Version of BERT):** DistilBERT is a smaller, more efficient version of BERT that retains 97% of BERT's language understanding while being 60% faster and using 60% less memory (Sanh et al., 2019)
5. **T5 (Text-to-Text Transfer Transformer):** T5, developed by Google Research, is a transformer-based model that treats every NLP task as a text-to-text problem. It is highly versatile and can perform a wide variety of NLP tasks by leveraging a unified architecture and large-scale pretraining (Raffel et al., 2020)

2.5. Text Classification

Text classification assigns a document to a predefined category. It can be binary or multi-class, where binary classification can also be used for multi-label classification (Anis, 2022).

2.6. Artificial Intelligence Algorithms

AI algorithms, inspired by human intelligence, perform tasks like learning, reasoning, and problem-solving. They process and analyze complex data, including natural language (Russell & Norvig, 2016). Effective algorithms for text data analysis include:

1. **LDA:** Probabilistic model for discrete data clusters, identifying hidden topics (Sayadi, 2017).
2. **CNN:** Network using minimal preprocessing, useful for detecting named entities (Widiastuti, 2019).
3. **LSTM:** Extends memory of RNNs, storing states of each cell for sequential processing (Schmidhuber & Hochreiter, 1997).
4. **RBFN:** Neural network for curve-fitting in high-dimensional space, useful for classifying participation data into semantic, spatial, or temporal patterns (Zhang et al., 2011).

3. Methodology

This paper explores the integration of AI models for semantic, spatial, and temporal analysis of citizen participation data on digital platforms. The methodology involves several steps:

- **Exploration of Citizen Participation Platforms:** Establish foundational understanding of functionalities and data generated.
- **Framework for CPP Data Contextualization:** Analyze data based on semantic, spatial, and temporal dimensions.
- **Review of Textual Data Analysis Techniques:** Identify key dimensions for analysis.
- **Search for Appropriate AI Architectures:** Design AI models tailored to each dimension.
- **Evaluation of AI Model Designs:** Assess accuracy scores for models like Named Entity Recognition (NER) and Entity Classification.
- **Selection and Integration of Models:** Choose the best models for each dimension and analyze results to understand citizen participation patterns.

3.1. Choice of Pre-trained NER Model:

We selected a pre-trained NER model based on performance, corpus size, and integration environment. After comparing several models, including SpaCy, Stanford Core NLP, OpenNLP, Gate, and NLTK, we excluded Java-based models due to integration constraints. Between SpaCy and NLTK, SpaCy was preferred for its larger corpus size and better performance. After evaluating the available SpaCy models, we chose `fr-core-news-sm` for its smaller size and efficiency in identifying patterns in citizen participation texts.

4. Proposed AI Models for Semantic, spatial and temporal Analysis of citizen participation data on digital government platforms

4.1. The proposed Semantic Dimension Model

- **Design of Solution 1 of the Semantic Model**

This solution is based on the pre-trained SpaCy model with custom entity recognition. The goal is to detect and classify semantic patterns from a given text. Semantic patterns include: Question, Governing Entity, Reference, Number/Metric, Link or document/file, Tag, Hashtag, Emoticon.
Figure 2 shows the semantic patterns detected by Solution 1 (using the NER model) and Solution 2 (using the LLM model) in the text.

- **Design of Solution 2 of the Semantic Model**

In this solution, we will employ Large Language Models (LLMs) to enhance the detection and classification of semantic patterns within citizen participation data. The model is pre-trained on vast amounts of textual data and by fine-tuning it, we can detect and classify complex semantic entities which are listed in the solution 1 of the semantic model. By integrating LLMs, the model strengthens the decision-making framework by offering a comprehensive understanding of citizen engagement and by improving the data processing on digital government platforms. The illustrative diagram for this solution is similar to Solution 1, as it shares the same inputs and outputs; however, the model used will be different to detect specific semantic patterns.

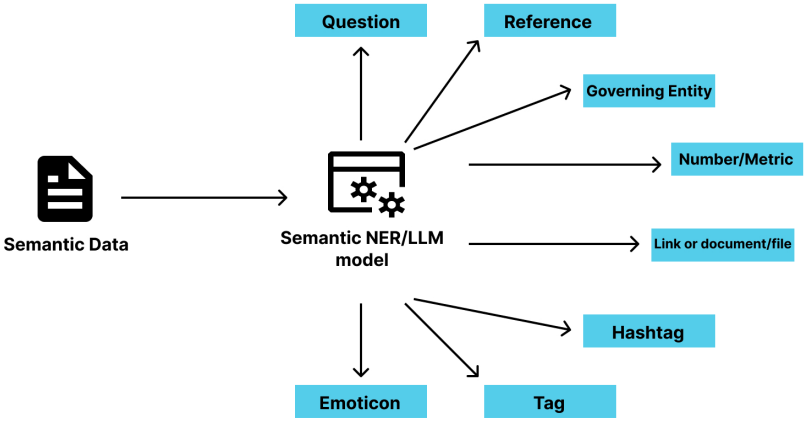

Fig. 2 – Illustrative diagram of the Semantic Dimension Model using NER/LLM

4.2. The proposed Spatial dimension Model

One essential dimension in data analysis is the extraction of spatial data. Two solutions are proposed: one using the SpaCy NER model with a neural classification model, and one using the pre-trained SpaCy NER model combined with a geolocation API and an algorithmic classification process.

- **Design of Solution 1 of the Spatial Model** This solution involves implementing two complementary models:

- Spatial NER Model: Similar to the semantic dimension, input data is prepared, annotated, and divided into training and testing corpora. This model extracts spatial patterns without classifying them. Figure 3 shows the spatial entity that this model is designed to detect in the text. **- Spatial Entity Classification Model:** This

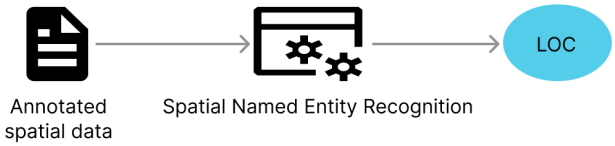

Fig. 3 – Illustrative diagram of the Spatial NER model

model classifies the spatial patterns detected by the first Spatial NER model, processing the annotated corpus and outputting six class categories using a Feed Forward network. Figure 4 shows the spatial patterns that this model is designed to classify.

- **Design of Solution 2 of the Spatial Model**
  This solution uses the pre-trained SpaCy model to identify location and organization entities (Loc, Org), then prepares an NER model to detect classes like Cities_provinces_Countries, Spatial entity approximated position, and Hashtag. The entity results are then classified according to logical constraints. Figure 5 illustrates the second solution as well as the spatial patterns that this solution is designed to classify.

4.3. The proposed Temporal dimension Model

- Design of Solution 1 of the Temporal Model: This solution includes two complementary models: a Temporal NER model, similar to the semantic dimension and the first spatial solution, which detects

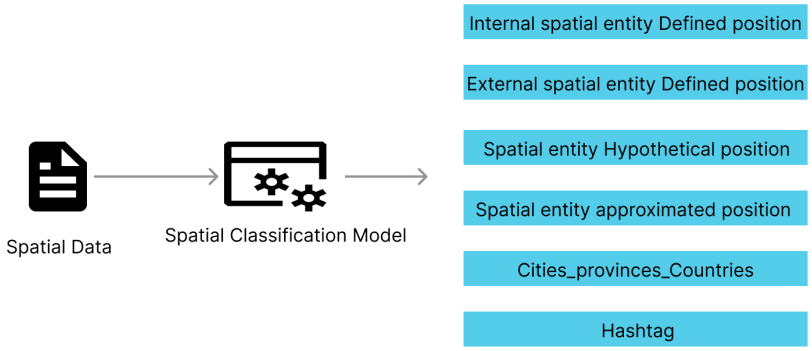

Fig. 4 – Illustrative diagram of the first spatial classification model

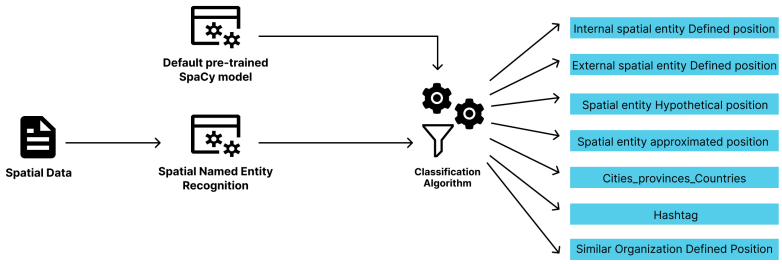

Fig. 5 – Illustrative diagram of the second spatial classification solution

temporal patterns from the annotated corpus, and a Temporal Entity Classification model that automatically classifies the temporal entities detected by the Temporal NER model. Figure 6 shows the temporal entity that this model is designed to detect in the text. Figure 7 shows the temporal patterns that this model is designed to classify.

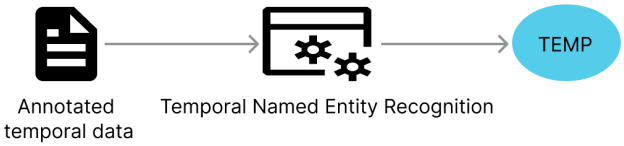

Fig. 6 – Illustrative diagram of the Temporal NER model

- Design of Solution 2 of the Temporal Model: This solution uses the pre-trained SpaCy model to detect the date from the (DATE) entity after translation, then applies the NER model trained with collected temporal data to identify deictic expressions and temporal hashtags. The extracted information is processed through a classification algorithm based on logical classification rules. Figure 8 illustrates the second solution as well as the temporal patterns that this solution is designed to classify.

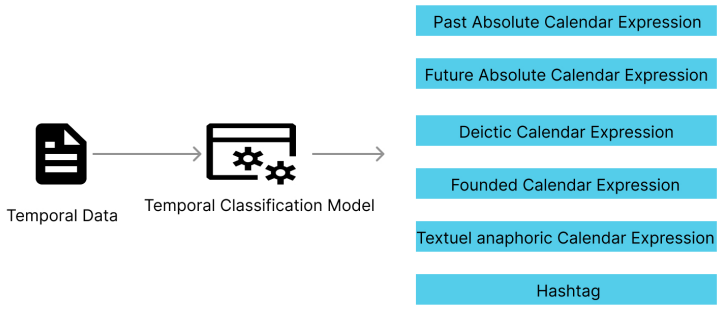

Fig. 7 – Illustrative diagram of the temporal classification model

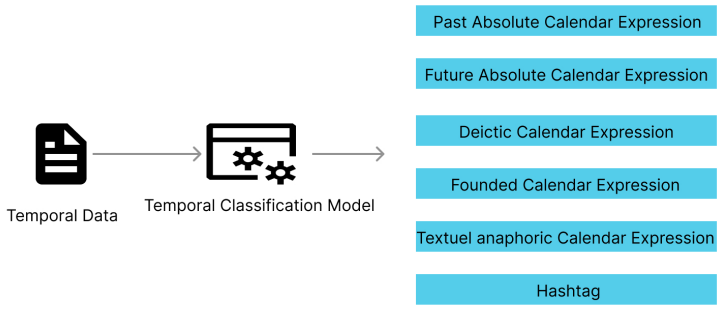

Fig. 8 – Illustrative diagram of the temporal classification model

5. Discussion and Conclusion

This study explores the integration of AI models for semantic, spatial, and temporal analysis in citizen participation data on digital platforms . Automating data analysis through AI enhances the ability to identify nuanced patterns, supporting scalable and efficient decision-making processes tailored to citizen needs (Marzouki et al., 2022a). Semantic analysis captures stakeholders' experiences and concerns, spatial analysis further contributes by mapping out the geographic dimensions of citizen inputs, thereby aligning community needs with spatial strategies in urban planning (Lafrance et al., 2019), and temporal analysis tracks changes over time (Andrienko et al., 2010), fostering proactive governance (Marzouki et al., 2022b).
The integration of AI-driven methodologies represents a significant advance in the transformation of digital citizen participation platforms. This approach addresses data scalability and complexity, improving decision-making processes in urban governance. By bridging the gap between citizen data and actionable insights, it fosters more inclusive and data-informed policy-making.
Our research aims at automating the analysis of large volumes of textual data, in order to provide actionable insights for city decision-makers. Future work will include collecting real citizen participation data, testing the proposed models, and developing a participatory platform integrated with decision support mechanisms. Further refinement of these AI models will enhance the effectiveness of citizen participation platforms, including the analysis of other data types, like images and videos, to provide a comprehensive understanding of citizens' living contexts.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 22 May 2025

Abstract. Medical financial literacy is essential to make smart decisions in healthcare settings and prevent unanticipated financial hardships. Existing literature has shown that young adults often struggle to understand information associated with health insurance and the financial planning necessary for health-related costs. AI-driven chatbots are emerging as educational tools that have the potential to address this issue. This exploratory study examined an AI chatbot aimed at enhancing medical financial literacy among high school students. Participants engaged with the chatbot's responses to medical financial questions while also rating the clarity, ease of use, trustworthiness, and educational value of the chatbot engagement. Our experiment results supported that the chatbot increased students' understanding of the financial aspect of healthcare - 76.9 percent of students reported a high degree of understanding, 80.8 percent rated the chatbot's responses as clear, and 73.1 percent reported they would recommend it to a peer. The responses indicated that students found the chatbot helpful, but suggested that interactive features be added and/or real-world finance features be incorporated into the chatbot.

Keywords. Conversational AI, Medical financial literacy, Young adults, Chatbot, exploratory study.

1. Introduction

Medical financial literacy refers to the ability to understand and manage healthcare-related finances. Achieving medical financial literacy allows a person to make informed healthcare decisions and avoid unexpected financial burdens. Although important, many do not know much about health insurance before an emergency or treatment. Most patients reported learning about health insurance through trial and error during treatment (Waters et al., 2022). These gaps in medical financial literacy may have caused people to be unprepared to navigate the intricacy of healthcare costs. According to the Kaiser Family Foundation (KFF)'s 2023 report, AIAN and Hispanic US citizens under 65 have high uninsured rates at 18.7 percent and 17.9 percent. This is double their white counterparts at 6.5 percent.

Medical financial literacy education is one of the solutions to alleviate such financial burden. Financial literacy among young people today is increasingly important as finances become more complex. The financial landscape is evolving, showing the need for the early introduction of financial education so that the youth today can make informed financial decisions. Many states have recognized this need by incorporating financial literacy courses into their curriculum, showing the importance of giving students resources that better equip them for the future (Mancone et al., 2024). Most 18-year-olds are held financially responsible for their healthcare (Cruz et al., 2024). Many graduating high school students are likely to be unaware of the unexpected financial costs in the American healthcare system. Several studies have underscored the misunderstandings and obstacles that young adults face in navigating the costs associated with the healthcare system (Cruz et al.,

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

2024; Mancone et al., 2024; Waters et al., 2022). For example, studies depict that adolescent and young adult cancer survivors tend to have difficulty comprehending health insurance, which makes them more vulnerable to financial risk (Vaca Lopez et al., 2023; Waters et al., 2022).

One solution to this problem is AI. AI is a useful educational tool, and studies support the idea that chatbots can enhance understanding of complex topics (Cruz et al., 2024; Nur Azlina Mohamed Mokmin, 2021; Reshawn Ramjattan, 2022). Chatbot technology has been successful in increasing the ease of use of educational software in healthcare (Nur Azlina Mohamed Mokmin, 2021; Reshawn Ramjattan, 2022). By extending the argument to the digital native generation, an AI chatbot would be effective in helping high schoolers further comprehend medical finances. Another study further supports the idea that chatbots can be a useful tool in health literacy. The overall assessment showed that the developed chatbot has significant potential to be used as a bridge to increase health literacy among students and young adults (Nur Azlina Mohamed Mokmin, 2021).

This study aims to address the existing gap in knowledge regarding the potential of AI chatbots to improve medical financial literacy, thereby contributing to the use of digital technologies to tackle a significant societal issue. This study evaluates the effectiveness of an AI chatbot in enhancing high school students' understanding of medical financial concepts. The chatbot was designed to tailor responses based on the user's location and grade level, ensuring relevance. As a team of student researchers, we identified five commonly asked questions related to medical financial literacy as five prompts for the AI chatbot. We invited high school students (N=26) to review the chatbot-generated responses to these prompts. Participants were shown prompts to answer and the chatbot's responses. Students then completed a survey that assessed various aspects of the chatbot's performance, including understandability, clarity, ease of use, reliability, and the knowledge gained (Naamati-Schneider, 2024). This process allowed us to assess students' perceptions of the chatbot's educational value and identify areas for improvement.

This study demonstrates how an AI-based chatbot can effectively improve high school students' medical financial literacy by providing clear, accessible, and relevant information regarding healthcare costs, highlighting AI's ability to simplify complex ideas for young learners.

2. Literature Review

Improving medical financial literacy requires new tools, with AI-powered chatbots emerging as a viable solution. They provide real-time explanations that simplify complex insurance concepts. Studies have found that adolescent and young adult cancer survivors lack understanding of insurance coverage, leaving them at greater risk of financial hardship (Waters et al., 2022). Another study finds students largely unaware of key insurance concepts like out-of-pocket costs and coverage limits (Cruz et al., 2024). These findings suggest conventional education methods are insufficient, underscoring the need for alternatives like AI-driven learning.

AI chatbots are increasingly used in education for personalized, interactive learning. Evidence shows chatbots improve student engagement and comprehension in healthcare topics (Vaca Lopez et al., 2023). They simulate real financial scenarios, enabling active learning over passive consumption. One study showed chatbots improved understanding of complex topics via immediate, personalized feedback (Naamati-Schneider, 2024). This is proof of the incorporation of chatbots in medical financial literacy education. Their effectiveness depends on providing accurate, trustworthy, and engaging content. Users find chatbots helpful for healthcare learning, though trust depends on transparency and accuracy (Vaca Lopez et al., 2023). Another study established that interventions using chatbots enhanced financial and health literacy, and individuals indicated that they were more confident in making fully informed decisions following AI-supported tools (Mancone et al., 2024). Some limitations remain, though, including the lack of personalization and interactive engagement elements, potentially impacting long-term retention and user trust (Reshawn Ramjattan, 2022). This paper aims to incorporate user feedback to enhance learning outcomes and promote increased participation.

3. Methodology

3.1. Medical Financial Literacy Chatbot

The AI chatbot, developed using the Dify platform (see Figure 1), is designed to educate high school students transitioning to college about medical financial literacy. Tailored to their grade level, it delivers clear, engaging

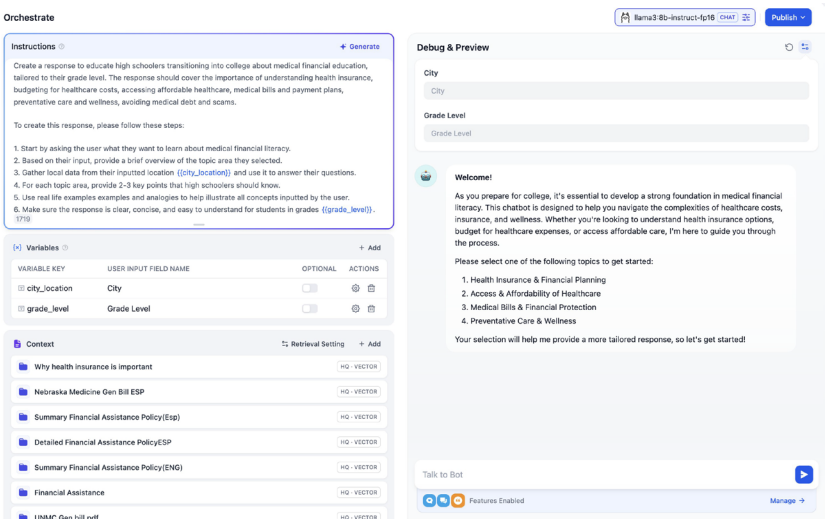

Fig. 1 – System Design for AI Chatbot.

responses on topics such as health insurance, budgeting for healthcare, accessing affordable care, managing medical bills, and avoiding debt or scams. The chatbot uses a structured approach: users choose a topic, receive an overview, and get localized answers based on their city. Real-life examples aid understanding, while a vectorized knowledge base with resources like Nebraska Medicine bills and student insurance guides ensures accurate, location-specific insights. Hosted on Dify's open-source framework, the chatbot combines ease of deployment with robust LLM-driven (llama3:8b-instruct-fp16) capabilities, making it an effective educational tool for young adults navigating healthcare finances.

3.2. Study Design

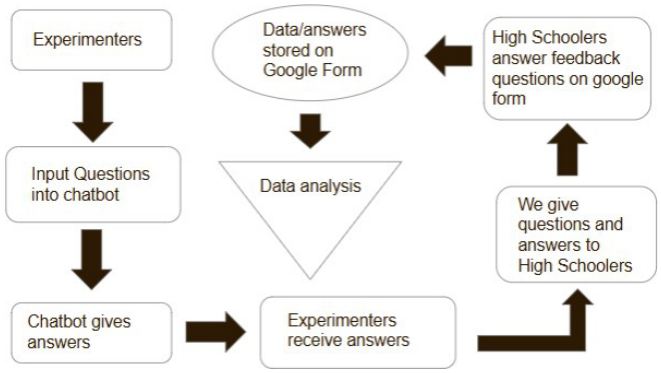

Fig. 2 – The participant-driven data collection process using the chatbot.

This study employed a survey-based, cross-sectional design to evaluate the effectiveness of a conversational AI chatbot in enhancing medical financial literacy among high school students. Due to the school's AI usage policy, students were not permitted to interact directly with the chatbot on campus. To address this limitation, we identified the five most frequently asked questions related to medical financial literacy and obtained responses from the AI chatbot. These responses were then shared with the high school students using Google Slides to collect quantitative data on their understanding, trust, and perceived educational value. Figure 2 illustrates the participant-driven data collection process using the chatbot. 26 high school participants were asked to go step by step through the provided answers to ensure exposure to the content covered by the chatbot. Afterward, the participants took a feedback survey on Google Forms via QR code. The feedback survey consisted of quantitative Likert-scale questions regarding the interpretation of clarity, perceived usefulness, and areas for improvement in the chatbot's learning content for grades 9-12, who participated in our experiment. We showed them 5 commonly asked prompts directed to the chatbot, that addressed concepts about health insurance that are most relevant to young adults, copays, deductibles, private vs public insurance, and handling unaffordable medical bills, which were answered by the chatbot (e.g. Figure 3). The experiment has been approved by the high school supervisor to protect the students' well-being and privacy. No identifiable data was shared outside of the high school research team.

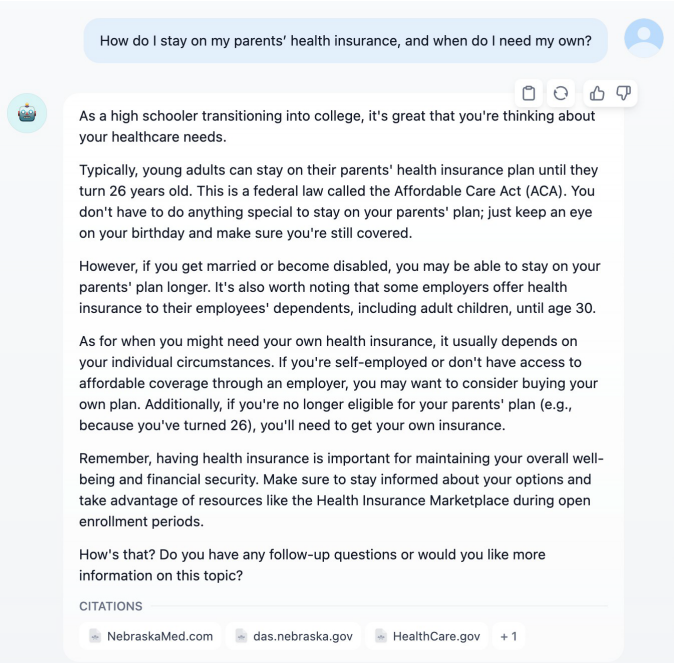

Fig. 3 – AI chatbot explains how to stay on parents' health insurance and when to get your own, with clear guidance.

4. Findings

We generated these findings from our research on the perceived learning of medical finances through an AI-powered chatbot. (see Table 1).

Tab. 1 – Participant responses categorized by pre-existing knowledge, learning outcomes, perceived accuracy, and overall impact of the medical finance chatbot.

Categories	Questions	Mean of Likert Scale (1-5)	Percentage over 3 on Likert Scale (1-5)
Pre-Existing Knowledge & Familiarity	2. On a scale of 1-5, how familiar are you with medical financial concepts (e.g., insurance, medical billing, healthcare costs)?	2.35 ±0.94	7.7%
	5. Before seeing the chatbot's responses, how would you rate your understanding of medical financial concepts?	2.58 ±1.17	19.2%
Learning & Comprehension	3. On a scale of 1-5, to what extent did you learn from the chatbot?	3.81 ±1.23	73.1%
	4. On a scale of 1-5, how clear and understandable were the explanations?	4 ±1.06	80.8%
	6. After seeing the chatbot's responses, how would you rate your understanding of the medical financial concepts in the questions?	3.61 ±0.94	65.3%
Appropriateness & Accuracy	7. On a scale of 1-5, was the chatbot's explanation appropriate for your grade level?	4 ±1.26	69.2%
	8. Did you feel confident that the chatbot was providing accurate and reliable information?	4.12 ±1.14	80.8%
Impact & Recommendation	9. Do you feel more prepared to handle medical financial situations after using the chatbot?	3.54 ±1.20	61.5%
	10. Would you recommend this chatbot to other students?	3.96 ±1.22	73.1%

First, our chatbot was perceived as a valuable educational resource in educating about healthcare expenses. We used a Likert scale for this, and we found that 80.8 percent of students scored clarity as 4 or 5, and 69.2 percent of students scored the explanation as being appropriate for their grade level as a 4 or 5 as well. This indicates that the chatbot effectively simplified topics like insurance, deductibles, and medical billing. That being said, some participants did suggest that interactive features (quizzes or real-world finance scenarios) would further enhance engagement. Second, our data suggested that the chatbot significantly improved high school students' comprehension of medical financial concepts. Still using the Likert scale, we found that before engaging with the chatbot, 50 percent of students rated their understanding as low (1-2). After interacting with the chatbot, 76.9 percent of students rated their understanding high (4-5). This shows that students learned from the chatbot and that the chatbot's ability to simplify complex concepts into easy explanations is remarkable. Some students did note that topics such as insurance comparisons and handling unaffordable medical bills needed further explanation. Furthermore, 80.0 percent of students ranked their confidence in accurate responses as high on the Likert scale (4-5). 73.1 percent of students said that they would recommend it to their peers. These results show that students found the chatbot credible and useful as a learning tool. User feedback highlighted the accurate responses, but one way we could improve is by improving conciseness and adding real-life examples. Overall, these findings demonstrate that AI-powered chatbots can serve as effective tools for improving medical financial literacy among high school students. By enhancing clarity, comprehension, and trust, such tools have the potential to bridge knowledge gaps and empower young individuals with essential healthcare financial knowledge.

5. Conclusion

Our findings show that our AI chatbot can be an effective educational tool for improving medical financial literacy among high school students. The chatbot was successful in enhancing perceived educational value, comprehension, and fostering confidence. Our exploratory research and experiment demonstrate the potential of AI educational tools to bridge the gap between youth and complex medical and financial concepts. The study faces limitations due to its sample size, which may not be generalizable to all high school demographics. Our data collection relies on self-reporting, which introduces potential biases into the responses obtained from participants. A better approach for future studies would be to administer pre-tests and post-tests to measure knowledge gain. Additionally, there was a lack of live chatbot interaction, as responses were displayed rather than allowing people to interact with the chatbot directly. Future research should examine more diverse demographics of participants, incorporate interactive functionalities and real-world tasks, and utilize pre- and post-assessments of understanding to increase the robustness of the findings.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 22 May 2025

Abstract. Taking full advantage of multiple official government data sources is crucial for government emergency management agencies and authorities to formulate scientific and feasible crisis communication policies and measures. The current study examined the case of the public health emergency to explore the association between government microblog activities and the evolution of the public health emergency. Moreover, the present research utilized latent Dirichlet allocation (LDA) topic modeling to detect dominant pandemic-related themes in the government microblog dataset and the government press release conference dataset. Research results indicate that the evolution of government microblog activities is generally similar to that of the pandemic outbreak. The current research also found that government microblog messages and press releases had consistent pandemic-related themes (medical treatments, nucleic acid testing, pandemic statistics, pandemic updates, press conferences, and material support). These results can assistant government agencies and stakeholders obtain a comprehensive understanding of the evolution of public health emergencies and public feelings, concerns, and issues, which will further improve their crisis communication ability.

Poster, DOI: https://doi.org/10.59490/dgo.2025.1018

1. Introduction

Public health emergencies such as Western Africa Ebola, Zika, and COVID-19 pandemic have posed an enormous threat to human life and health in the past decade. Owing to the high infectivity, uncertainty, and unpredictability of epidemics, many countries have implemented strict social distancing initiatives to restrict its spread, resulting in difficulties in face-to-face communication between stakeholders and a move to online communication (Wang & Xiong, 2022). The main goals of online crisis communication in public health emergencies are to share pandemic-related information and boost the situational awareness of stakeholders.

Compared with traditional media, government social media accounts have become a pivotal crisis communication medium for public sectors to disseminate crisis information and interact with citizens during public health emergencies (Zeemering, 2021). Government emergency management agencies proactively use government social media accounts for the timely release of pandemic-related information, policies, and measures to meet citizens' information needs (Tang et al., 2021). Meanwhile, citizens increasingly use government social media accounts in a proactive manner to obtain relatively authentic and authoritative pandemic-related information and express their opinions, attitudes, and suggestions regarding the performance of the government in epidemic response (Wang et al., 2023). In addition, many studies have revealed a correlation between disaster severity and the degree of social media users' online participation (Fang et al., 2019). Wong and Jensen (2020) reported that increases in new cases lead to higher levels of online communication among Twitter users during emergencies.

COVID-19 as the novel coronavirus continues to mutate, the risk of epidemic transmission is ever-present, and the pressure of the epidemic response in various countries remains high. However, the COVID-19 outbreak attracted significant attention and caused great social panic. As a measure to alleviate the impact of the pandemic on physical and mental health and regulate misinformation and rumors, government agencies should release prevention policies in a timely manner via their official social media accounts (Dong & Lian, 2022). Hence, to improve the

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

efficiency of public health crisis communication, it is warrant to conduct more comprehensive investigation of the topics released by government social media accounts and netizen attitudes during public health crises.

Although scholars have investigated government social media accounts regarding their users' behavior during public health emergencies (Tang et al., 2021; Wang et al., 2023), most such research has adopted traditional research methods such as questionnaire surveys with a limited sample, which makes it difficult to comprehensively understand the entire scope of major topics associated with the pandemic released by government social media accounts and track communication across each public health crisis stage. To better understand how government social media account for crisis communication information during public health emergencies, this study utilized text-mining technologies and natural language processing methods to analyze government social media messages posted by government agencies during the pandemic in depth.

2. Research methods

This study collected three primary types of data: pandemic-related statistics, government microblog data, and government press release conference data. pandemic-related statistics collected from "website of the Shanghai Municipal Health Commission" during the period from March 1 to May 31, 2022, were used to demonstrate the evolution of the pandemic. Government microblog data were obtained from Sina Weibo "Released in Shanghai". We employed the Weibo Search API to download related government microblog messages from March 1 to May 31, 2022, resulting in the collection of 1330 government microblog messages. Government press releases conferences data related to the epidemic were obtained from government website "The State Council Information Office of the People's Republic of China" during the period from March 1 to May 31, 2022, and compiled into a Microsoft Word file containing 92 documents.

The framework and approach applied in this manuscript for pandemic-related topic identification from various official government data sources is schematically shown in Fig. 1, consisting of three phases: data collection, data processing, and data analysis. The data collection and preprocessing procedures were demonstrated in the previous section. Then, using the filtered government microblog data, the amount of government microblog activity (number of messages, likes, forwards, and comments) was calculated for each week. These were compared with weekly epidemiological updates on pandemic (number of deaths, confirmed cases, asymptomatic cases, and new cases) to present the evolution of the pandemic and government microblog activities.

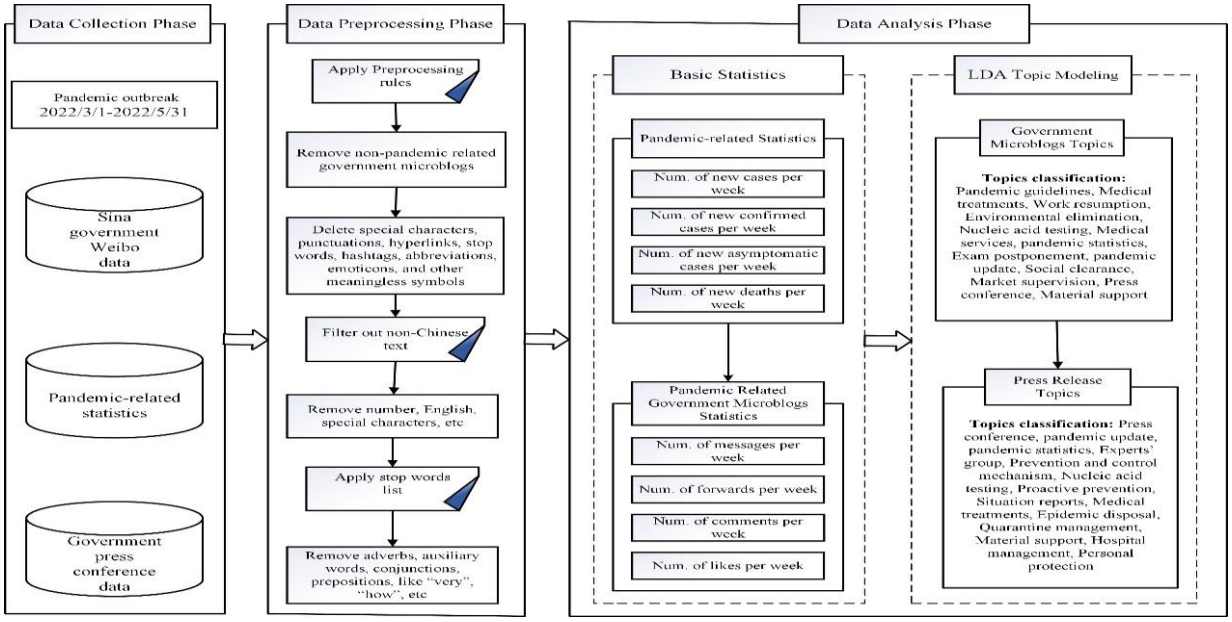

Fig. 1. Research framework.

3. Results

3.1 The evolution of government microblog activities and association with the pandemic

The time series of government microblog activities (number of messages, likes, forwards, and comments) and weekly epidemiological updates on pandemic (number of deaths, confirmed cases, asymptomatic cases, and new cases) from March 1 to May 31, 2022, are plotted in Figs. 2 and 3. It is evident that the variations in government microblog activities were similar to the evolution of the pandemic, except for the number of pandemic-related

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

messages. The pandemic began on March 1 and lasted until May 31, causing severe socioeconomic, physical, and mental health impacts. During the incubation period (before March 1, 2022), few cases were reported in government website "Shanghai Municipal Health Commission" and government microblog "Released in Shanghai." During the outbreak period (March 1 to April 13, 2022), the number of new cases increased every week, but government microblog activities showed some fluctuations, especially for the number of pandemic-related messages; the number of likes, forwards, and comments display the same variation trend. During the recession period (April 14 to May 17, 2022), the number of new cases gradually decreased each week, but government microblog activities gradually stabilized at a lower level of participation. During the recovery period (May 17 to May 31, 2022), the number of new cases gradually stabilized after a precipitous decline, and the government microblog activities were maintained at a lower level of participation except for May 31, when the Shanghai government announced a full resumption of normal production and life order in the city, which resulted in strong government microblog activities, except for the number of messages.

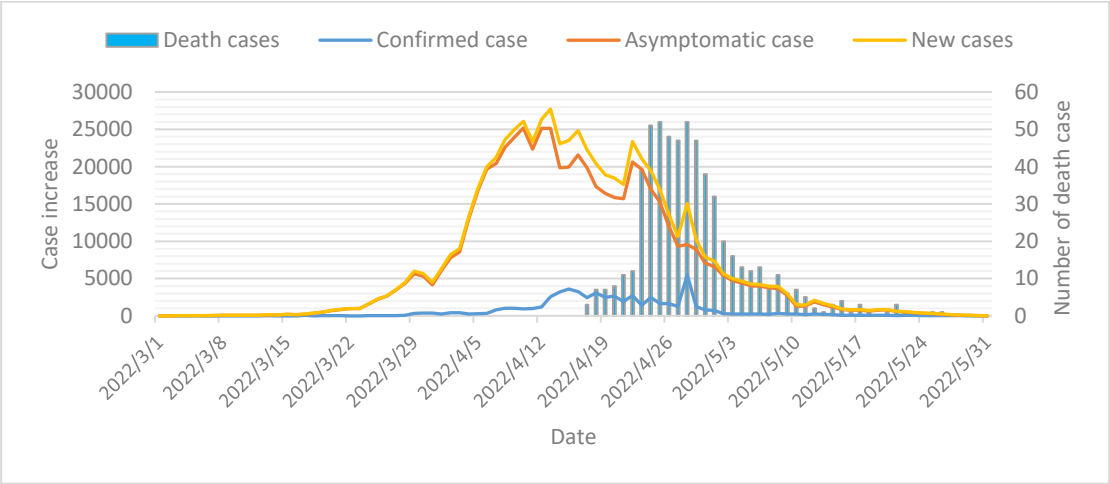

Fig. 2. The pandemic-related case information.

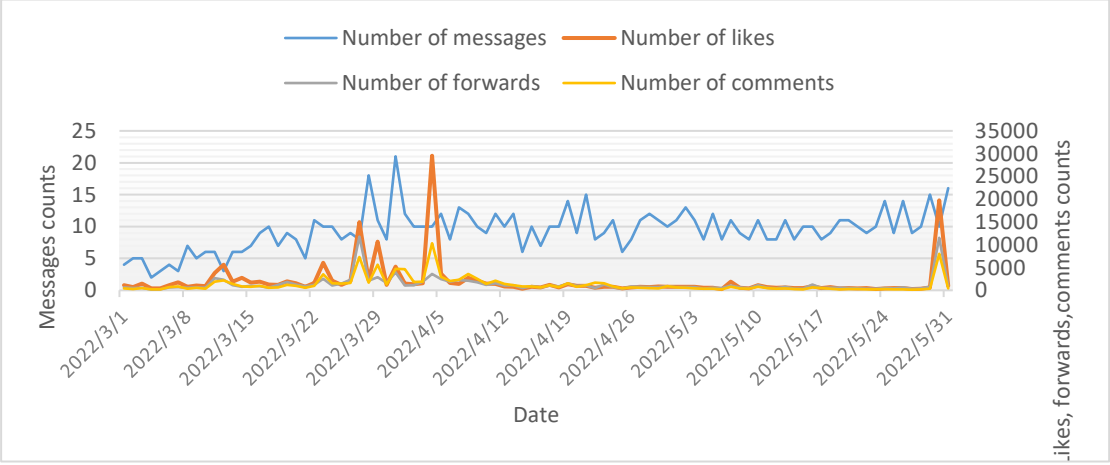

Fig. 3. Temporal variations of government microblog activities (number of messages, likes, forwards, comments) during the pandemic.

3.2 The evolution of pandemic-related government microblog topics

Government microblogs were assigned topics using the LDA algorithm. For the LDA, the number of keywords per topic was set to 10. We calculated the perplexity scores for different numbers of topics (e.g., 20, 30, and 50). For government microblog message data, we found that the perplexity score is a minimum for 13 topics, which means that the maximum accuracy of the LDA model is achieved when the number of topics is 13. We then employed LDA with 2,000 Gibbs sampling iterations to train the dataset. Gibbs sampling is a Markov chain Monte Carlo algorithm that is used to acquire a sequence of samples from an approximate multivariate probability distribution when direct sampling is difficult. The 13 topics were identified from government microblog message data. The 13 topic categories of the government microblog message data, followed by the corresponding keywords from the LDA output, are summarized in Table 1, where each topic is characterized by 10 words and manually interpreted and labeled based on the characterized words.

3.3 The evolution of pandemic-related government press release conferences topics

To detect hidden topics in our government press release dataset, we leveraged the LDA algorithm for topic modeling analysis. For the municipal government's official press release data, we found that the perplexity score was the minimum for 14 topics. Table 2 reports the 14 topic categories of the press release data, and each topic is characterized by 10 words and with manual interpretation and labeling based on the characterized words.

4. Discussion

Compared with the LDA topic modeling analysis results of government microblog message data, there were certain consistent pandemic-related themes (medical treatments, nucleic acid testing, pandemic statistics, pandemic updates, press conferences, and material support), revealing that government emergency management agencies attach great importance to medical treatments, nucleic acid testing, pandemic statistics, pandemic updates, press conferences, and material support. Additionally, those some consistent pandemic-related themes are in line with the public concern about issues related to the pandemic, and in line with Shanghai's epidemic prevention and control measures. However, they also have some unique pandemic-related themes; for example, government microblogs focused on the topics of pandemic guidelines, work resumption, environmental elimination, medical services, exam postponement, social clearance, and market supervision, while government press release conferences concentrated on the themes of expert groups, prevention and control mechanisms, proactive prevention, situation reports, epidemic disposal, quarantine management, hospital management, and personal protection. This difference in pandemic-related topics may be due to the functional positioning of government microblogs and press releases. Government microblogs are more functional carriers for the timely release of authoritative pandemic-related information, whereas government press release conferences mainly introduce the pandemic situation and answer reporters' questions.

5. Conclusion

In this study, we selected government microblogs, government websites, and government press release conferences to investigate the linear relationship between government microblog activities (number of messages, likes, forwards, and comments) and weekly epidemiological updates on pandemic (number of deaths, confirmed cases, asymptomatic cases, and new cases) in fine-grained detail, and utilized LDA topic modeling methods to identify various pandemic-related themes from the government microblog dataset and government press release conference dataset during the pandemic. Our r results revealed that the variations in government microblog activities were similar to the evolution of the pandemic. Furthermore, we found that government microblog messages and press releases had consistent pandemic-related themes (medical treatments, nucleic acid testing, pandemic statistics, pandemic updates, press conferences, and material support). However, government microblogs mainly focused on the topics of pandemic guidelines, work resumption, environmental elimination, medical services, exam postponement, social clearance, and market supervision, while government press release conferences mainly focused on the themes of expert groups, prevention and control mechanisms, proactive prevention, situation reports, epidemic disposal, quarantine management, hospital management, and personal protection.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 19 May 2025

Abstract. The paper presents the results of using automated tools to study the dissemination of information in media, social networks and instant messengers, as well as the comments to mobile applications, allowing to search for information by keywords. The cases analysed are the Unified Ecosystem of Urban Services "Digital Petersburg" and its flagship application "I Live Here", as well as the mobile application "Unified Card of St. Petersburg Resident" as part of a study on the social impact of digital services. The data obtained indicate on low awareness of citizens about digital public services. At the same time, we can talk about the high demand among citizens for the "Unified Card of St. Petersburg Resident" service, where, unlike the first case, there is active feedback from the authorities and work to eliminate the shortcomings of the service.

Keywords. Digital Services, Social Networks, Messengers, Mobile Applications, Social Impact, User Satisfaction.
Poster, DOI: https://doi.org/10.59490/dgo.2025.932

1. Introduction

Currently, many governments are actively developing portals, public accounts in social networks and instant messengers, as well as digital services for interaction with citizens. But how to evaluate the impact of such interaction? We made an attempt to contribute answering this question. We reveal the fragments of a research project which aims to contribute to the measuring the social impact of digital urban services based on the case of St. Petersburg, Russia. For this purpose, a corresponding empirical base is collected using different research methods. In addition, digital services and their social impact are studied in conjunction with a specific local context, which differs, as expected, depending on the administrative level. We use the capabilities of a new automated tool that allows, based on user comments, to identify the demand for digital services by city residents using the cases of the digital services ecosystem “Digital Petersburg” (and its flagship project “I Live Here”), as well as the mobile application “Unified Card of St. Petersburg Resident”. The study allows us to understand the reasons and motivation on the part of both city authorities and users.

Since urban digital services are provided to citizens by government, the process of using services can be considered as network interactions ranked according to the principle of satisfying citizens' needs for a specific service. Several studies (Alawneh et al., 2013; Kitsios et al., 2019; Horan & Abhichandani, 2006) developed the frameworks for evaluating citizen satisfaction with digital services. The studies a focus on specific fields (for instance, health) and countries (for instance, Jordan and Greece). Kitsios et al. (2019) applied the MUSA (MUlticriteria Satisfaction Analysis) method to assess the users’ satisfaction with an e-appointment system in Greece. Alawneh et al. (2013) conducted a survey of 400 employees in four universities of Jordan and identified five factors (security and privacy, trust, accessibility, awareness of public services, and quality of public services) that may affect the Jordanians' satisfaction with e-government. Novak, Hoffman & Yung (2003), Tang & Wang (2004) and Reynolds (2011) used usability/ease of use to measure electronic customer satisfaction. To summarize, it can be noted once again that the social impact of digital services (electronic interaction between citizens and authorities) is an indicator of

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

satisfaction with the services provided, in the form of a social resource of citizens (time, efforts, new communication opportunities, etc.) and a social resource of authorities (trust).

2. Research Case 1: Ecosystem of Urban Services "Digital Petersburg"

The unified ecosystem of city services "Digital Petersburg" (ECS) was launched on the initiative of the Government of St. Petersburg in December 2021. ECS is a model for providing digital services or services aggregated on a unified Internet platform (https://petersburg.ru/mainPortal/services). The mini-application "I Live Here", implemented on the VKontakte (VK, Russian online social media based in Saint Petersburg) platform, is the flagship project of "Digital Petersburg", launched in December 2022. The developers position the mini-application as the most useful project for users, so the conducted study is focused more on the analysis of the mini-application "I Live Here". In essence, the mini-application is an adapted catalogue of the portal's services for VKontakte users. In general, the ecosystem of urban services seems to be an innovative solution for creating and maintaining a sustainable urban environment, which can be scaled to other regions (Minaev et al., 2023).

However, as our previous research has shown (Filatova et al., 2024), not all services created by the authorities are in demand by citizens and only a small part of St. Petersburg residents access the ecosystem, although almost three years have passed since the launch of the ecosystem.

A series of focus groups conducted as part of the project showed that the use of digital services depends on two main factors: perceived quality of the service and awareness of it. Perceived quality is influenced by several external variables: how people perceive the security and privacy of a service; the discrepancy between supply and demand in terms of what is offered and what people are looking for; and the quality of the content, which includes web design and the quality of the information provided. However, as a very important reason, citizens named the poor awareness about the application "I live here" and the created ecosystem as an obstacle to the growth of the ecosystem. Therefore, as part of the research, we tested a tool for studying the dissemination of information in the media, social networks, instant messengers and mobile apps, which in the future can help in developing strategies for promoting new services.

3. Pilot Testing of an Automated Tool for Studying the Dissemination of Information in Social Networks and Instant Messengers

For the pilot testing of the new tool, the task was to collect all publications in the media and posts in social networks and instant messengers for six months that contain the phrases "ecosystem of urban services" and the separate service "I live here". Next, it was analysed how users discuss these topics in social networks and instant messengers and how information is disseminated.

The stages of the study included several key steps. At the initial stage, the analytical service "Medialogy" was used to collect data, which allowed collecting all messages and publications that contained the phrases "I live here" and "Ecosystem of city services" from various sources, such as media, social networks and instant messengers. These data were accumulated and stored in a database for subsequent analysis. Based on the collected data, topic modelling was carried out using machine learning algorithms such as LDA (Latent Dirichlet Allocation) to identify the main topics and sentiments in the discussions. The topic modelling stage allowed identifying key topics related to the use of the "I live here" service, determining positive, negative and neutral user sentiments, and detecting the trends in the discussions. The final stage of the study was a comparative analysis of data collected from social networks and messengers.

The messages were collected for the period from February 1, 2024 to May 1, 2024. The database for the query "I live here" consisted of 17,691 posts and 9,935 comments. However, this is too common a phrase, so the words "service", "application" and others were added to identify comments on the topic of the application. As a result, 3,820 thematic posts and 115 comments on the topic were identified. For the query "ecosystem of urban services", 928 posts and only 5 comments were found.

Table 1 presents the results of topic modelling performed using the LDA (Latent Dirichlet Allocation) algorithm to analyse the corpus of comments containing mentions of the “I Live Here” service. LDA is a machine learning method for topic modelling that allows to automatically detect hidden topics in texts. The main principle of the method is that each document is considered as a mixture of several topics, and each topic is represented by a set of words associated with certain probabilities.

The algorithm identified four key topics in the analysed dataset (Table 1). The topic 2 contains mostly general words that do not carry a specific information load. Topics 1, 3, and 4 include more subject groups of words related to various aspects of the service. The first topic concerns issues related to energy resource management and news about power outages, the third topic concerns issues related to kindergartens and the provision of services through

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

the public services portal, and the fourth topic concerns the availability of preschool institutions for children in different age groups and areas.

Overall, the analysis showed that, with some exceptions, no residents discuss the topic of urban digital services provided by the city government. Thus, only five key news items were identified over the six months, which were initially released by the government of St. Petersburg, and then these same news items were verbatim posted a large number of times in various government public pages, mainly in the accounts of schools, kindergartens, and housing agencies. Comments on them are extremely rare and almost always with zero engagement.

Table 1. Results of topic modelling

No.	Topics
1	water, follow, energy resources, news, development, group, service, being developed, notifications, shutdowns
2	I live, application, service, residents, month, meaning, unfortunately, pick up
3	kindergarten, portal, translation, online, carried out, course, reception, submit, public services
4	children, available, level, places, areas, age, availability, preschool, age, present

4. Research Case 2: Mobile Application "Unified Card of St. Petersburg Resident"

To conduct the study, a parser program was created that allowed to automatically collect all reviews for the period 2019-2024 from the Google Play Market platform related to the mobile application "Unified Card of St. Petersburg Resident" (Russian abbreviation: EKP). As a result, more than 600 reviews were collected, which contained both text data and user ratings (grades). The analysis included several stages: collecting data from the platform, preprocessing the text array, classifying reviews and topic modelling using the LDA (Latent Dirichlet Allocation) method.

To prepare the data before applying LDA, they were pre-processed to improve the quality of the analysis. At this stage, the texts were “cleaned”, including the removal of punctuation, numbers and extra spaces, as well as conversion to a single lower case. Stop words that do not have a semantic value were excluded, and lemmatization was carried out, allowing words to be converted to basic grammatical forms.

The next step was to implement the topic modelling procedure using LDA. The algorithm, trained on the prepared text data, identified a specified number of topics. The key topics related to the functionality of the application, the quality of its implementation, the convenience of the interface, and the desired expansion of functionality by users were identified (Table 2).

Table 2. Results of user comments topic modelling

No.	Topics
1	card, travel, code, enter, ekp, in general, get, metro, excellent, application
2	cards, balance, top up, application, metro, application, world, extremely, idea, developers
3	applications, balance, ekp, application, metro, money, top up, application, cards, activate
4	application, stop, works, sheet, card, convenient, support, map, entrance, transport
5	application, fit, metro, ekp, googl, pay, opens, password, updates, upd
6	works, application, record, updates, application, applications, enter, balance, confirmed, travel card
7	in general, application, cards, opportunity, pin, enter, travel card, stopped, constantly, top up
8	useless, card, password, impossible, map, application, works, internet, get, bank
9	card, application, cards, fingerprint, data, writes, transport, metro, podorozhnik, balance
10	works, application, writes, application, cards, impossible, top up, activation, useless, card

The overall analysis shows that the main concerns of users are related to technical problems, balance management, and functionality in the context of transport. User comments contain a lot of useful information for improving the application. Figure 1 shows that this mobile application was evaluated in more than half of cases as “1” (369 out of 638), the lowest grade on a 5-point scale.

Authorities’ responses (Table 3) to user feedback focus on several key aspects: Technical troubleshooting; Feedback and

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

support; New features and expanded capabilities; Security and Access.

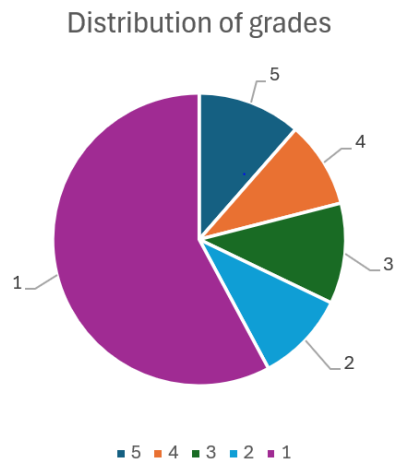

Fig. 1. Distribution of grades

Table 3. Results of authorities' responses topic modelling

No.	Topics
1	moment, application, ekp, evaluate, additional, inclusion, we plan, is, informational, in nature
2	technical, absent, independent, reasons, electronic, unfortunately, wallet, replenishment, possibility, application
3	apologies, we bring, inconvenience, eliminated, temporary, technical, pay, real, moment, will appear
4	should, application, clarify, errors, could, incident, payment, ekp, I ask, be sure
5	version, form, feedback, understand, model, indicating, we ask, review, error
6	authorization, service, support, ekp, application, mobile, contact, site, go through, public services
7	find out, store, incentives, application, project, surveys, news, service, you can, participate
8	pin, login, code, code, configure, cards, qr, you can, system, come up with
9	application, continue, work, useful, increase, number, functions, soon, problem, googl
10	pay, payment, add, vtb, ekp, rustor, available, first, samsung, mir

The general trend shows that authorities are actively working to improve the technical component of the application, its functionality and interaction with users, especially in terms of security and stability. There are also changes in feedback from the EKP: in 2019 about 10-15% of comments remained unanswered, but after 2022 all comments began to be answered. This indicates increased attention to user opinions and the readiness to improve the service.

5. Conclusion

The St. Petersburg government is campaigning to promote the city services ecosystem, and in particular the mini-application "I Live Here", but users still rarely use it. Citizens say that there is a lack of necessary information about the digital ecosystem, and also point out the lack of interactive functions for providing feedback. There are noticeable problems with the web design, navigation and search in the mini-application. The citizens are concerned about security and privacy issues. In fact, citizens are practically unaware of the "I Live Here" services and the product has no value for users yet. At the same time, we can talk about the high demand among citizens for the "Unified Card of St. Petersburg Resident", where, unlike the first case, there is active feedback from the authorities and work to eliminate the shortcomings of the service.

The further research will be related to identifying the reasons for the widespread use of non-governmental digital channels by citizens and the low use of government digital services, as well as a comparative analysis of data characterizing the behaviour of citizens with indicators of offline user activity.

Abstract. Despite the hype for AI-based generative applications, the original pitfalls in implementing AI-based technologies remain: data quality, readiness, and availability. AI results are tied to the quality of the data provided to the underlying algorithms. Inevitably, bad data produces bad results. The same happens for data readiness and availability: without correct preparation and access, even high-quality data cannot be used in AI-based solutions. To help decision-makers in the public sector, performance indicators applied to processes and, therefore, to public services can be used as tools to guide public project selection, allocation of resources, monitoring of results, etc. In this way, performance indicators can be used to standardize the evaluation of public policies, helping citizens and city administrators make more informed decisions regarding the environment they live in. In the present work, we propose a performance indicator development process (PIDP) based on AI clustering techniques, which can be used to gather key performance indicators (KPI) among available data from open data sources and consumed and/or produced by the core processes that implement a public service.

1. Introduction

Data-driven decision-making (sometimes abbreviated as DDDM) is the process of using data to inform your decision-making process and validate a course of action before committing to it (Stobierski, 2019). Despite its extensive use as a business management tool in the private sector, DDDM can and should be used to help decision makers in the public sector. The main goal of DDDM is to provide mechanisms for stakeholders in the public sector to make more informed decisions. For this reason, the ”data” part in DDDM is crucial in the decision-making process. Low-quality data should certainly lead to poor information provided to those stakeholders. Data quality is not easily verifiable during the decision-making process.

Performance indicators (PIs) are one of the most commonly used tools to evaluate processes in terms of effectiveness (Fisher, 2019) and their use is ubiquitous in the public sector (Smith, 1999). Key Performance Indicators (KPIs) are the result of performance indicators development and is tightly correlated to data processing based on artificial intelligence methods and technologies, as pointed by Bilal and Oyedele, 2020. The capacity of a KPI correctly identify in which level a public policy or service stands is closely dependent on the capacity of each PI that composes it. And each identified PI relays on the data that was used to gauge it.

2. Performance Indicators Development Process (PIDP)

The Performance Indicators Development Process (PIDP), as defined in our previous work brought by Xavier et al., 2024, explores and analyzes processes-related data to look for candidates for performance indicators. The PIDP uses clustering techniques to group related data together. First, the data is downloaded from available public data sources. The samples with the standardized data are analyzed to search for performance indicators among the features, present as the name of the columns of the data set. The PIDP also deals with difficulties regarding the quality of the data being processed. The same process is presented by other techniques like data envelopment analysis (DEA), as pointed by Ferreira et al., 2023. The PIDP depicts the basic concepts of PIs implementation. For this aspect, it can be seen as a framework to achieve the PIs implementation's goals, as a stakeholder-centred process developed by Dransfield et al., 1999

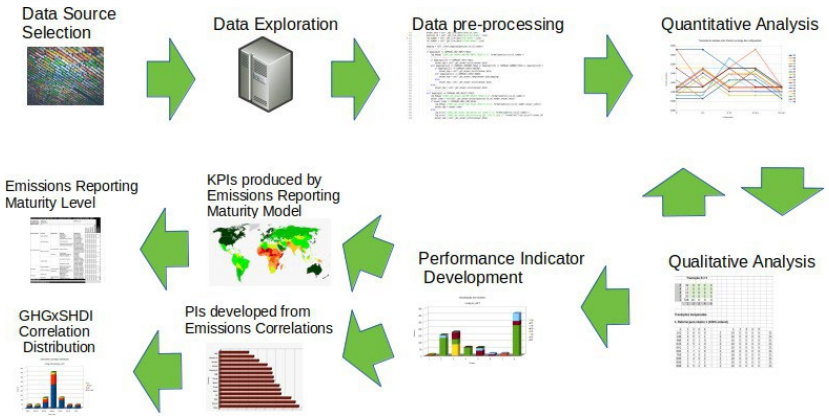

Fig. 1 – Performance indicators development process (PIDP) general view

The PIDP workflow overview is synthesized in Figure 1.

2.1. Data sources selection

The first step in the performance indicators development process (PIDP) is to obtain reliable data used in the decision-making process. For example, if the city administrators are interested in green-house gas' (GHG) emissions impacts, the PIDP will download data from databases that contain emissions-related data. Thus, cities represent a minimal viable comparison unit in this work.

In this work, we will use a public database provided by CDP (Carbon Disclosure Project) that contains emissions-related data from 814 cities gathered in 2019.

2.2. Data exploration

The next step in the PIDP is to narrow the emissions-related data into data units. A data unit is an abstraction extracted from the data structure (answers field in the CDP database, for example) that can provide insights on candidates to performance indicators.

The data to be explored should be initially reduced to represent a context (period of time, origin of the data, focus of the study - cities). Thus, the main goal of this scope filtering is to filter the valuable data among the data available from the databases. The process initiates attempts to correct errors such as inconsistencies found in the available data: e.g. wrong data type, empty value in "selection" or "multi-selection" answer type, empty value in "not null" answer. If the error cannot be recovered using other data from the same record, the record is discarded.

2.3. Data pre-processing

The data preprocessing step is responsible for preparing the available data to be correctly used by the cluster- ing algorithms and it requires the data to be cleaned from consistency errors. After an initial inspection of the data in the CDP database forms, inconsistencies and errors were found that could jeopardise the clustering process.

According to Shepperd et al., 2013, the best preprocessing strategy is that in which the problematic data should be treated first. Some cases of either conflicting feature values or implausible values should be discarded

before data can be used. Therefore, it was necessary to build a support system to deal with these issues and leverage the quantitative and qualitative analysis steps.

In this work, we use **functional data filtering**, in which filtering parameters are passed to preprocessing execution module to segregate only the information needed in the context of a preprocessing configuration and optimise the drill down during quantitative and qualitative analyses, and **errors mitigation** techniques, which can try to mitigate the effects of typos and other simple errors in the next steps of PIDP.

2.4. Quantitative analysis

The quantitative analysis of the results obtained from the clustering methods can be used to indicate features with better chances to be used as performance indicators. Thus, the clustering results are treated and viewed as an alternative to purely statistical ones. However, the main goal is to search for similarities and answers that indicate different approaches implemented by the cities that are grouped in the same cluster. The nuances of the clustering process, the comparative data generated, and the validation techniques are shown in the following sections.

2.5. Qualitative analysis

The main objective of the qualitative analysis phase is to compare the responses of different cities present in the same cluster, indicating a convergent approach over the data. Another strategy is to compare different responses from cities in different clusters, indicating a divergent approach in this case. The following sections detail the techniques involved in the step of the process.

To achieve this goal, the PIDP uses two techniques: and adaptation of **Grounded Data Theory**, in which the samples are checked for inconsistencies, and **Case Study**, in which a sample can be used to downgrade a PI's candidate.

3. Results

3.1. PIs developed from Emissions Reporting Correlations

Analysing the emissions reporting data correlations are another way to look for performance indicators. After some experiments with broadly used indicators like GDP, HDI and their variants, and others like OECD, C40, GCoM and SCI memberships, some results indicate correlations between then and emissions reported by cities. The cities total emissions clusters distribution is shown in Figure 2.

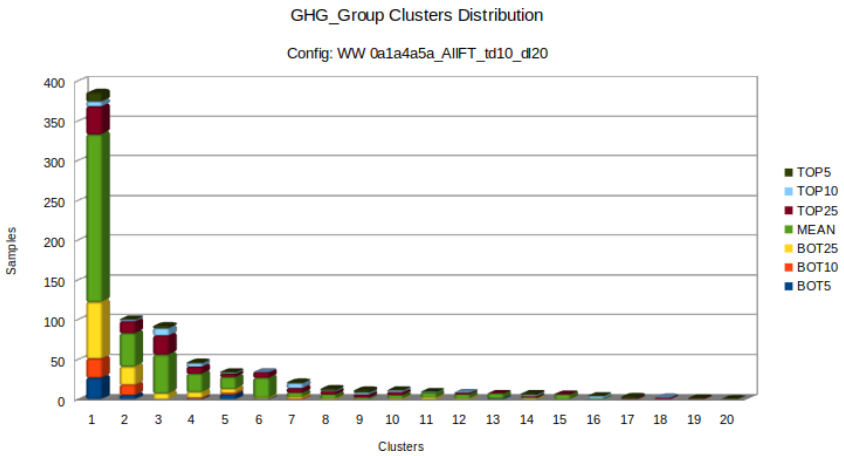

Fig. 2 – Cities total emissions in 2019 clusters distribution using configuration WW_0a1a4a5a_AllFT.

3.1.1. PI: SHDI x Cities Emissions

The correlations between emissions and human development index (HDI) can be seen in studies at the country level. Nevertheless, this work aims to use available sub-national human development index (SHDI) information to investigate the correlation between this index and cities total emissions.

3.1.2. PI: OECD x Cities Emissions

The organisation for Economic Co-operation and Development (OECD)OECDorganisation for Economic Co-operation and Development is a membership of developed countries that cooperate in economic matters. The cities in these countries follow the policies and directives negotiated in forums promoted by OECD. To some extent, part of these policies is applied as is by the cities.

3.1.3. PI: GCoM Membership

The Global Covenant of Mayors for Climate & Energy (GCoM) has more than ten thousand participant cities. It aims to monitor hazardous events related to climate and energy that occur inside cities' boundaries through mitigation plans and other additional information.

During the analysis, the prevalence between GCoM and CDP database was 73%, indicating that 219 cities reached by CDP partnership are still not part of GCoM by 2019. Considering the clusters with a prevalence ratio over 90%, clusters 5, 12, 16, 17, 18, 19, and 20 had 59 samples reprocessed.

However, the data obtained during the implementation of the plans are not uniform. A reason is that even though these cities were selected by representing overall performance, their methodology varies based on many aspects not covered by the questions set. An example of it is the question "4.3:Please give the name of the primary protocol; standard; or methodology ... city-wide GHG emissions".

3.1.4. PI: Smart Cities Index Membership

A consortium of international organisations maintains the Smart Cities Index (SCI) to rank cities in terms of developing connectivity to services provided by the cities. The list of cities in SCI in 2019 is available in the appendix. The cluster distribution of SCI members is shown in Figure 3. The SCI 2019 had 111 cities, and

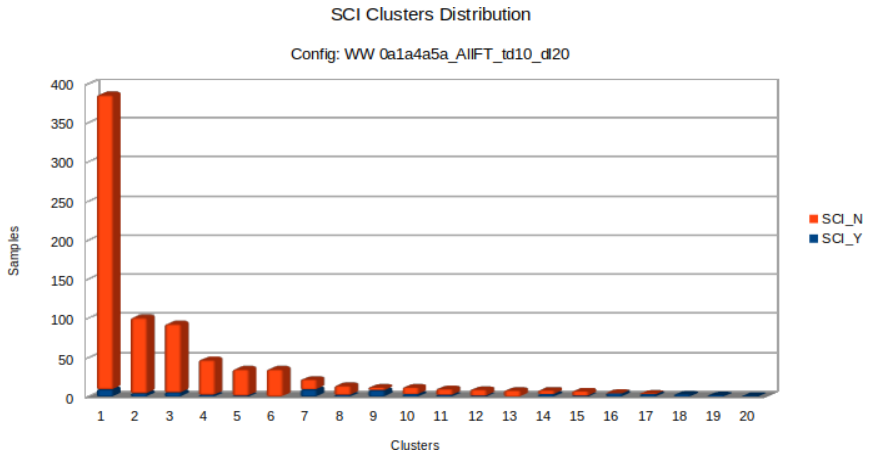

Fig. 3 – SCI clusters distribution using configuration WW_0a1a4a5a_AllFT.

63 of them are part of the CDP initiative. Even though it is not expected that all SCI cities have any direct goal related to emissions reduction, selecting the ones that are part of the CDP initiative introduces a bias that needs to be considered during the analysis. The clusters with SCI minimal prevalence were 1, 7, 9, 16, 18, 19, and 20, and the frequency of positive answers is similar to those of C40, although the execution of the actions is better. The distribution is shown in table 1 for comparison.

The distribution of the answers is a little more stable in this case. Still, 10% of the selected cities does not have a GHG emissions reduction target in place. In clusters 1 and 2, we have situations that represent errors during data processing or cities entered; the value "0" indicates that no information was provided. However, in clusters 4 and 7, there are some indications of "planning and not executing", confirming some cities have problems running the last mile and, for this, not getting the full benefits from emissions reduction initiatives.

The average of SHDI for cities in SCI is very high (879) and it is inclined to some uniformity in answers for at least 90% of them. It can be seen in distributions by clusters and by regions.

Tab. 1 – Selected samples clusters 1, 7, 9, 16, 18, 19 and 20 which are also in SCI database. The answers frequencies to the questions 1.0, 4.0 and 5.0 are shown.

Question	Positive Answers	Negative Answers
1.0: Does your city incorporate sustainability goals and targets (e.g. GHG reductions) into the master planning for the city?	93.65%	6.35%
4.0: Does your city have a city-wide emissions inventory to report	96.83%	3.17%
5.0: Do you have a GHG emissions reduction target in place at the city-wide level?	90.84%	9.52%

4. Conclusion and future works

According to the results of the experiments using PIDP and CDP, GCoM and SHDI databases, we can support the conclusion that it is possible to address the key performance indicators discovery through the development of performance indicators based on the analysis of the data present in those databases and the inter relations expressed in correlations found in them. Despite the correlations are weak in the first view, the qualitative analysis of the data showed problems regarding the quality of the data, mainly in the CDP database, in which data set were found both type of errors: typos and leniency, expressed in the form of the selection of the "first option" of the list box in some answers in which they are not suppose to exist.

To address this finding, one alternative is to develop an evaluation model of the quality of the data capable of predict idiosyncrasies in the fulfilment of the forms that are in the origin of the problematic data. In future works, we are aiming to develop these model, aggregating other AI-based technologies and a time series evaluation mechanisms.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 3 June 2025

Abstract. Digital Public Infrastructure (DPI) is a new concept that garnered significant attention during the 2023 G20 discussions. DPIs can help advance all United Nations Sustainable Development Goals, making research in this area critically important. Despite its significance, academic literature on DPI is still scarce. To help cover this gap, this poster proposes a DPI evaluation framework based on the United Nations' definition of DPI. The evaluation framework was applied to three potential DPI cases that emerged from the Brazilian finance sector. The selected cases include PIX, an instant payment solution; Open Finance Brazil, a consent-based data exchange solution; and DREX, the Brazilian central bank digital currency. Using the proposed evaluation framework, it was demonstrated that the first two cases can be considered DPIs, and the last one has the potential to become a DPI.

1. Introduction

During G20 India's presidency in 2023, the concept of Digital Public Infrastructure (DPI) got much attention (G20 Global Partnership for Financial Inclusion, 2023). In partnership with G20 India's presidency, the United Nations published a report connecting DPI's examples with the challenges of the Sustainable Development Goals (SDGs). The United Nations considers that the DPI approach has the potential to accelerate all the SDGs (United Nations, 2023).

Academic literature on this concept remains scarce. Researchers are trying to cover this gap. A DPI Map (Eaves et al., 2024) was recently published, identifying more than 250 cases of DPIs. However, these cases were not analyzed in depth. This poster addresses the following research question: what are the cases of DPI emerging in the Brazilian finance sector?

United Nations defines DPIs as: "a set of shared digital systems that should be secure and interoperable and can be built on open standards and specifications to deliver and provide equitable access to public and/or private services at societal scale and are governed by applicable legal frameworks and enabling rules to drive development, inclusion, innovation, trust, and competition and respect human rights and fundamental freedoms" (United Nations, 2023). Considering this concept of DPI, we identified three possible DPI cases in the Brazilian finance sector: PIX, Open Finance Brazil (OFB), and DREX. We proposed a framework to evaluate whether a case is a DPI and applied it to the three identified cases. After that, we discussed the implications of our findings for the DPI

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

scenario.

The remainder of this poster is organized into seven sections. Section 1 introduces the subject and the research. Section 2 presents the research method. Section 3 presents the DPI evaluation framework. Section 4 presents the three cases identified and evaluates them using the proposed framework. Section 5 discusses the implications of the findings and proposes future research. Section 6 presents the references.

2. Method

After conducting an exploratory review of the bibliography, the authors found that the concept of DPI is not well-established in the academic literature. Unsurprisingly, finding an evaluation framework for potential DPI cases was impossible. The authors focused on the United Nations definition of DPI and developed a DPI Evaluation Framework. This framework aims to support evaluating a case to determine whether it is a DPI, has the potential to scale as a DPI, or is not a DPI.

Some case studies of potential DPIs were performed, and the framework was applied. A case study is a research strategy that focuses on understanding particular situations. The research can involve single or multiple cases and collect different data types, like documents, interviews, questionnaires, and observations. Case studies are suitable for emergent study fields (Eisenhardt, 1989). Although the triangulation of multiple data collection methods is recommended (Eisenhardt, 1989), it is not mandatory. Case studies can be applied and used in many ways. Multiple cases may not yield the same rich descriptions as single cases, but they enable cross-data analysis (Cavaye, 1996).

The authors conducted a multiple-case study, selecting three cases from the Brazilian finance sector. It is essential to note that the finance sector was selected for scrutiny due to its direct connection to financial inclusion. Financial inclusion has been reported as an expected benefit of the DPI approach (G20 Global Partnership for Financial Inclusion, 2023). The cases identified were analyzed using secondary source data from official websites and online press. Then, the proposed DPI Evaluation Framework was applied to the cases. The retrieved data was sufficient to perform the evaluation using the evaluation framework. The cases and the evaluation results were compared and discussed.

3. DPI Evaluation Framework: a proposal

Based on the United Nations definition (United Nations, 2023), we proposed an evaluation framework for potential DPIs that can be in use, under implementation, or in conception. To develop the framework, the concept of DPI was broken into twelve characteristics that a potential DPI can have. These characteristics are respect for human rights, respect for fundamental rights, security, interoperability, open standards and specifications, access to public or private services, societal scale, legal frameworks, inclusion, innovation, trust, and competition.

Then, the characteristics were grouped into five topics, considering their similarities- and these topics were added to the framework. The five topics are (a) the qualifying conditions, (b) the technical aspects, (c) the value proposition, (d) the legal support, and (e) the enablers.

The qualifying conditions are the first to be analyzed, as cases without them cannot be considered potential DPIs. Technical aspects relate to a DPI's intrinsic characteristics, while the value proposition is related to how the DPI will be used. Legal support is closely tied to the enforcement of DPI and is essential to its legitimacy. The enabler aspect addresses what the DPI does not deliver but can enable through its use and dissemination.

Each characteristic of the evaluation framework can be evaluated in one of the proposed classifications: confirmed, planned, not considered, or missing information. The status “confirmed” will be used for potential DPIs that are in use and have the characteristic. The status “planned” will be used for potential DPIs under implementation/concept that plan to release the characteristic. The status “not considered” will be used for potential DPIs that do not (or will not) deliver the characteristic. The status “missing information” will be used when the researcher does not have sufficient information to analyze a characteristic.

4. Results

The case studies were based on secondary source data, including documents, websites, press media, videos, and norms. The authors collected four documents about PIX, five documents about OFB, and five documents about DREX. Table 1 summarizes the PIX, OFB, and DREX evaluations using the proposed framework. Sections 4.1, 4.2, and 4.3 describe the main characteristics and benefits of each infrastructure.

Table 1: Summary of PIX, OFB, and DREX evaluation using proposed framework

	Of competition	Confirmed	Confirmed	Planned

5.1 Case 1: PIX

PIX is an instant payment solution created by the Brazilian Central Bank (BCB) and launched in 2020. The significant benefits of PIX are its availability, cost, and ease of use. A person or business can make a payment 24 hours a day and 7 days a week, including holidays. People who use PIX do not incur transaction fees. Businesses that use PIX may incur lower fees compared to other payment methods. To make a transfer with PIX, it is not necessary to know the bank account of the recipient because the transfer uses a key that can be an email address, telephone number, Brazilian identifier (CPF or CNPJ), a random number, or a QR code.

PIX brought democratization and financial inclusion. It is a versatile solution that can handle various use cases. It is secure because banks have invested in ensuring robustness and security. Additionally, it is open and integrated, allowing for seamless engagement with both the traditional financial ecosystem and new entrants. The financial ecosystem has benefited from the launch of PIX. It helped increase digital payment, reducing the cost of using cash. It also stimulates competition between payment methods and the entry of fintech and big tech companies into this market.

5.2 Case 2: Open Finance Brazil

Open Finance Brazil (OFB) is a solution that enables the sharing of clients' data between authorized agents, as specified by the BCB, with the client's consent. OFB supports the sharing of data about each participant institution's products and services, the sharing of transactional client data, the starting of instant payments from interfaces that are not owned by the institution that has custody of funds and plans to connect with the insurance market.

The significant benefits for clients are easier control of their financial lives and ownership of their financial data. With OFB, clients can visualize multiple accounts using a single interface, making it easier to manage savings and debts. Data ownership enables clients to leverage their history to establish a relationship with other financial institutions, secure better rates, and gain access to credit. OFB can benefit the financial services ecosystem by enabling competition among financial institutions and fostering a more dynamic market.

5.3 Case 3: DREX

DREX is digital Real (Brazilian currency), a central bank digital currency (CBDC) for Brazil. A central bank digital currency (CBDC) is a digital liability of a central bank or other competent authority representing a jurisdiction’s sovereign currency available to the private sector (Dionysopoulos et al., 2023). More than a solution, DREX intends to be a platform for tokenization.

DREX aims to address the issue of delivery versus payment, where individuals must trust intermediaries to facilitate secure exchanges of expensive goods, such as cars or apartments. DREX may also address the challenges of international remittances and trade. Additionally, DREX can bring innovation to the financial market, generating benefits that cannot be accurately measured in advance.

5. Discussions and Future Research

The evaluation showed that considering the United Nations' definition of DPI (United Nations, 2023) and the evaluation framework proposed in this poster, PIX and OFB can be considered a DPI. On the other hand, DREX should be considered a potential DPI. The project is under implementation, but from the outset, it considers important characteristics of DPI as foundations for the platform it intends to deliver. The characteristic enabler of inclusion was identified as missing information, as it was not possible to find consistent references to inclusion in the retrieved documents. Hence, it is desirable to gather more information to determine whether or not it is a planned characteristic that was not well communicated.

DPIs in use must be continually evaluated, particularly in how they enable development, inclusion, innovation, trust, and competition. Although it is important to be an enabler of such actions to be considered a DPI, it is not guaranteed that these actions will happen. The creation of key indicators to measure the impact of DPIs on the entire ecosystem can help inform decisions about investments in the evolution and growth of DPIs.

This evaluation must be accompanied by a governance established for each project (implementation phase) or product (usage phase). Technical governance can evaluate the technical aspects and supervise the implementation and evolutions to guarantee that security, interoperability, open standards, and specifications are delivered and continually updated. Institutional governance can evaluate the value proposition, legal support, and enablers, make decisions about how to implement them, how to expand the usage of the infrastructure, and which partnerships need to be developed. All the cases analyzed use collaborative governance strategies (Olvik, 2024). These strategies are crucial to managing wicked problems that traditional methods cannot easily solve. Collaborative strategies try to create value for all parties involved, transforming the problem-solving process into a win-win game.

Unsurprisingly, the BCB led all the cases analyzed. BCB is a regulator of the Brazilian finance sector, aiming to make the market more efficient and promote financial inclusion. In a public report, BCB recognizes the difficulty of articulation of the private sector to create PIX infrastructure and the essential role of a public sector institution in coordinating the project (Banco Central do Brasil, 2022). It is important to study and theorize the role of public and private institutions in creating and promoting DPIs. Mazzucato and Ryan-Collins (2022) propose that the public sector needs to set a direction and public purpose for private and public actors to collaborate and innovate in solving societal problems, which they refer to as a "market-shaping" perspective. BCB may act in a "market-shaping" perspective, considering their coordination role in the three cases studied.

Considering that DREX is currently under implementation, further research is needed to investigate DREX in more detail. Future work can explore the relationship between CBDCs and DPIs. Another aspect that could be investigated in future studies is the issues related to the collaboration governance established for the project and how they connect to governance literature.

Abstract. As artificial intelligence (AI) technologies proliferate, the US federal government has oscillated on related executive orders, and no federal laws have addressed AI comprehensively. However, many states have passed legislations related to AI in the previous 5 years, and these laws are evolving and becoming more targeted, creating challenges and opportunities for government agencies. For this study, we compiled all passed and enacted legislations across the 50 US states in 2024 and examined them in terms of: *domains; regulation of AI use in the public sector and industry; and novel topics and issues being addressed.* In this preliminary analysis, we find that recent AI legislations are multiplying across US states, but unevenly. AI regulation across states continue to address various domains, including healthcare, education, and now also generative AI and AI-generated content. Legislations are expanding the role of the public sector in AI governance and AI policies, but issues of AI ethics, such as bias, are unevenly addressed across states, and few states have comprehensive AI governance frameworks.

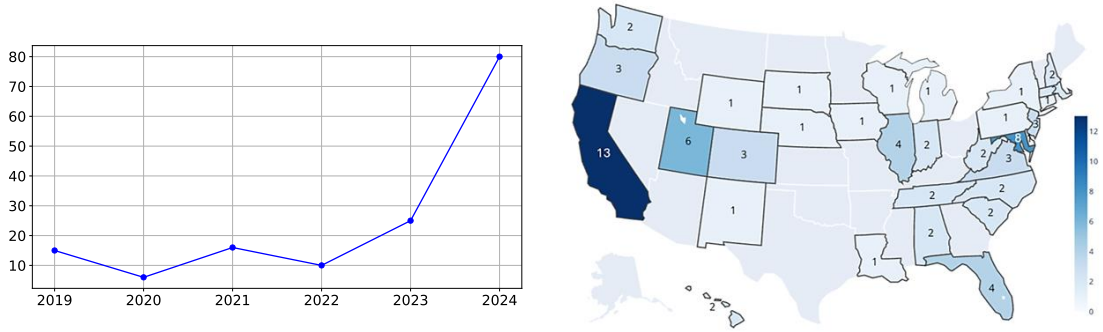
Poster, DOI: https://doi.org/10.59490/dgo.2025.937

1. Introduction

Artificial intelligence (AI) technologies continue to proliferate in public and private organizations (Medaglia et al., 2023; Zuiderwijk et al., 2021). Although the use of AI technologies is attractive through the promise of increased efficiencies, productivity and augmented cognitive capabilities, it has also proven to be a risky endeavour with potential negative consequences (Sousa et al., 2019; Wirtz et al., 2020). To address these negative consequences, ethical frameworks and regulations have been proposed (Barfield & Pagallo, 2022; Harrison & Luna-Reyes, 2022). Globally, the European Union is leading in terms of AI regulation (Artificial Intelligence Act, 2024) where the EU AI act mandates governance mechanisms and risk management practices for different types of AI technologies. In the United States (US), there is no broad legal framework to address AI, but executive orders and references to AI activities have been made in some legislations. On January 23, 2025, President Trump rescinded President Biden's prior Executive Order on AI (Federal Register, 2023) but promised that his administration would create an AI action plan to "sustain and enhance America's global AI dominance in order to promote human flourishing, economic competitiveness, and national security" (White House, 2025, Jan. 23).

In the meantime, many US states are actively promoting and/or regulating various aspects of AI (DePaula et al., 2024). While previous research has examined some aspects of these US state legislations, in this study we report on US state legislations passed or enacted in 2024 and discuss them in relation to previous trends in AI state legislations. We find a considerable increase in the amount of legislation addressing AI, an expansion into distinct issues not previously addressed, and a notable increase in the legislations providing comprehensive frameworks to address AI. In the following sections we explain our methods, report on preliminary results and discuss findings in terms of the implications for governments and digital government scholars.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license



2. Methodology

For this study, we compiled all passed and enacted legislation addressing AI in 2024 across the 50 US states from the National Conference of State Legislatures (NCSL, 2024) which yielded N=79 legislations. For this preliminary report, we examined these legislations in terms of several aspects, namely: *domains; regulation of AI use in the public sector and industry; and novel topics and issues being addressed.* The authors discussed and examined the categories of analysis in multiple coding iterations, and then divided the legislations among the authors so that each legislation was independently examined by at least two authors (detailed protocol available upon request). Further, we discussed commonalities and discrepancies across authors, and reached agreement on the most reasonable interpretation of the legislation for our categories given the text of the legislature and our coding rules.

3. Results

We present preliminary results of our analysis of US state legislations related to AI passed or enacted in year 2024. First, Figure 1 shows the growth in legislations over the years, and the total number of legislations passed/enacted across states in 2024.

Fig 1. Total passed and enacted legislations addressing AI: 2019-2024 time-series, and 2024 map.

Our results show that AI-related state legislation in the US have largely increased, but not all states are enacting AI legislations. The 79 pieces of legislation passed/enacted in 2024 amounts to more legislations than the previous 4 years combined. Legislative acts seem to be getting more comprehensive and further reaching, covering various domains, including healthcare, education, and now AI-generated content. However, some legislations simply appropriate funding for a particular activity (e.g. an AI-related organization) without any regulatory development. Legislations are expanding the role of the public sector in AI governance, but several issues, such as AI bias and workforce development, are not widely addressed across the states. California continues to be the state with the most passed/enacted AI-related legislations (N=13 in 2024), many of which are addressing ethical issues.

In our comparison of the 2024 legislations with the previous 4-year period (DePaula et al., 2024), we found roughly similar development of legislative acts in domains addressing health and education. In bills passed from 2019-2023, 36% focused on using AI for health purposes (e.g., cancer detection or drug development) or education programs featuring AI and other advanced technologies at the secondary and college levels. In 2024, the distribution of legislations addressing health-related or educational programs with AI is at a similar range. Legislation in the earlier period focused on the creation of advisory groups to inventory and/or make recommendations about existing uses of AI in state government (n=14/68), and we continued to see this emphasis in the 2024 legislations. Thirty percent of the earlier 2019-2023 legislations addressed private industry's use of AI through grants to encourage technology intensive manufacturing or certain regulations of business. However, in contrast, at this stage of analysis only about 11% legislative acts in 2024 focused on regulation of business and industry.

In a marked and dramatic departure from earlier legislation, the 2024 collection featured several acts that sought to enable individuals to clearly identify AI-generated content in contexts such as political and election advertisements and in child pornography, as well as providing individuals with a cause of action for litigating such uses. Legislations in 2024 began to address "generative AI" directly. Moreover, several legislations in this year, for example Maryland S818 and Utah S149, have developed comprehensive governance frameworks for AI regulation in their respective states.

4. Discussion

Based on this investigation, we made three main observations. First, several states, such as California, Florida, Maryland and Utah, have passed multiple legislative acts in 2024 suggesting that they are attempting to fill the federal void, but in so doing they are creating a patchwork of distinct governance systems across the country.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Second, given the various bills requiring advisory groups and task forces on AI, it would be prudent for states and local governments to exchange knowledge and findings from these working groups, and to capitalize on the different work being conducted. Finally, states provide different definitions of AI, and sometimes none at all. Disparities and lack of definitions can make it difficult for businesses to develop their plans or benefit from government incentives. Making sure that AI is clearly defined should benefit the AI policy process.

The future of federal guidance on AI remains uncertain. In the meantime, the challenges for digital government scholars are to track the volume and modalities of AI usage within state governments and assess the consequences. AI can potentially help with innovation in government service delivery, job creation and workforce development. However, there are many challenges associated with discrimination, disinformation, deep fakes, and other infringements on citizen rights that are not being addressed by AI legislation across US states.

Abstract: Government responsiveness is a critical component in citizen-government interac-tions, shaping public trust and the effectiveness of e-governance initiatives. However, resource constraints often lead to strategic responses aimed at managing citizens' emotions and avoiding conflicts, rather than resolving all issues. Despite this, few studies have examined government response strategies and their impact on citizen satisfaction. This study examines the impact of emotion-based responses on citizen satisfaction within the context of China's e-governance ini-tiatives. Utilizing data from the Chinese People's Daily "Message Board for Leaders" platform, we introduce the Emotion-based Responsiveness Framework in Government Communication, which quantifies government responses along four dimensions: positivity, empathy, reassurance, and personalization. We first use text analysis to identify linguistic patterns and emotional cues in gov-ernment replies. Then, we apply few-shot learning via the ChatGPT API to infer dimension scores across the dataset. Lastly, we test whether government's emotion-based responses will affect cit-izen's overall satisfaction. The result shows that the emotion-based response will positively affect citizens' satisfaction. The study contributes to e-governance literature by providing empirical ev-idence on the effectiveness of emotional communication strategies in digital government-citizen interactions. These insights have important implications for theory development in public admin-istration and offer practical guidance for improving government communication strategies in the digital age, especially in situations where complete problem resolution may not be feasible.

Keywords: Government responsiveness, Emotion-based response, Citizen satisfaction
Poster, DOI: https://doi.org/10.59490/dgo.2025.933

1. Introduction

Government-citizen interactions have undergone a digital transformation, enabling more frequent and scalable engagement through online platforms (Wong & Welch, 2004). However, responsiveness in the digital era requires more than timely replies; it demands empathetic, emotionally intelligent communication (Bons'on et al., 2012; Mergel, 2013b). This is especially essential when governments face limited capacity to fully resolve complex issues raised by citizens (Mergel, 2013a).In such contexts, emotional strategies in communication may serve as substitutes to manage expectations and build trust.

Scholars and practitioners alike recognize that digital governance is no longer solely concerned with service efficiency or technical transparency. Instead, it involves managing complex expectations, demonstrating empathy, and conveying respect and care through online responses on digital platforms. As governments face

mounting service requests and constrained administrative capacity, emotional strategies emerge as a cost-effective and symbolically powerful means to enhance public perception and manage dissatisfaction—especially when full resolution is not feasible. Recent studies have highlighted the emotional and relational dimensions of public service delivery, showing that tone, empathy, and perceived sincerity significantly affect citizen attitudes (Guy & Lee, 2015; Mergel, 2013b). However, this line of inquiry remains underdeveloped in the digital context. In particular, there is limited empirical research that systematically measures emotional responsiveness and evaluates its impact on citizen satisfaction. Therefore, this study addresses a key research question: to what extent do emotion-based government responses influence citizen satisfaction?

This study addresses existing gaps by developing a multi-dimensional framework to quantify emotion-based responsiveness and examining its effects on citizen satisfaction in a non-Western context. It moves beyond binary resolution metrics to assess how governments use emotional language as a communicative strategy in digital service delivery.

2. Theoretical Framework and Research Hypothesis

To better understand government responsiveness in government-citizen online interaction, this study proposes the Emotion-based Responsiveness Framework in Government Communication (as shown in Fig. 1) to analyze the emotional and personalized aspects of government responses in digital communication platforms. In this model, it examines government's emotion-based response by evaluating the extent to which it demonstrates positivity, empathy, reassurance and personalization, and subsequently analyzes how these dimensions influence citizens' overall satisfaction.

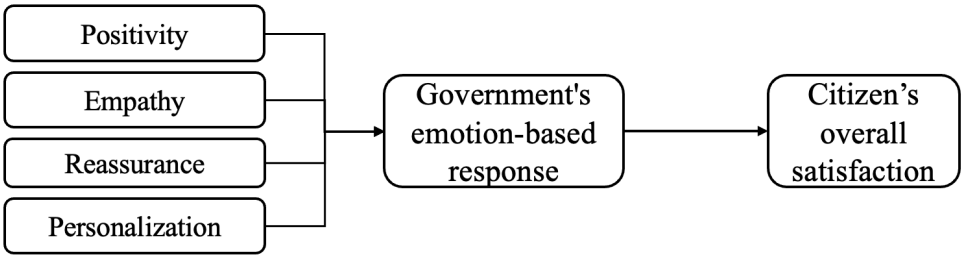

Fig. 1 – The Emotion-based Responsiveness Framework in Government Communication

Drawing from theories of emotional intelligence (Vigoda-Gadot & Meisler, 2010), we argue that emotion-based responsive communication can enhance perceived procedural fairness and reduce dissatisfaction. These emotional dimensions serve as signals of respect, engagement, and concern, all of which are associated with higher citizen trust and satisfaction in public administration literature. Based on the theoretical discussion, we propose the following hypotheses:

- **H1:** The degree of emotion-based responsiveness in government responses is positively associated with citizens' satisfaction.

3. Methodology

The data comes from the Chinese People's Daily *Message Board for Leaders*, a national platform for digital citizen-government interaction. Our dataset includes over 900,000 entries from 2019 to 2022, of which 333,892 include both government responses and citizen satisfaction ratings. For preliminary testing, we randomly select 3,000 pieces for investigation.

For data analysis, we begin by manually coding a stratified sample of several thousand responses to establish ground truth labels across the four emotional dimensions: positivity, empathy, reassurance, and personalization. Each dimension is coded as binary variable. This annotated dataset serves as the foundation for training few-shot learning prompts using the ChatGPT API. Carefully crafted examples guide the large language model (LLM) in predicting emotion scores for the remaining unlabeled responses. The performance of the ChatGPT model is assessed using standard classification metrics (as shown in Tab. 1). These metrics indicate a high

level of performance, with the precision score highlighting the model's ability to correctly identify positive instances, and the recall score reflecting its effectiveness in capturing all relevant instances. The F1 score, a harmonic mean of precision and recall, further confirms the model's balanced performance.

Tab. 1 – Performance metrics for classification models

	Accuracy	Precision	Recall	F1 Score
Reassurance	0.910	0.923	0.910	0.916
Positivity	0.888	0.906	0.888	0.890
Empathy	0.829	0.829	0.829	0.828
Personalization	0.854	0.954	0.854	0.886

Besides, we incorporate contextual and structural controls, including city-level socioeconomic indicators, message type, length of response and response time. Tab. 2 shows the details of the measurements and summary statistics of the variables.

Tab. 2 – Measurement of variables and descriptive statistics

Variable	Measurement	N	Mean	SD	Min	Max
Dependent Variable						
Satisfaction with government' response	Citizens' evaluation of response (Range: 0–5)	3,000	3.887	1.591	0.700	5.000
Independent Variable						
Emotion-based response	Total score of 'positivity', 'empathy', 'reassurance' and 'personalization'.	3,000	3.664	1.216	0.000	5.000
Positivity	Neutral or negative = 0, Positive = 1	3,000	0.762	0.426	0.000	1.000
Empathy	No empathy = 0, Empathy = 1	3,000	0.328	0.469	0.000	1.000
Reassurance	No reassurance = 0, Reassurance = 1	3,000	0.908	0.289	0.000	1.000
Personalization	No personalization = 0, Personalization = 1	3,000	0.833	0.373	0.000	1.000
Control Variable						
GDP per capita	GDP per capita (Logged)	3,000	4.251	0.389	3.612	5.255
Population	Total population (Logged)	3,000	3.856	0.667	1.539	4.851
Urbanization	Urban population / total population	3,000	0.642	0.109	0.357	0.893
Length of response	Total number of response words (Logged)	3,000	5.372	0.757	3.045	7.766
Response time	Response time – message time (Logged)	3,000	2.881	0.910	0.000	5.927
Message type	Consultation = 1, Suggestion = 2, Appreciation = 3, Complaint = 4, Assistance-seeking = 5	3,000	3.569	1.498	1.000	5.000

To estimate the effect of emotion-based responses on satisfaction, this study employs fixed-effects linear regression models accounting for temporal and regional heterogeneity.

4. Results and Key Findings

Tab. 3 shows that emotion-based responses have a statistically significant and positive effect on citizen satisfaction across both models. In Model (1), without control variables, the coefficient for emotion-based response is 0.055 ($p < 0.05$). When control variables are added in Model (2), the coefficient increases to 0.080 ($p < 0.01$), indicating a stronger and more robust association. This result suggests that citizens are more satisfied when government replies convey emotional qualities such as positivity, empathy, reassurance, and personalization.

These findings provide empirical support for the hypothesis that emotion-based responsiveness contributes meaningfully to citizen satisfaction. The positive and robust effect across models highlights the relevance of emotional cues in shaping perceptions of government responsiveness. This reinforces the theoretical claim that emotional strategies can serve as important tools in maintaining citizen trust and managing expectations in digital governance.

Tab. 3 – Effect of Emotion-based Response on Citizen Satisfaction

VARIABLES	(1) Without controls	(2) With controls
Emotion-based response	0.055**	0.080***
	(0.025)	(0.025)

Note: Robust standard errors in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

5. Implications

This study makes several important theoretical contributions. First, it introduces emotional responsiveness as a multi-dimensional construct in digital government communication and situates it within the broader literature on citizen satisfaction and public service delivery. While traditional e-governance research emphasizes transparency, efficiency, and responsiveness in terms of timeliness or completeness of resolution, our work expands the theoretical boundaries by incorporating emotional quality as an essential explanatory factor. Second, by proposing and validating the Emotion-based Responsiveness Framework in Government Communication, the study offers a systematic and replicable approach to measure emotional cues in government-citizen digital interactions. This enriches existing public administration theory by linking emotional intelligence to e-governance and showing that emotions are not ancillary but integral to citizen evaluations of public services.

From a practical perspective, the findings offer actionable strategies for governments seeking to enhance service quality and citizen satisfaction in the digital age. Public administrators can be trained in emotionally intelligent communication practices, including empathetic language, personalized content, and tone management. These elements can be embedded in standard operating procedures for frontline digital communication. Second, the application of LLM demonstrates the feasibility of scaling emotional analysis across large datasets. Governments can leverage such tools not only for monitoring response quality but also for real-time feedback loops and automated training systems. Moreover, emotion-based responsiveness metrics could be integrated into government performance evaluation frameworks to complement traditional measures like resolution rates and timeliness. Finally, for digital platform designers, the results suggest the value of embedding emotional logic into AI-powered response systems. Emotionally adaptive bots and response templates can significantly improve user experience and perception of fairness, especially in contexts where human capacity is limited and not all issues can be fully resolved.

6. Next Steps

Building on the preliminary findings, the next stage of the study will involve several key extensions. First, we will further improve the predictive accuracy of ChatGPT by refining prompt design, optimizing few-shot examples, and exploring advanced scoring mechanisms to better capture subtle emotional cues. Second, we will expand the analysis to cover the entire dataset of government responses to ensure greater generalizability and statistical power. Third, we will incorporate resolution degree as a moderating variable to assess whether emotion-based responses remain effective in the absence of full problem resolution. This will allow us to test

whether emotion-based communication can compensate for limited administrative action. Finally, we will replicate the emotion-based classification using Deepseek's API to validate the consistency of the results as a robustness check. These next steps aim to strengthen the empirical foundation of the study and provide more nuanced insights into the dynamics of strategic responsiveness in digital governance.

Abstract. Urban resilience is perceived as the response of governments towards unforeseen events. However, communities also develop their own mechanisms to transform and adapt more efficiently. With the integration of ICT in cities, rapid response and predictive capabilities are expected to improve urban management. Currently, cities face a critical, unprepared challenge: immigration. If inadequately addressed, immigration can strain national cohesion, identity, and economic stability. This paper examines urban resilience within virtual communities, focusing on how networking platforms foster integration and social cohesion enhancing urban and economic resilience. The networking platform *Meetup,* being used in 230 cities aiming to enhance trust among members and a faster integration through online and face-to-face interaction. With a qualitative approach including surveys, it is possible to measure how these communities' foster resilience and self-directed development.

Keywords. virtual communities, urban resilience, migration, networking platforms, integration.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1016

1. Introduction

Resilience refers to the ability to adapt in the face of adversity (Wu et al., 2013), and in urban contexts, it addresses a city's capacity to recover from physical, economic, institutional, and social challenges. Cities are increasingly vulnerable to political, economic, and social crises, not just natural disasters (Büyüközkan et al., 2022). Achieving urban resilience requires collaboration between communities and governments, addressing threats through the four pillars: resisting, recovering, adapting, and transforming (Gomes Ribeiro and Pena Jardim Gonçalves, 2019). Smart Cities aim to enhance resilience through technology, but technology alone isn't sufficient. High-quality companies, skilled labor, and the enhancement of adaptability are equally vital for urban systems to thrive (Zhou et al., 2021). Additionally, cities face challenges like immigration, which can strain economic, social, and cultural structures, highlighting the need for proactive policies to avoid urban failure (Castles, 2011).

Community resilience in informal settings involves self-reliant communities that adapt to challenges, with key components such as communication, cooperation, cohesion, coping, credibility, and a vision for the future (Matarrita-Cascante et al., 2017; Olcese et al., 2024; Ganor and Ben-Lavy, 2003). The role of Information and Communication Technologies (ICTs) in urban change is significant, as they enhance governance and civic engagement, turning citizens into agents of transformation (Miklian and Hoelscher, 2017). As digital transformation unfolds, citizens are creating platforms to promote integration and inclusion, which directly impact urban resilience (Panori et al., 2021). This highlights the gap in research on the direct effects of digital platforms and virtual communities on urban resilience.

Research question: **How is the creation of digital platforms and virtual communities fostering integration and inclusion, enhancing urban resilience?**

The paper explores citizen-driven efforts to integrate post-migration, contributing to existing strategies related to migration and integration. The structure includes an introduction to urban resilience, social cohesion, and the research question, followed by a theoretical background on urban resilience, smart cities, socio-cultural artifacts, social innovation, cultural importance, human capital, social capital, bridging the digital divide, and privacy concerns in smart communities. The methodology section discusses qualitative approaches and planned data collection, with a concluding outlook.

2. Theory background

2.1 Urban resilience responding to migration and integration

The migration crisis, driven by conflict and economic hardship, has intensified political tensions in the European Union, with concerns about cultural change and the erosion of shared values. However, migration also offers opportunities: with effective integration policies, it can benefit both migrants and host societies by strengthening socio-ecological systems and urban resilience (Sansus et al., 2020; Zapata-Barrero, 2023). As migration accelerates and urban populations grow—especially in smaller cities (UNDESA, 2014)—successful integration must address both physical needs (education, housing, healthcare) and social inclusion (Meijers et al., 2017). Highly skilled migrants, when well-integrated, can significantly contribute to shaping resilient, innovative urban economies (Tadesse and White, 2010). Human capital is central to Urban Economic Resilience, enhancing technological transformation and digital growth through shock resistance, recovery, and risk adaptation, making investment in human capital a policy priority (Zhou and Qi, 2023).

2.2 Cultural Sphere in Smart Cities

While smart cities primarily aim to enhance sustainability through technology, performance indicators often emphasize economic efficiency and the deployment of smart solutions. A more comprehensive concept is the "Smart Sustainable City," which integrates environmental and social sustainability alongside economic goals (Ahvenniemi et al., 2017). Key dimensions for ranking cities under this model—such as those outlined by the University of Navarra and the UN's SDGs—include human capital, social cohesion, governance, and environmental responsibility. Human capital involves cultural engagement and access to education (Berrone, 2024; UN, 2023), while social cohesion emphasizes inclusion and diversity. Economic vitality is gauged by factors like investment returns and startup activity, with cities generating the majority of global GDP. Governance highlights citizen-centered solutions, and environmental efforts focus on sustainable development and pollution reduction. Efficient mobility systems and inclusive urban planning are essential for shaping equitable urban spaces. A strong international profile boosts investment and tourism, while technology reflects societal prosperity and sets the foundation for future urban innovation. These interconnected dimensions reinforce the idea that truly smart cities must also be sustainable and inclusive.

2.3 Social Cohesion and Social Capital

Social cohesion refers to the shared values, sense of belonging, and solidarity among individuals in a society, especially across diverse backgrounds. While it promotes unity, it is often contrasted with social capital, which emphasizes functional networks and relationships. A key challenge is the perceived tension between ethnic diversity and social cohesion, with multiculturalism sometimes viewed as a threat to societal harmony (Goodhart, 2004; Cheong et al., 2007). The term itself is complex and can be measured at both national and community levels, though community-based assessments face limitations due to the subjective nature of social constructs and administrative boundaries. Social cohesion is commonly evaluated across three dimensions: political (e.g., voting and volunteering), economic (e.g., employment, income, labor force participation), and social (e.g., civic engagement, diversity, and informal interactions).

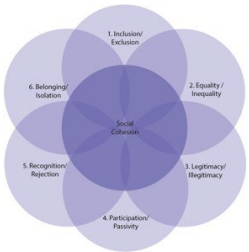

Fig. 1 - Dimensions of social cohesion (Rajulton et al., 2006).

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Social capital, which reflects the quality of relationships within and beyond communities, is a key indicator of well-being and a powerful tool for local policy implementation (Nakano and Washizu, 2021). It is typically categorized into bonding and bridging capital, assessed through trust, networks, and norms. In urban settings, leveraging social capital requires addressing challenges like population heterogeneity and the preservation of cultural heritage. This demands a shift in policy approaches, as changes can significantly influence urban planning, economic development, transportation, social initiatives, and tourism (Carrá, 2007).

2.4 Socio-technical ecosystems in the smart City and the Digital Divide

Smart cities are evolving as socio-technical ecosystems where digital socio-cultural artifacts empower citizens, foster social innovation, and enhance cultural value. However, unequal access to technology—the digital divide—threatens inclusivity (Baltac, 2019). This divide spans access, digital skills, and the benefits of ICT, often reflecting deeper social inequalities. Effective social innovation requires not just technology, but human-centered strategies and intermediaries to connect citizens, governments, and businesses. While ICT can enhance social capital, its impact is limited without support for marginalized groups. Thus, bridging the digital divide is essential to ensure smart cities truly serve as inclusive platforms for innovation and equitable urban transformation.

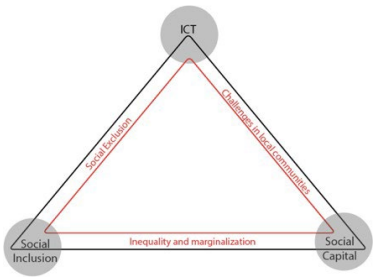

Fig. 2 - The triangle of Social Capital, ICT, Social Inclusion (Zinnbauer, 2007).

3. Methodology

3.1 Method and use case

This research uses a mixed-methods approach, combining Social Network Analysis (SNA), Actor-Network Theory (ANT), and Quantitative Data Analysis to explore the intersection of technology and migration. While online group interactions have existed since the 1970s, virtual communities are specifically defined as social aggregations that aim to build long-term personal relationships in cyberspace, driven by human emotions and shared intentions to engage in ongoing discussions. The term "community" in the digital context highlights how online networks can foster meaningful social connections. Social media, beyond facilitating superficial interactions, enhances access to information and aids in the development of social capital (Ellis et al., 2004). To validate the research framework (Figure 4), various indicators—such as integration, social inclusion, innovation, participation, and social cohesion—are assessed through digital platforms and virtual communities to measure urban resilience following migration. The specific case study for this analysis is the Meetup platform, which was designed to create local communities and enable connections across more than 230 cities, based on shared interests.

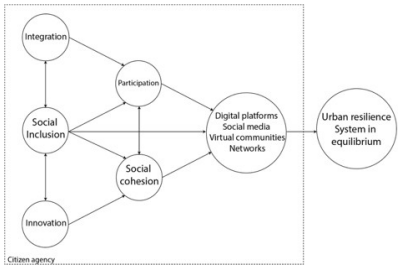

Fig. 3 - Research framework

3.2 Data Sampling and measurements

The methodology implemented to verify the proposed framework and assess the performance of sustainable smart cities focuses on key criteria such as urban resilience, sustainability and social cohesion. A questionnaire, adapted from relevant literature and adjusted to the framework of this paper. The indicators and constructs are listed in *Table 3.* Preliminary results emphasize the importance of well-being, citizen agency, technology usage, virtual communities and social cohesion as critical factors for the successful implementation of Sustainable Smart Cities

Abstract. Technical Education in Brazil faces challenges in standardizing digital certificate issuance and exchange across diverse platforms, affecting compliance, efficiency, and workforce integration. Unlike higher education, technical education has unique structural and regulatory demands that require a tailored interoperability solution. This study proposes an XML Schema Definition (XSD) designed specifically for technical education, extending beyond existing mod- els used in higher education. Leveraging XML's flexibility, the schema creates machine-readable digital certificates that improve security, transparency, and fraud prevention by providing a struc- tured framework. The research aims to facilitate regulatory compliance and streamline data ex- change between technical institutions and the Ministry of Education. A systematic literature re- view and comparative analysis highlight gaps in current digital document practices and support the schema's development. The findings demonstrate XML's potential as a transformative stan- dard for managing educational records in technical education, optimizing accessibility and en- abling seamless platform integration. Unlike prior efforts focused on higher education, this model addresses the specific operational and regulatory complexities of technical education. Implement- ing this schema tackles critical interoperability challenges and lays the foundation for advancing digital certification. By fostering innovation and collaboration, this work supports a unified, se- cure, and accessible digital certification system, promoting modernization and trust in Brazil's educational environment.

Keywords. Interoperability, Interoperability Standards, XML, Technical Education.
Poster, DOI: https://doi.org/10.59490/dgo.2025.1022

1. Background

Technical education improves employability, with rising employment rates highlighting the need for modernized document management. However, fragmented systems in Brazil hinder data exchange and increase fraud risks (Costa et al., 2020; de Barros & Ferraz, 2023; dos Anjos, 2019; Lepiane et al., 2019). Digitally signed documents reduce costs and enhance security (Martina et al., 2019; Pereira, 2015), while interoperability enables standardized, regulation-compliant exchanges (Costa et al., 2020; Diallo et al., 2011). This study proposes an XSD-based framework for technical diplomas, supporting integration with the Ministry of Education and offering scalability to other education levels.

2. Research Methods

- Objective:
  - Develop an XML-based interoperability model tailored for technical education.
- Methodology:

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

- Qualitative research and comparative analysis of XML models.
- Literature review of XML for digital certification in higher education.
- Analysis of interoperability models to ensure data integrity, authenticity, and compliance.

• Proposed Solution:
- A customized XML schema for seamless data exchange between technical education institutions and the Ministry of Education.
- Incorporation of essential metadata, standardized structures, and security mechanisms.
- XSD aligned with regulatory guidelines, including fields to support diverse technical curricula.

3. Proposal for a Standardized Interoperability Model

Brazil faces challenges in student retention and completion, particularly in technical education, due to the lack of standardized diploma recognition (OECD, 2024). The absence of uniformity in technical diplomas complicates the validation of skills and competencies, hindering student mobility and reducing employment and educational opportunities, contributing to higher dropout rates.

Figure 1 shows the drop in out-of-school rates from 16% (2013) to 8% (2022), underscoring how digital diplomas support transparency, efficiency, and secure, standardized verification (Martina et al., 2019; OECD, 2024). In Brazil, technical diplomas are still paper-based (Pereira, 2015), unlike in higher education. This work reviews legislation (Brasil, 2019; Ministério da Educação, 2019) and suggests adapting higher education XML/XSD interoperability models to technical education (Murray, 2002), where XML remains underused.

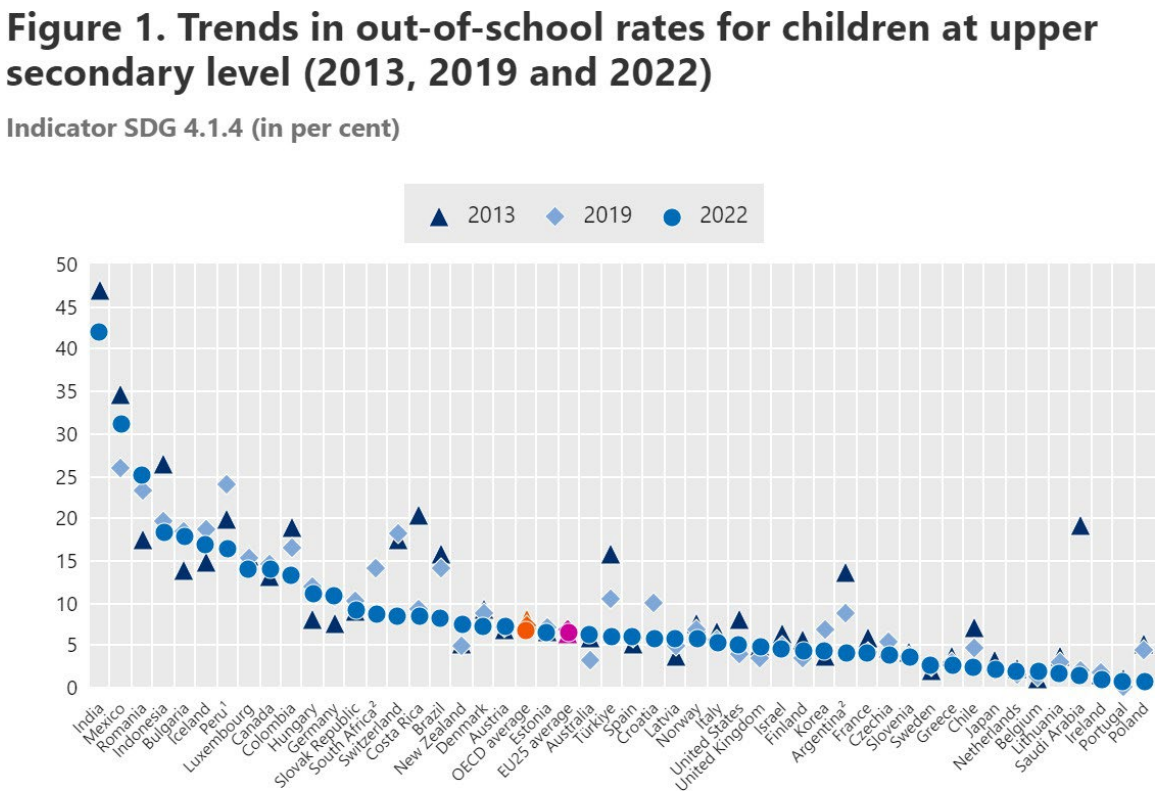

Fig. 1 – OCDE Trends in out-of-school rates for children at the upper secondary level (2013, 2019, and 2022)

Figure 2 demonstrates how XML enables secure, validated, and standardized academic record exchange between institutions. By replacing manual input with structured file exchanges, the interoperability standard ensures consistent communication. XML's flexible, hierarchical structure—combined with XSD—guarantees data consistency and enhances interoperability in technical education (Hedgebeth, 2008).

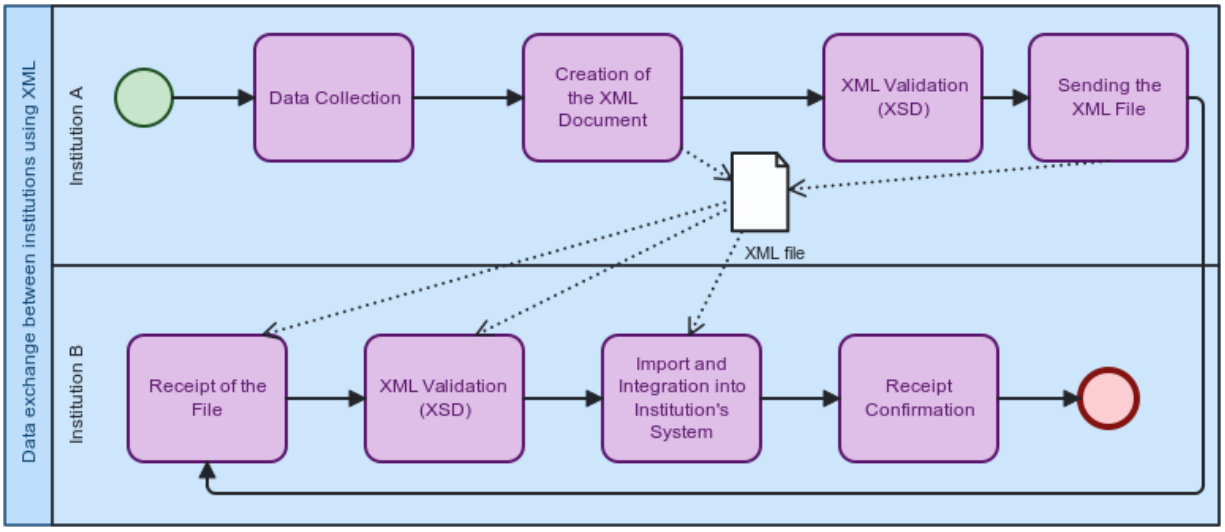

Fig. 2 – BPMN of data exchange between institutions using XML

4. Results

4.1. Academic Registration and Diploma Issuance Process

Figure 3 illustrates the graduation process at Technical Education Institutions (IEPT), where XML-based diplomas are generated, validated via SISTEC, digitally signed, and delivered to students. This automated workflow ensures secure, standardized, and interoperable credential exchange across educational systems.

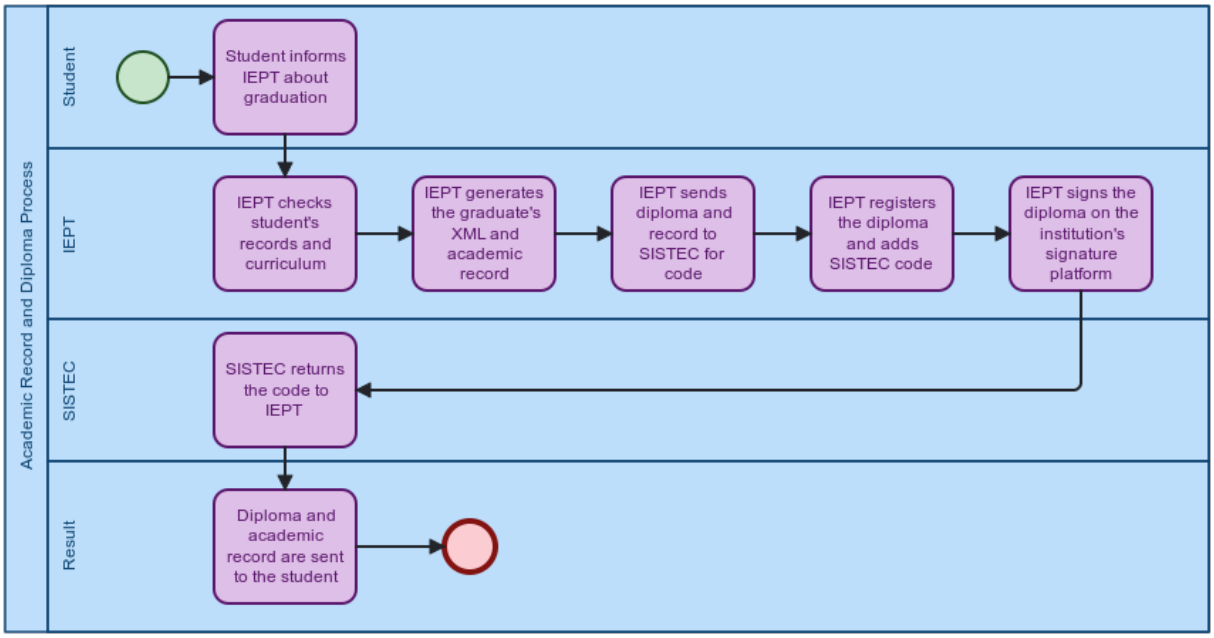

Fig. 3 – Academic Record and Diploma Process BPMN diagram

4.2. Classification of Digital Diploma Elements

We recommend directly adopting the same standard used in higher education to obtain the same advantages but with adjustments and specificities necessary for implementation in this teaching modality. Based on the higher education model, tags were classified according to their XSD structure:

- **General Diploma Information**
  - **Diploma tag:** Contains the diploma structure and signature.
  - **Diploma Information tag:** Includes diploma data, registration, and court decision information.
  - **Diploma Data tag:** Defines data about the graduate, completion date, course, issuing institution, and signatories.
  - **NSF tag:** Similar to Diploma Data but for institutions outside the federal system.
- **Registration**
  - **Registration Data tag:** Defines diploma registration data, such as educational system, record book, academic documentation, security, and additional info.
  - **NSF tag:** Similar to Registration Data but for institutions outside the federal system.
  - **Court Decision tag:** Defines registration information for diplomas affected by court decisions.
- **Graduate**
  - **Graduate Data tag:** Includes personal data such as nationality, birthplace, and personal IDs (e.g., CPF, ID).
  - **Data Diploma by Court Decision tag:** Similar to Graduate Data, but not all information will be inserted for court-affected diplomas.
- **Course**
  - **Course Data tag:** Defines course details, such as name, code, address, and authorization.
  - **NSF tag:** Similar to Course Data but for institutions outside the federal system.
  - **Course Data By Court Decision tag:** Defines course information for diplomas affected by court decisions.
- **Record Book**
  - **Record Book tag:** Defines documentation and control information for diplomas, including unique code, registration number, and diploma page.
  - **NSF tag:** Similar to Record Book but for institutions outside the federal system.
- **Judicial Process**
  - **Legal Process Information tag:** Contains details of legal processes related to the diploma, such as case number, judge, and decision.
  - **Statements About Process tag:** Defines statements about the diploma process.
- **Regulatory Act**
  - **Regulatory Act tag:** Defines information about regulatory acts to ensure educational service quality, such as type, number, date, and publication source.
  - **With or without systems tag:** Similar to the Regulatory Act, but with or without an information system.
- **Processing in systems**
  - Tag that contains information about degree processing in information systems.

The XSD schema is used to validate XML documents for digital diplomas by defining their required structure, including diploma details, course information, digital signatures, and academic records. The structure centers the diploma as the main element, with related data as subordinate elements. This flexible model supports special cases like judicial decisions or non-federal courses. At the end of the schema, a digital security layer ensures authentication and data integrity.

4.3. Data Control in Technical Education

SISTEC is the centralized system for managing technical education records in Brazil. Unlike higher education, where registration is decentralized, SISTEC unifies data, allowing seamless interoperability between institutions and the Ministry of Education. The system uses a unique locator code for diploma validation, replacing traditional registration books.

4.4. Digital Diploma Components

The digital diploma follows a structured XML schema, defining key elements such as diploma data, registration records, and legal decisions. Attributes like version, unique ID, and environment settings ensure standardization and interoperability across institutions.

4.5. Regulatory Framework Adaptations

Unlike higher education, which operates under a National Higher Education Assessment System and formal regulatory acts, technical education follows decentralized validation by State Education Councils. The XML model adjusts by excluding the higher education regulatory tag and focusing on course accreditation and authorization.

4.6. Tag Nomenclature Adjustments

Higher education terms like "IesEmissora" were adapted to "IeptEmissora" to reflect technical education institutions. Additionally, distinctions were made between federal and non-federal institutions, introducing "NSFT" (Non-Federal Technical System) tags.

4.7. Structural Modifications for Technical Education

The XML schema was adjusted to incorporate state and federal guidelines, accommodate course diversity, and enhance interoperability. Advanced security features, such as XML Advanced Electronic Signatures (XAdES), were integrated to ensure document integrity and authentication.

4.8. Enhancing Security with Digital Signatures

Digital signatures, regulated by ICP-Brasil, provide authenticity and integrity to digital diplomas. Already used in higher education, this security measure is proposed for technical education to ensure reliable, tamper-proof certification.

4.9. Validation and Feasibility Analysis in the Literature

Fig. 4 – Signed digital technical diploma, using the XML format for interoperability.

We validated the technical digital diploma's XSD using the ITI official validator (de Tecnologia da Informação (ITI), 2023), which ensures authenticity and compliance with digital signature standards in Brazil. Our validation process provided additional detailed information beyond the standard ITI output. The digitally signed diploma file diplomaTecnico_assinado.xml was successfully verified, as shown in Figure 4, containing three compliant signatures aligned with W3C XML Schema and ICP-Brasil standards. All cryptographic checks passed, and the certificates, issued by the Brazilian Federal Revenue and valid until 2025, showed no revocation issues, confirming the diploma's security and compliance.

4.10. Feasibility Analysis

This feasibility analysis assesses technical and operational challenges of adopting the XML standard in technical education. It examines system compatibility, security, stakeholder acceptance, and adaptability. Using a sociotechnical framework (Inocêncio et al., 2024), the study compares literature findings with key criteria relevant to Technical Education:

- **Compatibility:** XML is compatible with systems used by Technical Education institutions, supporting integration and interoperability (Inocêncio et al., 2024).
- **Acceptance:** XML is already accepted and implemented in Higher Education, which facilitates its adoption in Technical Education (Inocêncio et al., 2024).
- **Ease of Implementation:** XML is simple to implement and does not require major changes to existing processes and systems (Inocêncio et al., 2024).
- **Efficiency:** XML supports effective data exchange between students, institutions, and the Ministry of Education, improving operational performance (Inocêncio et al., 2024).
- **Security:** XML ensures the confidentiality and integrity of student data, complying with privacy and information security standards (Inocêncio et al., 2024).
- **Flexibility:** XML can adapt to various institutional contexts and needs within Technical Education. The use of NSFT tags, for example, allows for multiple scenarios without requiring structural changes (Inocêncio et al., 2024).
- **Regulatory Compliance:** XML complies with existing Brazilian standards and regulations. It is already used in Higher Education under various ordinances and decrees issued by the Ministry of Education (Inocêncio et al., 2024).

Based on the presented criteria, the feasibility of implementing the interoperability standard in Technical Education is assessed positively. Additionally, the authors specify that Technical Education must be addressed to establish a viable interoperability standard, including the diversity of institutions providing these programs (Inocêncio et al., 2024).

5. Conclusions

This study explores how XML enhances interoperability in technical education diplomas in Brazil, building on its proven use in higher education. An XSD-based structure enables secure document exchange with the Ministry of Education, addressing risks like fragmentation and fraud. The proposed model offers a scalable foundation for global digital credentialing.

In addition to interoperability, XML supports transparency, policy development, and efficient education management. This work contributes to standardization efforts and proposes an XML-based framework for technical diplomas. Future research should assess its scalability across education levels. Aligned with dg.o's focus, this study addresses digital governance, secure data exchange, and open standards. It offers a model that improves trust, transparency, and efficiency in credential verification—relevant for attendees working in education policy, digital identity, and public administration.

Abstract. This workshop explores capacity-building needs for public sector digital transformation in the context of smart cities and systemic resilience. Framed within the Erasmus+ CAP4CITY_DM project, it brings together academics, practitioners, and students to identify emerging skills and competencies across governance levels and sectors. The program includes a brief introduction to the REALITIES Joint Master's Curriculum, lightning talks from invited experts on digital governance, AI, smart communities, and innovation, followed by a collaborative session to map skill gaps in the field. Expected outcomes include shared insights on cross-sectoral capacity needs, contributions to curriculum development, and stronger connections between education, practice, and policy. The workshop supports a broader understanding of smart cities as part of interconnected systems to address complex societal challenges.

Keywords. Public sector transformation, smart city governance, resilient cities.
Workshop, DOI: https://doi.org/10.59490/dgo.2025.1012

1. Introduction

Smart sustainable cities represent a progression of how local governments – and increasingly, broader governance systems – apply digital technology to serve their populations, pursue sustainable development, and transform themselves to cope with societal challenges. With the goal of creating inclusive, safe, and climate-resilient urban development, collective efforts are needed including policymakers, academics, practitioners and citizens (Almulhim et al., 2024).

With the goal of tackling complex urban challenges, the success of smart cities requires more than just technology. A well-formulated data governance strategy, along with intelligent tools to use government data, is imperative for evidence-based policymaking. However, a governance strategy alone is not sufficient to ensure the improvement

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

of the overall well-being of inhabitants and, according to Mora et al. (2025), urgent reforms are needed to better incorporate scientific insights into smart city governance practices. Creating a citizen-centric approach is essential, ensuring participation and communication during the development, execution, and evaluation of policies to create equitable urban transformations.

The concept of Smart Sustainable Cities (SSC) has emerged from the increasing and urgent emphasis on providing social and environmental sustainability solutions for urban planning. It has become a significant term within policy and politics (Bibri and Krogstie, 2017), aligning with the Sustainable Development Goals (SDGs) (Beck et al., 2023). SSC is a field in continuous transformation, enabled by digital technologies and innovation, and empowered by stakeholder engagement and collaboration. An SSC constructs human, institutional and technical capacities to solve problems and create new development opportunities to raise and maintain the quality of life in communities and pursue sustainable development. As urban challenges become increasingly intersect with regional, national, and global dynamics, addressing sustainability and resilience requires a comprehensive, systemic perspective that extends beyond the local level (UN-Habitat, 2022).

Building on this conceptual foundation, research has demonstrated the relevance of digitalization in urban areas for a variety of purposes. Several studies have indicated that digitalization can enhance economic growth by attracting new business, driving higher innovation (Albino et al., 2015; Ismagilova et al., 2019; Hu & Zheng, 2021), and improving the efficiency of processes and resource utilization (Silva et al., 2018; Khan & Salah, 2018; Attaran et al., 2022). Other studies underscore the pivotal role of technologies in fostering interoperability among disparate systems, thereby creating a more cohesive and interconnected infrastructure to confront societal challenges (Gharaibeh et al., 2017; Bellini et al., 2022) and promote sustainability (Lim et al., 2018; Ismagilova et al., 2019; Xie et al., 2019). In summary, previous research underscores the pivotal role of digitalization in generating public value (Pereira et al., 2017) and its substantial impact on enhancing the quality of life of residents (Rodríguez Bolívar, 2019, 2021).

However, as highlighted before, the effectiveness of digital solutions increasingly depends on the collaborative ecosystems that support their implementation. There is an increasing understanding that collaboration among local governments might be as important for the success of smart cities as technology advances (UN-Habitat, 2022). The literature shows the importance of stakeholder collaboration as a vital element for effective development of smart cities (Komninos et. al., 2019), its performance (Appio, Lima and Paroutis, 2019; Komninos et al., 2019) and sustainability of its results (Correia et al., 2022). Additionally, a study shows that there are certain configurational approaches to increase collaboration in smart cities, which are context dependent, and that for large ecosystems there is a need for a smart city manager or a dedicated department (Clement, Manjon and Crutzen, 2022).

Given the complexity of smart city ecosystems, it is crucial to implement initiatives that not only provide technical training for current and future practitioners engaged in smart cities but also facilitate the exchange of experiences, perspectives, and expertise starting from a transdisciplinary approach. Academic programs should enable participants to develop a comprehensive understanding of the political, technical, and social landscape. This, in turn, will empower them to assess scenarios and cultivate successful collaborations for the effective development of smart cities that align with their objectives. This workshop is aimed at better understanding how academic programs – such as a master's in *Resilient Innovation Systems* – can help bridge the skills gap in public sector digital transformation. As the emerging concept of resilient smart cities evolves beyond a local governance tool, it is increasingly viewed as part of a wider network of interconnected systems –, including technical, institutional, and social – that span regions and sectors. Therefore, to effectively address today's most pressing societal challenges, future professionals must be prepared to think systemically, act collaboratively and innovate in multiple levels of governance.

2. Workshop Objectives and Program

This workshop welcomes academics, practitioners, and students interested in the topic of capacity building for smart cities and urban resilience through digital transformation. The objective is to advance understanding of the competencies and structures needed to support public sector innovation and to explore the growing demand for interdisciplinary capacity building in the context of digital governance, smart communities, and systemic resilience.

The workshop is organized into three main segments:

Welcome and Project Introduction: The session will begin with a brief round of introductions, followed by a short presentation of the Erasmus+ CAP4CITY_DM Project and the curriculum of the REALITIES Joint Master's Program, which focuses on resilient innovation systems and digital transformation in public governance.

Lightning Talks: A series of short expert talks will cover key themes related to smart governance, technological innovation, resilience, and stakeholder engagement. The talks will be followed by a moderated panel discussion

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

and an open Q&A session to foster dialogue and knowledge exchange.

The planned lightning talks include:

- Digital Governance for Societal Transformation *by Gabriela Viale Pereira*
- AI for Supporting Governance of Smart Sustainable Cities in Latin America *by Elsa Estevez*
- The role of Smart Communities in Emergency Situations *by Edimara Luciano*
- Smart City Governance and Multi-Level Collaboration *by Manuel Pedro Bolivar*
- Technology and Innovation for Digital Transformation and Resilience *by Tomasz Janowski*

These lightning talks illustrate the evolution of smart cities from local initiatives to complex, resilient systems that require coordinated governance, innovation, and stakeholder collaboration across scales.

Group Discussion and Collaborative Activity: Participants will take part in a structured collaborative session aimed at identifying current and emerging skills gaps in public sector digital transformation—particularly within the context of smart cities, urban innovation, and resilience. The session will explore what capacities are needed across governance levels and sectors to address complex societal challenges.

3. Expected Results and Conclusions

The workshop aims to generate insights into the key competencies and systemic capacities required for advancing public sector digital transformation and resilience. Through the collaborative group activity and expert talks, participants will contribute to a shared understanding of emerging skill gaps and cross-sectoral demands in the governance of resilient smart cities.

Key expected outcomes include:

- A preliminary map of relevant skills and knowledge areas to be addressed in transdisciplinary education for smart cities and digital governance
- Reflections on the challenges and opportunities of multi-level collaboration and stakeholder engagement
- Inputs that will inform the further development and refinement of the REALITIES Joint Master's Program curriculum
- Strengthened dialogue between academia, practitioners, and policy actors on advancing resilient digital innovation at scale

Abstract. In recent years—particularly following the COVID-19 pandemic—governments have expanded the use of digital technologies and automated systems in social protection policies. One of the most prominent developments in this field is the spread of Single Registries: unified databases of individuals and families in vulnerable situations, often integrated with artificial intelligence (AI) and automated decision-making tools. In Brazil, the Unified Registry for Social Programs ("Cadastro Único") has become the main infrastructure for identifying and selecting beneficiaries of a wide range of social programs, including Bolsa Família. As of late 2024, it holds data on over 95 million people. In July 2024, the Brazilian government launched its national Artificial Intelligence Plan, allocating R$ 1.76 billion to the use of AI in public services—part of which is earmarked for modernizing Cadastro Único. While automation can improve the management and coordination of social policies, it also introduces new risks. If not carefully implemented, automated systems can produce errors, limit access to rights, and reinforce existing inequalities. In 2019, the UN Special Rapporteur on extreme poverty warned of the emergence of a "digital welfare dystopia" marked by opacity, exclusion, and lack of accountability. This workshop proposes a critical dialogue on the expansion of AI and automation in social protection, using the Brazilian experience as a starting point. We aim to discuss how data-driven tools are reshaping eligibility, targeting, and control in welfare systems, and to reflect on how a data justice approach can help ensure that digital governance in this field promotes — not undermines — equity and inclusion.

1. Introduction

Created in 2001, the Unified Registry for Social Programs (*Cadastro Único para Programas Sociais – CadÚnico*) is a

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

tool of the Brazilian Federal Government designed to identify, register and select low-income families for access to social programs such as *Bolsa Família* and the Social Electricity Tariff, among others. Comprising software and forms that collect, process, and cross-check personal data of Brazilians living in poverty and extreme poverty [1], CadÚnico serves as an infrastructure for the implementation of social assistance programs [2]. It does so by applying income criteria and specific conditionalities for each government program, allowing cross-referencing information with other government agencies.

As of December 2024, more than 95 million Brazilians (or 41 million families) were registered in CadÚnico. In total, 45 Federal Government social programs currently rely on CadÚnico. States and municipalities also run programs that use the registry. Given the high number of programs and beneficiaries, datafication and automation are structural components of CadÚnico. It operates as a vast database which is automatically and periodically cross-checked with other government databases to verify the income data of registered families [3].

The increasing use of technology and automation in social protection programs is not a phenomenon exclusive to Brazil. The so-called Single Registries—unified databases of vulnerable citizens that incorporate artificial intelligence and automation—have been multiplying worldwide, with notable examples in South Africa (e.g., SOCPEN) and the Netherlands (e.g., BRP). In recent years, many of these Single Registry systems have introduced various technologies to automate registration, data cross-referencing, and beneficiary selection processes.

As Dencik et al. [4] point out, "smart" technologies, machine learning, and artificial intelligence are integral to how societies are organized and how decisions are made across different spheres. The types of services that can be accessed, how they are accessed, and the various governance models for public policies potentially involve data processing practices and automated decision-making.

The widespread use of technology can optimize the management of social protection programs, but it can also pose challenges for individuals who rely on these tools to exercise their rights. In 2019, in an analysis of the impact of data-driven and automated systems on income redistribution and service administration, the UN Special Rapporteur highlighted the potential risk of creating a dystopian state of digital welfare characterized by a passive and automated existence.

Studies in the field of Data Justice [5] [6] [7] seek to analyze this new era of digital governance in public policy from a perspective that, on the one hand, addresses power asymmetries in the use of personal data and, on the other, examines how data-driven technologies can promote distributive justice by increasing the visibility of marginalized groups [8].

In this context of intensified scrutiny of social assistance programs through a datafication-driven approach, artificial intelligence and automation have increasingly been incorporated into monitoring strategies. In 2024, the Federal Government announced the use of AI to "strengthen the fight against fraud in Bolsa Família and CadÚnico." [9] In other words, beyond the challenges related to the disproportionate exposure of beneficiaries' data in social protection programs, the growing use of invasive technologies for monitoring raise concerns about potential errors and injustices caused by automation.

2. Objectives

Based on the Brazilian case of CadÚnico, this workshop aims to discuss the challenges of expanding automated decision-making and AI in social protection policies. We seek insights into:

(1) **how automation has been incorporated into social protection programs worldwide**, focusing on the different technological tools and models being used, the role of AI in these systems, and the outcomes and challenges faced in various countries;
(2) **the benefits and risks of these automated systems,** examining both the positive impacts (such as increased efficiency) and the potential drawbacks, such as increased surveillance and potential biases. We also intend to discuss how automation can either improve or worsen access to services for marginalized groups;
(3) **how technologies can effectively address inequalities**; and
(4) **whether these technologies may inadvertently perpetuate inequalities**.

Through this dialogue, we aspire to collectively tackle challenges and explore more effective pathways for developing social protection policies grounded in data justice.

3. Methodology and Format

This workshop will adopt a participatory format that combines the World Café and Chatham House methods to foster an open and reflective environment (*The World Café is a structured conversational process aimed at encouraging collaborative dialogue and knowledge sharing through rotating small-group discussions. The Chatham House Rule offers the possibility of workshops in an atmosphere of trust: participants are free to use the information received, but the identity and affiliation of other speakers cannot be revealed; the event is not recorded or transcribed; and participants are allowed to post about it on social media, as long as no attributions are made to the statements*).

The structure is designed to balance theoretical framing with collaborative discussion, while respecting the time allocation of two 90-minute sessions. It will combine a conceptual presentation on Data Justice and the Brazilian Single Registry case, based on the research conducted by InternetLab and the Privacy International in partnership with University of St, Gallen. After the initial presentation, the workshop participants will be divided into four groups, each tasked with collectively discussing one targeted question. The activity will have the following structure:

1) Introduction and contextualization (15 minutes):
This opening segment will present the workshop's objectives, structure, and participatory rules. It aims to frame the discussion and foster a space for collective inquiry into the role of data and automation in social protection policies.

Presentation on Data Justice and CadÚnico (35 minutes):
To ensure a common foundation of knowledge among all participants, the workshop moderators will conduct a theoretical presentation on the concept of data justice. They will also present the results of the research *Data Justice and Social Protection: Technologies, Algorithms, and Automated Decisions in CadÚnico*, conducted by InternetLab, which will support the group discussions.

Group discussion (1 hour 30 minutes):
The workshop room will be organized into four discussion tables, each focused on one of the workshop's four key questions (as outlined in the previous section). Participants will be divided into groups and will rotate through two different tables in 45-minute rounds. Each table will have post-its on which participants will write key points from the discussion. This format ensures that everyone engages with at least two of the key questions, allowing for both focused and diverse contributions across topics.

Collective discussion (40 minutes):
Participants will reconvene in a plenary session to share key takeaways and reflect on cross-cutting themes.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

Moderators will synthesize insights from the discussion tables, identifying tensions, convergences, and directions for future research and advocacy. The workshop will close with a collaborative exercise to draft a preliminary agenda for data justice in the field of social protection.

4. Target Audience

The workshop is designed for researchers, policymakers, and civil society organizations that work at the intersection of technology, social protection, digital governance, artificial intelligence and data justice.

Abstract. As the world grapples with the challenge of integrating Artificial Intelligence (AI) into existing systems or processes, there is a resultant tension associated with the inherent nuances between determining where the role of the human-stops and that of the machine-begins. As new 4IR driven technologies are integrated into main-stream society, dialogue on the important topics of inclusive e-Governance and Digital Humanism from a global south perspective must be encouraged. This paper acknowledges the limitations of technologies developed from a western viewpoint that prioritises individualism over community which is an inherent trait of the indigenous worldviews. In the universal viewpoint of Digital Humanism, indigenous perspectives must be included. Digital humanism transposes the social concept of humanism into the digital realm. Digital humanism seeks to ensure that human values such as dignity, freedom, ethics, democracy, social justice and self-determination are not overlooked as technological capabilities become more sophisticated. Historically, developing countries have been identified as late adopters of technological advancements. This paper seeks to unpack the concept of Digital Humanism, explore its relevance to e-Governance and investigate its alignment to existing (global south) e-inclusion discourse.

Keywords. Digital Humanism, e-Governance, e-inclusion, inclusive e-Government, Digital democracy.
Workshop, DOI: https://doi.org/10.59490/dgo.2025.1067

1. Introduction

The global discussion around technology development and constraints cannot overlook the persistent threat of digital segregation of the global south. Foley *et al.* (2022) posit that the separation between 'the haves' and 'have nots' has transcended the socio-economic lines and now finds form in the online or digital world. This online isolation of population groups based on their socio-economic standing has potential to distort the potential benefits of using technology for the benefit of society. Kwet (2019) accuses Big Tech corporations of controlling the digital ecosystem by monopolising computer-mediated experiences, giving them direct power over political, economic and cultural domains of life. Kwet considers the United States responsible for reinventing colonialism in the Global South through the domination of digital technology. Bon *et al.* (2022) expresses the concern addressed in this paper of the omission of people from the global south from the debates about the future of the digital society, despite the large impact of digital technology on the lives and future of all people on the planet. With the introduction of digital humanism in the discourse of the future global south digital landscape, creates an opportunity including these 'overlooked' voices from the global south. Evolving from ideologies of authors like McLuhan (1964) who spoke of 'technological humanism', digital humanism is viewed as the cognitive shift of transposing the 'online world' into our perceived reality. According to McLuhan technology as a 'medium' affects

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

how we perceive and understand the world around us. Lollini (2011) raised concerns about the resultant side effects of an impoverished human culture and experience of the world as the quality of human experiences is neglected in favour of quantitative, neutral, impersonal, and commercial criteria.

2. Indigenous worldviews in the digital landscape

Johnson (2022) suggests that our perception of the world is biased by our experiences. It can therefore be deduced that the personal experiences of the HCI user experience (UX) designer permeate the final product. The premise of the deliberations of this paper are aligned with the proposition made by Gong et al. (2018) claiming that the user's physical, psychological and behavioural and (familiar) experience characteristics have become an integral part of human-computer inter-action design. Increasingly researchers are observing the potentially exclusionary impact of technological advancements. Lazem et al. (2021) partially attribute this to the dominance of Western methods, practices, standards, and classifications in the way new technology-related knowledge is created and globalised. To dilute the discriminatory effect of computerised systems, it is important to acknowledge that as stated by Zabel and Otto (2021) biases in human cognition and language find their way into a system and affect user perception. Further expansion from the individual to the wholistic view of the human experience Pigeon and Riley (2021) introduces the Indigenous Wholistic Framework (see Figure 1) which aims to promote access and inclusivity when conducting indigenous research.

Figure 1: Indigenous Wholistic Framework *(Pigeon and Riley, 2021)*

According to Cull et. al (2018) indigenous worldviews refer to the comprehensive (physical, emotional, spiritual and intellectual) view of an individual that is inter-connected to land and in relationship to others (family, communities, nations). This paper considers the practical implications of adopting the indigenous worldview perspective to the digital humanism context for application to the public sector digital landscape.

3. Inclusive e-governance

While e-Governance refers to the public sector efforts to digitize government services. Digital inclusion (Refat et. al, 2023) on the other hand, refers to use of information and communication technologies (ICTs) to achieve equitable access to government services for all. Neglecting digital inclusion considerations can have dire consequences for e-Governance, Lee and Porumbescu (2019) caution that "while the potential of e-government to improve the responsiveness of public service provision is well established, there is growing evidence that it can also engender new forms of inequality and social exclusion". A deeper level of reflection is required on the adequacy and relevance of constituent elements in e-governance. The South African government in their National e-Strategy Roadmap (2017) acknowledges the role of ICTs as an efficient means to provide information to poor and marginalized communities to improve their quality of life. According to Tejedo-Romero *et al.* (2022, p2), at a local government level "e-government is a fundamental tool for participation and communication, since its functionality and content are responsible for transmitting the essence of the municipality's management to citizens and convincing them to trust in its services". In considering the future of e-government Malodia et al. (2021) describe a multi-dimensional construct with three underlying dimensions, namely empowered citizenship, hyper-integrated network, and evolutionary system architecture. The redress for socio-economic inequalities can be achieved through the establishment of democratic systems of governance.

4. Digital democracy

Digital infrastructures are increasingly mediating the relationship between citizens and public institutions, moving the questions of control, authorship, and legitimacy to the core of democratic inquiry. Digital democracy also known as e-democracy considers the political implications of the use digital systems within the public sector in the

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

pursuit of and the practice of democracy. According to Akinyetun and Ebonine (2023), Digital democracy refers to initiatives to include digital instruments in the democratic process. In the deliberations on inclusive e-governance and digital democracy there is a need to consider human-centric approaches, taking into account the ethical and socio-political implications of implementing technologies. It originated in a critical and emancipatory tradition that positions human needs, purpose, skill, and creativity as central to the design and governance of technological systems (Cooley, 1989). These principles emphasize the importance of individual agency, participatory structures, and the capacity for people to act on their own terms within social and technical environments. Digital infrastructures intended to support democratic participation must be grounded in the specific social relations, knowledge practices, and lived realities of the communities they serve. This view affirmed as relevant for the African context by Dlamini et al. (2025) who deem the adoption of e-participation in local governance to be an important approach to enhance transparency, accountability, and citizen engagement in decision-making processes.

5. Digital humanism

While scholar opinions diverge on a definition of Digital Humanism, its foundation on the sociological concept 'humanism' cannot be disputed. In concluding a critical analysis of these opinions, Coeckelbergh (2024) notes that digital humanism is "an umbrella term that captures a number of key criticisms of the ways in which digital technologies are already changing our society and culture." Werthner et. al (2023) propose a definition of Digital Humanism as a term associated with the process of describing, analysing, and, predominantly, influencing the complex interplay of technology and humankind for a more humane and fair society, respecting universal human rights and dignities. The current discourse deals with the subject of digital humanism from a philosophical perspective, this paper advocates for a move towards a pragmatic application of its principles. As is often the case with the adoption of new technological ideas or breakthroughs developing countries are at risk for becoming late adopters. The underlying aspirational goals of digital humanism emphasise the importance of creating a more humane and fairer digital world, which respects universal human rights and dignities. In the expanded definition of digital humanism consideration must be given to including global views on 'humanism'. Digital Humanism shifts the discourse beyond the dichotomy of machines mimicking human behaviour and humans leveraging on the computational and processing capabilities of machines, to considering the social, ethical and legislative impact of the adoption of AI.

To structure debates on digital humanism Prem (2024) discussed five principles of digital humanism. These principles start by diagnosing the current situation and gradually progress to making demands on future digital technologies. This paper translates these principles into questions to better align digital humanism thinking to inclusive e-governance:

1. What is the current impact of technology on people and their co-evolution?
2. What is the government mandate for using technology to protect people and environment?
3. Is there political will for using technology to strengthen democracy and society?
4. How can government capitalise on the assertion that technologies are malleable?
5. Does government communication clearly confirm the differences between people and machines?

These principles serve as guidelines for understanding how digital humanism can be incorporated into e-government planning to establish a more e-inclusive society.

6. Conclusion

This paper brings to the fore fundamental viewpoints on the importance of the inclusion of indigenous worldviews not only in the formative stages of digital humanism discourse, but also more broadly in shaping the digital future of societies in the global south. The evolution of how our online realities, will inevitably start to mimic our 'real-world' realities must find the global south prepared to leverage on consciously using technology to benefit communities at local, provincial and national government levels. The public sector in the global south context remains the custodian for helping marginalised communities addresses inequalities. With the advent of AI technologies, the digital transformation goal of the public sector is the creation of an e-inclusive society. Where the values of its citizens relating to online dignity, freedom, ethics, democracy, social justice and self-determination continue to be upheld and protected. These values are not different from those enshrined in the formation of socio-economic and digital democracies. Digital humanism provides a human-centered umbrella for understanding the future implications of technological advancements on society. The five key questions raised, or digital humanism principles introduced in this paper, provide a pragmatic link between theory and the application of digital humanism thinking to the e-governance context.

The Potential of Blockchain Technology for Collaboration among Countries

Jefferson Bicca Charczuk[a], *Kerley* Silva[a]*, *Marco Tulio* da Silva Lima[a]

[a] Federal Data Processing Service (Serpro), Brazil

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 22 May 2025

Abstract. In today's interconnected world, cooperation between countries is crucial, whether to deal with challenges or opportunities in the economic, social, technological or environmental perspective. This document proposes a workshop regarding the potential use of blockchain technology to foster international cooperation among different countries, to address opportunities and challenges. Cross-border collaboration is often hindered by inefficiencies, lack of transparency, and trust issues between nations. Blockchain technology, characterized by its decentralized, transparent, and immutable nature, has the potential to change the way countries collaborate, offering new opportunities for more efficient, secure, and trusted cooperation.

Keywords. Blockchain, Public Sector, Collaboration, Cooperation, Opportunities, Challenges.
Workshop, DOI: https://doi.org/10.59490/dgo.2025.1009

1. Introduction

In today's interconnected world, cooperation between countries is crucial, whether to deal with challenges or opportunities in the economic, social, technological or environmental perspective. This document proposes a workshop regarding the potential use of blockchain technology to foster international cooperation among different countries, to address opportunities and challenges.

Cross-border collaboration is often hindered by inefficiencies, lack of transparency, and trust issues between nations. Blockchain technology, characterized by its decentralized, transparent, and immutable nature, has the potential to change the way countries collaborate, offering new opportunities for more efficient, secure, and trusted cooperation.

There are different ways in which blockchain can be potentially used by the public sector (Alexopoulos et al., 2019; Alketbi et al., 2018; Berryhill et al., 2018; Koster and Borgman, 2020; Olnes, Ubacht and Janssen, 2017). Some of the ways that the technology can support collaboration among countries are the following:

a) Enhancing Cross-Border Trade and Economic Cooperation

One of the most promising applications of blockchain for international collaboration lies in trade and supply chain management (Rukanova et al., 2021; Vanany, 2020; Westerlund et al., 2021; Zhang et al., 2021). Traditional international trade systems are often burdened by paperwork, delays, and inefficiencies in customs clearance, payments, and documentation. Blockchain can streamline these processes by providing a secure and transparent record of every transaction, from the manufacturer to the end consumer. This model enables and open the possibility to create standards, allowing interoperation which also aligns a common language between different actors.

Through blockchain-based platforms, countries can potentially reduce intermediaries, minimizing the risks of fraud. For example, blockchain can track goods in real-time as they cross borders, providing a transparent record that ensures compliance with international trade regulations, improving customs efficiency, and enhancing trust between trading partners.

b) Blockchain for Cross-Border Payments

Blockchain's potential to transform cross-border payments is another area with implications for international cooperation. Crypto economic models using blockchain enable payments, investments, lending and borrowing, allowing the representation of assets as tokens, that can be traded in digital exchanges (Zutshi et al., 2021). Remittances, international business payments, and the global movement of capital often suffer from high transaction costs, slow processing times, and the involvement of many intermediaries. Blockchain can reduce intermediaries, thereby reducing costs and making financial flows faster and more transparent.

Countries can collaborate on creating a stable infrastructure for international economic cooperation, allowing for the easier exchange of money across borders. Blockchain can provide the security and efficiency needed to support these digital currencies, ensuring that international transactions are both faster and more reliable.

c) Secure Data Sharing for Global Challenges and Cooperation

International cooperation often requires the exchange of data across borders, whether for education, security, environmental monitoring, or scientific research. Blockchain can provide a secure and transparent means for data sharing between countries, reducing the risks of data manipulation.

For example, blockchain could be used to track climate change data shared between nations, creating an immutable record of emissions reductions, resource usage, or conservation efforts. This would ensure that all participating countries are held accountable to their commitments under global or regional agreements. By ensuring that data cannot be altered or tampered with, blockchain increases transparency and trust among nations.

At its core, blockchain technology offers a decentralized and trustless system. Countries can collaborate through blockchain technology, leveraging open-source solutions to enhance mutual growth. By sharing knowledge and resources, they can create more efficient, transparent systems. Together, they can unlock new opportunities for innovative solutions. Even when countries don't fully trust each other, blockchain enables them to work together without relying on a central authority or intermediary. With blockchain, nations can collaborate on projects, share information, and exchange resources in a way that ensures transparency, accountability, and security.

d) Blockchain in International Governance and Accountability

International governance often involves complex negotiations between countries with differing interests, values, and political systems. Blockchain can help facilitate these discussions by providing a decentralized platform for governance where decisions are made collaboratively, transparently, and with accountability. Furthermore, blockchain can help in creating standards and protocols that can be adopted by different countries, ensuring interoperability and alignment of interests (Koller and Douglas, 2023).

One of the most innovative uses of blockchain in the context of international collaboration is its potential to transform voting systems (Jafar, Aziz and Shukur, 2021). Blockchain-based voting systems could be used to ensure that international bodies make decisions based on real-time input from all participants. Blockchain could also enhance transparency in international aid distribution, making it easier to track how funds are allocated, how they are spent, and whether they reach their intended recipients.

For example, in humanitarian aid scenarios, blockchain can help to track donations, ensuring that funds are used appropriately and reach the right beneficiaries. This would increase trust in among civil society and organizations and foster stronger collaboration between nations in solving crises such as disaster relief.

Blockchain-based voting could also be used in global referendums on pressing issues like international trade agreements and collective measures from different dimensions, such as environmental, social, technological and economical. By leveraging blockchain's security and transparency features, global and decentralized models of governance could become more inclusive and trusted by citizens around the world.

2. Workshop Proposal

a) Goal: to identify international challenges, analyse pain points and to map the potential use of blockchain.

b) Participants: Government representatives, tech developers, policymakers, international organizations, corporations, civil society, business leaders, researchers and students. By engaging in open dialogue, stakeholders from different backgrounds can share valuable insights, which can help shape more effective and adaptable strategies for implementing blockchain in an international context. The diversity of thought also enables the identification of potential challenges that may arise in different cultural, economic, and regulatory environments, allowing for more informed decision-making.

c) Steps:

- Brief presentation: regarding the workshop goals and about the potential of blockchain in the international context.
- Identification of international challenges or needs: Identification of common challenges, needs and inefficiencies that affect multiple countries. These challenges should be suitable for blockchain's unique features (e.g., transparency, security, tokenization, decentralization and standardization). At the end, the challenges will be organized according to PESTLE framework.
- Analysis of pain points: Dive deep into some of the specific needs and pain points of the different countries. Examination of the bottlenecks and inefficiencies in the international issues selected. Assessment regarding where is trust between parties lacking, as well as where decentralization or tokenization may be suitable.
- Map the potential use of blockchain: Explore how blockchain's capabilities can address some of the pain points identified. Map each challenge or need and align it with potential blockchain use cases. Use a value vs. feasibility matrix to prioritize ideas. The matrix should plot potential blockchain applications based on their feasibility (technical, regulatory, etc.) and value to stakeholders.

3. Conclusion: Blockchain as a Catalyst for Cooperation among Nations

Blockchain's potential to enhance international collaboration is promising and multifaceted. By offering secure, transparent, and decentralized systems, blockchain can help address some inefficiencies and trust deficits that currently exist between countries in areas such as trade, education, finance, governance, and environmental protection. As nations continue to face global challenges, as climate change and economic inequality, blockchain technology provides a powerful tool to foster more effective, transparent, and equitable international cooperation.

By embracing blockchain, countries can take a significant step toward more cohesive, accountable, and trustworthy partnerships. The time to explore its potential is now, as the future of international collaboration hinges on the willingness to innovate, adopt new technologies, and build a more connected world.

Therefore, it is expected that the workshop and discussions will consider the diverse perspectives of the participants to explore the use of blockchain technology in an international context. The exchange of different visions allows participants to deepen their understanding of blockchain's potential and limitations across various regions and sectors.

Moreover, the workshop can encourage cross-border collaboration, breaking down barriers and promoting the development of solutions that benefit many parties. This collaborative environment accelerates innovation, with participants more likely to create interoperable systems that can operate seamlessly across jurisdictions. The shared goal of maximizing blockchain's positive impact on different segments brings people together, fostering stronger partnerships and networks that extend beyond the duration of the workshop.

In conclusion, we expect that the workshop with diverse perspectives on blockchain may pave the way for more strategies that address different challenges and opportunities, while unlocking the technology's potential in an international context.

Workshop "Digital Government Measurement for Research and Public Policies"

*Manuella Maia Ribeiro a**

[a] Regional Center for Studies on the Development of the Information Society (Cetic.br), Brazilian Network Information Center (NIC.br), São Paulo, Brazil, manuella@nic.br, https://orcid.org/0000-0002-5420-1348.

Submitted: 31 January 2025, Revised: 26 March 2025, Accepted: 21 April 2025, Published: 22 May 2025

Abstract. Based on the Regional Center for Studies on the Development of the Information Society (Cetic.br) 20 years' experience on measuring information and communication technologies (ICT) in Brazil and its participation in various international indicators standards working groups, the workshop aims to familiarize the participants with digital government indicators and strategies to use them in research and public policies. To achieve this purpose, participants will be informed about the availability of secondary data related to digital transformation and digital government from both demand- and supply-side, including international databases. The organizers also intend to present showcases using datasets of national surveys in Brazil relating to the adoption of technologies by governments and individuals.

Keywords. Digital government, measurement, indicators.
Workshop, DOI: https://doi.org/10.59490/dgo.2025.1010

1. Introduction

Digital government initiatives have been considered essential to facilitate access to public information and services by the population and support the achievement of the Sustainable Development Goals (SDGs), among other national and international commitments. However, both progress between countries and the adoption of these initiatives by individuals can vary around the world. In this context, measuring digital government becomes essential to identify not only inequalities in the inclusion of technologies in the daily activities of public organizations, but also to help define government actions to advance in this area. In addition, the need to investigate the enablers and barriers to society's access to digital public services has been highlighted by academia, governments and international organizations, especially among the most vulnerable population. Therefore, it is also necessary to monitor how society is using digital government to ensure that people have access to the services and information they need.

Based on this scenario, this workshop aims to explore the use of secondary data in research and practice related to digital transformation and digital government. It seeks to provide insights into key international digital transformation indicators and discuss how researchers, practitioners and students can leverage these datasets to analyse government digital initiatives in Brazil and worldwide. The organizers intend to present databases on digital transformation and digital government, such as from International Telecommunication Union (ITU) data hub and microdata from Cetic.br surveys, highlighting potential usage for analysing and improving public policies.

The purpose of the workshop is to provide participants with practical knowledge on how to use these datasets—supported by the indicators and studies developed by the Regional Center for Studies on the Development of the Information Society (Cetic.br), a department of the Brazilian Network Information Center (NIC.br) and a UNESCO Category 2 Center in Brazil—to enhance research in digital government. The workshop is designed for researchers, students, and professionals interested in leveraging data for digital transformation and public sector research.

Copyright ©2025 by the authors. This conference paper is published under a CC-BY-4.0 license

The key topics of the workshop include:

- Secondary Data Analysis in Digital Transformation and Digital Government: Understanding the role of existing datasets in research and practice.
- Measuring Connectivity Across Countries in the Digital Era: Assessing the impact of connectivity on data usage by researchers, from more conservative to less conservative approaches.
- International Indicators of Digital Transformation: Exploring global datasets and methodologies for measuring digital transformation.

2. About the organizers

Since 2005, the Regional Center for Studies on the Development of the Information Society (Cetic.br), a department of the Brazilian Network Information Center (NIC.br), executive branch of the the Brazilian Internet Steering Committee (CGI.br), has been dedicated to monitor access, usage, and adoption of information and communication technologies (ICT) in Brazil. It accomplishes this by producing key indicators on ICT access, usage, and appropriation across different sectors of society. These insights support policymaking, research and the evaluation of public policies aimed at fostering Internet development in the country

In 2012, Cetic.br was designated as a Category 2 Center of UNESCO, becoming the first center focused on the advancement of information and knowledge societies. Affiliated with UNESCO's Communication and Information Sector, it plays a strategic role in supporting the institution's goals, contributing to the global effort to monitor and promote the development of information and knowledge societies, especially among Latin America and Portuguese-speaking African countries. Cetic.br's initiatives include efforts to highlight the importance of ICT measurement for public policy, facilitate discussions on the intersection of society and technology, and promote the exchange of experiences among key stakeholders involved in shaping knowledge societies.

3. Objectives for the participants

The Digital Government Measurement for Research and Public Policies workshop aims to familiarize participants with the knowledge and tools necessary to leverage digital government indicators and datasets for research and policymaking. By the end of the workshop, participants have a better understanding of:

- Role of Digital Government Indicators
    - Gain insights into the importance of measuring digital transformation in the public sector.
    - Identify key international and national indicators that track digital government progress.
- Explore Secondary Data Sources for Research and Public Policies
    - Learn about available secondary data sources, including demand- and supply-side datasets, to analyse digital transformation indicators.
    - Understand how international databases, such as those from the International Telecommunication Union (ITU) and Cetic.br/NIC.br, can contribute to research and policies.
- Apply Data and Indicators to Research and Public Policy
    - Explore practical examples of how datasets have been used to shape public policies in Brazil and other countries.
    - Develop strategies to integrate digital government indicators into academic research and public policies.

4. Format

The workshop is structured as an interactive session and lasts for 1 hour and 30 minutes. The format consists of a plenary session with short presentations by the organizers and continuous Q&A with the audience. The proposed schedule is as follows:

- Session introduction (up to 10 minutes);
- Short presentations by the organizers on each workshop theme (up to 10 minutes per theme);
- Q&A with the audience during the session;
- Closing comments and session summary (10 minutes).

This volume presents the proceedings of the 26th Annual International Conference on Digital Government Research (DG.O 2025), a landmark event marking the conference's first edition in South America, hosted in Porto Alegre, Brazil. Bringing together leading scholars and practitioners from 32 countries, this book explores the critical intersections of public administration, technological innovation, and civic engagement. It includes the full versions of the 119 papers presented over four days across 24 thematic tracks, chaired by 63 colleagues. Many served in multiple roles, reflecting the dedication and collaborative spirit that characterize our community. Together, these efforts ensured both the scientific quality and the intellectual diversity of the program.

The theme of DG.O 2025, *Digital Government Fostering Social Cohesion for Reducing Inequalities*, was especially relevant in the Brazilian context and aligned with ongoing international discussions. More than a technological endeavor, digital government represents a powerful means of addressing long-standing social and economic inequalities. In societies characterized by unequal opportunities, fostering social cohesion remains both a pressing challenge and a shared objective. The experiences of Brazil and Latin America highlight the value of inclusive approaches that strengthen participation, trust, resilience, and a sense of belonging. This perspective was reflected throughout the conference program, with tracks and sessions addressing, among other topics:

- Artificial Intelligence, Algorithmic Accountability, and Ethics in Government
- Data-Driven Public Policy, Open Data Ecosystems, and Digital Platforms
- Digital Democracy, E-Participation, and Public Engagement
- Smart Cities, Sustainable Governance, and Urban Social Cohesion
- GovTech, Cybersecurity, Trust, and Digital Public Infrastructure

This volume serves as an interesting resource for researchers, policymakers, and public administrators seeking actionable strategies to leverage digital transformation to build more inclusive, trustworthy, and resilient societies.
